  - User agents may focus one of those elements in the process, by running the [focusing steps](#)<sup>p769</sup> for that element, and may change the scrolling position of the document, or perform some other action that brings the element to the user's attention. For elements that are [form-associated custom elements](#)<sup>p697</sup>, user agents should use their [validation anchor](#)<sup>p710</sup> instead, for the purposes of these actions.
  - User agents may report more than one constraint violation.
  - User agents may coalesce related constraint violation reports if appropriate (e.g. if multiple radio buttons in a [group](#)<sup>p507</sup> are marked as required, only one error need be reported).
  - If one of the controls is not [being rendered](#)<sup>p1172</sup> (e.g. it has the [hidden](#)<sup>p758</sup> attribute set) then user agents may report a script error.
4. Return a *negative* result.

#### 4.10.20.3 The constraint validation API <sup>p58</sup><sub>5</sub>

##### For web developers (non-normative)

##### **`element` . `willValidate`**<sup>p586</sup>

Returns true if the element will be validated when the form is submitted; false otherwise.

##### **`element` . `setCustomValidity`**<sup>p586</sup>(*message*)

Sets a custom error, so that the element would fail to validate. The given message is the message to be shown to the user when reporting the problem to the user.

If the argument is the empty string, clears the custom error.

##### **`element` . `validity`**<sup>p586</sup> . `valueMissing`<sup>p587</sup>

Returns true if the element has no value but is a required field; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `typeMismatch`<sup>p587</sup>

Returns true if the element's value is not in the correct syntax; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `patternMismatch`<sup>p587</sup>

Returns true if the element's value doesn't match the provided pattern; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `tooLong`<sup>p587</sup>

Returns true if the element's value is longer than the provided maximum length; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `tooShort`<sup>p587</sup>

Returns true if the element's value, if it is not the empty string, is shorter than the provided minimum length; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `rangeUnderflow`<sup>p587</sup>

Returns true if the element's value is lower than the provided minimum; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `rangeOverflow`<sup>p587</sup>

Returns true if the element's value is higher than the provided maximum; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `stepMismatch`<sup>p587</sup>

Returns true if the element's value doesn't fit the rules given by the [step](#)<sup>p520</sup> attribute; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `badInput`<sup>p587</sup>

Returns true if the user has provided input in the user interface that the user agent is unable to convert to a value; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `customError`<sup>p587</sup>

Returns true if the element has a custom error; false otherwise.

##### **`element` . `validity`**<sup>p586</sup> . `valid`<sup>p587</sup>

Returns true if the element's value has no validity problems; false otherwise.

##### **`valid` = `element` . `checkValidity`**<sup>p587</sup>( )

Returns true if the element's value has no validity problems; false otherwise. Fires an [invalid](#)<sup>p1260</sup> event at the element in the latter case.

**`valid = element.reportValidityp588()`**

Returns true if the element's value has no validity problems; otherwise, returns false, fires an [invalid<sup>p1260</sup>](#) event at the element, and (if the event isn't canceled) reports the problem to the user.

**`element.validationMessagep588`**

Returns the error message that would be shown to the user if the element was to be checked for validity.

The **`willValidate`** attribute's getter must return true, if this element is a [candidate for constraint validation<sup>p583</sup>](#), and false otherwise (i.e., false if any conditions are [barring it from constraint validation<sup>p583</sup>](#)).

The **`willValidate`** attribute of [ElementInternals<sup>p707</sup>](#) interface, on getting, must throw a ["NotSupportedError" DOMException](#) if the [target element<sup>p708</sup>](#) is not a [form-associated custom element<sup>p697</sup>](#). Otherwise, it must return true if the [target element<sup>p708</sup>](#) is a [candidate for constraint validation<sup>p583</sup>](#), and false otherwise.

The **`setCustomValidity(message)`** method, when invoked, must set the [custom validity error message<sup>p583</sup>](#) to *message*.

### Example

In the following example, a script checks the value of a form control each time it is edited, and whenever it is not a valid value, uses the [setCustomValidity\(\)<sup>p586</sup>](#) method to set an appropriate message.

```
<label>Feeling: <input name=f type="text" oninput="check(this)"></label>
<script>
  function check(input) {
    if (input.value == "good" ||
        input.value == "fine" ||
        input.value == "tired") {
      input.setCustomValidity('' + input.value + ' is not a feeling.');
```

The **`validity`** attribute's getter must return a [ValidityState<sup>p586</sup>](#) object that represents the [validity states<sup>p583</sup>](#) of this element. This object is [live<sup>p44</sup>](#).

The **`validity`** attribute of [ElementInternals<sup>p707</sup>](#) interface, on getting, must throw a ["NotSupportedError" DOMException](#) if the [target element<sup>p708</sup>](#) is not a [form-associated custom element<sup>p697</sup>](#). Otherwise, it must return a [ValidityState<sup>p586</sup>](#) object that represents the [validity states<sup>p583</sup>](#) of the [target element<sup>p708</sup>](#). This object is [live<sup>p44</sup>](#).

IDL [Exposed=Window]

```
interface ValidityState {
  readonly attribute boolean valueMissing;
  readonly attribute boolean typeMismatch;
  readonly attribute boolean patternMismatch;
  readonly attribute boolean tooLong;
  readonly attribute boolean tooShort;
  readonly attribute boolean rangeUnderflow;
  readonly attribute boolean rangeOverflow;
  readonly attribute boolean stepMismatch;
  readonly attribute boolean badInput;
  readonly attribute boolean customError;
  readonly attribute boolean valid;
};
```

A [ValidityState<sup>p586</sup>](#) object has the following attributes. On getting, they must return true if the corresponding condition given in the following list is true, and false otherwise.

### **valueMissing**

The control is [suffering from being missing](#)<sup>p583</sup>.

### **typeMismatch**

The control is [suffering from a type mismatch](#)<sup>p583</sup>.

### **patternMismatch**

The control is [suffering from a pattern mismatch](#)<sup>p583</sup>.

### **tooLong**

The control is [suffering from being too long](#)<sup>p583</sup>.

### **tooShort**

The control is [suffering from being too short](#)<sup>p583</sup>.

### **rangeUnderflow**

The control is [suffering from an underflow](#)<sup>p583</sup>.

### **rangeOverflow**

The control is [suffering from an overflow](#)<sup>p584</sup>.

### **stepMismatch**

The control is [suffering from a step mismatch](#)<sup>p584</sup>.

### **badInput**

The control is [suffering from bad input](#)<sup>p584</sup>.

### **customError**

The control is [suffering from a custom error](#)<sup>p584</sup>.

### **valid**

None of the other conditions are true.

The **check validity steps** for an element *element* are:

1. If *element* is a [candidate for constraint validation](#)<sup>p583</sup> and does not [satisfy its constraints](#)<sup>p584</sup>, then:
  1. [Fire an event](#) named [invalid](#)<sup>p1260</sup> at *element*, with the [cancelable](#) attribute initialized to true (though canceling has no effect).
  2. Return false.
2. Return true.

The **checkValidity()** method, when invoked, must run the [check validity steps](#)<sup>p587</sup> on this element.

The **checkValidity()** method of the [ElementInternals](#)<sup>p707</sup> interface must run these steps:

1. Let *element* be this [ElementInternals](#)<sup>p707</sup>'s [target element](#)<sup>p708</sup>.
2. If *element* is not a [form-associated custom element](#)<sup>p697</sup>, then throw a ["NotSupportedError" DOMException](#).
3. Run the [check validity steps](#)<sup>p587</sup> on *element*.

The **report validity steps** for an element *element* are:

1. If *element* is a [candidate for constraint validation](#)<sup>p583</sup> and does not [satisfy its constraints](#)<sup>p584</sup>, then:
  1. Let *report* be the result of [firing an event](#) named [invalid](#)<sup>p1260</sup> at *element*, with the [cancelable](#) attribute initialized to true.
  2. If *report* is true, then report the problems with the constraints of this element to the user. When reporting the problem with the constraints to the user, the user agent may run the [focusing steps](#)<sup>p769</sup> for *element*, and may change the scrolling position of the document, or perform some other action that brings *element* to the user's attention. User agents may report more than one constraint violation, if *element* suffers from multiple problems at

once. If *element* is not [being rendered](#)<sup>p1172</sup>, then the user agent may, instead of notifying the user, [report the error](#)<sup>p921</sup> for the [running script](#)<sup>p907</sup>.

3. Return false.

2. Return true.

The `reportValidity()` method, when invoked, must run the [report validity steps](#)<sup>p587</sup> on this element.

The `reportValidity()` method of the [ElementInternals](#)<sup>p707</sup> interface must run these steps:

1. Let *element* be this [ElementInternals](#)<sup>p707</sup>'s [target element](#)<sup>p708</sup>.
2. If *element* is not a [form-associated custom element](#)<sup>p697</sup>, then throw a `"NotSupportedError"` `DOMException`.
3. Run the [report validity steps](#)<sup>p587</sup> on *element*.

The `validationMessage` attribute's getter must run these steps:

1. If this element is not a [candidate for constraint validation](#)<sup>p583</sup> or if this element [satisfies its constraints](#)<sup>p584</sup>, then return the empty string.
2. Return a suitably localized message that the user agent would show the user if this were the only form control with a validity constraint problem. If the user agent would not actually show a textual message in such a situation (e.g., it would show a graphical cue instead), then return a suitably localized message that expresses (one or more of) the validity constraint(s) that the control does not satisfy. If the element is a [candidate for constraint validation](#)<sup>p583</sup> and is [suffering from a custom error](#)<sup>p584</sup>, then the [custom validity error message](#)<sup>p583</sup> should be present in the return value.

#### 4.10.20.4 Security § p58

Servers should not rely on client-side validation. Client-side validation can be intentionally bypassed by hostile users, and unintentionally bypassed by users of older user agents or automated tools that do not implement these features. The constraint validation features are only intended to improve the user experience, not to provide any kind of security mechanism.

#### 4.10.21 Form submission § p58

##### 4.10.21.1 Introduction § p58

*This section is non-normative.*

When a form is submitted, the data in the form is converted into the structure specified by the [enctype](#)<sup>p565</sup>, and then sent to the destination specified by the [action](#)<sup>p564</sup> using the given [method](#)<sup>p564</sup>.

For example, take the following form:

```
<form action="/find.cgi" method=get>
  <input type=text name=t>
  <input type=search name=q>
  <input type=submit>
</form>
```

If the user types in "cats" in the first field and "fur" in the second, and then hits the submit button, then the user agent will load `/find.cgi?t=cats&q=fur`.

On the other hand, consider this form:

```
<form action="/find.cgi" method=post enctype="multipart/form-data">
  <input type=text name=t>
  <input type=search name=q>
  <input type=submit>
</form>
```

Given the same user input, the result on submission is quite different: the user agent instead does an HTTP POST to the given URL, with as the entity body something like the following text:

```
-----kYFrd4jNJEgCervE
Content-Disposition: form-data; name="t"

cats
-----kYFrd4jNJEgCervE
Content-Disposition: form-data; name="q"

fur
-----kYFrd4jNJEgCervE--
```

#### 4.10.21.2 Implicit submission § p58 9

A [form<sup>p479</sup>](#) element's **default button** is the first [submit button<sup>p479</sup>](#) in [tree order](#) whose [form owner<sup>p559</sup>](#) is that [form<sup>p479</sup>](#) element.

If the user agent supports letting the user submit a form implicitly (for example, on some platforms hitting the "enter" key while a text control is [focused<sup>p764</sup>](#) implicitly submits the form), then doing so for a form, whose [default button<sup>p589</sup>](#) has [activation behavior](#) and is not [disabled<sup>p563</sup>](#), must cause the user agent to [fire a click event<sup>p945</sup>](#) at that [default button<sup>p589</sup>](#).

#### Note

*There are pages on the Web that are only usable if there is a way to implicitly submit forms, so user agents are strongly encouraged to support this.*

If the form has no [submit button<sup>p479</sup>](#), then the implicit submission mechanism must do nothing if the form has more than one *field that blocks implicit submission*, and must [submit<sup>p589</sup>](#) the [form<sup>p479</sup>](#) element from the [form<sup>p479</sup>](#) element itself otherwise.

For the purpose of the previous paragraph, an element is a *field that blocks implicit submission* of a [form<sup>p479</sup>](#) element if it is an [input<sup>p486</sup>](#) element whose [form owner<sup>p559</sup>](#) is that [form<sup>p479</sup>](#) element and whose [type<sup>p488</sup>](#) attribute is in one of the following states: [Text<sup>p492</sup>](#), [Search<sup>p492</sup>](#), [URL<sup>p494</sup>](#), [Telephone<sup>p493</sup>](#), [E-mail<sup>p495</sup>](#), [Password<sup>p497</sup>](#), [Date<sup>p497</sup>](#), [Month<sup>p498</sup>](#), [Week<sup>p499</sup>](#), [Time<sup>p500</sup>](#), [Local Date and Time<sup>p501</sup>](#), [Number<sup>p502</sup>](#)

#### 4.10.21.3 Form submission algorithm § p58 9

Each [form<sup>p479</sup>](#) element has a **constructing entry list** boolean, initially false.

Each [form<sup>p479</sup>](#) element has a **firing submission events** boolean, initially false.

When a [form<sup>p479</sup>](#) element *form* is **submitted** from an element *submitter* (typically a button), optionally with a *submitted from [submit\(\)](#)<sup>p483</sup>* method flag set, the user agent must run the following steps:

1. If *form* [cannot navigate<sup>p285</sup>](#), then return.
2. If *form*'s [constructing entry list<sup>p589</sup>](#) is true, then return.
3. Let *form document* be *form*'s [node document](#).
4. If *form document*'s [active sandboxing flag set<sup>p835</sup>](#) has its [sandboxed forms browsing context flag<sup>p833</sup>](#) set, then return.
5. Let *form browsing context* be the [browsing context<sup>p804</sup>](#) of *form document*.
6. If the *submitted from [submit\(\)](#)<sup>p483</sup>* method flag is not set, then:
  1. If *form*'s [firing submission events<sup>p589</sup>](#) is true, then return.
  2. Set *form*'s [firing submission events<sup>p589</sup>](#) to true.
  3. If the *submitter* element's [no-validate state<sup>p565</sup>](#) is false, then [interactively validate the constraints<sup>p584</sup>](#) of *form* and examine the result. If the result is negative (i.e., the constraint validation concluded that there were invalid fields and probably informed the user of this), then:

1. Set *form*'s [firing submission events](#)<sup>p589</sup> to false.
2. Return.
4. Let *submitterButton* be null if *submitter* is *form*. Otherwise, let *submitterButton* be *submitter*.
5. Let *continue* be the result of [firing an event](#) named [submit](#)<sup>p1261</sup> at *form* using [SubmitEvent](#)<sup>p596</sup>, with the [submitter](#)<sup>p596</sup> attribute initialized to *submitterButton*, the [bubbles](#) attribute initialized to true, and the [cancelable](#) attribute initialized to true.
6. Set *form*'s [firing submission events](#)<sup>p589</sup> to false.
7. If *continue* is false, then return.
8. If *form* [cannot navigate](#)<sup>p285</sup>, then return.

**Note**

[Cannot navigate](#)<sup>p285</sup> is run again as dispatching the [submit](#)<sup>p1261</sup> event could have changed the outcome.

7. Let *encoding* be the result of [picking an encoding for the form](#)<sup>p594</sup>.
8. Let *entry list* be the result of [constructing the entry list](#)<sup>p592</sup> with *form*, *submitter*, and *encoding*.
9. If *form* [cannot navigate](#)<sup>p285</sup>, then return.

**Note**

[Cannot navigate](#)<sup>p285</sup> is run again as dispatching the [formdata](#)<sup>p1260</sup> event in [constructing the entry list](#)<sup>p592</sup> could have changed the outcome.

10. Let *action* be the *submitter* element's [action](#)<sup>p564</sup>.
11. If *action* is the empty string, let *action* be the [URL](#) of the *form* document.
12. [Parse](#)<sup>p87</sup> the [URL](#) *action*, relative to the *submitter* element's [node document](#). If this fails, return.
13. Let *parsed action* be the [resulting URL record](#)<sup>p87</sup>.
14. Let *scheme* be the [scheme](#) of *parsed action*.
15. Let *enctype* be the *submitter* element's [enctype](#)<sup>p565</sup>.
16. Let *method* be the *submitter* element's [method](#)<sup>p564</sup>.
17. Let *target* be the *submitter* element's [formtarget](#)<sup>p565</sup> attribute value, if the element is a [submit button](#)<sup>p479</sup> and has such an attribute. Otherwise, let it be the result of [getting an element's target](#)<sup>p153</sup> given *submitter*'s [form owner](#)<sup>p559</sup>.
18. Let *noopener* be the result of [getting an element's noopener](#)<sup>p285</sup> with *form* and *targetAttributeValue*.
19. Let *target browsing context* and *replace* be the result of applying [the rules for choosing a browsing context](#)<sup>p812</sup> using *target*, *form browsing context*, and *noopener*.
20. If *target browsing context* is null, then return.
21. If *form document* has not yet [completely loaded](#)<sup>p1145</sup> and the *submitted from* [submit\(\)](#)<sup>p483</sup> *method* flag is set, then set *replace* to true.
22. If the value of *method* is [dialog](#)<sup>p564</sup> then jump to the [submit dialog](#)<sup>p592</sup> steps.

Otherwise, select the appropriate row in the table below based on the value of *scheme* as given by the first cell of each row. Then, select the appropriate cell on that row based on the value of *method* as given in the first cell of each column. Then, jump to the steps named in that cell and defined below the table.

	<a href="#">GET</a> <sup>p564</sup>	<a href="#">POST</a> <sup>p564</sup>
http	<a href="#">Mutate action URL</a> <sup>p591</sup>	<a href="#">Submit as entity body</a> <sup>p591</sup>
https	<a href="#">Mutate action URL</a> <sup>p591</sup>	<a href="#">Submit as entity body</a> <sup>p591</sup>
ftp	<a href="#">Get action URL</a> <sup>p592</sup>	<a href="#">Get action URL</a> <sup>p592</sup>
javascript	<a href="#">Get action URL</a> <sup>p592</sup>	<a href="#">Get action URL</a> <sup>p592</sup>
data	<a href="#">Mutate action URL</a> <sup>p591</sup>	<a href="#">Get action URL</a> <sup>p592</sup>

	GET <sup>p564</sup>	POST <sup>p564</sup>
mailto	Mail with headers <sup>p592</sup>	Mail as body <sup>p592</sup>

If *scheme* is not one of those listed in this table, then the behavior is not defined by this specification. User agents should, in the absence of another specification defining this, act in a manner analogous to that defined in this specification for similar schemes.

Each [form<sup>p479</sup>](#) element has a **planned navigation**, which is either null or a [task<sup>p925</sup>](#); when the [form<sup>p479</sup>](#) is first created, its [planned navigation<sup>p591</sup>](#) must be set to null. In the behaviors described below, when the user agent is required to **plan to navigate** to a particular resource *destination*, it must run the following steps:

1. If *destination* is not a [request](#), then set *destination* to a new [request](#) whose [URL](#) is *destination*.
2. If the [form<sup>p479</sup>](#) element's [link types<sup>p289</sup>](#) include the [norereferrer<sup>p298</sup>](#) keyword, then set *destination*'s [referrer](#) to "no-referrer".
3. If the [form<sup>p479</sup>](#) has a non-null [planned navigation<sup>p591</sup>](#), remove it from its [task queue<sup>p924</sup>](#).
4. [Queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given the [form<sup>p479</sup>](#) element and the following steps:
  1. Set the [form<sup>p479</sup>](#)'s [planned navigation<sup>p591</sup>](#) to null.
  2. [Navigate<sup>p852</sup>](#) *target browsing context* to *destination*. If *replace* is true, then *target browsing context* must be navigated with [replacement enabled<sup>p865</sup>](#).

For the purposes of this task, *target browsing context* and *replace* are the variables that were set up when the overall form submission algorithm was run, with their values as they stood when this [planned navigation<sup>p591</sup>](#) was [queued<sup>p926</sup>](#).

5. Set the [form<sup>p479</sup>](#)'s [planned navigation<sup>p591</sup>](#) to the just-queued [task<sup>p925</sup>](#).

The behaviors are as follows:

#### Mutate action URL

Let *query* be the result of running the [application/x-www-form-urlencoded serializer](#) with *entry list* and *encoding*.

Set *parsed action*'s [query](#) component to *query*.

[Plan to navigate<sup>p591</sup>](#) to *parsed action*.

#### Submit as entity body

Switch on *enctype*:

↪ [application/x-www-form-urlencoded<sup>p565</sup>](#)

Let *body* be the result of running the [application/x-www-form-urlencoded serializer](#) with *entry list* and *encoding*.

Set *body* to the result of [encoding](#) *body*.

Let *MIME type* be "[application/x-www-form-urlencoded](#)".

↪ [multipart/form-data<sup>p565</sup>](#)

Let *body* be the result of running the [multipart/form-data encoding algorithm<sup>p595</sup>](#) with *entry list* and *encoding*.

Let *MIME type* be the concatenation of the string "multipart/form-data;", a U+0020 SPACE character, the string "boundary=", and the [multipart/form-data boundary string<sup>p595</sup>](#) generated by the [multipart/form-data encoding algorithm<sup>p595</sup>](#).

↪ [text/plain<sup>p565</sup>](#)

Let *body* be the result of running the [text/plain encoding algorithm<sup>p595</sup>](#) with *entry list*.

Set *body* to the result of [encoding](#) *body* using *encoding*.

Let *MIME type* be "text/plain".

[Plan to navigate<sup>p591</sup>](#) to a new [request](#) whose [url](#) is *parsed action*, [method](#) is *method*, [header list](#) consists of `Content-Type`/MIME type, and [body](#) is *body*.

### Get action URL

[Plan to navigate](#)<sup>p591</sup> to *parsed action*.

#### Note

*entry list is discarded.*

### Mail with headers

Let *headers* be the result of running the [application/x-www-form-urlencoded serializer](#) with *entry list* and *encoding*.

Replace occurrences of U+002B PLUS SIGN characters (+) in *headers* with the string "%20".

Set *parsed action*'s [query](#) to *headers*.

[Plan to navigate](#)<sup>p591</sup> to *parsed action*.

### Mail as body

Switch on *enctype*:

#### ↪ [text/plain](#)<sup>p565</sup>

Let *body* be the result of running the [text/plain encoding algorithm](#)<sup>p595</sup> with *entry list*.

Set *body* to the result of concatenating the result of [UTF-8 percent encoding](#) each code point in *body*, using the [default encode set](#). [\[URL\]](#)<sup>p1270</sup>

#### ↪ **Otherwise**

Let *body* be the result of running the [application/x-www-form-urlencoded serializer](#) with *entry list* and *encoding*.

If *parsed action*'s [query](#) is null, then set it to the empty string.

If *parsed action*'s [query](#) is not the empty string, then append a single U+0026 AMPERSAND character (&) to it.

Append "body=" to *parsed action*'s [query](#).

Append *body* to *parsed action*'s [query](#).

[Plan to navigate](#)<sup>p591</sup> to *parsed action*.

### Submit dialog

Let *subject* be the nearest ancestor [dialog](#)<sup>p603</sup> element of *form*, if any.

If there isn't one, or if it does not have an [open](#)<sup>p604</sup> attribute, do nothing. Otherwise, proceed as follows:

If *submitter* is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Image Button](#)<sup>p511</sup> state, then let *result* be the string formed by concatenating the [selected coordinate](#)<sup>p512</sup>'s x-component, expressed as a base-ten number using [ASCII digits](#), a U+002C COMMA character (,), and the [selected coordinate](#)<sup>p512</sup>'s y-component, expressed in the same way as the x-component.

Otherwise, if *submitter* has a [value](#)<sup>p559</sup>, then let *result* be that [value](#)<sup>p559</sup>.

Otherwise, there is no *result*.

Then, [close the dialog](#)<sup>p605</sup> *subject*. If there is a *result*, let that be the return value.

#### 4.10.21.4 Constructing the entry list <sup>§ p59</sup><sub>2</sub>

The algorithm to **construct the entry list** given a *form*, an optional *submitter*, and an optional *encoding*, is as follows. If not specified otherwise, *submitter* is null.

1. If *form*'s [constructing entry list](#)<sup>p589</sup> is true, then return null.
2. Set *form*'s [constructing entry list](#)<sup>p589</sup> to true.

3. Let *controls* be a list of all the [submittable elements](#)<sup>p479</sup> whose [form owner](#)<sup>p559</sup> is *form*, in [tree order](#).
4. Let *entry list* be a new empty [list](#) of [entries](#).
5. For each element *field* in *controls*, in [tree order](#):
  1. If any of the following is true:
    - The *field* element has a [datalist](#)<sup>p536</sup> element ancestor.
    - The *field* element is [disabled](#)<sup>p563</sup>.
    - The *field* element is a [button](#)<sup>p479</sup> but it is not *submitter*.
    - The *field* element is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Checkbox](#)<sup>p506</sup> state and whose [checkedness](#)<sup>p559</sup> is false.
    - The *field* element is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Radio Button](#)<sup>p507</sup> state and whose [checkedness](#)<sup>p559</sup> is false.
    - The *field* element is an [object](#)<sup>p367</sup> element that is not using a [plugin](#)<sup>p44</sup>.

Then continue.

2. If the *field* element is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Image Button](#)<sup>p511</sup> state, then:
  1. If the *field* element has a [name](#)<sup>p561</sup> attribute specified and its value is not the empty string, let *name* be that value followed by a single U+002E FULL STOP character (.). Otherwise, let *name* be the empty string.
  2. Let *namex* be the string consisting of the concatenation of *name* and a single U+0078 LATIN SMALL LETTER X character (x).
  3. Let *namey* be the string consisting of the concatenation of *name* and a single U+0079 LATIN SMALL LETTER Y character (y).
  4. The *field* element is *submitter*, and before this algorithm was invoked the user [indicated a coordinate](#)<sup>p512</sup>. Let *x* be the *x*-component of the coordinate selected by the user, and let *y* be the *y*-component of the coordinate selected by the user.
  5. [Append an entry](#)<sup>p594</sup> to *entry list* with *namex* and *x*.
  6. [Append an entry](#)<sup>p594</sup> to *entry list* with *namey* and *y*.
  7. Continue.
3. If the *field* is a [form-associated custom element](#)<sup>p697</sup>, then perform the [entry construction algorithm](#)<sup>p710</sup> given *field* and *entry list*, then [continue](#).
4. If either the *field* element does not have a [name](#)<sup>p561</sup> attribute specified, or its [name](#)<sup>p561</sup> attribute's value is the empty string, then [continue](#).
5. Let *name* be the value of the *field* element's [name](#)<sup>p561</sup> attribute.
6. If the *field* element is a [select](#)<sup>p530</sup> element, then for each [option](#)<sup>p539</sup> element in the [select](#)<sup>p530</sup> element's [list of options](#)<sup>p532</sup> whose [selectedness](#)<sup>p540</sup> is true and that is not [disabled](#)<sup>p539</sup>, [append an entry](#)<sup>p594</sup> to *entry list* with *name* and the [value](#)<sup>p540</sup> of the [option](#)<sup>p539</sup> element.
7. Otherwise, if the *field* element is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Checkbox](#)<sup>p506</sup> state or the [Radio Button](#)<sup>p507</sup> state, then:
  1. If the *field* element has a [value](#)<sup>p490</sup> attribute specified, then let *value* be the value of that attribute; otherwise, let *value* be the string "on".
  2. [Append an entry](#)<sup>p594</sup> to *entry list* with *name* and *value*.
8. Otherwise, if the *field* element is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [File Upload](#)<sup>p508</sup> state, then:
  1. If there are no [selected files](#)<sup>p508</sup>, then [append an entry](#)<sup>p594</sup> to *entry list* with *name* and a new [File](#) object with an empty name, [application/octet-stream](#) as type, and an empty body.

2. Otherwise, for each file in [selected files](#)<sup>p508</sup>, [append an entry](#)<sup>p594</sup> to *entry list* with *name* and a [File](#) object representing the file.
9. Otherwise, if the *field* element is an [object](#)<sup>p367</sup> element: try to obtain a form submission value from the [plugin](#)<sup>p44</sup>, and if that is successful, [append an entry](#)<sup>p594</sup> to *entry list* with *name* and the returned form submission value.
10. Otherwise, if the *field* element is an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Hidden](#)<sup>p492</sup> state and *name* is "[\\_charset\\_](#)<sup>p561</sup>":
  1. Let *charset* be the [name](#) of *encoding* if *encoding* is given, and "UTF-8" otherwise.
  2. [Append an entry](#)<sup>p594</sup> to *entry list* with *name* and *charset*.
11. Otherwise, if the *field* element is a [textarea](#)<sup>p541</sup> element, [append an entry](#)<sup>p594</sup> to *entry list* with *name* and the [value](#)<sup>p559</sup> of the *field* element, and the *prevent line break normalization flag* set.

**Note**

*In the case of the [value](#)<sup>p559</sup> of [textarea](#)<sup>p541</sup> elements, the line break normalization is already performed during the conversion of the control's [raw value](#)<sup>p542</sup> into the control's [value](#)<sup>p559</sup> (which also performs any necessary line wrapping).*

12. Otherwise, [append an entry](#)<sup>p594</sup> to *entry list* with *name* and the [value](#)<sup>p559</sup> of the *field* element.
13. If the element has a [dirname](#)<sup>p561</sup> attribute, and that attribute's value is not the empty string, then:
  1. Let *dirname* be the value of the element's [dirname](#)<sup>p561</sup> attribute.
  2. Let *dir* be the string "ltr" if [the directionality](#)<sup>p139</sup> of the element is '[ltr](#)<sup>p139</sup>', and "rtl" otherwise (i.e., when [the directionality](#)<sup>p139</sup> of the element is '[rtl](#)<sup>p139</sup>').
  3. [Append an entry](#)<sup>p594</sup> to *entry list* with *dirname* and *dir*.

**Note**

*An element can only have a [dirname](#)<sup>p561</sup> attribute if it is a [textarea](#)<sup>p541</sup> element or an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in either the [Text](#)<sup>p492</sup> state or the [Search](#)<sup>p492</sup> state.*

6. Let *form data* be a new [FormData](#) object associated with *entry list*.
7. [Fire an event](#) named [formdata](#)<sup>p1260</sup> at *form* using [FormDataEvent](#)<sup>p596</sup>, with the [formData](#)<sup>p596</sup> attribute initialized to *form data* and the [bubbles](#) attribute initialized to true.
8. Set *form*'s [constructing entry list](#)<sup>p589</sup> to false.
9. Return a [clone](#) of *entry list*.

To [append an entry](#) to *entry list*, given *name*, *value*, and optional *prevent line break normalization flag*, run these steps:

1. For *name*, replace every occurrence of U+000D (CR) not followed by U+000A (LF), and every occurrence of U+000A (LF) not preceded by U+000D (CR), by a string consisting of a U+000D (CR) and U+000A (LF).
2. Replace *name* with the result of [converting to a sequence of Unicode scalar values](#).
3. If *value* is not a [File](#) object, then:
  1. If the *prevent line break normalization flag* is unset, then replace every occurrence of U+000D (CR) not followed by U+000A (LF), and every occurrence of U+000A (LF) not preceded by U+000D (CR) in *value*, by a string consisting of a U+000D (CR) and U+000A (LF).
  2. Replace *value* with the result of [converting to a sequence of Unicode scalar values](#).
4. [Create an entry](#) with *name* and *value*, and [append](#) it to *entry list*.

#### 4.10.21.5 Selecting a form submission encoding §<sup>p59</sup>

If the user agent is to [pick an encoding for a form](#), it must run the following steps:

1. Let *encoding* be the [document's character encoding](#).
2. If the [form<sup>p479</sup>](#) element has an [accept-charset<sup>p480</sup>](#) attribute, set *encoding* to the return value of running these substeps:
  1. Let *input* be the value of the [form<sup>p479</sup>](#) element's [accept-charset<sup>p480</sup>](#) attribute.
  2. Let *candidate encoding labels* be the result of [splitting input on ASCII whitespace](#).
  3. Let *candidate encodings* be an empty list of [character encodings](#).
  4. For each token in *candidate encoding labels* in turn (in the order in which they were found in *input*), [get an encoding](#) for the token and, if this does not result in failure, append the [encoding](#) to *candidate encodings*.
  5. If *candidate encodings* is empty, return [UTF-8](#).
  6. Return the first encoding in *candidate encodings*.
3. Return the result of [getting an output encoding](#) from *encoding*.

#### 4.10.21.6 URL-encoded form data §<sup>p59</sup><sub>5</sub>

See [URL](#) for details on [application/x-www-form-urlencoded](#). [[URL](#)]<sup>p1270</sup>

#### 4.10.21.7 Multipart form data §<sup>p59</sup><sub>5</sub>

The [multipart/form-data encoding algorithm](#), given an *entry list* and *encoding*, is as follows:

1. Let *result* be the empty string.
2. For each [entry](#) in *entry list*:
  1. For each character in the entry's name and value that cannot be expressed using the selected character encoding, replace the character by a string consisting of a U+0026 AMPERSAND character (&), a U+0023 NUMBER SIGN character (#), one or more [ASCII digits](#) representing the code point of the character in base ten, and finally a U+003B (;).
3. Encode the (now mutated) *entry list* using the rules described by RFC 7578, *Returning Values from Forms: multipart/form-data*, and return the resulting byte stream. [[RFC7578](#)]<sup>p1270</sup>

Each entry in *entry list* is a *field*, the name of the entry is the *field name* and the value of the entry is the *field value*.

The order of parts must be the same as the order of fields in *entry list*. Multiple entries with the same name must be treated as distinct fields.

The parts of the generated [multipart/form-data<sup>p1262</sup>](#) resource that correspond to non-file fields must not have a ``Content-Typep88`` header specified. Their names and values must be encoded using the character encoding selected above.

File names included in the generated [multipart/form-data<sup>p1262</sup>](#) resource (as part of file fields) must use the character encoding selected above, though the precise name may be approximated if necessary (e.g. newlines could be removed from file names, quotes could be changed to "%22", and characters not expressible in the selected character encoding could be replaced by other characters).

The boundary used by the user agent in generating the return value of this algorithm is the **multipart/form-data boundary string**. (This value is used to generate the MIME type of the form submission payload generated by this algorithm.)

For details on how to interpret [multipart/form-data<sup>p1262</sup>](#) payloads, see RFC 7578. [[RFC7578](#)]<sup>p1270</sup>

#### 4.10.21.8 Plain text form data §<sup>p59</sup><sub>5</sub>

The [text/plain encoding algorithm](#), given an *entry list*, is as follows:

1. Let *result* be the empty string.

2. For each [entry](#) in *entry list*:
  1. If the entry's value is a [File](#) object, then set its value to the [File](#) object's [name](#).
  2. Append the entry's name to *result*.
  3. Append a single U+003D EQUALS SIGN character (=) to *result*.
  4. Append the entry's value to *result*.
  5. Append a U+000D CARRIAGE RETURN (CR) U+000A LINE FEED (LF) character pair to *result*.
3. Return *result*.

Payloads using the [text/plain](#) format are intended to be human readable. They are not reliably interpretable by computer, as the format is ambiguous (for example, there is no way to distinguish a literal newline in a value from the newline at the end of the value).

#### 4.10.21.9 The [SubmitEvent](#)<sup>p596</sup> interface § p59 6

```

IDL [Exposed=Window]
interface SubmitEvent : Event {
  constructor(DOMString type, optional SubmitEventInit eventInitDict = {});

  readonly attribute HTMLElement? submitter;
};

dictionary SubmitEventInit : EventInit {
  HTMLElement? submitter = null;
};

```

For web developers (non-normative)

##### [event.submitter](#)<sup>p596</sup>

Returns the element representing the [submit button](#)<sup>p479</sup> that triggered the [form submission](#)<sup>p588</sup>, or null if the submission was not triggered by a button.

The [submitter](#) attribute must return the value it was initialized to.

#### 4.10.21.10 The [FormDataEvent](#)<sup>p596</sup> interface § p59 6

```

IDL [Exposed=Window]
interface FormDataEvent : Event {
  constructor(DOMString type, FormDataEventInit eventInitDict);

  readonly attribute FormData formData;
};

dictionary FormDataEventInit : EventInit {
  required FormData formData;
};

```

For web developers (non-normative)

##### [event.formData](#)<sup>p596</sup>

Returns a [FormData](#) object representing names and values of elements associated to the target [form](#)<sup>p479</sup>. Operations on the [FormData](#) object will affect form data to be submitted.

The [formData](#) attribute must return the value it was initialized to. It represents a [FormData](#) object associated to the entry list that is [constructed](#)<sup>p592</sup> when the [form](#)<sup>p479</sup> is submitted.

## 4.10.22 Resetting a form <sup>§ p59</sup><sub>7</sub>

When a [form<sup>p479</sup>](#) element *form* is **reset**, run these steps:

1. Let *reset* be the result of [firing an event](#) named [reset<sup>p1261</sup>](#) at *form*, with the [bubbles](#) and [cancelable](#) attributes initialized to true.
2. If *reset* is true, then invoke the [reset algorithm<sup>p597</sup>](#) of each [resettable element<sup>p479</sup>](#) whose [form owner<sup>p559</sup>](#) is *form*.

Each [resettable element<sup>p479</sup>](#) defines its own **reset algorithm**. Changes made to form controls as part of these algorithms do not count as changes caused by the user (and thus, e.g., do not cause [input<sup>p1260</sup>](#) events to fire).

## 4.11 Interactive elements <sup>§ p59</sup><sub>7</sub>

### 4.11.1 The **details** element <sup>§ p59</sup><sub>7</sub>

#### Categories<sup>p125</sup>:

[Flow content<sup>p128</sup>](#).  
[Sectioning root<sup>p195</sup>](#).  
[Interactive content<sup>p129</sup>](#).  
[Palpable content<sup>p130</sup>](#).

#### Contexts in which this element can be used<sup>p125</sup>:

Where [flow content<sup>p128</sup>](#) is expected.

#### Content model<sup>p125</sup>:

One [summary<sup>p600</sup>](#) element followed by [flow content<sup>p128</sup>](#).

#### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

#### Content attributes<sup>p125</sup>:

[Global attributes<sup>p133</sup>](#)  
[open<sup>p597</sup>](#) — Whether the details are visible

#### Accessibility considerations<sup>p126</sup>:

[For authors](#).  
[For implementers](#).

#### DOM interface<sup>p126</sup>:

```
IDL [Exposed=Window]
interface HTMLDetailsElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute boolean open;
};
```

The [details<sup>p597</sup>](#) element [represents<sup>p120</sup>](#) a disclosure widget from which the user can obtain additional information or controls.

#### Note

The [details<sup>p597</sup>](#) element is not appropriate for footnotes. Please see [the section on footnotes<sup>p714</sup>](#) for details on how to mark up footnotes.

The first [summary<sup>p600</sup>](#) element child of the element, if any, [represents<sup>p120</sup>](#) the summary or legend of the details. If there is no child [summary<sup>p600</sup>](#) element, the user agent should provide its own legend (e.g. "Details").

The rest of the element's contents [represents<sup>p120</sup>](#) the additional information or controls.

The **open** content attribute is a [boolean attribute<sup>p65</sup>](#). If present, it indicates that both the summary and the additional information is to be shown to the user. If the attribute is absent, only the summary is to be shown.

When the element is created, if the attribute is absent, the additional information should be hidden; if the attribute is present, that information should be shown. Subsequently, if the attribute is removed, then the information should be hidden; if the attribute is added, the information should be shown.

The user agent should allow the user to request that the additional information be shown or hidden. To honor a request for the details to be shown, the user agent must [set](#) the [open<sup>p597</sup>](#) attribute on the element to the empty string. To honor a request for the information to be hidden, the user agent must [remove](#) the [open<sup>p597</sup>](#) attribute from the element.

#### Note

*This ability to request that additional information be shown or hidden may simply be the [activation behavior](#) of the appropriate [summary<sup>p600</sup>](#) element, in the case such an element exists. However, if no such element exists, user agents can still provide this ability through some other user interface affordance.*

Whenever the [open<sup>p597</sup>](#) attribute is added to or removed from a [details<sup>p597</sup>](#) element, the user agent must [queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given then [details<sup>p597</sup>](#) element that runs the following steps, which are known as the **details notification task steps**, for this [details<sup>p597</sup>](#) element:

1. If another [task<sup>p925</sup>](#) has been [queued<sup>p926</sup>](#) to run the [details notification task steps<sup>p598</sup>](#) for this [details<sup>p597</sup>](#) element, then return.

#### Note

*When the [open<sup>p597</sup>](#) attribute is toggled several times in succession, these steps essentially get coalesced so that only one event is fired.*

2. [Fire an event](#) named [toggle<sup>p1261</sup>](#) at the [details<sup>p597</sup>](#) element.

The [open](#) IDL attribute must [reflect<sup>p91</sup>](#) the [open<sup>p597</sup>](#) content attribute.

#### Example

The following example shows the [details<sup>p597</sup>](#) element being used to hide technical details in a progress report.

```
<section class="progress window">
  <h1>Copying "Really Achieving Your Childhood Dreams"</h1>
  <details>
    <summary>Copying... <progress max="375505392" value="97543282"></progress> 25%</summary>
    <dl>
      <dt>Transfer rate:</dt> <dd>452KB/s</dd>
      <dt>Local filename:</dt> <dd>/home/rpausch/raycd.m4v</dd>
      <dt>Remote filename:</dt> <dd>/var/www/lectures/raycd.m4v</dd>
      <dt>Duration:</dt> <dd>01:16:27</dd>
      <dt>Color profile:</dt> <dd>SD (6-1-6)</dd>
      <dt>Dimensions:</dt> <dd>320x240</dd>
    </dl>
  </details>
</section>
```

#### Example

The following shows how a [details<sup>p597</sup>](#) element can be used to hide some controls by default:

```
<details>
  <summary><label for=fn>Name & Extension:</label></summary>
  <p><input type=text id=fn name=fn value="Pillar Magazine.pdf">
  <p><label><input type=checkbox name=ext checked> Hide extension</label>
</details>
```

One could use this in conjunction with other [details<sup>p597</sup>](#) in a list to allow the user to collapse a set of fields down to a small set of headings, with the ability to open each one.

In these examples, the summary really just summarizes what the controls can change, and not the actual values, which is less than ideal.

#### Example

Because the `openp597` attribute is added and removed automatically as the user interacts with the control, it can be used in CSS to style the element differently based on its state. Here, a style sheet is used to animate the color of the summary when the element is opened or closed:

```
<style>
  details > summary { transition: color 1s; color: black; }
  details[open] > summary { color: red; }
</style>
<details>
  <summary>Automated Status: Operational</summary>
  <p>Velocity: 12m/s</p>
```

```
<p>Direction: North</p>
</details>
```

#### 4.11.2 The `summary` element §<sup>p60</sup><sub>0</sub>

##### Categories<sup>p125</sup>:

None.

##### Contexts in which this element can be used<sup>p125</sup>:

As the [first child](#) of a `detailsp597` element.

##### Content model<sup>p125</sup>:

[Phrasing content<sup>p129</sup>](#), optionally intermixed with [heading content<sup>p129</sup>](#).

##### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

##### Content attributes<sup>p125</sup>:

[Global attributes<sup>p133</sup>](#)

##### Accessibility considerations<sup>p126</sup>:

[For authors.](#)

[For implementers.](#)

##### DOM interface<sup>p126</sup>:

Uses [HTMLElement<sup>p121</sup>](#).

The `summaryp600` element [represents<sup>p120</sup>](#) a summary, caption, or legend for the rest of the contents of the `summaryp600` element's parent `detailsp597` element, if any.

A `summaryp600` element is a **summary for its parent details** if the following algorithm returns true:

1. If this `summaryp600` element has no parent, then return false.
2. Let *parent* be this `summaryp600` element's parent.
3. If *parent* is not a `detailsp597` element, then return false.
4. If *parent*'s first `summaryp600` element child is not this `summaryp600` element, then return false.
5. Return true.

The [activation behavior](#) of `summaryp600` elements is to run the following steps:

1. If this `summaryp600` element is not the [summary for its parent details<sup>p600</sup>](#), then return.
2. Let *parent* be this `summaryp600` element's parent.
3. If the [open<sup>p597</sup>](#) attribute is present on *parent*, then [remove](#) it. Otherwise, [set](#) *parent*'s [open<sup>p597</sup>](#) attribute to the empty string.

#### Note

This will then run the [details notification task steps<sup>p598</sup>](#).

#### 4.11.3 Commands §<sup>p60</sup><sub>0</sub>

##### 4.11.3.1 Facets §<sup>p60</sup><sub>0</sub>

A **command** is the abstraction behind menu items, buttons, and links. Once a command is defined, other parts of the interface can refer to the same command, allowing many access points to a single feature to share facets such as the [Disabled State<sup>p601</sup>](#).

Commands are defined to have the following **facets**:

### **Label**

The name of the command as seen by the user.

### **Access Key**

A key combination selected by the user agent that triggers the command. A command might not have an Access Key.

### **Hidden State**

Whether the command is hidden or not (basically, whether it should be shown in menus).

### **Disabled State**

Whether the command is relevant and can be triggered or not.

### **Action**

The actual effect that triggering the command will have. This could be a scripted event handler, a [URL](#) to which to [navigate](#)<sup>p852</sup>, or a form submission.

User agents may expose the [commands](#)<sup>p600</sup> that match the following criteria:

- The [Hidden State](#)<sup>p601</sup> facet is false (visible)
- The element is [in a document](#) with a non-null [browsing context](#)<sup>p804</sup>.
- Neither the element nor any of its ancestors has a [hidden](#)<sup>p758</sup> attribute specified.

User agents are encouraged to do this especially for commands that have [Access Keys](#)<sup>p601</sup>, as a way to advertise those keys to the user.

## **Example**

For example, such commands could be listed in the user agent's menu bar.

### **4.11.3.2 Using the `a` element to define a command** §<sup>p60</sup><sub>1</sub>

An [a](#)<sup>p234</sup> element with an [href](#)<sup>p279</sup> attribute [defines a command](#)<sup>p600</sup>.

The [Label](#)<sup>p601</sup> of the command is the element's [descendant text content](#).

The [Access Key](#)<sup>p601</sup> of the command is the element's [assigned access key](#)<sup>p779</sup>, if any.

The [Hidden State](#)<sup>p601</sup> of the command is true (hidden) if the element has a [hidden](#)<sup>p758</sup> attribute, and false otherwise.

The [Disabled State](#)<sup>p601</sup> facet of the command is true if the element or one of its ancestors is [inert](#)<sup>p759</sup>, and false otherwise.

The [Action](#)<sup>p601</sup> of the command is to [fire a click event](#)<sup>p945</sup> at the element.

### **4.11.3.3 Using the `button` element to define a command** §<sup>p60</sup><sub>1</sub>

A [button](#)<sup>p528</sup> element always [defines a command](#)<sup>p600</sup>.

The [Label](#)<sup>p601</sup>, [Access Key](#)<sup>p601</sup>, [Hidden State](#)<sup>p601</sup>, and [Action](#)<sup>p601</sup> facets of the command are determined [as for a elements](#)<sup>p601</sup> (see the previous section).

The [Disabled State](#)<sup>p601</sup> of the command is true if the element or one of its ancestors is [inert](#)<sup>p759</sup>, or if the element's [disabled](#)<sup>p563</sup> state is set, and false otherwise.

### **4.11.3.4 Using the `input` element to define a command** §<sup>p60</sup><sub>1</sub>

An [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in one of the [Submit Button](#)<sup>p511</sup>, [Reset Button](#)<sup>p513</sup>, [Image Button](#)<sup>p511</sup>, [Button](#)<sup>p514</sup>, [Radio Button](#)<sup>p507</sup>, or [Checkbox](#)<sup>p506</sup> states [defines a command](#)<sup>p600</sup>.

The [Label](#)<sup>p601</sup> of the command is determined as follows:

- If the [type<sup>p488</sup>](#) attribute is in one of the [Submit Button<sup>p511</sup>](#), [Reset Button<sup>p513</sup>](#), [Image Button<sup>p511</sup>](#), or [Button<sup>p514</sup>](#) states, then the [Label<sup>p601</sup>](#) is the string given by the [value<sup>p490</sup>](#) attribute, if any, and a UA-dependent, locale-dependent value that the UA uses to label the button itself if the attribute is absent.
- Otherwise, if the element is a [labeled control<sup>p484</sup>](#), then the [Label<sup>p601</sup>](#) is the [descendant text content](#) of the first [label<sup>p483</sup>](#) element in [tree order](#) whose [labeled control<sup>p484</sup>](#) is the element in question. (In JavaScript terms, this is given by `element.labels[0].textContent`.)
- Otherwise, if the [value<sup>p490</sup>](#) attribute is present, then the [Label<sup>p601</sup>](#) is the value of that attribute.
- Otherwise, the [Label<sup>p601</sup>](#) is the empty string.

#### Note

*Even though the [value<sup>p490</sup>](#) attribute on [input<sup>p486</sup>](#) elements in the [Image Button<sup>p511</sup>](#) state is non-conformant, the attribute can still contribute to the [Label<sup>p601</sup>](#) determination, if it is present and the Image Button's [alt<sup>p512</sup>](#) attribute is missing.*

The [Access Key<sup>p601</sup>](#) of the command is the element's [assigned access key<sup>p779</sup>](#), if any.

The [Hidden State<sup>p601</sup>](#) of the command is true (hidden) if the element has a [hidden<sup>p758</sup>](#) attribute, and false otherwise.

The [Disabled State<sup>p601</sup>](#) of the command is true if the element or one of its ancestors is [inert<sup>p759</sup>](#), or if the element's [disabled<sup>p563</sup>](#) state is set, and false otherwise.

The [Action<sup>p601</sup>](#) of the command is to [fire a click event<sup>p945</sup>](#) at the element.

#### 4.11.3.5 Using the **option** element to define a command §<sup>p60</sup><sub>2</sub>

An [option<sup>p539</sup>](#) element with an ancestor [select<sup>p530</sup>](#) element and either no [value<sup>p540</sup>](#) attribute or a [value<sup>p540</sup>](#) attribute that is not the empty string [defines a command<sup>p600</sup>](#).

The [Label<sup>p601</sup>](#) of the command is the value of the [option<sup>p539</sup>](#) element's [label<sup>p539</sup>](#) attribute, if there is one, or else the [option<sup>p539</sup>](#) element's [descendant text content](#), with [ASCII whitespace stripped and collapsed](#).

The [Access Key<sup>p601</sup>](#) of the command is the element's [assigned access key<sup>p779</sup>](#), if any.

The [Hidden State<sup>p601</sup>](#) of the command is true (hidden) if the element has a [hidden<sup>p758</sup>](#) attribute, and false otherwise.

The [Disabled State<sup>p601</sup>](#) of the command is true if the element is [disabled<sup>p539</sup>](#), or if its nearest ancestor [select<sup>p530</sup>](#) element is [disabled<sup>p563</sup>](#), or if it or one of its ancestors is [inert<sup>p759</sup>](#), and false otherwise.

If the [option<sup>p539</sup>](#)'s nearest ancestor [select<sup>p530</sup>](#) element has a [multiple<sup>p532</sup>](#) attribute, the [Action<sup>p601</sup>](#) of the command is to [toggle<sup>p533</sup>](#) the [option<sup>p539</sup>](#) element. Otherwise, the [Action<sup>p601</sup>](#) is to [pick<sup>p532</sup>](#) the [option<sup>p539</sup>](#) element.

#### 4.11.3.6 Using the **accesskey** attribute on a **legend** element to define a command §<sup>p60</sup><sub>2</sub>

A [legend<sup>p558</sup>](#) element [defines a command<sup>p600</sup>](#) if all of the following are true:

- It has an [assigned access key<sup>p779</sup>](#).
- It is a child of a [fieldset<sup>p555</sup>](#) element.
- Its parent has a descendant that [defines a command<sup>p600</sup>](#) that is neither a [label<sup>p483</sup>](#) element nor a [legend<sup>p558</sup>](#) element. This element, if it exists, is **the legend element's accesskey delegatee**.

The [Label<sup>p601</sup>](#) of the command is the element's [descendant text content](#).

The [Access Key<sup>p601</sup>](#) of the command is the element's [assigned access key<sup>p779</sup>](#).

The [Hidden State<sup>p601</sup>](#), [Disabled State<sup>p601</sup>](#), and [Action<sup>p601</sup>](#) facets of the command are the same as the respective facets of [the legend element's accesskey delegatee<sup>p602</sup>](#).

## Example

In this example, the [Legend](#)<sup>p558</sup> element specifies an [accesskey](#)<sup>p778</sup>, which, when activated, will delegate to the [input](#)<sup>p486</sup> element inside the [Legend](#)<sup>p558</sup> element.

```
<fieldset>
  <legend accesskey=p>
    <label>I want <input name=pizza type=number step=1 value=1 min=0>
      pizza(s) with these toppings</label>
  </legend>
  <label><input name=pizza-cheese type=checkbox checked> Cheese</label>
  <label><input name=pizza-ham type=checkbox checked> Ham</label>
  <label><input name=pizza-pineapple type=checkbox> Pineapple</label>
</fieldset>
```

### 4.11.3.7 Using the [accesskey](#) attribute to define a command on other elements §<sup>p60</sup><sub>3</sub>

An element that has an [assigned access key](#)<sup>p779</sup> defines a [command](#)<sup>p600</sup>.

If one of the earlier sections that define elements that [define commands](#)<sup>p600</sup> define that this element [defines a command](#)<sup>p600</sup>, then that section applies to this element, and this section does not. Otherwise, this section applies to that element.

The [Label](#)<sup>p601</sup> of the command depends on the element. If the element is a [labeled control](#)<sup>p484</sup>, the [descendant text content](#) of the first [Label](#)<sup>p483</sup> element in [tree order](#) whose [labeled control](#)<sup>p484</sup> is the element in question is the [Label](#)<sup>p601</sup> (in JavaScript terms, this is given by `element.labels[0].textContent`). Otherwise, the [Label](#)<sup>p601</sup> is the element's [descendant text content](#).

The [Access Key](#)<sup>p601</sup> of the command is the element's [assigned access key](#)<sup>p779</sup>.

The [Hidden State](#)<sup>p601</sup> of the command is true (hidden) if the element has a [hidden](#)<sup>p758</sup> attribute, and false otherwise.

The [Disabled State](#)<sup>p601</sup> of the command is true if the element or one of its ancestors is [inert](#)<sup>p759</sup>, and false otherwise.

The [Action](#)<sup>p601</sup> of the command is to run the following steps:

1. Run the [focusing steps](#)<sup>p769</sup> for the element.
2. [Fire a click event](#)<sup>p945</sup> at the element.

### 4.11.4 The [dialog](#) element §<sup>p60</sup><sub>3</sub>

#### Categories<sup>p125</sup>:

[Flow content](#)<sup>p128</sup>.  
[Sectioning root](#)<sup>p195</sup>.

#### Contexts in which this element can be used<sup>p125</sup>:

Where [flow content](#)<sup>p128</sup> is expected.

#### Content model<sup>p125</sup>:

[Flow content](#)<sup>p128</sup>.

#### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

#### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>  
[open](#)<sup>p604</sup> — Whether the dialog box is showing

#### Accessibility considerations<sup>p126</sup>:

[For authors](#).  
[For implementers](#).

MDN

MDN

## DOM interface<sup>p126</sup>:

```
IDL [Exposed=Window]
interface HTMLDialogElement : HTMLElement {
    [HTMLConstructor] constructor();

    [CEReactions] attribute boolean open;
    attribute DOMString returnValue;
    [CEReactions] void show();
    [CEReactions] void showModal();
    [CEReactions] void close(optional DOMString returnValue);
};
```

The [dialog<sup>p603</sup>](#) element represents a part of an application that a user interacts with to perform a task, for example a dialog box, inspector, or window.

The **open** attribute is a [boolean attribute<sup>p65</sup>](#). When specified, it indicates that the [dialog<sup>p603</sup>](#) element is active and that the user can interact with it.

A [dialog<sup>p603</sup>](#) element without an [open<sup>p604</sup>](#) attribute specified should not be shown to the user. This requirement may be implemented indirectly through the style layer. For example, user agents that [support the suggested default rendering<sup>p46</sup>](#) implement this requirement using the CSS rules described in the [rendering section<sup>p1172</sup>](#).

### Note

Removing the [open<sup>p604</sup>](#) attribute will usually hide the dialog. However, doing so has a number of strange additional consequences:

- The [close<sup>p1260</sup>](#) event will not be fired.
- The [close\(\)<sup>p605</sup>](#) method, and any [user-agent provided cancelation interface<sup>p605</sup>](#), will no longer be able to close the dialog.
- If the dialog was shown using its [showModal\(\)<sup>p605</sup>](#) method, the [Document<sup>p111</sup>](#) will still be [blocked<sup>p759</sup>](#).

For these reasons, it is generally better to never remove the [open<sup>p604</sup>](#) attribute manually. Instead, use the [close\(\)<sup>p605</sup>](#) method to close the dialog, or the [hidden<sup>p758</sup>](#) attribute to hide it.

The [tabindex<sup>p766</sup>](#) attribute must not be specified on [dialog<sup>p603</sup>](#) elements.

### For web developers (non-normative)

#### **dialog . show<sup>p604</sup>()**

Displays the [dialog<sup>p603</sup>](#) element.

#### **dialog . showModal<sup>p605</sup>()**

Displays the [dialog<sup>p603</sup>](#) element and makes it the top-most modal dialog.

This method honors the [autofocus<sup>p775</sup>](#) attribute.

#### **dialog . close<sup>p605</sup>( [ result ] )**

Closes the [dialog<sup>p603</sup>](#) element.

The argument, if provided, provides a return value.

#### **dialog . returnValue<sup>p605</sup> [ = result ]**

Returns the [dialog<sup>p603</sup>](#)'s return value.

Can be set, to update the return value.

When the [show\(\)](#) method is invoked, the user agent must run the following steps:

MDN

1. If the element already has an [open<sup>p604</sup>](#) attribute, then return.
2. Add an [open<sup>p604</sup>](#) attribute to the [dialog<sup>p603</sup>](#) element, whose value is the empty string.
3. Set the [dialog<sup>p603</sup>](#) to the [normal alignment<sup>p606</sup>](#) mode.
4. Run the [dialog focusing steps<sup>p605</sup>](#) for the [dialog<sup>p603</sup>](#) element.

When the `showModal()` method is invoked, the user agent must run the following steps:

1. Let *subject* be the [dialog<sup>p603</sup>](#) element on which the method was invoked.
2. If *subject* already has an [open<sup>p604</sup>](#) attribute, then throw an `"InvalidStateError"` [DOMException](#).
3. If *subject* is not [connected](#), then throw an `"InvalidStateError"` [DOMException](#).
4. Add an [open<sup>p604</sup>](#) attribute to *subject*, whose value is the empty string.
5. Set the [dialog<sup>p603</sup>](#) to the [centered alignment<sup>p606</sup>](#) mode.
6. Let *subject*'s [node document](#) be [blocked by the modal dialog<sup>p759</sup>](#) *subject*.
7. If *subject*'s [node document](#)'s [top layer](#) does not already [contain](#) *subject*, then [add](#) *subject* to *subject*'s [node document](#)'s [top layer](#).
8. Run the [dialog focusing steps<sup>p605</sup>](#) for *subject*.

The **dialog focusing steps** for a [dialog<sup>p603</sup>](#) element *subject* are as follows:

1. If *subject* is [inert<sup>p759</sup>](#), return.
2. Let *control* be the first descendant element of *subject*, in [tree order](#), that is not [inert<sup>p759</sup>](#) and has the [autofocus<sup>p775</sup>](#) attribute specified.  
  
If there isn't one, then let *control* be the first non-[inert<sup>p759</sup>](#) descendant element of *subject*, in tree order.  
  
If there isn't one of those either, then let *control* be *subject*.
3. Run the [focusing steps<sup>p769</sup>](#) for *control*.
4. Let *topDocument* be the [active document<sup>p804</sup>](#) of *control*'s [node document](#)'s [browsing context<sup>p804</sup>](#)'s [top-level browsing context<sup>p807</sup>](#).
5. If *control*'s [node document](#)'s [origin<sup>p829</sup>](#) is not the [same<sup>p830</sup>](#) as the [origin<sup>p829</sup>](#) of *topDocument*, then return.
6. [Empty](#) *topDocument*'s [autofocus candidates<sup>p775</sup>](#).
7. Set *topDocument*'s [autofocus processed flag<sup>p775</sup>](#) to true.

If at any time a [dialog<sup>p603</sup>](#) element is [removed from a Document<sup>p43</sup>](#), then if that [dialog<sup>p603</sup>](#) is in that [Document<sup>p111</sup>](#)'s [top layer](#), it must be [removed](#) from it.

When the `close()` method is invoked, the user agent must [close the dialog<sup>p605</sup>](#) that the method was invoked on. If the method was invoked with an argument, that argument must be used as the return value; otherwise, there is no return value.

When a [dialog<sup>p603</sup>](#) element *subject* is to be **closed**, optionally with a return value *result*, the user agent must run the following steps:

1. If *subject* does not have an [open<sup>p604</sup>](#) attribute, then return.
2. Remove *subject*'s [open<sup>p604</sup>](#) attribute.
3. If the argument *result* was provided, then set the [returnValue<sup>p605</sup>](#) attribute to the value of *result*.
4. If *subject* is in its [Document<sup>p111</sup>](#)'s [top layer](#), then [remove](#) it.
5. [Queue an element task<sup>p926</sup>](#) on the [user interaction task source<sup>p932</sup>](#) given the *subject* element to [fire an event](#) named [close<sup>p1260</sup>](#) at *subject*.

The **returnValue** IDL attribute, on getting, must return the last value to which it was set. On setting, it must be set to the new value. When the element is created, it must be set to the empty string.

**Canceling dialogs:** When [Document<sup>p111</sup>](#) is [blocked by a modal dialog<sup>p759</sup>](#) *dialog*, user agents may provide a user interface that, upon activation, [queues an element task<sup>p926</sup>](#) on the [user interaction task source<sup>p932</sup>](#) given the *dialog* element to run these steps:

1. Let *close* be the result of [firing an event](#) named [cancel<sup>p1260</sup>](#) at *dialog*, with the [cancelable](#) attribute initialized to true.
2. If *close* is true and *dialog* has an [open<sup>p604</sup>](#) attribute, then [close the dialog<sup>p605</sup>](#) with no return value.

## Note

An example of such a UI mechanism would be the user pressing the "Escape" key.

A [dialog<sup>p603</sup>](#) element is in one of two modes: **normal alignment** or **centered alignment**. When a [dialog<sup>p603</sup>](#) element is created, it must be placed in the [normal alignment<sup>p606</sup>](#) mode. In this mode, normal CSS requirements apply to the element. The [centered alignment<sup>p606</sup>](#) mode is only used for [dialog<sup>p603</sup>](#) elements that are in the [top layer](#). [\[FULLSCREEN\]<sup>p1266</sup>](#) [\[CSS\]<sup>p1264</sup>](#)

When an element *subject* is placed in [centered alignment<sup>p606</sup>](#) mode, and when it is in that mode and has new rendering boxes created, the user agent must set up the element such that its static position of the edge that corresponds to *subject*'s parent's [block-start](#) edge, for the purposes of calculating the [used value](#) of the appropriate box offset property ('[top](#)', '[right](#)', '[bottom](#)', or '[left](#)'), is the value that would place the element's [margin edge](#) on the side that corresponds to *subject*'s parent's [block-start](#) side as far from the same-side edge of the [viewport](#) as the element's opposing side [margin edge](#) from that same-side edge of the [viewport](#), if the element's dimension ('[width](#)' or '[height](#)') in *subject*'s parent's [block flow direction](#) is less than the same-axis dimension of the [viewport](#), and otherwise is the value that would place the element's [margin edge](#) on the side that corresponds to *subject*'s parent's [block-start](#) side at the same-side edge of the [viewport](#).

If there is a [dialog<sup>p603</sup>](#) element with [centered alignment<sup>p606</sup>](#) and that is [being rendered<sup>p1172</sup>](#) when its [browsing context<sup>p804</sup>](#) changes [viewport](#) dimensions (as measured in [CSS pixels](#)), or when this [dialog<sup>p603</sup>](#) element's parent changes [block flow direction](#), then the user agent must recreate the element's boxes, recalculating its edge that corresponds to this [dialog<sup>p603</sup>](#) element's parent's [block-start](#) edge as in the previous paragraph.

This static position of a [dialog<sup>p603</sup>](#) element's edge with [centered alignment<sup>p606</sup>](#) must remain the element's static position of that edge until its boxes are recreated. (The element's static position is only used in calculating the [used value](#) of the appropriate box offset property ('[top](#)', '[right](#)', '[bottom](#)', or '[left](#)') in certain situations; it's not used, for instance, to position the element if its '[position](#)' property is set to '[static](#)'.)

User agents in visual interactive media should allow the user to pan the [viewport](#) to access all parts of a [dialog<sup>p603</sup>](#) element's [border box](#), even if the element is larger than the [viewport](#) and the [viewport](#) would otherwise not have a scroll mechanism (e.g. because the [viewport](#)'s '[overflow](#)' property is set to '[hidden](#)').

The **open** IDL attribute must [reflect<sup>p91</sup>](#) the [open<sup>p604</sup>](#) content attribute.

MDN

## Example

This dialog box has some small print. The [strong<sup>p238</sup>](#) element is used to draw the user's attention to the more important part.

```
<dialog>
  <h1>Add to Wallet</h1>
  <p><strong><label for=amt>How many gold coins do you want to add to your
wallet?</label></strong></p>
  <p><input id=amt name=amt type=number min=0 step=0.01 value=100></p>
  <p><small>You add coins at your own risk.</small></p>
  <p><label><input name=round type=checkbox> Only add perfectly round coins </label></p>
  <p><input type=button onclick="submit()" value="Add Coins"></p>
</dialog>
```

## 4.12 Scripting §<sup>p60</sup><sub>6</sub>

Scripts allow authors to add interactivity to their documents.

Authors are encouraged to use declarative alternatives to scripting where possible, as declarative mechanisms are often more maintainable, and many users disable scripting.

## Example

For example, instead of using script to show or hide a section to show more details, the [details<sup>p597</sup>](#) element could be used.

Authors are also encouraged to make their applications degrade gracefully in the absence of scripting support.

## Example

For example, if an author provides a link in a table header to dynamically resort the table, the link could also be made to function without scripts by requesting the sorted table from the server.

✓ MDN

### 4.12.1 The `script` element <sup>§[p60](#)</sup><sub>7</sub>

#### Categories<sup>p125</sup>:

✓ MDN

[Metadata content](#)<sup>p128</sup>.

[Flow content](#)<sup>p128</sup>.

[Phrasing content](#)<sup>p129</sup>.

[Script-supporting element](#)<sup>p130</sup>.

#### Contexts in which this element can be used<sup>p125</sup>:

Where [metadata content](#)<sup>p128</sup> is expected.

Where [phrasing content](#)<sup>p129</sup> is expected.

Where [script-supporting elements](#)<sup>p130</sup> are expected.

#### Content model<sup>p125</sup>:

If there is no [src](#)<sup>p608</sup> attribute, depends on the value of the [type](#)<sup>p608</sup> attribute, but must match [script content restrictions](#)<sup>p617</sup>.

If there is a [src](#)<sup>p608</sup> attribute, the element must be either empty or contain only [script documentation](#)<sup>p619</sup> that also matches [script content restrictions](#)<sup>p617</sup>.

#### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

#### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>

[src](#)<sup>p608</sup> — Address of the resource

[type](#)<sup>p608</sup> — Type of script

[nomodule](#)<sup>p608</sup> — Prevents execution in user agents that support [module scripts](#)<sup>p896</sup>

[async](#)<sup>p608</sup> — Execute script when available, without blocking while fetching

[defer](#)<sup>p608</sup> — Defer script execution

[crossorigin](#)<sup>p609</sup> — How the element handles crossorigin requests

[integrity](#)<sup>p609</sup> — Integrity metadata used in *Subresource Integrity* checks [\[SRI\]](#)<sup>p1270</sup>

[referrerpolicy](#)<sup>p609</sup> — [Referrer policy](#) for [fetches](#) initiated by the element

#### Accessibility considerations<sup>p126</sup>:

[For authors.](#)

[For implementers.](#)

#### DOM interface<sup>p126</sup>:

```
IDL [Exposed=Window]
interface HTMLScriptElement : HTMLElement {
    [HTMLConstructor] constructor();

    [CEReactions] attribute USVString src;
    [CEReactions] attribute DOMString type;
    [CEReactions] attribute boolean noModule;
    [CEReactions] attribute boolean async;
    [CEReactions] attribute boolean defer;
    [CEReactions] attribute DOMString? crossorigin;
    [CEReactions] attribute DOMString text;
    [CEReactions] attribute DOMString integrity;
    [CEReactions] attribute DOMString referrerPolicy;

    // also has obsolete members
};
```

The [script](#)<sup>p607</sup> element allows authors to include dynamic script and data blocks in their documents. The element does not

[represent<sup>p120</sup>](#) content for the user.

The **type** attribute allows customization of the type of script represented:

- Omitting the attribute, setting it to the empty string, or setting it to a [JavaScript MIME type essence match](#), means that the script is a [classic script<sup>p896</sup>](#), to be interpreted according to the JavaScript [Script](#) top-level production. Classic scripts are affected by the [async<sup>p608</sup>](#) and [defer<sup>p608</sup>](#) attributes, but only when the [src<sup>p608</sup>](#) attribute is set. Authors should omit the [type<sup>p608</sup>](#) attribute instead of redundantly setting it.
- Setting the attribute to an [ASCII case-insensitive](#) match for the string "module" means that the script is a [module script<sup>p896</sup>](#), to be interpreted according to the JavaScript [Module](#) top-level production. Module scripts are not affected by the [defer<sup>p608</sup>](#) attribute, but are affected by the [async<sup>p608</sup>](#) attribute (regardless of the state of the [src<sup>p608</sup>](#) attribute).
- Setting the attribute to any other value means that the script is a **data block**, which is not processed. None of the [script<sup>p607</sup>](#) attributes (except [type<sup>p608</sup>](#) itself) have any effect on data blocks. Authors must use a [valid MIME type string](#) that is not a [JavaScript MIME type essence match](#) to denote data blocks.

#### Note

*The requirement that [data blocks<sup>p608</sup>](#) must be denoted using a [valid MIME type string](#) is in place to avoid potential future collisions. If this specification ever adds additional types of [script<sup>p895</sup>](#), they will be triggered by setting the [type<sup>p608</sup>](#) attribute to something which is not a MIME type, like how the "module" value denotes [module scripts<sup>p896</sup>](#). By using a valid MIME type string now, you ensure that your data block will not ever be reinterpreted as a different script type, even in future user agents.*

[Classic scripts<sup>p896</sup>](#) and [module scripts<sup>p896</sup>](#) can be embedded inline, or be imported from an external file using the **src** attribute, which if specified gives the [URL](#) of the external script resource to use. If [src<sup>p608</sup>](#) is specified, it must be a [valid non-empty URL potentially surrounded by spaces<sup>p86</sup>](#). The contents of inline [script<sup>p607</sup>](#) elements, or the external script resource, must conform with the requirements of the JavaScript specification's [Script](#) or [Module](#) productions, for [classic scripts<sup>p896</sup>](#) and [module scripts<sup>p896</sup>](#) respectively. [\[JAVASCRIPT\]<sup>p1267</sup>](#)

When used to include [data blocks<sup>p608</sup>](#), the data must be embedded inline, the format of the data must be given using the [type<sup>p608</sup>](#) attribute, and the contents of the [script<sup>p607</sup>](#) element must conform to the requirements defined for the format used. The [src<sup>p608</sup>](#), [async<sup>p608</sup>](#), [nomodule<sup>p608</sup>](#), [defer<sup>p608</sup>](#), [crossorigin<sup>p609</sup>](#), [integrity<sup>p609</sup>](#), and [referrerpolicy<sup>p609</sup>](#) attributes must not be specified.

The **nomodule** attribute is a [boolean attribute<sup>p65</sup>](#) that prevents a script from being executed in user agents that support [module scripts<sup>p896</sup>](#). This allows selective execution of [module scripts<sup>p896</sup>](#) in modern user agents and [classic scripts<sup>p896</sup>](#) in older user agents, [as shown below<sup>p611</sup>](#). The [nomodule<sup>p608</sup>](#) attribute must not be specified on [module scripts<sup>p896</sup>](#) (and will be ignored if it is).

The **async** and **defer** attributes are [boolean attributes<sup>p65</sup>](#) that indicate how the script should be evaluated. [Classic scripts<sup>p896</sup>](#) may specify [defer<sup>p608</sup>](#) or [async<sup>p608</sup>](#), but must not specify either unless the [src<sup>p608</sup>](#) attribute is present. [Module scripts<sup>p896</sup>](#) may specify the [async<sup>p608</sup>](#) attribute, but must not specify the [defer<sup>p608</sup>](#) attribute.

There are several possible modes that can be selected using these attributes, and depending on the script's type.

For [classic scripts<sup>p896</sup>](#), if the [async<sup>p608</sup>](#) attribute is present, then the classic script will be fetched [in parallel<sup>p41</sup>](#) to parsing and evaluated as soon as it is available (potentially before parsing completes). If the [async<sup>p608</sup>](#) attribute is not present but the [defer<sup>p608</sup>](#) attribute is present, then the classic script will be fetched [in parallel<sup>p41</sup>](#) and evaluated when the page has finished parsing. If neither attribute is present, then the script is fetched and evaluated immediately, blocking parsing until these are both complete.

For [module scripts<sup>p896</sup>](#), if the [async<sup>p608</sup>](#) attribute is present, then the module script and all its dependencies will be fetched [in parallel<sup>p41</sup>](#) to parsing, and the module script will be evaluated as soon as it is available (potentially before parsing completes). Otherwise, the module script and its dependencies will be fetched [in parallel<sup>p41</sup>](#) to parsing and evaluated when the page has finished parsing. (The [defer<sup>p608</sup>](#) attribute has no effect on module scripts.)

This is all summarized in the following schematic diagram:

### Note

The exact processing details for these attributes are, for mostly historical reasons, somewhat non-trivial, involving a number of aspects of HTML. The implementation requirements are therefore by necessity scattered throughout the specification. The algorithms below (in this section) describe the core of this processing, but these algorithms reference and are referenced by the parsing rules for [script](#)<sup>p607</sup>, [start](#)<sup>p1116</sup> and [end](#)<sup>p1129</sup> tags in HTML, [in foreign content](#)<sup>p1144</sup>, and [in XML](#)<sup>p1169</sup>, the rules for the [document.write\(\)](#)<sup>p950</sup> method, the handling of [scripting](#)<sup>p895</sup>, etc.

The [defer](#)<sup>p608</sup> attribute may be specified even if the [async](#)<sup>p608</sup> attribute is specified, to cause legacy Web browsers that only support [defer](#)<sup>p608</sup> (and not [async](#)<sup>p608</sup>) to fall back to the [defer](#)<sup>p608</sup> behavior instead of the blocking behavior that is the default.

The [crossorigin](#) attribute is a [CORS settings attribute](#)<sup>p89</sup>. For [classic scripts](#)<sup>p896</sup>, it controls whether error information will be exposed, when the script is obtained from other [origins](#)<sup>p829</sup>. For [module scripts](#)<sup>p896</sup>, it controls the [credentials mode](#) used for cross-origin requests.

### Note

Unlike [classic scripts](#)<sup>p896</sup>, [module scripts](#)<sup>p896</sup> require the use of the [CORS protocol](#) for cross-origin fetching.

The [integrity](#) attribute represents the [integrity metadata](#) for requests which this element is responsible for. The value is text. The [integrity](#)<sup>p609</sup> attribute must not be specified when the [src](#)<sup>p608</sup> attribute is not specified. [\[SRI\]](#)<sup>p1270</sup>

The [referrerpolicy](#) attribute is a [referrer policy attribute](#)<sup>p90</sup>. Its purpose is to set the [referrer policy](#) used when [fetching](#) the script, as well as any scripts imported from it. [\[REFERRERPOLICY\]](#)<sup>p1269</sup>

### Example

An example of a [script](#)<sup>p607</sup> element's [referrer policy](#) being used when fetching imported scripts but not other subresources:

```
<script referrerpolicy="origin">
  fetch('/api/data'); // not fetched with <script>'s referrer policy
  import('./utils.mjs'); // is fetched with <script>'s referrer policy ("origin" in this case)
</script>
```

Changing the [src](#)<sup>p608</sup>, [type](#)<sup>p608</sup>, [nomodule](#)<sup>p608</sup>, [async](#)<sup>p608</sup>, [defer](#)<sup>p608</sup>, [crossorigin](#)<sup>p609</sup>, [integrity](#)<sup>p609</sup>, and [referrerpolicy](#)<sup>p609</sup> attributes dynamically has no direct effect; these attributes are only used at specific times described below.

The IDL attributes [src](#), [type](#), [defer](#), and [integrity](#), must each [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

The [referrerPolicy](#) IDL attribute must [reflect](#)<sup>p91</sup> the [referrerpolicy](#)<sup>p609</sup> content attribute, [limited to only known values](#)<sup>p91</sup>.

MDN

The [crossOrigin](#) IDL attribute must [reflect](#)<sup>p91</sup> the [crossorigin](#)<sup>p609</sup> content attribute, [limited to only known values](#)<sup>p91</sup>.

The [noModule](#) IDL attribute must [reflect](#)<sup>p91</sup> the [nomodule](#)<sup>p608</sup> content attribute.

The [async](#) IDL attribute controls whether the element will execute asynchronously or not. If the element's ["non-blocking"](#)<sup>p612</sup> flag is set, then, on getting, the [async](#)<sup>p609</sup> IDL attribute must return true, and on setting, the ["non-blocking"](#)<sup>p612</sup> flag must first be unset, and then the content attribute must be removed if the IDL attribute's new value is false, and must be set to the empty string if the IDL attribute's new value is true. If the element's ["non-blocking"](#)<sup>p612</sup> flag is not set, the IDL attribute must [reflect](#)<sup>p91</sup> the [async](#)<sup>p608</sup> content

attribute.

#### For web developers (non-normative)

**`script` . `text`<sup>p610</sup> [ = `value` ]**

Returns the [child text content](#) of the element.

Can be set, to replace the element's children with the given value.

The `text` attribute's getter must return this [script](#)<sup>p607</sup> element's [child text content](#).

The [text](#)<sup>p610</sup> attribute's setter must [string replace all](#) with the given value within this [script](#)<sup>p607</sup> element.

#### Note

When inserted using the [document.write\(\)](#)<sup>p950</sup> method, [script](#)<sup>p607</sup> elements [usually](#)<sup>p1116</sup> execute (typically blocking further script execution or HTML parsing). When inserted using the [innerHTML](#) and [outerHTML](#) attributes, they do not execute at all.

#### Example

In this example, two [script](#)<sup>p607</sup> elements are used. One embeds an external [classic script](#)<sup>p896</sup>, and the other includes some data as a [data block](#)<sup>p608</sup>.

```
<script src="game-engine.js"></script>
<script type="text/x-game-map">
.....U.....e
o.....A....e
....A....AAA...e
.A..AAA..AAAAA...e
</script>
```

The data in this case might be used by the script to generate the map of a video game. The data doesn't have to be used that way, though; maybe the map data is actually embedded in other parts of the page's markup, and the data block here is just used by the site's search engine to help users who are looking for particular features in their game maps.

#### Example

The following sample shows how a [script](#)<sup>p607</sup> element can be used to define a function that is then used by other parts of the document, as part of a [classic script](#)<sup>p896</sup>. It also shows how a [script](#)<sup>p607</sup> element can be used to invoke script while the document is being parsed, in this case to initialize the form's output.

```
<script>
function calculate(form) {
  var price = 52000;
  if (form.elements.brakes.checked)
    price += 1000;
  if (form.elements.radio.checked)
    price += 2500;
  if (form.elements.turbo.checked)
    price += 5000;
  if (form.elements.sticker.checked)
    price += 250;
  form.elements.result.value = price;
}
</script>
<form name="pricecalc" onsubmit="return false" onchange="calculate(this)">
  <fieldset>
    <legend>Work out the price of your car</legend>
    <p>Base cost: £52000.</p>
    <p>Select additional options:</p>
    <ul>
      <li><label><input type="checkbox" name="brakes"> Ceramic brakes (£1000)</label></li>
      <li><label><input type="checkbox" name="radio"> Satellite radio (£2500)</label></li>
```

```

    <li><label><input type=checkbox name=turbo> Turbo charger (£5000)</label></li>
    <li><label><input type=checkbox name=sticker> "XZ" sticker (£250)</label></li>
  </ul>
  <p>Total: £<output name=result></output></p>
</fieldset>
<script>
  calculate(document.forms.pricecalc);
</script>
</form>

```

#### Example

The following sample shows how a [script<sup>p607</sup>](#) element can be used to include an external [module script<sup>p896</sup>](#).

```
<script type="module" src="app.mjs"></script>
```

This module, and all its dependencies (expressed through JavaScript `import` statements in the source file), will be fetched. Once the entire resulting module graph has been imported, and the document has finished parsing, the contents of `app.mjs` will be evaluated.

Additionally, if code from another [script<sup>p607</sup>](#) element in the same [Window<sup>p816</sup>](#) imports the module from `app.mjs` (e.g. via `import "./app.mjs";`), then the same [module script<sup>p896</sup>](#) created by the former [script<sup>p607</sup>](#) element will be imported.

#### Example

This example shows how to include a [module script<sup>p896</sup>](#) for modern user agents, and a [classic script<sup>p896</sup>](#) for older user agents:

```

<script type="module" src="app.mjs"></script>
<script nomodule defer src="classic-app-bundle.js"></script>

```

In modern user agents that support [module scripts<sup>p896</sup>](#), the [script<sup>p607</sup>](#) element with the [nomodule<sup>p608</sup>](#) attribute will be ignored, and the [script<sup>p607</sup>](#) element with a [type<sup>p608</sup>](#) of "module" will be fetched and evaluated (as a [module script<sup>p896</sup>](#)). Conversely, older user agents will ignore the [script<sup>p607</sup>](#) element with a [type<sup>p608</sup>](#) of "module", as that is an unknown script type for them — but they will have no problem fetching and evaluating the other [script<sup>p607</sup>](#) element (as a [classic script<sup>p896</sup>](#)), since they do not implement the [nomodule<sup>p608</sup>](#) attribute.

#### Example

The following sample shows how a [script<sup>p607</sup>](#) element can be used to write an inline [module script<sup>p896</sup>](#) that performs a number of substitutions on the document's text, in order to make for a more interesting reading experience (e.g. on a news site): [\[XKCD1288\]<sup>p1271</sup>](#)

```

<script type="module">
  import { walkAllTextNodeDescendants } from "./dom-utils.mjs";

  const substitutions = new Map([
    ["witnesses", "these dudes I know"]
    ["allegedly", "kinda probably"]
    ["new study", "Tumblr post"]
    ["rebuild", "avenge"]
    ["space", "spaaace"]
    ["Google glass", "Virtual Boy"]
    ["smartphone", "Pokédex"]
    ["electric", "atomic"]
    ["Senator", "Elf-Lord"]
    ["car", "cat"]
    ["election", "eating contest"]
    ["Congressional leaders", "river spirits"]
    ["homeland security", "Homestar Runner"]
  ]);

```

```

    ["could not be reached for comment", "is guilty and everyone knows it"]
  });

  function substitute(textNode) {
    for (const [before, after] of substitutions.entries()) {
      textNode.data = textNode.data.replace(new RegExp(`\\b${before}\\b`, "ig"), after);
    }
  }

  walkAllTextNodeDescendants(document.body, substitute);
</script>

```

Some notable features gained by using a module script include the ability to import functions from other JavaScript modules, strict mode by default, and how top-level declarations do not introduce new properties onto the [global object](#)<sup>p907</sup>. Also note that no matter where this [script](#)<sup>p607</sup> element appears in the document, it will not be evaluated until both document parsing has complete and its dependency (`dom-utils.mjs`) has been fetched and evaluated.

#### 4.12.1.1 Processing model <sup>§ p61</sup><sub>2</sub>

A [script](#)<sup>p607</sup> element has several associated pieces of state.

A [script](#)<sup>p607</sup> element has a flag indicating whether or not it has been **"already started"**. Initially, [script](#)<sup>p607</sup> elements must have this flag unset (script blocks, when created, are not "already started"). The [cloning steps](#) for [script](#)<sup>p607</sup> elements must set the "already started" flag on the copy if it is set on the element being cloned.

A [script](#)<sup>p607</sup> element has a **parser document**, which is either null or a [Document](#)<sup>p111</sup>. Initially, its value must be null. It is set by the [HTML parser](#)<sup>p1059</sup> and the [XML parser](#)<sup>p1168</sup> on [script](#)<sup>p607</sup> elements they insert, and affects the processing of those elements. [script](#)<sup>p607</sup> elements with non-null [parser documents](#)<sup>p612</sup> are known as **"parser-inserted"**.

A [script](#)<sup>p607</sup> element has a flag indicating whether the element will be **"non-blocking"**. Initially, [script](#)<sup>p607</sup> elements must have this flag set. It is unset by the [HTML parser](#)<sup>p1059</sup> and the [XML parser](#)<sup>p1168</sup> on [script](#)<sup>p607</sup> elements they insert. In addition, whenever a [script](#)<sup>p607</sup> element whose ["non-blocking"](#)<sup>p612</sup> flag is set has an [async](#)<sup>p608</sup> content attribute added, the element's ["non-blocking"](#)<sup>p612</sup> flag must be unset.

A [script](#)<sup>p607</sup> element has a flag indicating whether or not the script block is **"ready to be parser-executed"**. Initially, [script](#)<sup>p607</sup> elements must have this flag unset (script blocks, when created, are not "ready to be parser-executed"). This flag is used only for elements that are also ["parser-inserted"](#)<sup>p612</sup>, to let the parser know when to execute the script.

**The script's type** for a [script](#)<sup>p607</sup> element is either "classic" or "module". It is determined when the script is [prepared](#)<sup>p613</sup>, based on the [type](#)<sup>p608</sup> attribute of the element at that time.

A [script](#)<sup>p607</sup> element has a **preparation-time document**, which is a [Document](#)<sup>p111</sup> determined near the beginning of the [prepare a script](#)<sup>p613</sup> algorithm. It is used to prevent scripts that move between documents during [preparation](#)<sup>p613</sup> from [executing](#)<sup>p616</sup>.

A [script](#)<sup>p607</sup> element has a flag indicating whether or not the script is **from an external file**. It is determined when the script is [prepared](#)<sup>p613</sup>, based on the [src](#)<sup>p608</sup> attribute of the element at that time.

**The script's script** for a [script](#)<sup>p607</sup> element is either null or a [script](#)<sup>p895</sup> resulting from [preparing](#)<sup>p613</sup> the element. This is set asynchronously after the classic script or module graph is fetched. Once it is set, either to a [script](#)<sup>p895</sup> in the case of success or to null in the case of failure, the fetching algorithms will note that **the script is ready**, which can trigger other actions. The user agent must [delay the load event](#)<sup>p1145</sup> of the element's [node document](#) until [the script is ready](#)<sup>p612</sup>.

When a [script](#)<sup>p607</sup> element that is not ["parser-inserted"](#)<sup>p612</sup> experiences one of the events listed in the following list, the user agent must [immediately](#)<sup>p41</sup> [prepare](#)<sup>p613</sup> the [script](#)<sup>p607</sup> element:

- The [script](#)<sup>p607</sup> element [becomes connected](#)<sup>p44</sup>.
- The [script](#)<sup>p607</sup> element is [connected](#) and a node or document fragment is [inserted](#)<sup>p43</sup> into the [script](#)<sup>p607</sup> element, after any [script](#)<sup>p607</sup> elements [inserted](#)<sup>p43</sup> at that time.

- The `script`<sup>p607</sup> element is `connected` and has a `src`<sup>p608</sup> attribute set where previously the element had no such attribute.

To **prepare a script**, the user agent must act as follows:

1. If the `script`<sup>p607</sup> element is marked as having `"already started"`<sup>p612</sup>, then return. The script is not executed.
2. Let *parser document* be the element's `parser document`<sup>p612</sup>.
3. Set the element's `parser document`<sup>p612</sup> to null.

#### Note

*This is done so that if parser-inserted `script`<sup>p607</sup> elements fail to run when the parser tries to run them, e.g. because they are empty or specify an unsupported scripting language, another script can later mutate them and cause them to run again.*

4. If *parser document* is non-null and the element does not have an `async`<sup>p608</sup> attribute, then set the element's `"non-blocking"`<sup>p612</sup> flag to true.

#### Note

*This is done so that if a parser-inserted `script`<sup>p607</sup> element fails to run when the parser tries to run it, but it is later executed after a script dynamically updates it, it will execute in a non-blocking fashion even if the `async`<sup>p608</sup> attribute isn't set.*

5. Let *source text* be the element's `child text content`.
6. If the element has no `src`<sup>p608</sup> attribute, and *source text* is the empty string, then return. The script is not executed.
7. If the element is not `connected`, then return. The script is not executed.
8. If either:
  - the `script`<sup>p607</sup> element has a `type`<sup>p608</sup> attribute and its value is the empty string, or
  - the `script`<sup>p607</sup> element has no `type`<sup>p608</sup> attribute but it has a `language`<sup>p1215</sup> attribute and *that* attribute's value is the empty string, or
  - the `script`<sup>p607</sup> element has neither a `type`<sup>p608</sup> attribute nor a `language`<sup>p1215</sup> attribute, then

...let *the script block's type string* for this `script`<sup>p607</sup> element be `"text/javascript"`.

Otherwise, if the `script`<sup>p607</sup> element has a `type`<sup>p608</sup> attribute, let *the script block's type string* for this `script`<sup>p607</sup> element be the value of that attribute with `leading and trailing ASCII whitespace stripped`.

Otherwise, the element has a non-empty `language`<sup>p1215</sup> attribute; let *the script block's type string* for this `script`<sup>p607</sup> element be the concatenation of the string `"text/"` followed by the value of the `language`<sup>p1215</sup> attribute.

#### Note

*The `language`<sup>p1215</sup> attribute is never conforming, and is always ignored if there is a `type`<sup>p608</sup> attribute present.*

Determine `the script's type`<sup>p612</sup> as follows:

- If *the script block's type string* is a `JavaScript MIME type essence match`, `the script's type`<sup>p612</sup> is `"classic"`.
  - If *the script block's type string* is an `ASCII case-insensitive` match for the string `"module"`, `the script's type`<sup>p612</sup> is `"module"`.
  - If neither of the above conditions are true, then return. No script is executed.
9. If *parser document* is non-null, then set the element's `parser document`<sup>p612</sup> back to *parser document* and set the element's `"non-blocking"`<sup>p612</sup> flag to false.
  10. Set the element's `"already started"`<sup>p612</sup> flag.
  11. Set the element's `preparation-time document`<sup>p612</sup> to its `node document`.
  12. If *parser document* is non-null, and *parser document* is not equal to the element's `preparation-time document`<sup>p612</sup>, then return.

This step is not interoperable and is under debate: see [issue #2137](#).

13. If [scripting is disabled](#)<sup>p895</sup> for the [script](#)<sup>p607</sup> element, then return. The script is not executed.

Note

The definition of [scripting is disabled](#)<sup>p895</sup> means that, amongst others, the following scripts will not execute: scripts in XMLHttpRequest's [responseXML](#) documents, scripts in [DOMParser](#)<sup>p951</sup>-created documents, scripts in documents created by [XSLTProcessor](#)<sup>p49</sup>'s [transformToDocument](#)<sup>p49</sup> feature, and scripts that are first inserted by a script into a [Document](#)<sup>p111</sup> that was created using the [createDocument\(\)](#) API. [[XHR](#)]<sup>p1271</sup> [[DOMPARSING](#)]<sup>p1266</sup> [[XSLTP](#)]<sup>p1272</sup> [[DOM](#)]<sup>p1266</sup>

14. If the [script](#)<sup>p607</sup> element has a [nomodule](#)<sup>p608</sup> content attribute and [the script's type](#)<sup>p612</sup> is "classic", then return. The script is not executed.

Note

This means specifying [nomodule](#)<sup>p608</sup> on a [module script](#)<sup>p896</sup> has no effect; the algorithm continues onward.

15. If the [script](#)<sup>p607</sup> element does not have a [src](#)<sup>p608</sup> content attribute, and the [Should element's inline behavior be blocked by Content Security Policy?](#) algorithm returns "Blocked" when executed upon the [script](#)<sup>p607</sup> element, "script", and *source text*, then return. The script is not executed. [[CSP](#)]<sup>p1264</sup>

16. If the [script](#)<sup>p607</sup> element has an [event](#)<sup>p1215</sup> attribute and a [for](#)<sup>p1215</sup> attribute, and [the script's type](#)<sup>p612</sup> is "classic", then:

1. Let *for* be the value of the [for](#)<sup>p1215</sup> attribute.
2. Let *event* be the value of the [event](#)<sup>p1215</sup> attribute.
3. [Strip leading and trailing ASCII whitespace](#) from *event* and *for*.
4. If *for* is not an [ASCII case-insensitive](#) match for the string "window", then return. The script is not executed.
5. If *event* is not an [ASCII case-insensitive](#) match for either the string "onload" or the string "onload()", then return. The script is not executed.

17. If the [script](#)<sup>p607</sup> element has a [charset](#)<sup>p1213</sup> attribute, then let *encoding* be the result of [getting an encoding](#) from the value of the [charset](#)<sup>p1213</sup> attribute.

If the [script](#)<sup>p607</sup> element does not have a [charset](#)<sup>p1213</sup> attribute, or if [getting an encoding](#) failed, let *encoding* be the same as [the encoding](#) of the [script](#)<sup>p607</sup> element's [node document](#).

Note

If [the script's type](#)<sup>p612</sup> is "module", this encoding will be ignored.

18. Let *classic script CORS setting* be the current state of the element's [crossorigin](#)<sup>p609</sup> content attribute.

19. Let *module script credentials mode* be the [module script credentials mode](#)<sup>p89</sup> for the element's [crossorigin](#)<sup>p609</sup> content attribute.

20. Let *cryptographic nonce* be the element's [\[\[CryptographicNonce\]\]](#)<sup>p90</sup> internal slot's value.

21. If the [script](#)<sup>p607</sup> element has an [integrity](#)<sup>p609</sup> attribute, then let *integrity metadata* be that attribute's value. Otherwise, let *integrity metadata* be the empty string.

22. Let *referrer policy* be the current state of the element's [referrerpolicy](#)<sup>p609</sup> content attribute.

23. Let *parser metadata* be "parser-inserted" if the [script](#)<sup>p607</sup> element is ["parser-inserted"](#)<sup>p612</sup>, and "not-parser-inserted" otherwise.

24. Let *options* be a [script fetch options](#)<sup>p898</sup> whose [cryptographic nonce](#)<sup>p898</sup> is *cryptographic nonce*, [integrity metadata](#)<sup>p898</sup> is *integrity metadata*, [parser metadata](#)<sup>p898</sup> is *parser metadata*, [credentials mode](#)<sup>p898</sup> is *module script credentials mode*, and [referrer policy](#)<sup>p898</sup> is *referrer policy*.

25. Let *settings object* be the element's [node document](#)'s [relevant settings object](#)<sup>p913</sup>.

26. If the element has a [src](#)<sup>p608</sup> content attribute, then:

1. Let *src* be the value of the element's [src](#)<sup>p608</sup> attribute.
2. If *src* is the empty string, [queue a task](#)<sup>p925</sup> to [fire an event](#) named [error](#)<sup>p1260</sup> at the element, and return.

3. Set the element's [from an external file](#)<sup>p612</sup> flag.
4. [Parse](#)<sup>p87</sup> *src* relative to the element's [node document](#).
5. If the previous step failed, [queue a task](#)<sup>p925</sup> to [fire an event](#) named [error](#)<sup>p1269</sup> at the element, and return. Otherwise, let *url* be the [resulting URL record](#)<sup>p87</sup>.
6. Switch on [the script's type](#)<sup>p612</sup>:
  - ↪ "classic"
    - [Fetch a classic script](#)<sup>p899</sup> given *url*, *settings object*, *options*, *classic script CORS setting*, and *encoding*.
  - ↪ "module"
    - [Fetch an external module script graph](#)<sup>p900</sup> given *url*, *settings object*, and *options*.

When the chosen algorithm asynchronously completes, set [the script's script](#)<sup>p612</sup> to the result. At that time, [the script is ready](#)<sup>p612</sup>.

For performance reasons, user agents may start fetching the classic script or module graph (as defined above) as soon as the [src](#)<sup>p608</sup> attribute is set, instead, in the hope that the element will be inserted into the document (and that the [crossorigin](#)<sup>p609</sup> attribute won't change value in the meantime). Either way, once the element is [inserted into the document](#)<sup>p43</sup>, the load must have started as described in this step. If the UA performs such prefetching, but the element is never inserted in the document, or the [src](#)<sup>p608</sup> attribute is dynamically changed, or the [crossorigin](#)<sup>p609</sup> attribute is dynamically changed, then the user agent will not execute the script so obtained, and the fetching process will have been effectively wasted.

27. If the element does not have a [src](#)<sup>p608</sup> content attribute, run these substeps:

1. Let *base URL* be the [script](#)<sup>p607</sup> element's [node document's document base URI](#)<sup>p87</sup>.
2. Switch on [the script's type](#)<sup>p612</sup>:
  - ↪ "classic"
    1. Let *script* be the result of [creating a classic script](#)<sup>p904</sup> using *source text*, *settings object*, *base URL*, and *options*.
    2. Set [the script's script](#)<sup>p612</sup> to *script*.
    3. [The script is ready](#)<sup>p612</sup>.
  - ↪ "module"
    1. [Fetch an inline module script graph](#)<sup>p901</sup>, given *source text*, *base URL*, *settings object*, and *options*. When this asynchronously completes, set [the script's script](#)<sup>p612</sup> to the result. At that time, [the script is ready](#)<sup>p612</sup>.

28. Then, follow the first of the following options that describes the situation:

- ↪ **If [the script's type](#)<sup>p612</sup> is "classic", and the element has a [src](#)<sup>p608</sup> attribute, and the element has a [defer](#)<sup>p608</sup> attribute, and the element is "[parser-inserted](#)"<sup>p612</sup>, and the element does not have an [async](#)<sup>p608</sup> attribute**
- ↪ **If [the script's type](#)<sup>p612</sup> is "module", and the element is "[parser-inserted](#)"<sup>p612</sup>, and the element does not have an [async](#)<sup>p608</sup> attribute**

Add the element to the end of the **list of scripts that will execute when the document has finished parsing** associated with the [Document](#)<sup>p111</sup> of the parser that created the element.

When [the script is ready](#)<sup>p612</sup>, set the element's "[ready to be parser-executed](#)"<sup>p612</sup> flag. The parser will handle executing the script.

- ↪ **If [the script's type](#)<sup>p612</sup> is "classic", and the element has a [src](#)<sup>p608</sup> attribute, and the element is "[parser-inserted](#)"<sup>p612</sup>, and the element does not have an [async](#)<sup>p608</sup> attribute**

The element is the [pending parsing-blocking script](#)<sup>p616</sup> of the [Document](#)<sup>p111</sup> of the parser that created the element. (There can only be one such script per [Document](#)<sup>p111</sup> at a time.)

When [the script is ready](#)<sup>p612</sup>, set the element's "[ready to be parser-executed](#)"<sup>p612</sup> flag. The parser will handle executing the script.

- ↪ If **the script's type**<sup>p612</sup> is "classic", and the element has a **src**<sup>p608</sup> attribute, and the element does not have an **async**<sup>p608</sup> attribute, and the element does not have the **"non-blocking"**<sup>p612</sup> flag set
  - ↪ If **the script's type**<sup>p612</sup> is "module", and the element does not have an **async**<sup>p608</sup> attribute, and the element does not have the **"non-blocking"**<sup>p612</sup> flag set
- Add the element to the end of the **list of scripts that will execute in order as soon as possible** associated with the element's **preparation-time document**<sup>p612</sup>.

When **the script is ready**<sup>p612</sup>, run the following steps:

1. If the element is not now the first element in the **list of scripts that will execute in order as soon as possible**<sup>p616</sup> to which it was added above, then mark the element as ready but return without executing the script yet.
2. *Execution*: **Execute the script block**<sup>p616</sup> corresponding to the first script element in this **list of scripts that will execute in order as soon as possible**<sup>p616</sup>.
3. Remove the first element from this **list of scripts that will execute in order as soon as possible**<sup>p616</sup>.
4. If this **list of scripts that will execute in order as soon as possible**<sup>p616</sup> is still not empty and the first entry has already been marked as ready, then jump back to the step labeled *execution*.

↪ If **the script's type**<sup>p612</sup> is "classic", and the element has a **src**<sup>p608</sup> attribute

↪ If **the script's type**<sup>p612</sup> is "module"

The element must be added to the **set of scripts that will execute as soon as possible** of the element's **preparation-time document**<sup>p612</sup>.

When **the script is ready**<sup>p612</sup>, **execute the script block**<sup>p616</sup> and then remove the element from the **set of scripts that will execute as soon as possible**<sup>p616</sup>.

↪ If the element does not have a **src**<sup>p608</sup> attribute, and the element is **"parser-inserted"**<sup>p612</sup>, and either the parser that created the **script**<sup>p607</sup> is an **XML parser**<sup>p1168</sup> or it's an **HTML parser**<sup>p1059</sup> whose **script nesting level**<sup>p1061</sup> is not greater than one, and the element's **parser document**<sup>p612</sup> has a **style sheet that is blocking scripts**<sup>p174</sup>

The element is the **pending parsing-blocking script**<sup>p616</sup> of its **parser document**<sup>p612</sup>. (There can only be one such script per **Document**<sup>p111</sup> at a time.)

Set the element's **"ready to be parser-executed"**<sup>p612</sup> flag. The parser will handle executing the script.

↪ **Otherwise**

**Immediately**<sup>p41</sup> **execute the script block**<sup>p616</sup>, even if other scripts are already executing.

The **pending parsing-blocking script** of a **Document**<sup>p111</sup> is used by the **Document**<sup>p111</sup>'s parser(s).

#### Note

If a **script**<sup>p607</sup> element that blocks a parser gets moved to another **Document**<sup>p111</sup> before it would normally have stopped blocking that parser, it nonetheless continues blocking that parser until the condition that causes it to be blocking the parser no longer applies (e.g., if the script is a **pending parsing-blocking script**<sup>p616</sup> because the original **Document**<sup>p111</sup> has a **style sheet that is blocking scripts**<sup>p174</sup> when it was parsed, but then the script is moved to another **Document**<sup>p111</sup> before the blocking style sheet(s) loaded, the script still blocks the parser until the style sheets are all loaded, at which time the script executes and the parser is unblocked).

To **execute a script block** given a **script**<sup>p607</sup> element *scriptElement*:

1. Let *document* be *scriptElement*'s **node document**.
2. If *scriptElement*'s **parser document**<sup>p612</sup> is non-null, and *scriptElement*'s **parser document**<sup>p612</sup> is not equal to *document*, then return.

This step is not interoperable and is under debate: see [issue #2137](#).

3. If *scriptElement*'s **preparation-time document**<sup>p612</sup> is not equal to *document*, then return.
4. If **the script's script**<sup>p612</sup> is null for *scriptElement*, then **fire an event** named **error**<sup>p1260</sup> at *scriptElement*, and return.

5. If *scriptElement* is [from an external file](#)<sup>p612</sup>, or [the script's type](#)<sup>p612</sup> for *scriptElement* is "module", then increment *document*'s [ignore-destructive-writes counter](#)<sup>p950</sup>.
6. Switch on [the script's type](#)<sup>p612</sup> for *scriptElement*:
  - ↪ "classic"
    1. Let *oldCurrentScript* be the value to which *document*'s [currentScript](#)<sup>p117</sup> object was most recently set.
    2. If *scriptElement*'s [root](#) is not a [shadow root](#), then set *document*'s [currentScript](#)<sup>p117</sup> attribute to *scriptElement*. Otherwise, set it to null.

**Note**  
This does not use the [in a document tree](#) check, as *scriptElement* could have been removed from the document prior to execution, and in that scenario [currentScript](#)<sup>p117</sup> still needs to point to it.

    3. [Run the classic script](#)<sup>p906</sup> given by [the script's script](#)<sup>p612</sup> for *scriptElement*.
    4. Set *document*'s [currentScript](#)<sup>p117</sup> attribute to *oldCurrentScript*.
  - ↪ "module"
    1. Assert: *document*'s [currentScript](#)<sup>p117</sup> attribute is null.
    2. [Run the module script](#)<sup>p906</sup> given by [the script's script](#)<sup>p612</sup> for *scriptElement*.
7. Decrement the [ignore-destructive-writes counter](#)<sup>p950</sup> of *document*, if it was incremented in the earlier step.
8. If *scriptElement* is [from an external file](#)<sup>p612</sup>, then [fire an event](#) named [load](#)<sup>p1261</sup> at *scriptElement*.

#### 4.12.1.2 Scripting languages §<sup>p61</sup><sub>7</sub>

User agents are not required to support JavaScript. This standard needs to be updated if a language other than JavaScript comes along and gets similar wide adoption by web browsers. Until such a time, implementing other languages is in conflict with this standard, given the processing model defined for the [script](#)<sup>p607</sup> element.

Servers should use [text/javascript](#)<sup>p1262</sup> for JavaScript resources. Servers should not use other [JavaScript MIME types](#) for JavaScript resources, and must not use non-[JavaScript MIME types](#).

For external JavaScript resources, MIME type parameters in ``Content-Type`<sup>p88</sup> headers are generally ignored. (In some cases the ``charset`` parameter has an effect.) However, for the [script](#)<sup>p607</sup> element's [type](#)<sup>p608</sup> attribute they are significant; it uses the [JavaScript MIME type essence match](#) concept.

**Note**  
For example, scripts with their [type](#)<sup>p608</sup> attribute set to "text/javascript; charset=utf-8" will not be evaluated, even though that is a valid [JavaScript MIME type](#) when parsed.

Furthermore, again for external JavaScript resources, special considerations apply around ``Content-Type`<sup>p88</sup> header processing as detailed in the [prepare a script](#)<sup>p613</sup> algorithm and [Fetch](#). [\[FETCH\]](#)<sup>p1266</sup>

#### 4.12.1.3 Restrictions for contents of [script](#) elements §<sup>p61</sup><sub>7</sub>

**Note**  
The easiest and safest way to avoid the rather strange restrictions described in this section is to always escape an ASCII case-insensitive match for "`<! -`" as "`< \! -`", "`<script`" as "`< \script`", and "`</script`" as "`< \script`" when these sequences appear in literals in scripts (e.g. in strings, regular expressions, or comments), and to avoid writing code that uses such constructs in expressions. Doing so avoids the pitfalls that the restrictions in this section are prone to triggering: namely, that, for historical reasons, parsing of [script](#)<sup>p607</sup> blocks in HTML is a strange and exotic practice that acts unintuitively in the face of these sequences.

The [script<sup>p607</sup>](#) element's [descendant text content](#) must match the script production in the following ABNF, the character set for which is Unicode. [\[ABNF\]<sup>p1264</sup>](#)

```
script      = outer *( comment-open inner comment-close outer )

outer       = < any string that doesn't contain a substring that matches not-in-outer >
not-in-outer = comment-open
inner       = < any string that doesn't contain a substring that matches not-in-inner >
not-in-inner = comment-close / script-open

comment-open = "<!--"
comment-close = "-->"
script-open  = "<" s c r i p t tag-end

s          = %x0053 ; U+0053 LATIN CAPITAL LETTER S
s          =/ %x0073 ; U+0073 LATIN SMALL LETTER S
c          = %x0043 ; U+0043 LATIN CAPITAL LETTER C
c          =/ %x0063 ; U+0063 LATIN SMALL LETTER C
r          = %x0052 ; U+0052 LATIN CAPITAL LETTER R
r          =/ %x0072 ; U+0072 LATIN SMALL LETTER R
i          = %x0049 ; U+0049 LATIN CAPITAL LETTER I
i          =/ %x0069 ; U+0069 LATIN SMALL LETTER I
p          = %x0050 ; U+0050 LATIN CAPITAL LETTER P
p          =/ %x0070 ; U+0070 LATIN SMALL LETTER P
t          = %x0054 ; U+0054 LATIN CAPITAL LETTER T
t          =/ %x0074 ; U+0074 LATIN SMALL LETTER T

tag-end    = %x0009 ; U+0009 CHARACTER TABULATION (tab)
tag-end    =/ %x000A ; U+000A LINE FEED (LF)
tag-end    =/ %x000C ; U+000C FORM FEED (FF)
tag-end    =/ %x0020 ; U+0020 SPACE
tag-end    =/ %x002F ; U+002F SOLIDUS (/)
tag-end    =/ %x003E ; U+003E GREATER-THAN SIGN (>)
```

When a [script<sup>p607</sup>](#) element contains [script documentation<sup>p619</sup>](#), there are further restrictions on the contents of the element, as described in the section below.

#### Example

The following script illustrates this issue. Suppose you have a script that contains a string, as in:

```
var example = 'Consider this string: <!-- <script>';
console.log(example);
```

If one were to put this string directly in a [script<sup>p607</sup>](#) block, it would violate the restrictions above:

```
<script>
  var example = 'Consider this string: <!-- <script>';
  console.log(example);
</script>
```

The bigger problem, though, and the reason why it would violate those restrictions, is that actually the script would get parsed weirdly: *the script block above is not terminated*. That is, what looks like a "`</script>`" end tag in this snippet is actually still part of the [script<sup>p607</sup>](#) block. The script doesn't execute (since it's not terminated); if it somehow were to execute, as it might if the markup looked as follows, it would fail because the script (highlighted here) is not valid JavaScript:

```
<script>
  var example = 'Consider this string: <!-- <script>';
  console.log(example);
</script>
<!-- despite appearances, this is actually part of the script still! -->
```

```

<script>
  ... // this is the same script block still...
</script>

```

What is going on here is that for legacy reasons, "`<!--`" and "`<script`" strings in [script<sup>p607</sup>](#) elements in HTML need to be balanced in order for the parser to consider closing the block.

By escaping the problematic strings as mentioned at the top of this section, the problem is avoided entirely:

```

<script>
  // Note: `s` is an escape sequence for `s`.
  var example = 'Consider this string: <!-- <script>';
  console.log(example);
</script>
<!-- this is just a comment between script blocks -->
<script>
  ... // this is a new script block
</script>

```

It is possible for these sequences to naturally occur in script expressions, as in the following examples:

```

if (x<!--y) { ... }
if ( player<script ) { ... }

```

In such cases the characters cannot be escaped, but the expressions can be rewritten so that the sequences don't occur, as in:

```

if (x < !--y) { ... }
if (!--y > x) { ... }
if (!(--y) > x) { ... }
if (player < script) { ... }
if (script > player) { ... }

```

Doing this also avoids a different pitfall as well: for related historical reasons, the string "`<!--`" in [classic scripts<sup>p896</sup>](#) is actually treated as a line comment start, just like "`/*`".

#### 4.12.1.4 Inline documentation for external scripts §<sup>p61</sup><sub>9</sub>

If a [script<sup>p607</sup>](#) element's [src<sup>p608</sup>](#) attribute is specified, then the contents of the [script<sup>p607</sup>](#) element, if any, must be such that the value of the [text<sup>p610</sup>](#) IDL attribute, which is derived from the element's contents, matches the documentation production in the following ABNF, the character set for which is Unicode. [\[ABNF\]<sup>p1264</sup>](#)

```

documentation = *( *( space / tab / comment ) [ line-comment ] newline )
comment       = slash star *( not-star / star not-slash ) 1*star slash
line-comment  = slash slash *not-newline

; characters
tab           = %x0009 ; U+0009 CHARACTER TABULATION (tab)
newline      = %x000A ; U+000A LINE FEED (LF)
space        = %x0020 ; U+0020 SPACE
star         = %x002A ; U+002A ASTERISK (*)
slash        = %x002F ; U+002F SOLIDUS (/)
not-newline  = %x0000-0009 / %x000B-10FFFF
              ; a scalar value other than U+000A LINE FEED (LF)
not-star     = %x0000-0029 / %x002B-10FFFF
              ; a scalar value other than U+002A ASTERISK (*)
not-slash    = %x0000-002E / %x0030-10FFFF
              ; a scalar value other than U+002F SOLIDUS (/)

```

## Note

This corresponds to putting the contents of the element in JavaScript comments.

## Note

This requirement is in addition to the earlier restrictions on the syntax of contents of [script<sup>p607</sup>](#) elements.

## Example

This allows authors to include documentation, such as license information or API information, inside their documents while still referring to external script files. The syntax is constrained so that authors don't accidentally include what looks like valid script while also providing a [src<sup>p608</sup>](#) attribute.

```
<script src="cool-effects.js">
  // create new instances using:
  //   var e = new Effect();
  // start the effect using .play, stop using .stop:
  //   e.play();
  //   e.stop();
</script>
```

### 4.12.1.5 Interaction of [script<sup>p607</sup>](#) elements and XSLT §<sup>p62</sup><sub>0</sub>

This section is non-normative.

This specification does not define how XSLT interacts with the [script<sup>p607</sup>](#) element. However, in the absence of another specification actually defining this, here are some guidelines for implementers, based on existing implementations:

- When an XSLT transformation program is triggered by an `<?xml-stylesheet?>` processing instruction and the browser implements a direct-to-DOM transformation, [script<sup>p607</sup>](#) elements created by the XSLT processor need to have its [parser document<sup>p612</sup>](#) set correctly, and run in document order (modulo scripts marked [defer<sup>p608</sup>](#) or [async<sup>p608</sup>](#)), [immediately<sup>b41</sup>](#), as the transformation is occurring.
- The [XSLTProcessor<sup>p49</sup>.transformToDocument\(\)<sup>p49</sup>](#) method adds elements to a [Document<sup>p111</sup>](#) object with a null [browsing context<sup>p804</sup>](#), and, accordingly, any [script<sup>p607</sup>](#) elements they create need to have their "already started"<sup>p612</sup> flag set in the [prepare a script<sup>p613</sup>](#) algorithm and never get executed ([scripting is disabled<sup>p895</sup>](#)). Such [script<sup>p607</sup>](#) elements still need to have their [parser document<sup>p612</sup>](#) set, though, such that their [async<sup>p609</sup>](#) IDL attribute will return false in the absence of an [async<sup>p608</sup>](#) content attribute.
- The [XSLTProcessor<sup>p49</sup>.transformToFragment\(\)<sup>p49</sup>](#) method needs to create a fragment that is equivalent to one built manually by creating the elements using [document.createElementNS\(\)](#). For instance, it needs to create [script<sup>p607</sup>](#) elements with null [parser document<sup>p612</sup>](#) and that don't have their "already started"<sup>p612</sup> flag set, so that they will execute when the fragment is inserted into a document.

The main distinction between the first two cases and the last case is that the first two operate on [Document<sup>p111</sup>](#)s and the last operates on a fragment.

### 4.12.2 The [noscript](#) element §<sup>p62</sup><sub>0</sub>

#### Categories<sup>p125</sup>:

[Metadata content<sup>p128</sup>](#).  
[Flow content<sup>p128</sup>](#).  
[Phrasing content<sup>p129</sup>](#).

#### Contexts in which this element can be used<sup>p125</sup>:

In a [head<sup>p150</sup>](#) element of an [HTML document](#), if there are no ancestor [noscript<sup>p620</sup>](#) elements.  
Where [phrasing content<sup>p129</sup>](#) is expected in [HTML documents](#), if there are no ancestor [noscript<sup>p620</sup>](#) elements.

### Content model<sup>p125</sup>:

When [scripting is disabled](#)<sup>p895</sup>, in a [head](#)<sup>p150</sup> element: in any order, zero or more [link](#)<sup>p154</sup> elements, zero or more [style](#)<sup>p170</sup> elements, and zero or more [meta](#)<sup>p160</sup> elements.

When [scripting is disabled](#)<sup>p895</sup>, not in a [head](#)<sup>p150</sup> element: [transparent](#)<sup>p130</sup>, but there must be no [noscript](#)<sup>p620</sup> element descendants.

Otherwise: text that conforms to the requirements given in the prose.

### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>

### Accessibility considerations<sup>p126</sup>:

[For authors](#).

[For implementers](#).

### DOM interface<sup>p126</sup>:

Uses [HTML<sup>Element</sup>](#)<sup>p121</sup>.

The [noscript](#)<sup>p620</sup> element [represents](#)<sup>p120</sup> nothing if [scripting is enabled](#)<sup>p895</sup>, and [represents](#)<sup>p120</sup> its children if [scripting is disabled](#)<sup>p895</sup>. It is used to present different markup to user agents that support scripting and those that don't support scripting, by affecting how the document is parsed.

When used in [HTML documents](#), the allowed content model is as follows:

#### In a [head](#)<sup>p150</sup> element, if [scripting is disabled](#)<sup>p895</sup> for the [noscript](#)<sup>p620</sup> element

The [noscript](#)<sup>p620</sup> element must contain only [link](#)<sup>p154</sup>, [style](#)<sup>p170</sup>, and [meta](#)<sup>p160</sup> elements.

#### In a [head](#)<sup>p150</sup> element, if [scripting is enabled](#)<sup>p895</sup> for the [noscript](#)<sup>p620</sup> element

The [noscript](#)<sup>p620</sup> element must contain only text, except that invoking the [HTML fragment parsing algorithm](#)<sup>p1157</sup> with the [noscript](#)<sup>p620</sup> element as the [context](#)<sup>p1157</sup> element and the text contents as the *input* must result in a list of nodes that consists only of [link](#)<sup>p154</sup>, [style](#)<sup>p170</sup>, and [meta](#)<sup>p160</sup> elements that would be conforming if they were children of the [noscript](#)<sup>p620</sup> element, and no [parse errors](#)<sup>p1061</sup>.

#### Outside of [head](#)<sup>p150</sup> elements, if [scripting is disabled](#)<sup>p895</sup> for the [noscript](#)<sup>p620</sup> element

The [noscript](#)<sup>p620</sup> element's content model is [transparent](#)<sup>p130</sup>, with the additional restriction that a [noscript](#)<sup>p620</sup> element must not have a [noscript](#)<sup>p620</sup> element as an ancestor (that is, [noscript](#)<sup>p620</sup> can't be nested).

#### Outside of [head](#)<sup>p150</sup> elements, if [scripting is enabled](#)<sup>p895</sup> for the [noscript](#)<sup>p620</sup> element

The [noscript](#)<sup>p620</sup> element must contain only text, except that the text must be such that running the following algorithm results in a conforming document with no [noscript](#)<sup>p620</sup> elements and no [script](#)<sup>p607</sup> elements, and such that no step in the algorithm throws an exception or causes an [HTML parser](#)<sup>p1059</sup> to flag a [parse error](#)<sup>p1061</sup>:

1. Remove every [script](#)<sup>p607</sup> element from the document.
2. Make a list of every [noscript](#)<sup>p620</sup> element in the document. For every [noscript](#)<sup>p620</sup> element in that list, perform the following steps:
  1. Let *s* be the [child text content](#) of the [noscript](#)<sup>p620</sup> element.
  2. Set the [outerHTML](#) attribute of the [noscript](#)<sup>p620</sup> element to the value of *s*. (This, as a side-effect, causes the [noscript](#)<sup>p620</sup> element to be removed from the document.) [\[DOMPARSING\]](#)<sup>p1266</sup>

### Note

*All these contortions are required because, for historical reasons, the [noscript](#)<sup>p620</sup> element is handled differently by the [HTML parser](#)<sup>p1059</sup> based on whether [scripting was enabled or not](#)<sup>p1076</sup> when the parser was invoked.*

The [noscript](#)<sup>p620</sup> element must not be used in [XML documents](#).

### Note

*The [noscript](#)<sup>p620</sup> element is only effective in [the HTML syntax](#)<sup>p1047</sup>, it has no effect in [the XML syntax](#)<sup>p1168</sup>. This is because the way it works is by essentially "turning off" the parser when scripts are enabled, so that the contents of the element are treated as pure*

text and not as real elements. XML does not define a mechanism by which to do this.

The `noscript`<sup>p620</sup> element has no other requirements. In particular, children of the `noscript`<sup>p620</sup> element are not exempt from [form submission](#)<sup>p588</sup>, scripting, and so forth, even when [scripting is enabled](#)<sup>p895</sup> for the element.

#### Example

In the following example, a `noscript`<sup>p620</sup> element is used to provide fallback for a script.

```
<form action="calcSquare.php">
  <p>
    <label for=x>Number</label>:
    <input id="x" name="x" type="number">
  </p>
  <script>
    var x = document.getElementById('x');
    var output = document.createElement('p');
    output.textContent = 'Type a number; it will be squared right then!';
    x.form.appendChild(output);
    x.form.onsubmit = function () { return false; }
    x.oninput = function () {
      var v = x.valueAsNumber;
      output.textContent = v + ' squared is ' + v * v;
    };
  </script>
  <noscript>
    <input type=submit value="Calculate Square">
  </noscript>
</form>
```

When script is disabled, a button appears to do the calculation on the server side. When script is enabled, the value is computed on-the-fly instead.

The `noscript`<sup>p620</sup> element is a blunt instrument. Sometimes, scripts might be enabled, but for some reason the page's script might fail. For this reason, it's generally better to avoid using `noscript`<sup>p620</sup>, and to instead design the script to change the page from being a scriptless page to a scripted page on the fly, as in the next example:

```
<form action="calcSquare.php">
  <p>
    <label for=x>Number</label>:
    <input id="x" name="x" type="number">
  </p>
  <input id="submit" type=submit value="Calculate Square">
  <script>
    var x = document.getElementById('x');
    var output = document.createElement('p');
    output.textContent = 'Type a number; it will be squared right then!';
    x.form.appendChild(output);
    x.form.onsubmit = function () { return false; }
    x.oninput = function () {
      var v = x.valueAsNumber;
      output.textContent = v + ' squared is ' + v * v;
    };
    var submit = document.getElementById('submit');
    submit.parentNode.removeChild(submit);
  </script>
</form>
```

The above technique is also useful in [XML documents](#), since `noscript`<sup>p620</sup> is not allowed there.

### 4.12.3 The `template` element § p62

#### Categories<sup>p125</sup>:

[Metadata content](#)<sup>p128</sup>.  
[Flow content](#)<sup>p128</sup>.  
[Phrasing content](#)<sup>p129</sup>.  
[Script-supporting element](#)<sup>p130</sup>.

#### Contexts in which this element can be used<sup>p125</sup>:

Where [metadata content](#)<sup>p128</sup> is expected.  
Where [phrasing content](#)<sup>p129</sup> is expected.  
Where [script-supporting elements](#)<sup>p130</sup> are expected.  
As a child of a [colgroup](#)<sup>p452</sup> element that doesn't have a [span](#)<sup>p453</sup> attribute.

#### Content model<sup>p125</sup>:

[Nothing](#)<sup>p127</sup> (for clarification, [see example](#)<sup>p623</sup>).

#### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

#### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>

#### Accessibility considerations<sup>p126</sup>:

[For authors](#).  
[For implementers](#).

#### DOM interface<sup>p126</sup>:

```
IDL [Exposed=Window]
interface HTMLTemplateElement : HTMLElement {
    [HTMLConstructor] constructor();

    readonly attribute DocumentFragment content;
};
```

The [template](#)<sup>p623</sup> element is used to declare fragments of HTML that can be cloned and inserted in the document by script.

In a rendering, the [template](#)<sup>p623</sup> element [represents](#)<sup>p120</sup> nothing.

The [template contents](#)<sup>p624</sup> of a [template](#)<sup>p623</sup> element [are not children of the element itself](#)<sup>p1049</sup>.

#### Note

*It is also possible, as a result of DOM manipulation, for a [template](#)<sup>p623</sup> element to contain [Text](#) nodes and element nodes; however, having any is a violation of the [template](#)<sup>p623</sup> element's content model, since its content model is defined as [nothing](#)<sup>p127</sup>.*

#### Example

For example, consider the following document:

```
<!doctype html>
<html lang="en">
  <head>
    <title>Homework</title>
  <body>
    <template id="template"><p>Smile!</p></template>
    <script>
      let num = 3;
      const fragment = document.getElementById('template').content.cloneNode(true);
      while (num-- > 1) {
        fragment.firstChild.before(fragment.firstChild.cloneNode(true));
        fragment.firstChild.textContent += fragment.lastChild.textContent;
      }
    </script>
  </body>
</html>
```

```
document.body.appendChild(fragment);
</script>
</html>
```

The [p<sup>p207</sup>](#) element in the [template<sup>p623</sup>](#) is *not* a child of the [template<sup>p623</sup>](#) in the DOM; it is a child of the [DocumentFragment](#) returned by the [template<sup>p623</sup>](#) element's [content<sup>p624</sup>](#) IDL attribute.

If the script were to call [appendChild\(\)](#) on the [template<sup>p623</sup>](#) element, that would add a child to the [template<sup>p623</sup>](#) element (as for any other element); however, doing so is a violation of the [template<sup>p623</sup>](#) element's content model.

#### For web developers (non-normative)

##### **template . content<sup>p624</sup>**

Returns the [template contents<sup>p624</sup>](#) (a [DocumentFragment](#)).

Each [template<sup>p623</sup>](#) element has an associated [DocumentFragment](#) object that is its **template contents**. The [template contents<sup>p624</sup>](#) have [no conformance requirements<sup>p120</sup>](#). When a [template<sup>p623</sup>](#) element is created, the user agent must run the following steps to establish the [template contents<sup>p624</sup>](#):

1. Let *doc* be the [template<sup>p623</sup>](#) element's [node document](#)'s [appropriate template contents owner document<sup>p624</sup>](#).
2. Create a [DocumentFragment](#) object whose [node document](#) is *doc* and [host](#) is the [template<sup>p623</sup>](#) element.
3. Set the [template<sup>p623</sup>](#) element's [template contents<sup>p624</sup>](#) to the newly created [DocumentFragment](#) object.

A [Document<sup>p111</sup>](#) *doc*'s **appropriate template contents owner document** is the [Document<sup>p111</sup>](#) returned by the following algorithm:

1. If *doc* is not a [Document<sup>p111</sup>](#) created by this algorithm, then:
  1. If *doc* does not yet have an **associated inert template document**, then:
    1. Let *new doc* be a new [Document<sup>p111</sup>](#) (whose [browsing context<sup>p804</sup>](#) is null). This is "a [Document<sup>p111</sup>](#) created by this algorithm" for the purposes of the step above.
    2. If *doc* is an [HTML document](#), mark *new doc* as an [HTML document](#) also.
    3. Let *doc*'s [associated inert template document<sup>p624</sup>](#) be *new doc*.
  2. Set *doc* to *doc*'s [associated inert template document<sup>p624</sup>](#).

#### Note

Each [Document<sup>p111</sup>](#) not created by this algorithm thus gets a single [Document<sup>p111</sup>](#) to act as its proxy for owning the [template contents<sup>p624</sup>](#) of all its [template<sup>p623</sup>](#) elements, so that they aren't in a [browsing context<sup>p804</sup>](#) and thus remain inert (e.g. scripts do not run). Meanwhile, [template<sup>p623</sup>](#) elements inside [Document<sup>p111</sup>](#) objects that are created by this algorithm just reuse the same [Document<sup>p111</sup>](#) owner for their contents.

2. Return *doc*.

The [adopting steps](#) (with *node* and *oldDocument* as parameters) for [template<sup>p623</sup>](#) elements are the following:

1. Let *doc* be *node*'s [node document](#)'s [appropriate template contents owner document<sup>p624</sup>](#).

#### Note

*node*'s [node document](#) is the [Document<sup>p111</sup>](#) object that *node* was just adopted into.

2. Adopt *node*'s [template contents<sup>p624</sup>](#) (a [DocumentFragment](#) object) into *doc*.

The **content** IDL attribute must return the [template<sup>p623</sup>](#) element's [template contents<sup>p624</sup>](#).

The [cloning steps](#) for a [template<sup>p623</sup>](#) element *node* being cloned to a copy *copy* must run the following steps:

1. If the *clone children flag* is not set in the calling [clone](#) algorithm, return.

- Let *copied contents* be the result of [cloning](#) all the children of *node*'s [template contents](#)<sup>p624</sup>, with *document* set to *copy*'s [template contents](#)<sup>p624</sup>'s [node document](#), and with the *clone children flag* set.
- Append *copied contents* to *copy*'s [template contents](#)<sup>p624</sup>.

### Example

In this example, a script populates a table four-column with data from a data structure, using a [template](#)<sup>p623</sup> to provide the element structure instead of manually generating the structure from markup.

```
<!DOCTYPE html>
<html lang='en'>
<title>Cat data</title>
<script>
  // Data is hard-coded here, but could come from the server
  var data = [
    { name: 'Pillar', color: 'Ticked Tabby', sex: 'Female (neutered)', legs: 3 },
    { name: 'Hedral', color: 'Tuxedo', sex: 'Male (neutered)', legs: 4 },
  ];
</script>
<table>
  <thead>
    <tr>
      <th>Name <th>Color <th>Sex <th>Legs
    </thead>
    <tbody>
      <template id="row">
        <tr><td><td><td><td>
      </template>
    </tbody>
  </table>
<script>
  var template = document.querySelector('#row');
  for (var i = 0; i < data.length; i += 1) {
    var cat = data[i];
    var clone = template.content.cloneNode(true);
    var cells = clone.querySelectorAll('td');
    cells[0].textContent = cat.name;
    cells[1].textContent = cat.color;
    cells[2].textContent = cat.sex;
    cells[3].textContent = cat.legs;
    template.parentNode.appendChild(clone);
  }
</script>
```

This example uses [cloneNode\(\)](#) on the [template](#)<sup>p623</sup>'s contents; it could equivalently have used [document.importNode\(\)](#), which does the same thing. The only difference between these two APIs is when the [node document](#) is updated: with [cloneNode\(\)](#) it is updated when the nodes are appended with [appendChild\(\)](#), with [document.importNode\(\)](#) it is updated when the nodes are cloned.

#### 4.12.3.1 Interaction of [template](#)<sup>p623</sup> elements with XSLT and XPath §<sup>p62</sup><sub>5</sub>

*This section is non-normative.*

This specification does not define how XSLT and XPath interact with the [template](#)<sup>p623</sup> element. However, in the absence of another specification actually defining this, here are some guidelines for implementers, which are intended to be consistent with other processing described in this specification:

- An XSLT processor based on an XML parser that acts [as described in this specification](#)<sup>p1168</sup> needs to act as if [template](#)<sup>p623</sup> elements contain as descendants their [template contents](#)<sup>p624</sup> for the purposes of the transform.
- An XSLT processor that outputs a DOM needs to ensure that nodes that would go into a [template](#)<sup>p623</sup> element are instead placed into the element's [template contents](#)<sup>p624</sup>.

- XPath evaluation using the XPath DOM API when applied to a [Document](#)<sup>p111</sup> parsed using the [HTML parser](#)<sup>p1059</sup> or the [XML parser](#)<sup>p1168</sup> described in this specification needs to ignore [template contents](#)<sup>p624</sup>.

#### 4.12.4 The **slot** element §<sup>p62</sup> 6

##### Categories<sup>p125</sup>:

[Flow content](#)<sup>p128</sup>.  
[Phrasing content](#)<sup>p129</sup>.

##### Contexts in which this element can be used<sup>p125</sup>:

Where [phrasing content](#)<sup>p129</sup> is expected.

##### Content model<sup>p125</sup>:

[Transparent](#)<sup>p130</sup>

##### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

##### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>  
[name](#)<sup>p626</sup> — Name of shadow tree slot

##### Accessibility considerations<sup>p126</sup>:

[For authors](#).  
[For implementers](#).

##### DOM interface<sup>p126</sup>:

```
IDL [Exposed=Window]
interface HTMLSlotElement : HTMLElement {
    [HTMLConstructor] constructor();

    [CEReactions] attribute DOMString name;
    sequence<Node> assignedNodes(optional AssignedNodesOptions options = {});
    sequence<Element> assignedElements(optional AssignedNodesOptions options = {});
};

dictionary AssignedNodesOptions {
    boolean flatten = false;
};
```

The [slot](#)<sup>p626</sup> element defines a [slot](#). It is typically used in a [shadow tree](#). A [slot](#)<sup>p626</sup> element [represents](#)<sup>p120</sup> its [assigned nodes](#), if any, and its contents otherwise.

The [name](#) content attribute may contain any string value. It represents a [slot's name](#).

#### Note

The [name](#)<sup>p626</sup> attribute is used to [assign slots](#) to other elements: a [slot](#)<sup>p626</sup> element with a [name](#)<sup>p626</sup> attribute creates a named [slot](#) to which any element is [assigned](#) if that element has a [slot](#)<sup>p134</sup> attribute whose value matches that [name](#)<sup>p626</sup> attribute's value, and the [slot](#)<sup>p626</sup> element is a child of the [shadow tree](#) whose [root's host](#) has that corresponding [slot](#)<sup>p134</sup> attribute value.

#### For web developers (non-normative)

##### **slot** . [name](#)<sup>p627</sup>

Can be used to get and set [slot's name](#).

##### **slot** . [assignedNodes](#)<sup>p627</sup> ()

Returns [slot's assigned nodes](#).

##### **slot** . [assignedNodes](#)<sup>p627</sup> ({ [flatten](#): true })

Returns [slot's assigned nodes](#), if any, and [slot's children](#) otherwise, and does the same for any [slot](#)<sup>p626</sup> elements encountered therein, recursively, until there are no [slot](#)<sup>p626</sup> elements left.

### `slot.assignedElements`<sup>p627</sup>()

Returns *slot*'s [assigned nodes](#), limited to elements.

### `slot.assignedElements`<sup>p627</sup>({ `flatten`: true })

Returns the same as [assignedNodes\({ `flatten`: true }\)](#)<sup>p627</sup>, limited to elements.

The `name` IDL attribute must [reflect](#)<sup>p91</sup> the content attribute of the same name.

The `assignedNodes(options)` method, when invoked, must run these steps:

1. If the value of *options*'s `flatten` member is false, then return this element's [assigned nodes](#).
2. Return the result of [finding flattened slottables](#) with this element.

The `assignedElements(options)` method, when invoked, must run these steps:

1. If the value of *options*'s `flatten` member is false, then return this element's [assigned nodes](#), filtered to contain only [Element](#) nodes.
2. Return the result of [finding flattened slottables](#) with this element, filtered to contain only [Element](#) nodes.

## 4.12.5 The `canvas` element §<sup>p62</sup><sub>7</sub>

### Categories<sup>p125</sup>:

[Flow content](#)<sup>p128</sup>.  
[Phrasing content](#)<sup>p129</sup>.  
[Embedded content](#)<sup>p129</sup>.  
[Palpable content](#)<sup>p130</sup>.

### Contexts in which this element can be used<sup>p125</sup>:

Where [embedded content](#)<sup>p129</sup> is expected.

### Content model<sup>p125</sup>:

[Transparent](#)<sup>p130</sup>, but with no [interactive content](#)<sup>p129</sup> descendants except for [a](#)<sup>p234</sup> elements, [img](#)<sup>p314</sup> elements with [usemap](#)<sup>p439</sup> attributes, [button](#)<sup>p528</sup> elements, [input](#)<sup>p486</sup> elements whose [type](#)<sup>p488</sup> attribute are in the [Checkbox](#)<sup>p506</sup> or [Radio Button](#)<sup>p507</sup> states, [input](#)<sup>p486</sup> elements that are [buttons](#)<sup>p479</sup>, and [select](#)<sup>p530</sup> elements with a [multiple](#)<sup>p532</sup> attribute or a [display size](#)<sup>p532</sup> greater than 1.

### Tag omission in text/html<sup>p125</sup>:

Neither tag is omissible.

### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>  
[width](#)<sup>p628</sup> — Horizontal dimension  
[height](#)<sup>p628</sup> — Vertical dimension

### Accessibility considerations<sup>p126</sup>:

[For authors](#).  
[For implementers](#).

### DOM interface<sup>p126</sup>:

```
IDL typedef (CanvasRenderingContext2D or ImageBitmapRenderingContext or WebGLRenderingContext or WebGL2RenderingContext) RenderingContext;
```

```
[Exposed=Window]
interface HTMLCanvasElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute unsigned long width;
  [CEReactions] attribute unsigned long height;
```

```

RenderingContext? getContext(DOMString contextId, optional any options = null);

USVString toDataURL(optional DOMString type = "image/png", optional any quality);
void toBlob(BlobCallback _callback, optional DOMString type = "image/png", optional any
quality);
OffscreenCanvas transferControlToOffscreen();
};

callback BlobCallback = void (Blob? blob);

```

The [canvas](#)<sup>p627</sup> element provides scripts with a resolution-dependent bitmap canvas, which can be used for rendering graphs, game graphics, art, or other visual images on the fly.

Authors should not use the [canvas](#)<sup>p627</sup> element in a document when a more suitable element is available. For example, it is inappropriate to use a [canvas](#)<sup>p627</sup> element to render a page heading: if the desired presentation of the heading is graphically intense, it should be marked up using appropriate elements (typically [h1](#)<sup>p186</sup>) and then styled using CSS and supporting technologies such as [shadow trees](#).

When authors use the [canvas](#)<sup>p627</sup> element, they must also provide content that, when presented to the user, conveys essentially the same function or purpose as the [canvas](#)<sup>p627</sup>'s bitmap. This content may be placed as content of the [canvas](#)<sup>p627</sup> element. The contents of the [canvas](#)<sup>p627</sup> element, if any, are the element's [fallback content](#)<sup>p129</sup>.

In interactive visual media, if [scripting is enabled](#)<sup>p895</sup> for the [canvas](#)<sup>p627</sup> element, and if support for [canvas](#)<sup>p627</sup> elements has been enabled, then the [canvas](#)<sup>p627</sup> element [represents](#)<sup>p120</sup> [embedded content](#)<sup>p129</sup> consisting of a dynamically created image, the element's bitmap.

In non-interactive, static, visual media, if the [canvas](#)<sup>p627</sup> element has been previously associated with a rendering context (e.g. if the page was viewed in an interactive visual medium and is now being printed, or if some script that ran during the page layout process painted on the element), then the [canvas](#)<sup>p627</sup> element [represents](#)<sup>p120</sup> [embedded content](#)<sup>p129</sup> with the element's current bitmap and size. Otherwise, the element represents its [fallback content](#)<sup>p129</sup> instead.

In non-visual media, and in visual media if [scripting is disabled](#)<sup>p895</sup> for the [canvas](#)<sup>p627</sup> element or if support for [canvas](#)<sup>p627</sup> elements has been disabled, the [canvas](#)<sup>p627</sup> element [represents](#)<sup>p120</sup> its [fallback content](#)<sup>p129</sup> instead.

When a [canvas](#)<sup>p627</sup> element [represents](#)<sup>p120</sup> [embedded content](#)<sup>p129</sup>, the user can still focus descendants of the [canvas](#)<sup>p627</sup> element (in the [fallback content](#)<sup>p129</sup>). When an element is [focused](#)<sup>p764</sup>, it is the target of keyboard interaction events (even though the element itself is not visible). This allows authors to make an interactive canvas keyboard-accessible: authors should have a one-to-one mapping of interactive regions to [focusable areas](#)<sup>p763</sup> in the [fallback content](#)<sup>p129</sup>. (Focus has no effect on mouse interaction events.) [\[UIEVENTS\]](#)<sup>p1270</sup>

An element whose nearest [canvas](#)<sup>p627</sup> element ancestor is [being rendered](#)<sup>p1172</sup> and [represents](#)<sup>p120</sup> [embedded content](#)<sup>p129</sup> is an element that is **being used as relevant canvas fallback content**.

The [canvas](#)<sup>p627</sup> element has two attributes to control the size of the element's bitmap: **width** and **height**. These attributes, when specified, must have values that are [valid non-negative integers](#)<sup>p67</sup>. The [rules for parsing non-negative integers](#)<sup>p67</sup> must be used to **obtain their numeric values**. If an attribute is missing, or if parsing its value returns an error, then the default value must be used instead. The [width](#)<sup>p628</sup> attribute defaults to 300, and the [height](#)<sup>p628</sup> attribute defaults to 150. MDN

When setting the value of the [width](#)<sup>p628</sup> or [height](#)<sup>p628</sup> attribute, if the [context mode](#)<sup>p629</sup> of the [canvas](#)<sup>p627</sup> element is set to [placeholder](#)<sup>p629</sup>, the user agent must throw an **"InvalidStateError" DOMException** and leave the attribute's value unchanged.

The [intrinsic dimensions](#) of the [canvas](#)<sup>p627</sup> element when it [represents](#)<sup>p120</sup> [embedded content](#)<sup>p129</sup> are equal to the dimensions of the element's bitmap.

The user agent must use a square pixel density consisting of one pixel of image data per coordinate space unit for the bitmaps of a [canvas](#)<sup>p627</sup> and its rendering contexts.

**Note**  
 A [canvas](#)<sup>p627</sup> element can be sized arbitrarily by a style sheet, its bitmap is then subject to the **'object-fit'** CSS property.

The bitmaps of [canvas](#)<sup>p627</sup> elements, the bitmaps of [ImageBitmap](#)<sup>p970</sup> objects, as well as some of the bitmaps of rendering contexts, such as those described in the sections on the [CanvasRenderingContext2D](#)<sup>p632</sup> and [ImageBitmapRenderingContext](#)<sup>p680</sup> objects below, have an **origin-clean** flag, which can be set to true or false. Initially, when the [canvas](#)<sup>p627</sup> element or [ImageBitmap](#)<sup>p970</sup> object is created, its bitmap's [origin-clean](#)<sup>p629</sup> flag must be set to true.

A [canvas](#)<sup>p627</sup> element can have a rendering context bound to it. Initially, it does not have a bound rendering context. To keep track of whether it has a rendering context or not, and what kind of rendering context it is, a [canvas](#)<sup>p627</sup> also has a **canvas context mode**, which is initially **none** but can be changed to either **placeholder**, **2d**, **bitmaprenderer**, **webgl**, or **webgl2** by algorithms defined in this specification.

When its [canvas context mode](#)<sup>p629</sup> is [none](#)<sup>p629</sup>, a [canvas](#)<sup>p627</sup> element has no rendering context, and its bitmap must be [transparent black](#) with an [intrinsic width](#) equal to [the numeric value](#)<sup>p628</sup> of the element's [width](#)<sup>p628</sup> attribute and an [intrinsic height](#) equal to [the numeric value](#)<sup>p628</sup> of the element's [height](#)<sup>p628</sup> attribute, those values being interpreted in [CSS pixels](#), and being updated as the attributes are set, changed, or removed.

When its [canvas context mode](#)<sup>p629</sup> is [placeholder](#)<sup>p629</sup>, a [canvas](#)<sup>p627</sup> element has no rendering context. It serves as a placeholder for an [OffscreenCanvas](#)<sup>p682</sup> object, and the content of the [canvas](#)<sup>p627</sup> element is updated by calling the [commit\(\)](#)<sup>p683</sup> method of the [OffscreenCanvas](#)<sup>p682</sup> object's rendering context.

When a [canvas](#)<sup>p627</sup> element represents [embedded content](#)<sup>p129</sup>, it provides a [paint source](#) whose width is the element's [intrinsic width](#), whose height is the element's [intrinsic height](#), and whose appearance is the element's bitmap.

Whenever the [width](#)<sup>p628</sup> and [height](#)<sup>p628</sup> content attributes are set, removed, changed, or redundantly set to the value they already have, then the user agent must perform the action from the row of the following table that corresponds to the [canvas](#)<sup>p627</sup> element's [context mode](#)<sup>p629</sup>.

<a href="#">Context Mode</a> <sup>p629</sup>	Action
<a href="#">2d</a> <sup>p629</sup>	Follow the steps to <a href="#">set bitmap dimensions</a> <sup>p637</sup> to <a href="#">the numeric values</a> <sup>p628</sup> of the <a href="#">width</a> <sup>p628</sup> and <a href="#">height</a> <sup>p628</sup> content attributes.
<a href="#">webgl</a> <sup>p629</sup> or <a href="#">webgl2</a> <sup>p629</sup>	Follow the behavior defined in the WebGL specifications. <a href="#">[WEBGL]</a> <sup>p1271</sup>
<a href="#">bitmaprenderer</a> <sup>p629</sup>	If the context's <a href="#">bitmap mode</a> <sup>p681</sup> is set to <a href="#">blank</a> <sup>p681</sup> , run the steps to <a href="#">set an ImageBitmapRenderingContext's output bitmap</a> <sup>p681</sup> , passing the <a href="#">canvas</a> <sup>p627</sup> element's rendering context.
<a href="#">placeholder</a> <sup>p629</sup>	Do nothing.
<a href="#">none</a> <sup>p629</sup>	Do nothing.

The [width](#) and [height](#) IDL attributes must [reflect](#)<sup>p91</sup> the respective content attributes of the same name, with the same defaults.

#### For web developers (non-normative)

**`context = canvas . getContext`**<sup>p629</sup>(*contextId* [, *options* ] )

Returns an object that exposes an API for drawing on the canvas. *contextId* specifies the desired API: "[2d](#)<sup>p630</sup>", "[bitmaprenderer](#)<sup>p630</sup>", "[webgl](#)<sup>p630</sup>", or "[webgl2](#)<sup>p630</sup>". *options* is handled by that API.

This specification defines the "[2d](#)<sup>p630</sup>" and "[bitmaprenderer](#)<sup>p630</sup>" contexts below. The WebGL specifications define the "[webgl](#)<sup>p630</sup>" and "[webgl2](#)<sup>p630</sup>" contexts. [\[WEBGL\]](#)<sup>p1271</sup>

Returns null if *contextId* is not supported, or if the canvas has already been initialized with another context type (e.g., trying to get a "[2d](#)<sup>p630</sup>" context after getting a "[webgl](#)<sup>p630</sup>" context).

The [getContext\(contextId, options\)](#) method of the [canvas](#)<sup>p627</sup> element, when invoked, must run these steps:

1. If *options* is not an [object](#), then set *options* to null.
2. Set *options* to the result of [converting options](#) to a JavaScript value.

3. Run the steps in the cell of the following table whose column header matches this [canvas](#)<sup>p627</sup> element's [canvas context mode](#)<sup>p629</sup> and whose row header matches *contextId*:

	<a href="#">none</a> <sup>p629</sup>	<a href="#">2d</a> <sup>p629</sup>	<a href="#">bitmaprenderer</a> <sup>p629</sup>	<a href="#">webgl</a> <sup>p629</sup> or <a href="#">webgl2</a> <sup>p629</sup>	<a href="#">placeholder</a> <sup>p629</sup>
"2d"	Follow the <a href="#">2D context creation algorithm</a> <sup>p637</sup> defined in the section below, passing it this <a href="#">canvas</a> <sup>p627</sup> element and <i>options</i> , to obtain a <a href="#">CanvasRenderingContext2D</a> <sup>p632</sup> object; if this does not throw an exception, then set this <a href="#">canvas</a> <sup>p627</sup> element's <a href="#">context mode</a> <sup>p629</sup> to <a href="#">2d</a> <sup>p629</sup> , and return the <a href="#">CanvasRenderingContext2D</a> <sup>p632</sup> object.	Return the same object as was returned the last time the method was invoked with this same first argument.	Return null.	Return null.	Throw an <a href="#">"InvalidStateError"</a> <sup>p629</sup> <a href="#">DOMException</a> .
"bitmaprenderer"	Follow the <a href="#">ImageBitmapRenderingContext creation algorithm</a> <sup>p682</sup> defined in the section below, passing it this <a href="#">canvas</a> <sup>p627</sup> element and <i>options</i> , to obtain an <a href="#">ImageBitmapRenderingContext</a> <sup>p680</sup> object; then set this <a href="#">canvas</a> <sup>p627</sup> element's <a href="#">context mode</a> <sup>p629</sup> to <a href="#">bitmaprenderer</a> <sup>p629</sup> , and return the <a href="#">ImageBitmapRenderingContext</a> <sup>p680</sup> object.	Return null.	Return the same object as was returned the last time the method was invoked with this same first argument.	Return null.	Throw an <a href="#">"InvalidStateError"</a> <sup>p629</sup> <a href="#">DOMException</a> .
"webgl" or "webgl2", if the user agent supports the WebGL feature in its current configuration	Follow the instructions given in the WebGL specifications' <i>Context Creation</i> sections to obtain a <a href="#">WebGLRenderingContext</a> , <a href="#">WebGL2RenderingContext</a> , or null; if the returned value is null, then return null; otherwise, set this <a href="#">canvas</a> <sup>p627</sup> element's <a href="#">context mode</a> <sup>p629</sup> to <a href="#">webgl</a> <sup>p629</sup> or <a href="#">webgl2</a> <sup>p629</sup> , and return the <a href="#">WebGLRenderingContext</a> or <a href="#">WebGL2RenderingContext</a> object. <a href="#">[WEBGL]</a> <sup>p1271</sup>	Return null.	Return null.	Return the same object as was returned the last time the method was invoked with this same first argument.	Throw an <a href="#">"InvalidStateError"</a> <sup>p629</sup> <a href="#">DOMException</a> .
An unsupported value*	Return null.	Return null.	Return null.	Return null.	Throw an <a href="#">"InvalidStateError"</a> <sup>p629</sup> <a href="#">DOMException</a> .

\* For example, the "[webgl](#)<sup>p630</sup>" or "[webgl2](#)<sup>p630</sup>" value in the case of a user agent having exhausted the graphics hardware's abilities and having no software fallback implementation.

#### For web developers (non-normative)

**`url = canvas . toDataURL`**<sup>p630</sup>( [ *type* [, *quality* ] ] )

Returns a [data: URL](#) for the image in the canvas.

The first argument, if provided, controls the type of the image to be returned (e.g. PNG or JPEG). The default is "[image/png](#)<sup>p1262</sup>"; that type is also used if the given type isn't supported. The second argument applies if the type is an image format that supports variable quality (such as "[image/jpeg](#)<sup>p1262</sup>"), and is a number in the range 0.0 to 1.0 inclusive indicating the desired quality level for the resulting image.

When trying to use types other than "[image/png](#)<sup>p1262</sup>", authors can check if the image was really returned in the requested format by checking to see if the returned string starts with one of the exact strings "data:image/png," or "data:image/png;". If it does, the image is PNG, and thus the requested type was not supported. (The one exception to this is if the canvas has either no height or no width, in which case the result might simply be "data: ,".)

**`canvas . toBlob`**<sup>p631</sup>(*callback* [, *type* [, *quality* ] ] )

Creates a [Blob](#) object representing a file containing the image in the canvas, and invokes a callback with a handle to that object.

The second argument, if provided, controls the type of the image to be returned (e.g. PNG or JPEG). The default is "[image/png](#)<sup>p1262</sup>"; that type is also used if the given type isn't supported. The third argument applies if the type is an image format that supports variable quality (such as "[image/jpeg](#)<sup>p1262</sup>"), and is a number in the range 0.0 to 1.0 inclusive indicating the desired quality level for the resulting image.

**`canvas . transferControlToOffscreen`**<sup>p631</sup>( )

Returns a newly created [OffscreenCanvas](#)<sup>p682</sup> object that uses the [canvas](#)<sup>p627</sup> element as a placeholder. Once the [canvas](#)<sup>p627</sup> element has become a placeholder for an [OffscreenCanvas](#)<sup>p682</sup> object, its intrinsic size can no longer be changed, and it cannot have a rendering context. The content of the placeholder canvas is updated by calling the [commit\(\)](#)<sup>p683</sup> method of the [OffscreenCanvas](#)<sup>p682</sup> object's rendering context.

The [toDataURL](#)(*type*, *quality*) method, when invoked, must run these steps:

1. If this [canvas](#)<sup>p627</sup> element's [bitmap's origin-clean](#)<sup>p629</sup> flag is set to false, then throw a ["SecurityError" DOMException](#).
2. If this [canvas](#)<sup>p627</sup> element's bitmap has no pixels (i.e. either its horizontal dimension or its vertical dimension is zero) then return the string "data: ,". (This is the shortest [data: URL](#); it represents the empty string in a [text/plain](#) resource.)
3. Let *file* be [a serialization of this canvas element's bitmap as a file](#)<sup>p688</sup>, passing *type* and *quality* if given.
4. If *file* is null then return "data: ,".
5. Return a [data: URL](#) representing *file*. [\[RFC2397\]](#)<sup>p1269</sup>

The [toBlob\(\*callback\*, \*type\*, \*quality\*\)](#) method, when invoked, must run these steps:

1. If this [canvas](#)<sup>p627</sup> element's [bitmap's origin-clean](#)<sup>p629</sup> flag is set to false, then throw a ["SecurityError" DOMException](#).
2. Let *result* be null.
3. If this [canvas](#)<sup>p627</sup> element's bitmap has pixels (i.e., neither its horizontal dimension nor its vertical dimension is zero), then set *result* to a copy of this [canvas](#)<sup>p627</sup> element's bitmap.
4. Run these steps [in parallel](#)<sup>p41</sup>:
  1. If *result* is non-null, then set *result* to [a serialization of result as a file](#)<sup>p688</sup> with *type* and *quality* if given.
  2. [Queue an element task](#)<sup>p926</sup> on the **canvas blob serialization task source** given the [canvas](#)<sup>p627</sup> element to run these steps:
    1. If *result* is non-null, then set *result* to a new [Blob](#) object, created in the [relevant Realm](#)<sup>p913</sup> of this [canvas](#)<sup>p627</sup> element, representing *result*. [\[FILEAPI\]](#)<sup>p1266</sup>
    2. [Invoke](#) *callback* with « *result* ».

The [transferControlToOffscreen\(\)](#) method, when invoked, must run these steps:

1. If this [canvas](#)<sup>p627</sup> element's [context mode](#)<sup>p629</sup> is not set to [none](#)<sup>p629</sup>, throw an ["InvalidStateError" DOMException](#).
2. Let *offscreenCanvas* be a new [OffscreenCanvas](#)<sup>p682</sup> object with its width and height equal to the values of the [width](#)<sup>p628</sup> and [height](#)<sup>p628</sup> content attributes of this [canvas](#)<sup>p627</sup> element.
3. Set the [placeholder canvas element](#)<sup>p683</sup> of *offscreenCanvas* to be a weak reference to this [canvas](#)<sup>p627</sup> element.
4. Set this [canvas](#)<sup>p627</sup> element's [context mode](#)<sup>p629</sup> to [placeholder](#)<sup>p629</sup>.
5. Return *offscreenCanvas*.

```

## Note

To maintain compatibility with existing Web content, user agents need to enumerate methods defined in [CanvasUserInterface](#)<sup>p633</sup> immediately after the [stroke\(\)](#)<sup>p663</sup> method on [CanvasRenderingContext2D](#)<sup>p632</sup> objects.

For web developers (non-normative)

**context** = `canvas.getContext('2d' [, { [ alphap637: true ] [, desynchronizedp637: false ] } ] )`

Returns a [CanvasRenderingContext2D](#)<sup>p632</sup> object that is permanently bound to a particular [canvas](#)<sup>p627</sup> element.

If the [alpha](#)<sup>p637</sup> member is false, then the context is forced to always be opaque.

If the [desynchronized](#)<sup>p637</sup> member is true, then the context might be [desynchronized](#)<sup>p636</sup>.

**context** . `canvas`<sup>p637</sup>

Returns the [canvas](#)<sup>p627</sup> element.

**attributes** = `canvas.getContextAttributes`<sup>p636</sup>( )

Returns an object whose:

- [alpha](#)<sup>p636</sup> member is true if the context has an alpha channel, or false if it was forced to be opaque.
- [desynchronized](#)<sup>p637</sup> member is true if the context can be [desynchronized](#)<sup>p636</sup>.

A [CanvasRenderingContext2D](#)<sup>p632</sup> object has an **output bitmap** that is initialized when the object is created.

The [output bitmap](#)<sup>p636</sup> has an [origin-clean](#)<sup>p629</sup> flag, which can be set to true or false. Initially, when one of these bitmaps is created, its [origin-clean](#)<sup>p629</sup> flag must be set to true.

The [CanvasRenderingContext2D](#)<sup>p632</sup> object also has an **alpha** boolean. When a [CanvasRenderingContext2D](#)<sup>p632</sup> object's [alpha](#)<sup>p636</sup> is false, then its alpha channel must be fixed to 1.0 (fully opaque) for all pixels, and attempts to change the alpha component of any pixel must be silently ignored.

#### Note

*Thus, the bitmap of such a context starts off as [opaque black](#) instead of [transparent black](#); `clearRect()`<sup>p659</sup> always results in [opaque black](#) pixels, every fourth byte from `getImageData()`<sup>p669</sup> is always 255, the `putImageData()`<sup>p670</sup> method effectively ignores every fourth byte in its input, and so on. However, the alpha component of styles and images drawn onto the canvas are still honoured up to the point where they would impact the [output bitmap](#)<sup>p636</sup>'s alpha channel; for instance, drawing a 50% transparent white square on a freshly created [output bitmap](#)<sup>p636</sup> with its [alpha](#)<sup>p636</sup> set to false will result in a fully-opaque gray square.*

The [CanvasRenderingContext2D](#)<sup>p632</sup> object also has a **desynchronized** boolean. When a [CanvasRenderingContext2D](#)<sup>p632</sup> object's [desynchronized](#)<sup>p636</sup> is true, then the user agent may optimize the rendering of the canvas to reduce the latency, as measured from input events to rasterization, by desynchronizing the canvas paint cycle from the event loop, bypassing the ordinary user agent rendering algorithm, or both. Insofar as this mode involves bypassing the usual paint mechanisms, rasterization, or both, it might introduce visible tearing artifacts.

#### Note

*The user agent usually renders on a buffer which is not being displayed, quickly swapping it and the one being scanned out for presentation; the former buffer is called back buffer and the latter front buffer. A popular technique for reducing latency is called front buffer rendering, also known as single buffer rendering, where rendering happens in parallel and rapidly with the scanning out process. This technique reduces the latency at the price of potentially introducing tearing artifacts and can be used to implement in total or part of the [desynchronized](#)<sup>p636</sup> boolean. [\[MULTIPLEBUFFERING\]](#)<sup>p1268</sup>*

#### Note

*The [desynchronized](#)<sup>p636</sup> boolean can be useful when implementing certain kinds of applications, such as drawing applications, where the latency between input and rasterization is critical.*

The `getContextAttributes()` method, when invoked, must return a [CanvasRenderingContext2DSettings](#)<sup>p631</sup> dictionary containing the following members:

- [alpha](#)<sup>p636</sup>, set to this context's [alpha](#)<sup>p636</sup>.
- [desynchronized](#)<sup>p636</sup>, set to this context's [desynchronized](#)<sup>p636</sup>.

The [CanvasRenderingContext2D](#)<sup>p632</sup> 2D rendering context represents a flat linear Cartesian surface whose origin (0,0) is at the top left corner, with the coordinate space having x values increasing when going right, and y values increasing when going down. The x-coordinate of the right-most edge is equal to the width of the rendering context's [output bitmap](#)<sup>p636</sup> in [CSS pixels](#); similarly, the

y-coordinate of the bottom-most edge is equal to the height of the rendering context's [output bitmap](#)<sup>p636</sup> in [CSS pixels](#).

The size of the coordinate space does not necessarily represent the size of the actual bitmaps that the user agent will use internally or during rendering. On high-definition displays, for instance, the user agent may internally use bitmaps with four device pixels per unit in the coordinate space, so that the rendering remains at high quality throughout. Anti-aliasing can similarly be implemented using oversampling with bitmaps of a higher resolution than the final image on the display.

#### Example

Using [CSS pixels](#) to describe the size of a rendering context's [output bitmap](#)<sup>p636</sup> does not mean that when rendered the canvas will cover an equivalent area in [CSS pixels](#). [CSS pixels](#) are reused for ease of integration with CSS features, such as text layout.

In other words, the [canvas](#)<sup>p627</sup> element below's rendering context has a 200x200 [output bitmap](#)<sup>p636</sup> (which internally uses [CSS pixels](#) as a unit for ease of integration with CSS) and is rendered as 100x100 [CSS pixels](#):

```
<canvas width=200 height=200 style=width:100px;height:100px>
```

The **2D context creation algorithm**, which is passed a *target* (a [canvas](#)<sup>p627</sup> element) and *options*, consists of running these steps:

1. Let *settings* be the result of [converting](#) *options* to the dictionary type [CanvasRenderingContext2DSettings](#)<sup>p631</sup>. (This can throw an exception.).
2. Let *context* be a new [CanvasRenderingContext2D](#)<sup>p632</sup> object.
3. Initialize *context*'s [canvas](#)<sup>p637</sup> attribute to point to *target*.
4. Set *context*'s [output bitmap](#)<sup>p636</sup> to the same bitmap as *target*'s bitmap (so that they are shared).
5. [Set bitmap dimensions](#)<sup>p637</sup> to [the numeric values](#)<sup>p628</sup> of *target*'s [width](#)<sup>p628</sup> and [height](#)<sup>p628</sup> content attributes.
6. Set *context*'s [alpha](#)<sup>p636</sup> to *settings*'s **alpha**.
7. Set *context*'s [desynchronized](#)<sup>p636</sup> to *settings*'s **desynchronized**.
8. Return *context*.

When the user agent is to **set bitmap dimensions** to *width* and *height*, it must run these steps:

1. [Reset the rendering context to its default state](#)<sup>p639</sup>.
2. Resize the [output bitmap](#)<sup>p636</sup> to the new *width* and *height* and clear it to [transparent black](#).
3. Let *canvas* be the [canvas](#)<sup>p627</sup> element to which the rendering context's [canvas](#)<sup>p637</sup> attribute was initialized.
4. If [the numeric value](#)<sup>p628</sup> of *canvas*'s [width](#)<sup>p628</sup> content attribute differs from *width*, then set *canvas*'s [width](#)<sup>p628</sup> content attribute to the shortest possible string representing *width* as a [valid non-negative integer](#)<sup>p67</sup>.
5. If [the numeric value](#)<sup>p628</sup> of *canvas*'s [height](#)<sup>p628</sup> content attribute differs from *height*, then set *canvas*'s [height](#)<sup>p628</sup> content attribute to the shortest possible string representing *height* as a [valid non-negative integer](#)<sup>p67</sup>.

#### Example

Only one square appears to be drawn in the following example:

```
// canvas is a reference to a <canvas> element
var context = canvas.getContext('2d');
context.fillRect(0,0,50,50);
canvas.setAttribute('width', '300'); // clears the canvas
context.fillRect(0,100,50,50);
canvas.width = canvas.width; // clears the canvas
context.fillRect(100,0,50,50); // only this square remains
```

The [canvas](#) attribute must return the value it was initialized to when the object was created.

The [CanvasFillRule](#)<sup>p631</sup> enumeration is used to select the **fill rule** algorithm by which to determine if a point is inside or outside a path.

The value "**nonzero**" value indicates the nonzero winding rule, wherein a point is considered to be outside a shape if the number of times a half-infinite straight line drawn from that point crosses the shape's path going in one direction is equal to the number of times it crosses the path going in the other direction.

The "**evenodd**" value indicates the even-odd rule, wherein a point is considered to be outside a shape if the number of times a half-infinite straight line drawn from that point crosses the shape's path is even.

If a point is not outside a shape, it is inside the shape.

The [ImageSmoothingQuality](#)<sup>p631</sup> enumeration is used to express a preference for the interpolation quality to use when smoothing images.

The "**low**" value indicates a preference for a low level of image interpolation quality. Low-quality image interpolation may be more computationally efficient than higher settings.

The "**medium**" value indicates a preference for a medium level of image interpolation quality.

The "**high**" value indicates a preference for a high level of image interpolation quality. High-quality image interpolation may be more computationally expensive than lower settings.

#### Note

*Bilinear scaling is an example of a relatively fast, lower-quality image-smoothing algorithm. Bicubic or Lanczos scaling are examples of image-smoothing algorithms that produce higher-quality output. This specification does not mandate that specific interpolation algorithms be used.*

#### 4.12.5.1.1 Implementation notes § p63

*This section is non-normative.*

The [output bitmap](#)<sup>p636</sup>, when it is not directly displayed by the user agent, implementations can, instead of updating this bitmap, merely remember the sequence of drawing operations that have been applied to it until such time as the bitmap's actual data is needed (for example because of a call to [drawImage\(\)](#)<sup>p666</sup>, or the [createImageBitmap\(\)](#)<sup>p972</sup> factory method). In many cases, this will be more memory efficient.

The bitmap of a [canvas](#)<sup>p627</sup> element is the one bitmap that's pretty much always going to be needed in practice. The [output bitmap](#)<sup>p636</sup> of a rendering context, when it has one, is always just an alias to a [canvas](#)<sup>p627</sup> element's bitmap.

Additional bitmaps are sometimes needed, e.g. to enable fast drawing when the canvas is being painted at a different size than its [intrinsic size](#), or to enable double buffering so that graphics updates, like page scrolling for example, can be processed concurrently while canvas draw commands are being executed.

#### 4.12.5.1.2 The canvas state § p63

Objects that implement the [CanvasState](#)<sup>p632</sup> interface maintain a stack of drawing states. **Drawing states** consist of:

- The current [transformation matrix](#)<sup>p652</sup>.
- The current [clipping region](#)<sup>p663</sup>.
- The current values of the following attributes: [strokeStyle](#)<sup>p656</sup>, [fillStyle](#)<sup>p656</sup>, [globalAlpha](#)<sup>p672</sup>, [lineWidth](#)<sup>p640</sup>, [lineCap](#)<sup>p640</sup>, [lineJoin](#)<sup>p640</sup>, [miterLimit](#)<sup>p640</sup>, [lineDashOffset](#)<sup>p640</sup>, [shadowOffsetX](#)<sup>p673</sup>, [shadowOffsetY](#)<sup>p673</sup>, [shadowBlur](#)<sup>p673</sup>, [shadowColor](#)<sup>p673</sup>, [filter](#)<sup>p674</sup>, [globalCompositeOperation](#)<sup>p672</sup>, [font](#)<sup>p644</sup>, [textAlign](#)<sup>p645</sup>, [textBaseline](#)<sup>p645</sup>, [direction](#)<sup>p645</sup>, [imageSmoothingEnabled](#)<sup>p673</sup>, [imageSmoothingQuality](#)<sup>p673</sup>.
- The current [dash list](#)<sup>p640</sup>.

#### Note

*The [current default path](#)<sup>p662</sup> and the rendering context's bitmaps are not part of the drawing state. The [current default path](#)<sup>p662</sup> is persistent, and can only be reset using the [beginPath\(\)](#)<sup>p663</sup> method. The bitmaps depend on whether and how the rendering*

context is bound to a [canvas<sup>p627</sup>](#) element.

For web developers (non-normative)

**context . save<sup>p639</sup> ()**

Pushes the current state onto the stack.

**context . restore<sup>p639</sup> ()**

Pops the top state on the stack, restoring the context to that state.

The **save ()** method, when invoked, must push a copy of the current drawing state onto the drawing state stack. ✓ MDN

The **restore ()** method, when invoked, must pop the top entry in the drawing state stack, and reset the drawing state it describes. If there is no saved state, then the method must do nothing. N

When the user agent is to **reset the rendering context to its default state**, it must clear the drawing state stack and everything that [drawing state<sup>p638</sup>](#) consists of to initial values.

#### 4.12.5.1.3 Line styles §<sup>p63</sup> 9

For web developers (non-normative)

**context . lineWidth<sup>p640</sup> [ = value ]**

**styles . lineWidth<sup>p640</sup> [ = value ]**

Returns the current line width.

Can be set, to change the line width. Values that are not finite values greater than zero are ignored.

**context . lineCap<sup>p640</sup> [ = value ]**

**styles . lineCap<sup>p640</sup> [ = value ]**

Returns the current line cap style.

Can be set, to change the line cap style.

The possible line cap styles are "butt", "round", and "square". Other values are ignored.

**context . lineJoin<sup>p640</sup> [ = value ]**

**styles . lineJoin<sup>p640</sup> [ = value ]**

Returns the current line join style.

Can be set, to change the line join style.

The possible line join styles are "bevel", "round", and "miter". Other values are ignored.

**context . miterLimit<sup>p640</sup> [ = value ]**

**styles . miterLimit<sup>p640</sup> [ = value ]**

Returns the current miter limit ratio.

Can be set, to change the miter limit ratio. Values that are not finite values greater than zero are ignored.

**context . setLineDash<sup>p640</sup> (segments)**

**styles . setLineDash<sup>p640</sup> (segments)**

Sets the current line dash pattern (as used when stroking). The argument is a list of distances for which to alternately have the line on and the line off.

**segments = context . getLineDash<sup>p640</sup> ()**

**segments = styles . getLineDash<sup>p640</sup> ()**

Returns a copy of the current line dash pattern. The array returned will always have an even number of entries (i.e. the pattern is normalized).

**context . lineDashOffset<sup>p640</sup>**

**styles . lineDashOffset<sup>p640</sup>**

Returns the phase offset (in the same units as the line dash pattern).

Can be set, to change the phase offset. Values that are not finite values are ignored.

Objects that implement the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface have attributes and methods (defined in this section) that control how lines are treated by the object.

The **lineWidth** attribute gives the width of lines, in coordinate space units. On getting, it must return the current value. On setting, zero, negative, infinite, and NaN values must be ignored, leaving the value unchanged; other values must change the current value to the new value.

When the object implementing the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface is created, the [lineWidth](#)<sup>p640</sup> attribute must initially have the value 1.0.

The **lineCap** attribute defines the type of endings that UAs will place on the end of lines. The three valid values are "butt", "round", and "square".

On getting, it must return the current value. On setting, the current value must be changed to the new value.

When the object implementing the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface is created, the [lineCap](#)<sup>p640</sup> attribute must initially have the value "butt".

The **lineJoin** attribute defines the type of corners that UAs will place where two lines meet. The three valid values are "bevel", "round", and "miter".

On getting, it must return the current value. On setting, the current value must be changed to the new value.

When the object implementing the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface is created, the [lineJoin](#)<sup>p640</sup> attribute must initially have the value "miter".

When the [lineJoin](#)<sup>p640</sup> attribute has the value "miter", strokes use the miter limit ratio to decide how to render joins. The miter limit ratio can be explicitly set using the **miterLimit** attribute. On getting, it must return the current value. On setting, zero, negative, infinite, and NaN values must be ignored, leaving the value unchanged; other values must change the current value to the new value.

When the object implementing the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface is created, the [miterLimit](#)<sup>p640</sup> attribute must initially have the value 10.0.

Each [CanvasPathDrawingStyles](#)<sup>p634</sup> object has a **dash list**, which is either empty or consists of an even number of non-negative numbers. Initially, the [dash list](#)<sup>p640</sup> must be empty.

The **setLineDash()** method, when invoked, must run these steps:

1. Let *a* be the argument.
2. If any value in *a* is not finite (e.g. an Infinity or a NaN value), or if any value is negative (less than zero), then return (without throwing an exception; user agents could show a message on a developer console, though, as that would be helpful for debugging).
3. If the number of elements in *a* is odd, then let *a* be the concatenation of two copies of *a*.
4. Let the object's [dash list](#)<sup>p640</sup> be *a*.

When the **getLineDash()** method is invoked, it must return a sequence whose values are the values of the object's [dash list](#)<sup>p640</sup>, in the same order.

It is sometimes useful to change the "phase" of the dash pattern, e.g. to achieve a "marching ants" effect. The phase can be set using the **lineDashOffset** attribute. On getting, it must return the current value. On setting, infinite and NaN values must be ignored, leaving the value unchanged; other values must change the current value to the new value.

When the object implementing the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface is created, the [lineDashOffset](#)<sup>p640</sup> attribute must initially have the value 0.0.

When a user agent is to **trace a path**, given an object *style* that implements the [CanvasPathDrawingStyles](#)<sup>p634</sup> interface, it must run the following algorithm. This algorithm returns a new [path](#)<sup>p647</sup>.

1. Let *path* be a copy of the path being traced.
2. Prune all zero-length [line segments](#)<sup>p647</sup> from *path*.
3. Remove from *path* any subpaths containing no lines (i.e. subpaths with just one point).
4. Replace each point in each subpath of *path* other than the first point and the last point of each subpath by a *join* that joins the line leading to that point to the line leading out of that point, such that the subpaths all consist of two points (a starting point with a line leading out of it, and an ending point with a line leading into it), one or more lines (connecting the points and the joins), and zero or more joins (each connecting one line to another), connected together such that each subpath is a series of one or more lines with a join between each one and a point on each end.
5. Add a straight closing line to each closed subpath in *path* connecting the last point and the first point of that subpath; change the last point to a join (from the previously last line to the newly added closing line), and change the first point to a join (from the newly added closing line to the first line).
6. If *style*'s [dash list](#)<sup>p640</sup> is empty, then jump to the step labeled *convert*.
7. Let *pattern width* be the concatenation of all the entries of *style*'s [dash list](#)<sup>p640</sup>, in coordinate space units.
8. For each subpath *subpath* in *path*, run the following substeps. These substeps mutate the subpaths in *path in vivo*.
  1. Let *subpath width* be the length of all the lines of *subpath*, in coordinate space units.
  2. Let *offset* be the value of *style*'s [lineDashOffset](#)<sup>p640</sup>, in coordinate space units.
  3. While *offset* is greater than *pattern width*, decrement it by *pattern width*.  
While *offset* is less than zero, increment it by *pattern width*.
  4. Define *L* to be a linear coordinate line defined along all lines in *subpath*, such that the start of the first line in the subpath is defined as coordinate 0, and the end of the last line in the subpath is defined as coordinate *subpath width*.
  5. Let *position* be zero minus *offset*.
  6. Let *index* be 0.
  7. Let *current state* be *off* (the other states being *on* and *zero-on*).
  8. *Dash on*: Let *segment length* be the value of *style*'s [dash list](#)<sup>p640</sup>'s *index*th entry.
  9. Increment *position* by *segment length*.
  10. If *position* is greater than *subpath width*, then end these substeps for this subpath and start them again for the next subpath; if there are no more subpaths, then jump to the step labeled *convert* instead.
  11. If *segment length* is nonzero, then let *current state* be *on*.
  12. Increment *index* by one.
  13. *Dash off*: Let *segment length* be the value of *style*'s [dash list](#)<sup>p640</sup>'s *index*th entry.
  14. Let *start* be the offset *position* on *L*.
  15. Increment *position* by *segment length*.
  16. If *position* is less than zero, then jump to the step labeled *post-cut*.
  17. If *start* is less than zero, then let *start* be zero.
  18. If *position* is greater than *subpath width*, then let *end* be the offset *subpath width* on *L*. Otherwise, let *end* be the offset *position* on *L*.
  19. Jump to the first appropriate step:
    - ↪ **If *segment length* is zero and *current state* is *off***  
Do nothing, just continue to the next step.
    - ↪ **If *current state* is *off***  
Cut the line on which *end* finds itself short at *end* and place a point there, cutting in two the subpath that it

was in; remove all line segments, joins, points, and subpaths that are between *start* and *end*; and finally place a single point at *start* with no lines connecting to it.

The point has a *directionality* for the purposes of drawing line caps (see below). The directionality is the direction that the original line had at that point (i.e. when *L* was defined above).

↪ **Otherwise**

Cut the line on which *start* finds itself into two at *start* and place a point there, cutting in two the subpath that it was in, and similarly cut the line on which *end* finds itself short at *end* and place a point there, cutting in two the subpath that it was in, and then remove all line segments, joins, points, and subpaths that are between *start* and *end*.

If *start* and *end* are the same point, then this results in just the line being cut in two and two points being inserted there, with nothing being removed, unless a join also happens to be at that point, in which case the join must be removed.

20. *Post-cut*: If *position* is greater than *subpath width*, then jump to the step labeled *convert*.
21. If *segment length* is greater than zero, then let *positioned-at-on-dash* be false.
22. Increment *index* by one. If it is equal to the number of entries in *style's dash list*<sup>p640</sup>, then let *index* be 0.
23. Return to the step labeled *dash on*.

9. *Convert*: This is the step that converts the path to a new path that represents its stroke.

Create a new [path](#)<sup>p647</sup> that describes the edge of the areas that would be covered if a straight line of length equal to *style's LineWidth*<sup>p649</sup> was swept along each subpath in *path* while being kept at an angle such that the line is orthogonal to the path being swept, replacing each point with the end cap necessary to satisfy *style's LineCap*<sup>p649</sup> attribute as described previously and elaborated below, and replacing each join with the join necessary to satisfy *style's LineJoin*<sup>p649</sup> type, as defined below.

**Caps**: Each point has a flat edge perpendicular to the direction of the line coming out of it. This is then augmented according to the value of *style's LineCap*<sup>p649</sup>. The "butt" value means that no additional line cap is added. The "round" value means that a semi-circle with the diameter equal to *style's LineWidth*<sup>p649</sup> width must additionally be placed on to the line coming out of each point. The "square" value means that a rectangle with the length of *style's LineWidth*<sup>p649</sup> width and the width of half *style's LineWidth*<sup>p649</sup> width, placed flat against the edge perpendicular to the direction of the line coming out of the point, must be added at each point.

Points with no lines coming out of them must have two caps placed back-to-back as if it was really two points connected to each other by an infinitesimally short straight line in the direction of the point's *directionality* (as defined above).

**Joins**: In addition to the point where a join occurs, two additional points are relevant to each join, one for each line: the two corners found half the line width away from the join point, one perpendicular to each line, each on the side furthest from the other line.

A triangle connecting these two opposite corners with a straight line, with the third point of the triangle being the join point, must be added at all joins. The [LineJoin](#)<sup>p649</sup> attribute controls whether anything else is rendered. The three aforementioned values have the following meanings:

The "bevel" value means that this is all that is rendered at joins.

The "round" value means that an arc connecting the two aforementioned corners of the join, abutting (and not overlapping) the aforementioned triangle, with the diameter equal to the line width and the origin at the point of the join, must be added at joins.

The "miter" value means that a second triangle must (if it can given the miter length) be added at the join, with one line being the line between the two aforementioned corners, abutting the first triangle, and the other two being continuations of the outside edges of the two joining lines, as long as required to intersect without going over the miter length.

The miter length is the distance from the point where the join occurs to the intersection of the line edges on the outside of the join. The miter limit ratio is the maximum allowed ratio of the miter length to half the line width. If the miter length would cause the miter limit ratio (as set by *style's miterLimit*<sup>p649</sup> attribute) to be exceeded, then this second triangle must not be added.

The subpaths in the newly created path must be oriented such that for any point, the number of times a half-infinite straight line drawn from that point crosses a subpath is even if and only if the number of times a half-infinite straight line drawn from that same point crosses a subpath going in one direction is equal to the number of times it crosses a subpath going in the

other direction.

10. Return the newly created path.

#### 4.12.5.1.4 Text styles <sup>§ p64</sup><sub>3</sub>

For web developers (non-normative)

**context . font**<sup>p644</sup> [ = value ]

**styles . font**<sup>p644</sup> [ = value ]

Returns the current font settings.

Can be set, to change the font. The syntax is the same as for the CSS `font` property; values that cannot be parsed as CSS font values are ignored.

Relative keywords and lengths are computed relative to the font of the `canvas`<sup>p627</sup> element.

**context . textAlign**<sup>p645</sup> [ = value ]

**styles . textAlign**<sup>p645</sup> [ = value ]

Returns the current text alignment settings.

Can be set, to change the alignment. The possible values are and their meanings are given below. Other values are ignored. The default is "start".

**context . textBaseline**<sup>p645</sup> [ = value ]

**styles . textBaseline**<sup>p645</sup> [ = value ]

Returns the current baseline alignment settings.

Can be set, to change the baseline alignment. The possible values and their meanings are given below. Other values are ignored. The default is "alphabetic"<sup>p646</sup>.

**context . direction**<sup>p645</sup> [ = value ]

**styles . direction**<sup>p645</sup> [ = value ]

Returns the current directionality.

Can be set, to change the directionality. The possible values and their meanings are given below. Other values are ignored. The default is "inherit"<sup>p646</sup>.

Objects that implement the `CanvasTextDrawingStyles`<sup>p634</sup> interface have attributes (defined in this section) that control how text is laid out (rasterized or outlined) by the object. Such objects can also have a **font style source object**. For `CanvasRenderingContext2D`<sup>p632</sup> objects, this is the `canvas`<sup>p627</sup> element given by the value of the context's `canvas`<sup>p637</sup> attribute. For `OffscreenCanvasRenderingContext2D`<sup>p686</sup> objects, this is the `associated OffscreenCanvas object`<sup>p686</sup>.

Font resolution for the `font style source object`<sup>p643</sup> requires a `font source`. This is determined for a given *object* implementing `CanvasTextDrawingStyles`<sup>p634</sup> by the following steps: `[CSSFONTLOAD]`<sup>p1265</sup>

1. If *object*'s `font style source object`<sup>p643</sup> is a `canvas`<sup>p627</sup> element, return the element's `node document`.
2. Otherwise, *object*'s `font style source object`<sup>p643</sup> is an `OffscreenCanvas`<sup>p682</sup> object:
  1. Let *global* be *object*'s `relevant global object`<sup>p913</sup>.
  2. If *global* is a `Window`<sup>p816</sup> object, then return *global*'s `associated Document`<sup>p818</sup>.
  3. Assert: *global* implements `WorkerGlobalScope`<sup>p1024</sup>.
  4. Return *global*.

#### Example

This is an example of font resolution with a regular `canvas`<sup>p627</sup> element with ID `c1`.

```
const font = new FontFace("MyCanvasFont", "url(mycanvasfont.ttf)");
documents.fonts.add(font);
```

```
const context = document.getElementById("c1").getContext("2d");
document.fonts.ready.then(function() {
  context.font = "64px MyCanvasFont";
  context.fillText("hello", 0, 0);
});
```

In this example, the canvas will display text using `mycanvasfont.ttf` as its font.

### Example

This is an example of how font resolution can happen using [OffscreenCanvas](#)<sup>p682</sup>. Assuming a [canvas](#)<sup>p627</sup> element with ID `c2` which is transferred to a worker like so:

```
const offscreenCanvas = document.getElementById("c2").transferControlToOffscreen();
worker.postMessage(offscreenCanvas, [offscreenCanvas]);
```

Then, in the worker:

```
self.onmessage = function(ev) {
  const transferredCanvas = ev.data;
  const context = transferredCanvas.getContext("2d");
  const font = new FontFace("MyFont", "url(myfont.ttf)");
  self.fonts.add(font);
  self.fonts.ready.then(function() {
    context.font = "64px MyFont";
    context.fillText("hello", 0, 0);
  });
};
```

In this example, the canvas will display a text using `myfont.ttf`. Notice that the font is only loaded inside the worker, and not in the document context.

The **font** IDL attribute, on setting, must be [parsed as a CSS <'font'> value](#) (but without supporting property-independent style sheet syntax like 'inherit'), and the resulting font must be assigned to the context, with the **'line-height'** component forced to 'normal', with the **'font-size'** component converted to [CSS pixels](#), and with system fonts being computed to explicit values. If the new value is syntactically incorrect (including using property-independent style sheet syntax like 'inherit' or 'initial'), then it must be ignored, without assigning a new font value. [\[CSS\]](#)<sup>p1264</sup>

Font family names must be interpreted in the context of the [font style source object](#)<sup>p643</sup> when the font is to be used; any fonts embedded using `@font-face` or loaded using [FontFace](#)<sup>p69</sup> objects that are visible to the [font style source object](#)<sup>p643</sup> must therefore be available once they are loaded. (Each [font style source object](#)<sup>p643</sup> has a [font source](#), which determines what fonts are available.) If a font is used before it is fully loaded, or if the [font style source object](#)<sup>p643</sup> does not have that font in scope at the time the font is to be used, then it must be treated as if it was an unknown font, falling back to another as described by the relevant CSS specifications. [\[CSSFONTS\]](#)<sup>p1265</sup> [\[CSSFONTLOAD\]](#)<sup>p1265</sup>

On getting, the [font](#)<sup>p644</sup> attribute must return the [serialized form](#) of the current font of the context (with no **'line-height'** component). [\[CSSOM\]](#)<sup>p1265</sup>

### Example

For example, after the following statement:

```
context.font = 'italic 400 12px/2 Unknown Font, sans-serif';
```

...the expression `context.font` would evaluate to the string `"italic 12px "Unknown Font", sans-serif"`. The "400" font-weight doesn't appear because that is the default value. The line-height doesn't appear because it is forced to "normal", the default value.

When the object implementing the [CanvasTextDrawingStyles](#)<sup>p634</sup> interface is created, the font of the context must be set to 10px sans-serif. When the **'font-size'** component is set to lengths using percentages, **'em'** or **'ex'** units, or the **'larger'** or **'smaller'** keywords, these must be interpreted relative to the [computed value](#) of the **'font-size'** property of the [font style source object](#)<sup>p643</sup> at the time that

the attribute is set, if it is an element. When the 'font-weight' component is set to the relative values 'bolder' and 'lighter', these must be interpreted relative to the [computed value](#) of the 'font-weight' property of the [font style source object](#)<sup>p643</sup> at the time that the attribute is set, if it is an element. If the [computed values](#) are undefined for a particular case (e.g. because the [font style source object](#)<sup>p643</sup> is not an element or is not [being rendered](#)<sup>p1172</sup>), then the relative keywords must be interpreted relative to the normal-weight 10px sans-serif default.

The **textAlign** IDL attribute, on getting, must return the current value. On setting, the current value must be changed to the new value. When the object implementing the [CanvasTextDrawingStyles](#)<sup>p634</sup> interface is created, the [textAlign](#)<sup>p645</sup> attribute must initially have the value [start](#)<sup>p645</sup>.

The **textBaseline** IDL attribute, on getting, must return the current value. On setting, the current value must be changed to the new value. When the object implementing the [CanvasTextDrawingStyles](#)<sup>p634</sup> interface is created, the [textBaseline](#)<sup>p645</sup> attribute must initially have the value [alphabetic](#)<sup>p646</sup>.

The **direction** IDL attribute, on getting, must return the current value. On setting, the current value must be changed to the new value. When the object implementing the [CanvasTextDrawingStyles](#)<sup>p634</sup> interface is created, the [direction](#)<sup>p645</sup> attribute must initially have the value [inherit](#)<sup>p646</sup>.

The [textAlign](#)<sup>p645</sup> attribute's allowed keywords are as follows:

**start**

Align to the start edge of the text (left side in left-to-right text, right side in right-to-left text).

**end**

Align to the end edge of the text (right side in left-to-right text, left side in right-to-left text).

**left**

Align to the left.

**right**

Align to the right.

**center**

Align to the center.

The [textBaseline](#)<sup>p645</sup> attribute's allowed keywords correspond to alignment points in the font:

The keywords map to these alignment points as follows:

**top**

The top of the em square

### hanging

The hanging baseline

### middle

The middle of the em square

### alphabetic

The alphabetic baseline

### ideographic

The ideographic baseline

### bottom

The bottom of the em square

The [direction](#)<sup>p645</sup> attribute's allowed keywords are as follows:

### ltr

Treat input to the [text preparation algorithm](#)<sup>p646</sup> as left-to-right text.

### rtl

Treat input to the [text preparation algorithm](#)<sup>p646</sup> as right-to-left text.

### inherit

Default to the directionality of the [canvas](#)<sup>p627</sup> element or [Document](#)<sup>p111</sup> as appropriate.

The **text preparation algorithm** is as follows. It takes as input a string *text*, a [CanvasTextDrawingStyles](#)<sup>p634</sup> object *target*, and an optional length *maxWidth*. It returns an array of glyph shapes, each positioned on a common coordinate space, a *physical alignment* whose value is one of *left*, *right*, and *center*, and an [inline box](#). (Most callers of this algorithm ignore the *physical alignment* and the [inline box](#).)

1. If *maxWidth* was provided but is less than or equal to zero or equal to NaN, then return an empty array.
2. Replace all [ASCII whitespace](#) in *text* with U+0020 SPACE characters.
3. Let *font* be the current font of *target*, as given by that object's [font](#)<sup>p644</sup> attribute.
4. Apply the appropriate step from the following list to determine the value of *direction*:
  - ↪ **If the *target* object's [direction](#)<sup>p645</sup> attribute has the value "[ltr](#)<sup>p646</sup>"**  
Let *direction* be '[ltr](#)<sup>p139</sup>'.
  - ↪ **If the *target* object's [direction](#)<sup>p645</sup> attribute has the value "[rtl](#)<sup>p646</sup>"**  
Let *direction* be '[rtl](#)<sup>p139</sup>'.
  - ↪ **If the *target* object's [font style source object](#)<sup>p643</sup> is an element**  
Let *direction* be [the directionality](#)<sup>p139</sup> of the *target* object's [font style source object](#)<sup>p643</sup>.
  - ↪ **If the *target* object's [font style source object](#)<sup>p643</sup> is a [Document](#)<sup>p111</sup> with a non-null [document element](#)**  
Let *direction* be [the directionality](#)<sup>p139</sup> of the *target* object's [font style source object](#)<sup>p643</sup>'s [document element](#).
  - ↪ **Otherwise**  
Let *direction* be '[ltr](#)<sup>p139</sup>'.
5. Form a hypothetical infinitely-wide CSS [line box](#) containing a single [inline box](#) containing the text *text*, with all the properties at their initial values except the '[font](#)' property of the [inline box](#) set to *font*, the '[direction](#)' property of the [inline box](#) set to *direction*, and the '[white-space](#)' property set to 'pre'. [\[CSS\]](#)<sup>p1264</sup>
6. If *maxWidth* was provided and the hypothetical width of the [inline box](#) in the hypothetical [line box](#) is greater than *maxWidth* [CSS pixels](#), then change *font* to have a more condensed font (if one is available or if a reasonably readable one can be synthesized by applying a horizontal scale factor to the font) or a smaller font, and return to the previous step.
7. The *anchor point* is a point on the [inline box](#), and the *physical alignment* is one of the values *left*, *right*, and *center*. These variables are determined by the [textAlign](#)<sup>p645</sup> and [textBaseline](#)<sup>p645</sup> values as follows:

Horizontal position:

If `textAlign`<sup>p645</sup> is `left`<sup>p645</sup>

If `textAlign`<sup>p645</sup> is `start`<sup>p645</sup> and `direction` is `'ltr'`

If `textAlign`<sup>p645</sup> is `end`<sup>p645</sup> and `direction` is `'rtl'`

Let the *anchor point*'s horizontal position be the left edge of the [inline box](#), and let *physical alignment* be *left*.

If `textAlign`<sup>p645</sup> is `right`<sup>p645</sup>

If `textAlign`<sup>p645</sup> is `end`<sup>p645</sup> and `direction` is `'ltr'`

If `textAlign`<sup>p645</sup> is `start`<sup>p645</sup> and `direction` is `'rtl'`

Let the *anchor point*'s horizontal position be the right edge of the [inline box](#), and let *physical alignment* be *right*.

If `textAlign`<sup>p645</sup> is `center`<sup>p645</sup>

Let the *anchor point*'s horizontal position be half way between the left and right edges of the [inline box](#), and let *physical alignment* be *center*.

Vertical position:

If `textBaseline`<sup>p645</sup> is `top`<sup>p645</sup>

Let the *anchor point*'s vertical position be the top of the em box of the first available font of the [inline box](#).

If `textBaseline`<sup>p645</sup> is `hanging`<sup>p646</sup>

Let the *anchor point*'s vertical position be the hanging baseline of the first available font of the [inline box](#).

If `textBaseline`<sup>p645</sup> is `middle`<sup>p646</sup>

Let the *anchor point*'s vertical position be half way between the bottom and the top of the em box of the first available font of the [inline box](#).

If `textBaseline`<sup>p645</sup> is `alphabetic`<sup>p646</sup>

Let the *anchor point*'s vertical position be the alphabetic baseline of the first available font of the [inline box](#).

If `textBaseline`<sup>p645</sup> is `ideographic`<sup>p646</sup>

Let the *anchor point*'s vertical position be the ideographic baseline of the first available font of the [inline box](#).

If `textBaseline`<sup>p645</sup> is `bottom`<sup>p646</sup>

Let the *anchor point*'s vertical position be the bottom of the em box of the first available font of the [inline box](#).

- Let *result* be an array constructed by iterating over each glyph in the [inline box](#) from left to right (if any), adding to the array, for each glyph, the shape of the glyph as it is in the [inline box](#), positioned on a coordinate space using [CSS pixels](#) with its origin is at the *anchor point*.
- Return *result*, *physical alignment*, and the inline box.

#### 4.12.5.1.5 Building paths §<sup>p64</sup><sub>7</sub>

Objects that implement the [CanvasPath](#)<sup>p634</sup> interface have a [path](#)<sup>p647</sup>. A **path** has a list of zero or more subpaths. Each subpath consists of a list of one or more points, connected by straight or curved **line segments**, and a flag indicating whether the subpath is closed or not. A closed subpath is one where the last point of the subpath is connected to the first point of the subpath by a straight line. Subpaths with only one point are ignored when painting the path.

[Paths](#)<sup>p647</sup> have a **need new subpath** flag. When this flag is set, certain APIs create a new subpath rather than extending the previous one. When a [path](#)<sup>p647</sup> is created, its [need new subpath](#)<sup>p647</sup> flag must be set.

When an object implementing the [CanvasPath](#)<sup>p634</sup> interface is created, its [path](#)<sup>p647</sup> must be initialized to zero subpaths.

For web developers (non-normative)

**`context . moveTo`**<sup>p650</sup>(*x*, *y*)

**`path . moveTo`**<sup>p650</sup>(*x*, *y*)

Creates a new subpath with the given point.

**`context . closePath`**<sup>p650</sup>()

**`path . closePath`**<sup>p650</sup>()

Marks the current subpath as closed, and starts a new subpath with a point the same as the start and end of the newly closed subpath.

**context . moveTo<sup>p650</sup>(x, y)**

**path . moveTo<sup>p650</sup>(x, y)**

Adds the given point to the current subpath, connected to the previous one by a straight line.

**context . quadraticCurveTo<sup>p650</sup>(cp<sub>x</sub>, cp<sub>y</sub>, x, y)**

**path . quadraticCurveTo<sup>p650</sup>(cp<sub>x</sub>, cp<sub>y</sub>, x, y)**

Adds the given point to the current subpath, connected to the previous one by a quadratic Bézier curve with the given control point.

**context . bezierCurveTo<sup>p650</sup>(cp<sub>1x</sub>, cp<sub>1y</sub>, cp<sub>2x</sub>, cp<sub>2y</sub>, x, y)**

**path . bezierCurveTo<sup>p650</sup>(cp<sub>1x</sub>, cp<sub>1y</sub>, cp<sub>2x</sub>, cp<sub>2y</sub>, x, y)**

Adds the given point to the current subpath, connected to the previous one by a cubic Bézier curve with the given control points.

**context . arcTo<sup>p650</sup>(x<sub>1</sub>, y<sub>1</sub>, x<sub>2</sub>, y<sub>2</sub>, radius)**

**path . arcTo<sup>p650</sup>(x<sub>1</sub>, y<sub>1</sub>, x<sub>2</sub>, y<sub>2</sub>, radius)**

Adds an arc with the given control points and radius to the current subpath, connected to the previous point by a straight line.

Throws an ["IndexSizeError" DOMException](#) if the given radius is negative.

**context . arc<sup>p651</sup>(x, y, radius, startAngle, endAngle [, anticlockwise ] )**

**path . arc<sup>p651</sup>(x, y, radius, startAngle, endAngle [, anticlockwise ] )**

Adds points to the subpath such that the arc described by the circumference of the circle described by the arguments, starting at the given start angle and ending at the given end angle, going in the given direction (defaulting to clockwise), is added to the path, connected to the previous point by a straight line.

Throws an ["IndexSizeError" DOMException](#) if the given radius is negative.

**context . ellipse<sup>p651</sup>(x, y, radiusX, radiusY, rotation, startAngle, endAngle [, anticlockwise] )**

**path . ellipse<sup>p651</sup>(x, y, radiusX, radiusY, rotation, startAngle, endAngle [, anticlockwise] )**

Adds points to the subpath such that the arc described by the circumference of the ellipse described by the arguments, starting at the given start angle and ending at the given end angle, going in the given direction (defaulting to clockwise), is added to the path, connected to the previous point by a straight line.

Throws an ["IndexSizeError" DOMException](#) if the given radius is negative.

**context . rect<sup>p651</sup>(x, y, w, h)**

**path . rect<sup>p651</sup>(x, y, w, h)**

Adds a new closed subpath to the path, representing the given rectangle.

The following methods allow authors to manipulate the [paths<sup>p647</sup>](#) of objects implementing the [CanvasPath<sup>p634</sup>](#) interface.

For objects implementing the [CanvasDrawPath<sup>p633</sup>](#) and [CanvasTransform<sup>p632</sup>](#) interfaces, the points passed to the methods, and the resulting lines added to [current default path<sup>p662</sup>](#) by these methods, must be transformed according to the [current transformation](#)

[matrix](#)<sup>p652</sup> before being added to the path.

The `moveTo(x, y)` method, when invoked, must run these steps:

✓ MDN

1. If either of the arguments are infinite or NaN, then return.
2. Create a new subpath with the specified point as its first (and only) point.

When the user agent is to **ensure there is a subpath** for a coordinate (x, y) on a [path](#)<sup>p647</sup>, the user agent must check to see if the [path](#)<sup>p647</sup> has its [need new subpath](#)<sup>p647</sup> flag set. If it does, then the user agent must create a new subpath with the point (x, y) as its first (and only) point, as if the [moveTo\(\)](#)<sup>p650</sup> method had been called, and must then unset the [path](#)<sup>p647</sup>'s [need new subpath](#)<sup>p647</sup> flag.

The `closePath()` method, when invoked, must do nothing if the object's path has no subpaths. Otherwise, it must mark the last subpath as closed, create a new subpath whose first point is the same as the previous subpath's first point, and finally add this new subpath to the path.

✓ MDN

#### Note

*If the last subpath had more than one point in its list of points, then this is equivalent to adding a straight line connecting the last point back to the first point of the last subpath, thus "closing" the subpath.*

New points and the lines connecting them are added to subpaths using the methods described below. In all cases, the methods only modify the last subpath in the object's path.

The `lineTo(x, y)` method, when invoked, must run these steps:

✓ MDN

1. If either of the arguments are infinite or NaN, then return.
2. If the object's path has no subpaths, then [ensure there is a subpath](#)<sup>p650</sup> for (x, y).
3. Otherwise, connect the last point in the subpath to the given point (x, y) using a straight line, and then add the given point (x, y) to the subpath.

The `quadraticCurveTo(cpx, cpy, x, y)` method, when invoked, must run these steps:

✓ MDN

1. If any of the arguments are infinite or NaN, then return.
2. [Ensure there is a subpath](#)<sup>p650</sup> for (cpx, cpy)
3. Connect the last point in the subpath to the given point (x, y) using a quadratic Bézier curve with control point (cpx, cpy). [\[BEZIER\]](#)<sup>p1264</sup>
4. Add the given point (x, y) to the subpath.

The `bezierCurveTo(cp1x, cp1y, cp2x, cp2y, x, y)` method, when invoked, must run these steps:

✓ MDN

1. If any of the arguments are infinite or NaN, then return.
2. [Ensure there is a subpath](#)<sup>p650</sup> for (cp1x, cp1y).
3. Connect the last point in the subpath to the given point (x, y) using a cubic Bézier curve with control points (cp1x, cp1y) and (cp2x, cp2y). [\[BEZIER\]](#)<sup>p1264</sup>
4. Add the point (x, y) to the subpath.

The `arcTo(x1, y1, x2, y2, radius)` method, when invoked, must run these steps:

✓ MDN

1. If any of the arguments are infinite or NaN, then return.
2. [Ensure there is a subpath](#)<sup>p650</sup> for (x1, y1).
3. If *radius* is negative, then throw an `"IndexSizeError" DOMException`.
4. Let the point (x0, y0) be the last point in the subpath, transformed by the inverse of the [current transformation matrix](#)<sup>p652</sup> (so that it is in the same coordinate system as the points passed to the method).

5. If the point  $(x_0, y_0)$  is equal to the point  $(x_1, y_1)$ , or if the point  $(x_1, y_1)$  is equal to the point  $(x_2, y_2)$ , or if *radius* is zero, then add the point  $(x_1, y_1)$  to the subpath, and connect that point to the previous point  $(x_0, y_0)$  by a straight line.
6. Otherwise, if the points  $(x_0, y_0)$ ,  $(x_1, y_1)$ , and  $(x_2, y_2)$  all lie on a single straight line, then add the point  $(x_1, y_1)$  to the subpath, and connect that point to the previous point  $(x_0, y_0)$  by a straight line.
7. Otherwise, let *The Arc* be the shortest arc given by circumference of the circle that has radius *radius*, and that has one point tangent to the half-infinite line that crosses the point  $(x_0, y_0)$  and ends at the point  $(x_1, y_1)$ , and that has a different point tangent to the half-infinite line that ends at the point  $(x_1, y_1)$  and crosses the point  $(x_2, y_2)$ . The points at which this circle touches these two lines are called the start and end tangent points respectively. Connect the point  $(x_0, y_0)$  to the start tangent point by a straight line, adding the start tangent point to the subpath, and then connect the start tangent point to the end tangent point by *The Arc*, adding the end tangent point to the subpath.

The **`arc(x, y, radius, startAngle, endAngle, anticlockwise)`** method, when invoked, must run the [ellipse method steps](#)<sup>p651</sup> with this, *x*, *y*, *radius*, *radius*, 0, *startAngle*, *endAngle*, and *anticlockwise*.

#### Note

This makes it equivalent to [`ellipse\(\)`](#)<sup>p651</sup> except that both radii are equal and rotation is 0.

The **`ellipse(x, y, radiusX, radiusY, rotation, startAngle, endAngle, anticlockwise)`** method, when invoked, must run the [ellipse method steps](#)<sup>p651</sup> with this, *x*, *y*, *radiusX*, *radiusY*, *rotation*, *startAngle*, *endAngle*, and *anticlockwise*.

The **ellipse method steps**, given *canvasPath*, *x*, *y*, *radiusX*, *radiusY*, *rotation*, *startAngle*, *endAngle*, and *anticlockwise*, are:

1. If any of the arguments are infinite or NaN, then return.
2. If either *radiusX* or *radiusY* are negative, then throw an `"IndexSizeError" DOMException`.
3. If *canvasPath*'s path has any subpaths, then add a straight line from the last point in the subpath to the start point of the arc.
4. Add the start and end points of the arc to the subpath, and connect them with an arc. The arc and its start and end points are defined as follows:

Consider an ellipse that has its origin at  $(x, y)$ , that has a major-axis radius *radiusX* and a minor-axis radius *radiusY*, and that is rotated about its origin such that its semi-major axis is inclined *rotation* radians clockwise from the x-axis.

If *anticlockwise* is false and *endAngle*-*startAngle* is equal to or greater than  $2\pi$ , or, if *anticlockwise* is true and *startAngle*-*endAngle* is equal to or greater than  $2\pi$ , then the arc is the whole circumference of this ellipse, and the point at *startAngle* along this circle's circumference, measured in radians clockwise from the ellipse's semi-major axis, acts as both the start point and the end point.

Otherwise, the points at *startAngle* and *endAngle* along this circle's circumference, measured in radians clockwise from the ellipse's semi-major axis, are the start and end points respectively, and the arc is the path along the circumference of this ellipse from the start point to the end point, going anti-clockwise if *anticlockwise* is true, and clockwise otherwise. Since the points are on the ellipse, as opposed to being simply angles from zero, the arc can never cover an angle greater than  $2\pi$  radians.

#### Note

Even if the arc covers the entire circumference of the ellipse and there are no other points in the subpath, the path is not closed unless the [`closePath\(\)`](#)<sup>p650</sup> method is appropriately invoked.

The **`rect(x, y, w, h)`** method, when invoked, must run these steps:

1. If any of the arguments are infinite or NaN, then return.
2. Create a new subpath containing just the four points  $(x, y)$ ,  $(x+w, y)$ ,  $(x+w, y+h)$ ,  $(x, y+h)$ , in that order, with those four points connected by straight lines.
3. Mark the subpath as closed.
4. Create a new subpath with the point  $(x, y)$  as the only point in the subpath.

#### 4.12.5.1.6 `Path2D`<sup>p635</sup> objects §<sup>p65</sup><sub>2</sub>

`Path2D`<sup>p635</sup> objects can be used to declare paths that are then later used on objects implementing the `CanvasDrawPath`<sup>p633</sup> interface. In addition to many of the APIs described in earlier sections, `Path2D`<sup>p635</sup> objects have methods to combine paths, and to add text to paths.

For web developers (non-normative)

**`path = new Path2D`<sup>p652</sup>`()`**

Creates a new empty `Path2D`<sup>p635</sup> object.

**`path = new Path2D`<sup>p652</sup>`(path)`**

When `path` is a `Path2D`<sup>p635</sup> object, returns a copy.

When `path` is a string, creates the path described by the argument, interpreted as SVG path data. [\[SVG\]](#)<sup>p1270</sup>

**`path.addPath`<sup>p652</sup>`(path [, transform ])`**

Adds to the path the path given by the argument.

The `Path2D(path)` constructor, when invoked, must run these steps:

1. Let `output` be a new `Path2D`<sup>p635</sup> object.
2. If `path` is not given, then return `output`.
3. If `path` is a `Path2D`<sup>p635</sup> object, then add all subpaths of `path` to `output` and return `output`. (In other words, it returns a copy of the argument.)
4. Let `svgPath` be the result of parsing and interpreting `path` according to SVG 2's rules for path data. [\[SVG\]](#)<sup>p1270</sup>

#### Note

*The resulting path could be empty. SVG defines error handling rules for parsing and applying path data.*

5. Let `(x, y)` be the last point in `svgPath`.
6. Add all the subpaths, if any, from `svgPath` to `output`.
7. Create a new subpath in `output` with `(x, y)` as the only point in the subpath.
8. Return `output`.

The `addPath(b, transform)` method, when invoked on a `Path2D`<sup>p635</sup> object `a`, must run these steps:

1. If the `Path2D`<sup>p635</sup> object `b` has no subpaths, then return.
2. Let `matrix` be the result of [creating a DOMMatrix from the 2D dictionary](#) `transform`.
3. If one or more of `matrix`'s [m11 element](#), [m12 element](#), [m21 element](#), [m22 element](#), [m41 element](#), or [m42 element](#) are infinite or NaN, then return.
4. Create a copy of all the subpaths in `b`. Let this copy be known as `c`.
5. Transform all the coordinates and lines in `c` by the transform matrix `matrix`.
6. Let `(x, y)` be the last point in the last subpath of `c`.
7. Add all the subpaths in `c` to `a`.
8. Create a new subpath in `a` with `(x, y)` as the only point in the subpath.

#### 4.12.5.1.7 Transformations §<sup>p65</sup><sub>2</sub>

Objects that implement the `CanvasTransform`<sup>p632</sup> interface have a **current transformation matrix**, as well as methods (described in this section) to manipulate it. When an object implementing the `CanvasTransform`<sup>p632</sup> interface is created, its transformation matrix must be initialized to the identity matrix.

The [current transformation matrix](#)<sup>p652</sup> is applied to coordinates when creating the [current default path](#)<sup>p662</sup>, and when painting text,

shapes, and [Path2D](#)<sup>p635</sup> objects, on objects implementing the [CanvasTransform](#)<sup>p632</sup> interface.

The transformations must be performed in reverse order.

#### Note

*For instance, if a scale transformation that doubles the width is applied to the canvas, followed by a rotation transformation that rotates drawing operations by a quarter turn, and a rectangle twice as wide as it is tall is then drawn on the canvas, the actual result will be a square.*

#### For web developers (non-normative)

##### **context . scale**<sup>p653</sup>(*x*, *y*)

Changes the [current transformation matrix](#)<sup>p652</sup> to apply a scaling transformation with the given characteristics.

##### **context . rotate**<sup>p653</sup>(*angle*)

Changes the [current transformation matrix](#)<sup>p652</sup> to apply a rotation transformation with the given characteristics. The angle is in radians.

##### **context . translate**<sup>p653</sup>(*x*, *y*)

Changes the [current transformation matrix](#)<sup>p652</sup> to apply a translation transformation with the given characteristics.

##### **context . transform**<sup>p653</sup>(*a*, *b*, *c*, *d*, *e*, *f*)

Changes the [current transformation matrix](#)<sup>p652</sup> to apply the matrix given by the arguments as described below.

##### **matrix = context . getTransform**<sup>p654</sup>()

Returns a copy of the [current transformation matrix](#)<sup>p652</sup>, as a newly created [DOMMatrix](#) object.

##### **context . setTransform**<sup>p654</sup>(*a*, *b*, *c*, *d*, *e*, *f*)

Changes the [current transformation matrix](#)<sup>p652</sup> to the matrix given by the arguments as described below.

##### **context . setTransform**<sup>p654</sup>(*transform*)

Changes the [current transformation matrix](#)<sup>p652</sup> to the matrix represented by the passed [DOMMatrix2DInit](#) dictionary.

##### **context . resetTransform**<sup>p654</sup>()

Changes the [current transformation matrix](#)<sup>p652</sup> to the identity matrix.

The **scale**(*x*, *y*) method, when invoked, must run these steps:

1. If either of the arguments are infinite or NaN, then return.
2. Add the scaling transformation described by the arguments to the [current transformation matrix](#)<sup>p652</sup>. The *x* argument represents the scale factor in the horizontal direction and the *y* argument represents the scale factor in the vertical direction. The factors are multiples.

The **rotate**(*angle*) method, when invoked, must run these steps:

1. If *angle* is infinite or NaN, then return.
2. Add the rotation transformation described by the argument to the [current transformation matrix](#)<sup>p652</sup>. The *angle* argument represents a clockwise rotation angle expressed in radians.

The **translate**(*x*, *y*) method, when invoked, must run these steps:

1. If either of the arguments are infinite or NaN, then return.
2. Add the translation transformation described by the arguments to the [current transformation matrix](#)<sup>p652</sup>. The *x* argument represents the translation distance in the horizontal direction and the *y* argument represents the translation distance in the vertical direction. The arguments are in coordinate space units.

The **transform**(*a*, *b*, *c*, *d*, *e*, *f*) method, when invoked, must run these steps:

1. If any of the arguments are infinite or NaN, then return.
2. Replace the [current transformation matrix](#)<sup>p652</sup> with the result of multiplying the current transformation matrix with the matrix described by:

```
a c e
b d f
0 0 1
```

**Note**

The arguments *a*, *b*, *c*, *d*, *e*, and *f* are sometimes called *m11*, *m12*, *m21*, *m22*, *dx*, and *dy* or *m11*, *m21*, *m12*, *m22*, *dx*, and *dy*. Care ought to be taken in particular with the order of the second and third arguments (*b* and *c*) as their order varies from API to API and APIs sometimes use the notation *m12/m21* and sometimes *m21/m12* for those positions.

The `getTransform()` method, when invoked, must return a newly created [DOMMatrix](#) representing a copy of the [current transformation matrix](#)<sup>p652</sup> matrix of the context.

**Note**

This returned object is not live, so updating it will not affect the [current transformation matrix](#)<sup>p652</sup>, and updating the [current transformation matrix](#)<sup>p652</sup> will not affect an already returned [DOMMatrix](#).

The `setTransform(a, b, c, d, e, f)` method, when invoked, must run these steps:

1. If any of the arguments are infinite or NaN, then return.
2. Reset the [current transformation matrix](#)<sup>p652</sup> to the identity matrix.
3. Invoke the [transform](#)<sup>p653</sup>(*a*, *b*, *c*, *d*, *e*, *f*) method with the same arguments.

The `setTransform(transform)` method, when invoked, must run these steps:

1. Let *matrix* be the result of [creating a DOMMatrix from the 2D dictionary transform](#).
2. If one or more of *matrix*'s [m11 element](#), [m12 element](#), [m21 element](#), [m22 element](#), [m41 element](#), or [m42 element](#) are infinite or NaN, then return.
3. Reset the [current transformation matrix](#)<sup>p652</sup> to *matrix*.

The `resetTransform()` method, when invoked, must reset the [current transformation matrix](#)<sup>p652</sup> to the identity matrix.

**Note**

Given a matrix of the form created by the [transform\(\)](#)<sup>p653</sup> and [setTransform\(\)](#)<sup>p654</sup> methods, i.e.,

```
a c e
b d f
0 0 1
```

the resulting transformed coordinates after transform matrix multiplication will be

$$x_{new} = a x + c y + e$$

$$y_{new} = b x + d y + f$$

#### 4.12.5.1.8 Image sources for 2D rendering contexts § p654

Some methods on the [CanvasDrawImage](#)<sup>p634</sup> and [CanvasFillStrokeStyles](#)<sup>p632</sup> interfaces take the union type [CanvasImageSource](#)<sup>p631</sup> as an argument.

This union type allows objects implementing any of the following interfaces to be used as image sources:

- [HTMLCanvasElement](#)<sup>p627</sup> ([canvas](#)<sup>p627</sup> elements)
- [HTMLImageElement](#)<sup>p631</sup> ([img](#)<sup>p314</sup> or [SVG image](#) elements)
- [HTMLVideoElement](#)<sup>p374</sup> ([video](#)<sup>p373</sup> elements)
- [ImageBitmap](#)<sup>p970</sup>

## Note

Although not formally specified as such, *SVG image* elements are expected to be implemented nearly identical to *img* elements. That is, *SVG image* elements share the fundamental concepts and features of *img* elements.

## Note

The *ImageBitmap* interface can be created from a number of other image-representing types, including *ImageData*.

To check the usability of the *image* argument, where *image* is a *CanvasImageSource* object, run these steps:

1. Switch on *image*:

↪ *HTMLorSVGImageElement*

If *image*'s *current request*'s *state* is *broken*, then throw an *"InvalidStateError"* *DOMException*.

If *image* is not *fully decodable*, then return *bad*.

If *image* has an *intrinsic width* or *intrinsic height* (or both) equal to zero, then return *bad*.

↪ *HTMLVideoElement*

If *image*'s *readyState* attribute is either *HAVE\_NOTHING* or *HAVE\_METADATA*, then return *bad*.

↪ *HTMLCanvasElement*

↪ *OffscreenCanvas*

If *image* has either a horizontal dimension or a vertical dimension equal to zero, then throw an *"InvalidStateError"* *DOMException*.

↪ *ImageBitmap*

If *image*'s *[[Detached]]* internal slot value is set to true, then throw an *"InvalidStateError"* *DOMException*.

2. Return *good*.

When a *CanvasImageSource* object represents an *HTMLorSVGImageElement*, the element's image must be used as the source image.

Specifically, when a *CanvasImageSource* object represents an animated image in an *HTMLorSVGImageElement*, the user agent must use the default image of the animation (the one that the format defines is to be used when animation is not supported or is disabled), or, if there is no such image, the first frame of the animation, when rendering the image for *CanvasRenderingContext2D* APIs.

When a *CanvasImageSource* object represents an *HTMLVideoElement*, then the frame at the *current playback position* when the method with the argument is invoked must be used as the source image when rendering the image for *CanvasRenderingContext2D* APIs, and the source image's dimensions must be the *intrinsic width* and *intrinsic height* of the *media resource* (i.e. after any aspect-ratio correction has been applied).

When a *CanvasImageSource* object represents an *HTMLCanvasElement*, the element's bitmap must be used as the source image.

When a *CanvasImageSource* object represents an element that is *being rendered* and that element has been resized, the original image data of the source image must be used, not the image as it is rendered (e.g. *width* and *height* attributes on the source element have no effect on how the object is interpreted when rendering the image for *CanvasRenderingContext2D* APIs).

When a *CanvasImageSource* object represents an *ImageBitmap*, the object's bitmap image data must be used as the source image.

An object *image* is **not origin-clean** if, switching on *image*:

↪ *HTMLorSVGImageElement*

↪ *HTMLVideoElement*

*image*'s *origin* is not *same origin* with *entry settings object*'s *origin*.

↪ *HTMLCanvasElement*

↪ *ImageBitMap*

*image*'s bitmap's *origin-clean* flag is false.

#### 4.12.5.1.9 Fill and stroke styles <sup>p65</sup><sub>6</sub>

##### For web developers (non-normative)

###### **context . fillStyle<sup>p656</sup> [ = value ]**

Returns the current style used for filling shapes.

Can be set, to change the fill style.

The style can be either a string containing a CSS color, or a [CanvasGradient<sup>p635</sup>](#) or [CanvasPattern<sup>p635</sup>](#) object. Invalid values are ignored.

###### **context . strokeStyle<sup>p656</sup> [ = value ]**

Returns the current style used for stroking shapes.

Can be set, to change the stroke style.

The style can be either a string containing a CSS color, or a [CanvasGradient<sup>p635</sup>](#) or [CanvasPattern<sup>p635</sup>](#) object. Invalid values are ignored.

Objects that implement the [CanvasFillStrokeStyles<sup>p632</sup>](#) interface have attributes and methods (defined in this section) that control how shapes are treated by the object.

The **fillStyle** attribute represents the color or style to use inside shapes, and the **strokeStyle** attribute represents the color or style to use for the lines around the shapes.

Both attributes can be either strings, [CanvasGradient<sup>p635</sup>](#)s, or [CanvasPattern<sup>p635</sup>](#)s. On setting, strings must be [parsed<sup>p57</sup>](#) with this [canvas<sup>p627</sup>](#) element and the color assigned, and [CanvasGradient<sup>p635</sup>](#) and [CanvasPattern<sup>p635</sup>](#) objects must be assigned themselves. If parsing the value results in failure, then it must be ignored, and the attribute must retain its previous value. If the new value is a [CanvasPattern<sup>p635</sup>](#) object that is marked as [not origin-clean<sup>p658</sup>](#), then the [CanvasRenderingContext2D<sup>p632</sup>](#)'s [origin-clean<sup>p629</sup>](#) flag must be set to false.

When set to a [CanvasPattern<sup>p635</sup>](#) or [CanvasGradient<sup>p635</sup>](#) object, the assignment is [live<sup>p44</sup>](#), meaning that changes made to the object after the assignment do affect subsequent stroking or filling of shapes.

On getting, if the value is a color, then the [serialization of the color<sup>p656</sup>](#) must be returned. Otherwise, if it is not a color but a [CanvasGradient<sup>p635</sup>](#) or [CanvasPattern<sup>p635</sup>](#), then the respective object must be returned. (Such objects are opaque and therefore only useful for assigning to other attributes or for comparison to other gradients or patterns.)

The **serialization of a color** for a color value is a string, computed as follows: if it has alpha equal to 1.0, then the string is a lowercase six-digit hex value, prefixed with a "#" character (U+0023 NUMBER SIGN), with the first two digits representing the red component, the next two digits representing the green component, and the last two digits representing the blue component, the digits being [ASCII lower hex digits](#). Otherwise, the color value has alpha less than 1.0, and the string is the color value in the CSS `rgba()` functional-notation format: the literal string "rgba" (U+0072 U+0067 U+0062 U+0061) followed by a U+0028 LEFT PARENTHESIS, a base-ten integer in the range 0-255 representing the red component (using [ASCII digits](#) in the shortest form possible), a literal U+002C COMMA and U+0020 SPACE, an integer for the green component, a comma and a space, an integer for the blue component, another comma and space, a U+0030 DIGIT ZERO, if the alpha value is greater than zero then a U+002E FULL STOP (representing the decimal point), if the alpha value is greater than zero then one or more [ASCII digits](#) representing the fractional part of the alpha, and finally a U+0029 RIGHT PARENTHESIS. User agents must express the fractional part of the alpha value, if any, with the level of precision necessary for the alpha value, when reparsed, to be interpreted as the same alpha value.

When the context is created, the [fillStyle<sup>p656</sup>](#) and [strokeStyle<sup>p656</sup>](#) attributes must initially have the string value #000000.

When the value is a color, it must not be affected by the transformation matrix when used to draw on bitmaps.

There are two types of gradients, linear gradients and radial gradients, both represented by objects implementing the opaque [CanvasGradient<sup>p635</sup>](#) interface.

Once a gradient has been created (see below), stops are placed along it to define how the colors are distributed along the gradient. The color of the gradient at each stop is the color specified for that stop. Between each such stop, the colors and the alpha component must be linearly interpolated over the RGBA space without premultiplying the alpha value to find the color to use at that offset. Before the first stop, the color must be the color of the first stop. After the last stop, the color must be the color of the last stop. When there are no stops, the gradient is [transparent black](#).

##### For web developers (non-normative)

### **`gradient . addColorStop`**<sup>p657</sup>(*offset*, *color*)

Adds a color stop with the given color to the gradient at the given offset. 0.0 is the offset at one end of the gradient, 1.0 is the offset at the other end.

Throws an ["IndexSizeError" DOMException](#) if the offset is out of range. Throws a ["SyntaxError" DOMException](#) if the color cannot be parsed.

### **`gradient = context . createLinearGradient`**<sup>p657</sup>(*x0*, *y0*, *x1*, *y1*)

Returns a [CanvasGradient](#)<sup>p635</sup> object that represents a linear gradient that paints along the line given by the coordinates represented by the arguments.

### **`gradient = context . createRadialGradient`**<sup>p657</sup>(*x0*, *y0*, *r0*, *x1*, *y1*, *r1*)

Returns a [CanvasGradient](#)<sup>p635</sup> object that represents a radial gradient that paints along the cone given by the circles represented by the arguments.

If either of the radii are negative, throws an ["IndexSizeError" DOMException](#) exception.

The [addColorStop\(\*offset\*, \*color\*\)](#) method on the [CanvasGradient](#)<sup>p635</sup>, when invoked, must run these steps:

✓ MDN

1. If the *offset* is less than 0 or greater than 1, then throw an ["IndexSizeError" DOMException](#).
2. Let *parsed color* be the result of [parsing](#)<sup>p57</sup> *color*.

#### Note

*No element is passed to the parser because [CanvasGradient](#)<sup>p635</sup> objects are [canvas](#)<sup>p627</sup>-neutral — a [CanvasGradient](#)<sup>p635</sup> object created by one [canvas](#)<sup>p627</sup> can be used by another, and there is therefore no way to know which is the "element in question" at the time that the color is specified.*

3. If *parsed color* is failure, throw a ["SyntaxError" DOMException](#).
4. Place a new stop on the gradient, at offset *offset* relative to the whole gradient, and with the color *parsed color*.

If multiple stops are added at the same offset on a gradient, then they must be placed in the order added, with the first one closest to the start of the gradient, and each subsequent one infinitesimally further along towards the end point (in effect causing all but the first and last stop added at each point to be ignored).

The [createLinearGradient\(\*x0\*, \*y0\*, \*x1\*, \*y1\*\)](#) method takes four arguments that represent the start point (*x0*, *y0*) and end point (*x1*, *y1*) of the gradient. The method, when invoked, must return a linear [CanvasGradient](#)<sup>p635</sup> initialized with the specified line.

Linear gradients must be rendered such that all points on a line perpendicular to the line that crosses the start and end points have the color at the point where those two lines cross (with the colors coming from the [interpolation and extrapolation](#)<sup>p656</sup> described above). The points in the linear gradient must be transformed as described by the [current transformation matrix](#)<sup>p652</sup> when rendering.

If  $x0 = x1$  and  $y0 = y1$ , then the linear gradient must paint nothing.

The [createRadialGradient\(\*x0\*, \*y0\*, \*r0\*, \*x1\*, \*y1\*, \*r1\*\)](#) method takes six arguments, the first three representing the start circle with origin (*x0*, *y0*) and radius *r0*, and the last three representing the end circle with origin (*x1*, *y1*) and radius *r1*. The values are in coordinate space units. If either of *r0* or *r1* are negative, then an ["IndexSizeError" DOMException](#) must be thrown. Otherwise, the method, when invoked, must return a radial [CanvasGradient](#)<sup>p635</sup> initialized with the two specified circles.

Radial gradients must be rendered by following these steps:

1. If  $x0 = x1$  and  $y0 = y1$  and  $r0 = r1$ , then the radial gradient must paint nothing. Return.
2. Let  $x(\omega) = (x1-x0)\omega + x0$

$$\text{Let } y(\omega) = (y1-y0)\omega + y0$$

$$\text{Let } r(\omega) = (r1-r0)\omega + r0$$

Let the color at  $\omega$  be the color at that position on the gradient (with the colors coming from the [interpolation and extrapolation](#)<sup>p656</sup> described above).

3. For all values of  $\omega$  where  $r(\omega) > 0$ , starting with the value of  $\omega$  nearest to positive infinity and ending with the value of  $\omega$  nearest to negative infinity, draw the circumference of the circle with radius  $r(\omega)$  at position  $(x(\omega), y(\omega))$ , with the color at  $\omega$ , but only painting on the parts of the bitmap that have not yet been painted on by earlier circles in this step for this rendering

of the gradient.

#### Note

This effectively creates a cone, touched by the two circles defined in the creation of the gradient, with the part of the cone before the start circle (0.0) using the color of the first offset, the part of the cone after the end circle (1.0) using the color of the last offset, and areas outside the cone untouched by the gradient ([transparent black](#)).

The resulting radial gradient must then be transformed as described by the [current transformation matrix](#)<sup>p652</sup> when rendering.

Gradients must be painted only where the relevant stroking or filling effects requires that they be drawn.

Patterns are represented by objects implementing the opaque [CanvasPattern](#)<sup>p635</sup> interface.

#### For web developers (non-normative)

##### **`pattern = context . createPattern`**<sup>p658</sup>**(`image`, `repetition`)**

Returns a [CanvasPattern](#)<sup>p635</sup> object that uses the given image and repeats in the direction(s) given by the `repetition` argument.

The allowed values for `repetition` are `repeat` (both directions), `repeat-x` (horizontal only), `repeat-y` (vertical only), and `no-repeat` (neither). If the `repetition` argument is empty, the value `repeat` is used.

If the image isn't yet fully decoded, then nothing is drawn. If the image is a canvas with no data, throws an ["InvalidStateError" DOMException](#).

##### **`pattern . setTransform`**<sup>p658</sup>**(`transform`)**

Sets the transformation matrix that will be used when rendering the pattern during a fill or stroke painting operation.

The **`createPattern(image, repetition)`** method, when invoked, must run these steps:

1. Let *usability* be the result of [checking the usability of](#)<sup>p655</sup> *image*.
2. If *result* is *bad*, then return null.
3. Assert: *result* is *good*.
4. If *repetition* is the empty string, then set it to "repeat".
5. If *repetition* is not a [case-sensitive](#)<sup>p65</sup> match for one of "repeat", "repeat-x", "repeat-y", or "no-repeat", then throw a ["SyntaxError" DOMException](#).
6. Let *pattern* be a new [CanvasPattern](#)<sup>p635</sup> object with the image *image* and the repetition behavior given by *repetition*.
7. If *image* is [not origin-clean](#)<sup>p655</sup>, then mark *pattern* as **not origin-clean**.
8. Return *pattern*.

Modifying the *image* used when creating a [CanvasPattern](#)<sup>p635</sup> object after calling the [createPattern\(\)](#)<sup>p658</sup> method must not affect the pattern(s) rendered by the [CanvasPattern](#)<sup>p635</sup> object.

Patterns have a transformation matrix, which controls how the pattern is used when it is painted. Initially, a pattern's transformation matrix must be the identity matrix.

The **`setTransform(transform)`** method, when invoked, must run these steps:

1. Let *matrix* be the result of [creating a DOMMatrix from the 2D dictionary](#) *transform*.
2. If one or more of *matrix*'s [m11 element](#), [m12 element](#), [m21 element](#), [m22 element](#), [m41 element](#), or [m42 element](#) are infinite or NaN, then return.
3. Reset the pattern's transformation matrix to *matrix*.

When a pattern is to be rendered within an area, the user agent must run the following steps to determine what is rendered:

1. Create an infinite [transparent black](#) bitmap.
2. Place a copy of the image on the bitmap, anchored such that its top left corner is at the origin of the coordinate space, with one coordinate space unit per [CSS pixel](#) of the image, then place repeated copies of this image horizontally to the left and

right, if the repetition behavior is "repeat-x", or vertically up and down, if the repetition behavior is "repeat-y", or in all four directions all over the bitmap, if the repetition behavior is "repeat".

If the original image data is a bitmap image, then the value painted at a point in the area of the repetitions is computed by filtering the original image data. When scaling up, if the [imageSmoothingEnabled](#)<sup>p673</sup> attribute is set to false, then the image must be rendered using nearest-neighbor interpolation. Otherwise, the user agent may use any filtering algorithm (for example bilinear interpolation or nearest-neighbor). User agents which support multiple filtering algorithms may use the value of the [imageSmoothingQuality](#)<sup>p673</sup> attribute to guide the choice of filtering algorithm. When such a filtering algorithm requires a pixel value from outside the original image data, it must instead use the value from wrapping the pixel's coordinates to the original image's dimensions. (That is, the filter uses 'repeat' behavior, regardless of the value of the pattern's repetition behavior.)

3. Transform the resulting bitmap according to the pattern's transformation matrix.
4. Transform the resulting bitmap again, this time according to the [current transformation matrix](#)<sup>p652</sup>.
5. Replace any part of the image outside the area in which the pattern is to be rendered with [transparent black](#).
6. The resulting bitmap is what is to be rendered, with the same origin and same scale.

If a radial gradient or repeated pattern is used when the transformation matrix is singular, then the resulting style must be [transparent black](#) (otherwise the gradient or pattern would be collapsed to a point or line, leaving the other pixels undefined). Linear gradients and solid colors always define all points even with singular transformation matrices.

#### 4.12.5.1.10 Drawing rectangles to the bitmap <sup>§<sub>9</sub>p65</sup>

Objects that implement the [CanvasRect](#)<sup>p633</sup> interface provide the following methods for immediately drawing rectangles to the bitmap. The methods each take four arguments; the first two give the *x* and *y* coordinates of the top left of the rectangle, and the second two give the width *w* and height *h* of the rectangle, respectively.

The [current transformation matrix](#)<sup>p652</sup> must be applied to the following four coordinates, which form the path that must then be closed to get the specified rectangle: (*x*, *y*), (*x*+*w*, *y*), (*x*+*w*, *y*+*h*), (*x*, *y*+*h*).

Shapes are painted without affecting the [current default path](#)<sup>p662</sup>, and are subject to the [clipping region](#)<sup>p663</sup>, and, with the exception of [clearRect\(\)](#)<sup>p659</sup>, also [shadow effects](#)<sup>p673</sup>, [global alpha](#)<sup>p672</sup>, and [global composition operators](#)<sup>p672</sup>.

#### For web developers (non-normative)

**context . clearRect**<sup>p659</sup>(*x*, *y*, *w*, *h*)

Clears all pixels on the bitmap in the given rectangle to [transparent black](#).

**context . fillRect**<sup>p659</sup>(*x*, *y*, *w*, *h*)

Paints the given rectangle onto the bitmap, using the current fill style.

**context . strokeRect**<sup>p660</sup>(*x*, *y*, *w*, *h*)

Paints the box that outlines the given rectangle onto the bitmap, using the current stroke style.

The [clearRect\(\*x\*, \*y\*, \*w\*, \*h\*\)](#) method, when invoked, must run these steps:

1. If any of the arguments are infinite or NaN, then return.
2. Let *pixels* be the set of pixels in the specified rectangle that also intersect the current [clipping region](#)<sup>p663</sup>.
3. Clear the pixels in *pixels* to a [transparent black](#), erasing any previous image.

#### Note

*If either height or width are zero, this method has no effect, since the set of pixels would be empty.*

The [fillRect\(\*x\*, \*y\*, \*w\*, \*h\*\)](#) method, when invoked, must run these steps:

1. If any of the arguments are infinite or NaN, then return.
2. If either *w* or *h* are zero, then return.

3. Paint the specified rectangular area using the [fillStyle<sup>p656</sup>](#).

The `strokeRect(x, y, w, h)` method, when invoked, must run these steps:

✓ MDN

1. If any of the arguments are infinite or NaN, then return.
2. Take the result of [tracing the path<sup>p640</sup>](#) described below, using the [CanvasPathDrawingStyles<sup>p634</sup>](#) interface's line styles, and fill it with the [strokeStyle<sup>p656</sup>](#).

If both *w* and *h* are zero, the path has a single subpath with just one point (*x*, *y*), and no lines, and this method thus has no effect (the [trace a path<sup>p640</sup>](#) algorithm returns an empty path in that case).

If just one of either *w* or *h* is zero, then the path has a single subpath consisting of two points, with coordinates (*x*, *y*) and (*x*+*w*, *y*+*h*), in that order, connected by a single straight line.

Otherwise, the path has a single subpath consisting of four points, with coordinates (*x*, *y*), (*x*+*w*, *y*), (*x*+*w*, *y*+*h*), and (*x*, *y*+*h*), connected to each other in that order by straight lines.

#### 4.12.5.1.11 Drawing text to the bitmap §<sup>p66</sup><sub>0</sub>

✓ MDN

For web developers (non-normative)

**`context . fillTextp660(text, x, y [, maxWidth ] )`**

**`context . strokeTextp660(text, x, y [, maxWidth ] )`**

Fills or strokes (respectively) the given text at the given position. If a maximum width is provided, the text will be scaled to fit that width if necessary.

**`metrics = context . measureTextp661(text)`**

Returns a [TextMetrics<sup>p635</sup>](#) object with the metrics of the given text in the current font.

**`metrics . widthp661`**

**`metrics . actualBoundingBoxLeftp661`**

**`metrics . actualBoundingBoxRightp661`**

**`metrics . fontBoundingBoxAscentp661`**

**`metrics . fontBoundingBoxDescentp661`**

**`metrics . actualBoundingBoxAscentp661`**

**`metrics . actualBoundingBoxDescentp661`**

**`metrics . emHeightAscentp661`**

**`metrics . emHeightDescentp662`**

**`metrics . hangingBaselinep662`**

**`metrics . alphabeticBaselinep662`**

**`metrics . ideographicBaselinep662`**

Returns the measurement described below.

Objects that implement the [CanvasText<sup>p633</sup>](#) interface provide the following methods for rendering text.

The `fillText()` and `strokeText()` methods take three or four arguments, *text*, *x*, *y*, and optionally *maxWidth*, and render the given text at the given (*x*, *y*) coordinates ensuring that the text isn't wider than *maxWidth* if specified, using the current [font<sup>p644</sup>](#), [textAlign<sup>p645</sup>](#), and [textBaseline<sup>p645</sup>](#) values. Specifically, when the methods are invoked, the user agent must run these steps:

1. If any of the arguments are infinite or NaN, then return.
2. Run the [text preparation algorithm<sup>p646</sup>](#), passing it *text*, the object implementing the [CanvasText<sup>p633</sup>](#) interface, and, if the *maxWidth* argument was provided, that argument. Let *glyphs* be the result.
3. Move all the shapes in *glyphs* to the right by *x* CSS pixels and down by *y* CSS pixels.
4. Paint the shapes given in *glyphs*, as transformed by the [current transformation matrix<sup>p652</sup>](#), with each CSS pixel in the coordinate space of *glyphs* mapped to one coordinate space unit.

For `fillText()p660`, `fillStylep656` must be applied to the shapes and `strokeStylep656` must be ignored. For

`strokeText()` <sup>p660</sup>, the reverse holds: `strokeStyle` <sup>p656</sup> must be applied to the result of `tracing` <sup>p640</sup> the shapes using the object implementing the `CanvasText` <sup>p633</sup> interface for the line styles, and `fillStyle` <sup>p656</sup> must be ignored.

These shapes are painted without affecting the current path, and are subject to `shadow effects` <sup>p673</sup>, `global alpha` <sup>p672</sup>, the `clipping region` <sup>p663</sup>, and `global composition operators` <sup>p672</sup>.

The `measureText()` method takes one argument, `text`. When the method is invoked, the user agent must run the `text preparation algorithm` <sup>p646</sup>, passing it `text` and the object implementing the `CanvasText` <sup>p633</sup> interface, and then using the returned `inline box` must return a new `TextMetrics` <sup>p635</sup> object with members behaving as described in the following list: [\[CSS\]](#) <sup>p1264</sup>

✓ MDN

#### **`width` attribute**

The width of that `inline box`, in `CSS pixels`. (The text's advance width.)

#### **`actualBoundingBoxLeft` attribute**

The distance parallel to the baseline from the alignment point given by the `textAlign` <sup>p645</sup> attribute to the left side of the bounding rectangle of the given text, in `CSS pixels`; positive numbers indicating a distance going left from the given alignment point.

✓ MDN

#### **Note**

*The sum of this value and the next (`actualBoundingBoxRight` <sup>p661</sup>) can be wider than the width of the `inline box` (`width` <sup>p661</sup>), in particular with slanted fonts where characters overhang their advance width.*

#### **`actualBoundingBoxRight` attribute**

The distance parallel to the baseline from the alignment point given by the `textAlign` <sup>p645</sup> attribute to the right side of the bounding rectangle of the given text, in `CSS pixels`; positive numbers indicating a distance going right from the given alignment point.

✓ MDN

#### **`fontBoundingBoxAscent` attribute**

The distance from the horizontal line indicated by the `textBaseline` <sup>p645</sup> attribute to the top of the highest bounding rectangle of all the fonts used to render the text, in `CSS pixels`; positive numbers indicating a distance going up from the given baseline.

✓ MDN

#### **Note**

*This value and the next are useful when rendering a background that have to have a consistent height even if the exact text being rendered changes. The `actualBoundingBoxAscent` <sup>p661</sup> attribute (and its corresponding attribute for the descent) are useful when drawing a bounding box around specific text.*

#### **`fontBoundingBoxDescent` attribute**

The distance from the horizontal line indicated by the `textBaseline` <sup>p645</sup> attribute to the bottom of the lowest bounding rectangle of all the fonts used to render the text, in `CSS pixels`; positive numbers indicating a distance going down from the given baseline.

✓ MDN

#### **`actualBoundingBoxAscent` attribute**

The distance from the horizontal line indicated by the `textBaseline` <sup>p645</sup> attribute to the top of the bounding rectangle of the given text, in `CSS pixels`; positive numbers indicating a distance going up from the given baseline.

✓ MDN

#### **Note**

*This number can vary greatly based on the input text, even if the first font specified covers all the characters in the input. For example, the `actualBoundingBoxAscent` <sup>p661</sup> of a lowercase "o" from an alphabetic baseline would be less than that of an uppercase "F". The value can easily be negative; for example, the distance from the top of the em box (`textBaseline` <sup>p645</sup> value "`top` <sup>p645</sup>") to the top of the bounding rectangle when the given text is just a single comma ", " would likely (unless the font is quite unusual) be negative.*

#### **`actualBoundingBoxDescent` attribute**

The distance from the horizontal line indicated by the `textBaseline` <sup>p645</sup> attribute to the bottom of the bounding rectangle of the given text, in `CSS pixels`; positive numbers indicating a distance going down from the given baseline.

✓ MDN

#### **`emHeightAscent` attribute**

The distance from the horizontal line indicated by the `textBaseline` <sup>p645</sup> attribute to the highest top of the em squares in the `line box`, in `CSS pixels`; positive numbers indicating that the given baseline is below the top of that em square (so this value will usually be positive). Zero if the given baseline is the top of that em square; half the font size if the given baseline is the middle of that em square.

✓ MDN

**emHeightDescent** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p645</sup> attribute to the lowest bottom of the em squares in the [line box](#), in [CSS pixels](#); positive numbers indicating that the given baseline is above the bottom of that em square. (Zero if the given baseline is the bottom of that em square.)

**hangingBaseline** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p645</sup> attribute to the hanging baseline of the [line box](#), in [CSS pixels](#); positive numbers indicating that the given baseline is below the hanging baseline. (Zero if the given baseline is the hanging baseline.)

**alphabeticBaseline** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p645</sup> attribute to the alphabetic baseline of the [line box](#), in [CSS pixels](#); positive numbers indicating that the given baseline is below the alphabetic baseline. (Zero if the given baseline is the alphabetic baseline.)

**ideographicBaseline** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p645</sup> attribute to the ideographic baseline of the [line box](#), in [CSS pixels](#); positive numbers indicating that the given baseline is below the ideographic baseline. (Zero if the given baseline is the ideographic baseline.)

**Note**

*Glyphs rendered using [fillText\(\)](#)<sup>p660</sup> and [strokeText\(\)](#)<sup>p660</sup> can spill out of the box given by the font size (the em square size) and the width returned by [measureText\(\)](#)<sup>p661</sup> (the text width). Authors are encouraged to use the bounding box values described above if this is an issue.*

**Note**

*A future version of the 2D context API might provide a way to render fragments of documents, rendered using CSS, straight to the canvas. This would be provided in preference to a dedicated way of doing multiline layout.*

**4.12.5.1.12 Drawing paths to the canvas** §<sup>p66</sup><sub>2</sub>

Objects that implement the [CanvasDrawPath](#)<sup>p633</sup> interface have a **current default path**. There is only one [current default path](#)<sup>p662</sup>, it is not part of the [drawing state](#)<sup>p638</sup>. The [current default path](#)<sup>p662</sup> is a [path](#)<sup>p647</sup>, as described above.

## For web developers (non-normative)

**context . beginPath**<sup>p663</sup>( )

Resets the [current default path](#)<sup>p662</sup>.

**context . fill**<sup>p663</sup>( [ fillRule ] )**context . fill**<sup>p663</sup>( path [, fillRule ] )

Fills the subpaths of the [current default path](#)<sup>p662</sup> or the given path with the current fill style, obeying the given fill rule.

**context . stroke**<sup>p663</sup>( )**context . stroke**<sup>p663</sup>( path )

Strokes the subpaths of the [current default path](#)<sup>p662</sup> or the given path with the current stroke style.

**context . clip**<sup>p663</sup>( [ fillRule ] )**context . clip**<sup>p663</sup>( path [, fillRule ] )

Further constrains the clipping region to the [current default path](#)<sup>p662</sup> or the given path, using the given fill rule to determine what points are in the path.

**context . isPointInPath**<sup>p663</sup>( x, y [, fillRule ] )**context . isPointInPath**<sup>p663</sup>( path, x, y [, fillRule ] )

Returns true if the given point is in the [current default path](#)<sup>p662</sup> or the given path, using the given fill rule to determine what points are in the path.

**context . isPointInStroke<sup>p663</sup>(x, y)**

**context . isPointInStroke<sup>p663</sup>(path, x, y)**

Returns true if the given point would be in the region covered by the stroke of the [current default path<sup>p662</sup>](#) or the given path, given the current stroke style.

The **beginPath()** method, when invoked, must empty the list of subpaths in the context's [current default path<sup>p662</sup>](#) so that it once again has zero subpaths.

Where the following method definitions use the term *intended path*, it means the [Path2D<sup>p635</sup>](#) argument, if one was provided, or the [current default path<sup>p662</sup>](#) otherwise.

When the intended path is a [Path2D<sup>p635</sup>](#) object, the coordinates and lines of its subpaths must be transformed according to the [current transformation matrix<sup>p652</sup>](#) on the object implementing the [CanvasTransform<sup>p632</sup>](#) interface when used by these methods (without affecting the [Path2D<sup>p635</sup>](#) object itself). When the intended path is the [current default path<sup>p662</sup>](#), it is not affected by the transform. (This is because transformations already affect the [current default path<sup>p662</sup>](#) when it is constructed, so applying it when it is painted as well would result in a double transformation.)

The **fill()** method, when invoked, must fill all the subpaths of the intended path, using [fillStyle<sup>p656</sup>](#), and using the [fill rule<sup>p638</sup>](#) indicated by the *fillRule* argument. Open subpaths must be implicitly closed when being filled (without affecting the actual subpaths).

The **stroke()** method, when invoked, must [trace<sup>p640</sup>](#) the intended path, using this [CanvasPathDrawingStyles<sup>p634</sup>](#) object for the line styles, and then fill the resulting path using the [strokeStyle<sup>p656</sup>](#) attribute, using the [nonzero winding rule<sup>p638</sup>](#).

#### Note

*As a result of how the algorithm to [trace a path<sup>p640</sup>](#) is defined, overlapping parts of the paths in one stroke operation are treated as if their union was what was painted.*

#### Note

*The stroke style is affected by the transformation during painting, even if the intended path is the [current default path<sup>p662</sup>](#).*

Paths, when filled or stroked, must be painted without affecting the [current default path<sup>p662</sup>](#) or any [Path2D<sup>p635</sup>](#) objects, and must be subject to [shadow effects<sup>p673</sup>](#), [global alpha<sup>p672</sup>](#), the [clipping region<sup>p663</sup>](#), and [global composition operators<sup>p672</sup>](#). (The effect of transformations is described above and varies based on which path is being used.)

The **clip()** method, when invoked, must create a new **clipping region** by calculating the intersection of the current clipping region and the area described by the intended path, using the [fill rule<sup>p638</sup>](#) indicated by the *fillRule* argument. Open subpaths must be implicitly closed when computing the clipping region, without affecting the actual subpaths. The new clipping region replaces the current clipping region.

When the context is initialized, the clipping region must be set to the largest infinite surface (i.e. by default, no clipping occurs).

The **isPointInPath()** method, when invoked, must return true if the point given by the x and y coordinates passed to the method, when treated as coordinates in the canvas coordinate space unaffected by the current transformation, is inside the intended path as determined by the [fill rule<sup>p638</sup>](#) indicated by the *fillRule* argument; and must return false otherwise. Open subpaths must be implicitly closed when computing the area inside the path, without affecting the actual subpaths. Points on the path itself must be considered to be inside the path. If either of the arguments are infinite or NaN, then the method must return false.

The **isPointInStroke()** method, when invoked, must return true if the point given by the x and y coordinates passed to the method, when treated as coordinates in the canvas coordinate space unaffected by the current transformation, is inside the path that results from [tracing<sup>p640</sup>](#) the intended path, using the [nonzero winding rule<sup>p638</sup>](#), and using the [CanvasPathDrawingStyles<sup>p634</sup>](#) interface for the line styles; and must return false otherwise. Points on the resulting path must be considered to be inside the path. If either of the arguments are infinite or NaN, then the method must return false.

#### Example

This [canvas<sup>p627</sup>](#) element has a couple of checkboxes. The path-related commands are highlighted:

```
<canvas height=400 width=750>
  <label><input type=checkbox id=showA> Show As</label>
  <label><input type=checkbox id=showB> Show Bs</label>
  <!-- ... -->
</canvas>
<script>
  function drawCheckbox(context, element, x, y, paint) {
    context.save();
    context.font = '10px sans-serif';
    context.textAlign = 'left';
    context.textBaseline = 'middle';
    var metrics = context.measureText(element.labels[0].textContent);
    if (paint) {
      context.beginPath();
      context.strokeStyle = 'black';
      context.rect(x-5, y-5, 10, 10);
      context.stroke();
      if (element.checked) {
        context.fillStyle = 'black';
        context.fill();
      }
      context.fillText(element.labels[0].textContent, x+5, y);
    }
    context.beginPath();
    context.rect(x-7, y-7, 12 + metrics.width+2, 14);

    context.drawFocusIfNeeded(element);
    context.restore();
  }
  function drawBase() { /* ... */ }
  function drawAs() { /* ... */ }
  function drawBs() { /* ... */ }
  function redraw() {
    var canvas = document.getElementsByTagName('canvas')[0];
    var context = canvas.getContext('2d');
    context.clearRect(0, 0, canvas.width, canvas.height);
    drawCheckbox(context, document.getElementById('showA'), 20, 40, true);
    drawCheckbox(context, document.getElementById('showB'), 20, 60, true);
    drawBase();
    if (document.getElementById('showA').checked)
      drawAs();
    if (document.getElementById('showB').checked)
      drawBs();
  }
  function processClick(event) {
    var canvas = document.getElementsByTagName('canvas')[0];
    var context = canvas.getContext('2d');
    var x = event.clientX;
    var y = event.clientY;
    var node = event.target;
    while (node) {
      x -= node.offsetLeft - node.scrollLeft;
      y -= node.offsetTop - node.scrollTop;
      node = node.offsetParent;
    }
    drawCheckbox(context, document.getElementById('showA'), 20, 40, false);
    if (context.isPointInPath(x, y))
      document.getElementById('showA').checked = !(document.getElementById('showA').checked);
    drawCheckbox(context, document.getElementById('showB'), 20, 60, false);
  }
</script>
</body>
</html>
```

```

if (context.isPointInPath(x, y))
  document.getElementById('showB').checked = !(document.getElementById('showB').checked);
redraw();
}
document.getElementsByTagName('canvas')[0].addEventListener('focus', redraw, true);
document.getElementsByTagName('canvas')[0].addEventListener('blur', redraw, true);
document.getElementsByTagName('canvas')[0].addEventListener('change', redraw, true);
document.getElementsByTagName('canvas')[0].addEventListener('click', processClick, false);
redraw();
</script>

```

#### 4.12.5.1.13 Drawing focus rings and scrolling paths into view <sup>§<sup>p66</sup></sup><sub>5</sub>

For web developers (non-normative)

**context . drawFocusIfNeeded<sup>p665</sup>(element)**

**context . drawFocusIfNeeded<sup>p665</sup>(path, element)**

If the given element is [focused<sup>p764</sup>](#), draws a focus ring around the [current default path<sup>p662</sup>](#) or the given path, following the platform conventions for focus rings.

**context . scrollPathIntoView<sup>p666</sup>()**

**context . scrollPathIntoView<sup>p666</sup>(path)**

Scrolls the [current default path<sup>p662</sup>](#) or the given path into view. This is especially useful on devices with small screens, where the whole canvas might not be visible at once.

Objects that implement the [CanvasUserInterface<sup>p633</sup>](#) interface provide the following methods to control drawing focus rings and scrolling paths into view.

The **drawFocusIfNeeded(element)** method, when invoked, must run these steps:

1. If *element* is not [focused<sup>p764</sup>](#) or is not a descendant of the element with whose context the method is associated, then return.
2. Draw a focus ring of the appropriate style along the intended path, following platform conventions.

#### Note

*Some platforms only draw focus rings around elements that have been focused from the keyboard, and not those focused from the mouse. Other platforms simply don't draw focus rings around some elements at all unless relevant accessibility features are enabled. This API is intended to follow these conventions. User agents that implement distinctions based on the manner in which the element was focused are encouraged to classify focus driven by the [focus\(\)<sup>p775</sup>](#) method based on the kind of user interaction event from which the call was triggered (if any).*

The focus ring should not be subject to the [shadow effects<sup>p673</sup>](#), the [global alpha<sup>p672</sup>](#), the [global composition operators<sup>p672</sup>](#), or any of the members in the [CanvasFillStrokeStyles<sup>p632</sup>](#), [CanvasPathDrawingStyles<sup>p634</sup>](#), [CanvasTextDrawingStyles<sup>p634</sup>](#) interfaces, but *should* be subject to the [clipping region<sup>p663</sup>](#). (The effect of transformations is described above and varies based on which path is being used.)

3. [Inform the user<sup>p666</sup>](#) that the focus is at the location given by the intended path. User agents may wait until the next time the [event loop<sup>p924</sup>](#) reaches its [update the rendering<sup>p927</sup>](#) step to optionally inform the user.

User agents should not implicitly close open subpaths in the intended path when drawing the focus ring.

#### Note

*This might be a moot point, however. For example, if the focus ring is drawn as an axis-aligned bounding rectangle around the points in the intended path, then whether the subpaths are closed or not has no effect. This specification intentionally does not specify precisely how focus rings are to be drawn: user agents are expected to honor their platform's native conventions.*

The `scrollPathIntoView()` method, when invoked, must run these steps:

1. Let *specifiedRectangle* be the rectangle of the bounding box of the intended path.
2. Let *notionalChild* be a hypothetical element that is a rendered child of the `canvas`<sup>p627</sup> element whose dimensions are those of *specifiedRectangle*.
3. [Scroll \*notionalChild\* into view](#) with *behavior* set to "auto", *block* set to "start", and *inline* set to "nearest".
4. Optionally, [inform the user](#)<sup>p666</sup> that the caret or selection (or both) cover *specifiedRectangle* of the canvas. The user agent may wait until the next time the [event loop](#)<sup>p924</sup> reaches its [update the rendering](#)<sup>p927</sup> step to optionally inform the user.

"Inform the user", as used in this section, does not imply any persistent state change. It could mean, for instance, calling a system accessibility API to notify assistive technologies such as magnification tools so that the user's magnifier moves to the given area of the canvas. However, it does not associate the path with the element, or provide a region for tactile feedback, etc.

#### 4.12.5.1.14 Drawing images §<sup>p666</sup><sub>6</sub>

Objects that implement the `CanvasDrawImage`<sup>p634</sup> interface have the `drawImage` method to draw images.

This method can be invoked with three different sets of arguments:

- `drawImage(image, dx, dy)`
- `drawImage(image, dx, dy, dw, dh)`
- `drawImage(image, sx, sy, sw, sh, dx, dy, dw, dh)`

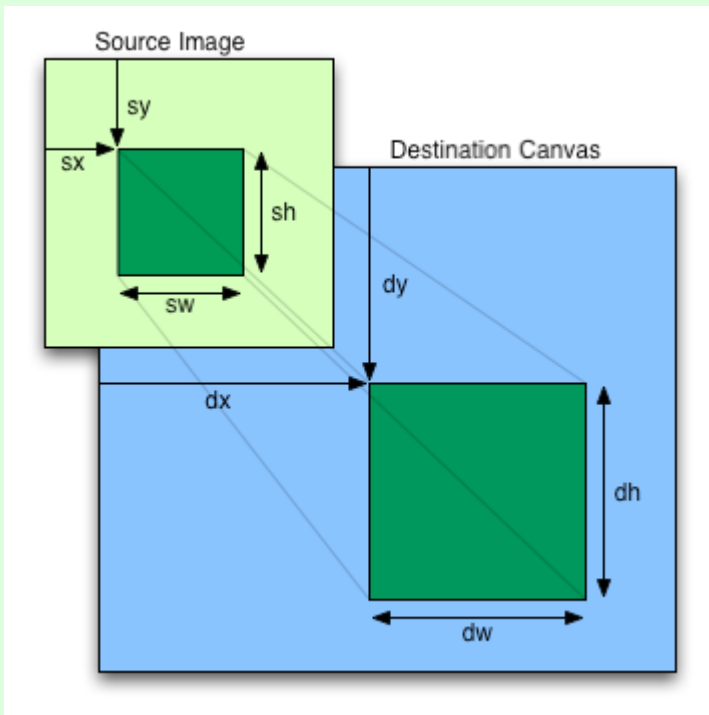

For web developers (non-normative)

**`context . drawImage`<sup>p666</sup>`(image, dx, dy)`**

**`context . drawImage`<sup>p666</sup>`(image, dx, dy, dw, dh)`**

**`context . drawImage`<sup>p666</sup>`(image, sx, sy, sw, sh, dx, dy, dw, dh)`**

Draws the given image onto the canvas. The arguments are interpreted as follows:

If the image isn't yet fully decoded, then nothing is drawn. If the image is a canvas with no data, throws an `"InvalidStateError"` `DOMException`.

When the `drawImage()`<sup>p666</sup> method is invoked, the user agent must run these steps:

1. If any of the arguments are infinite or NaN, then return.

- Let *usability* be the result of [checking the usability of \*image\*](#)<sup>p655</sup>.
- If *usability* is *bad*, then return (without drawing anything).
- Establish the source and destination rectangles as follows:

If not specified, the *dw* and *dh* arguments must default to the values of *sw* and *sh*, interpreted such that one [CSS pixel](#) in the image is treated as one unit in the [output bitmap](#)<sup>p636</sup>'s coordinate space. If the *sx*, *sy*, *sw*, and *sh* arguments are omitted, then they must default to 0, 0, the image's [intrinsic width](#) in image pixels, and the image's [intrinsic height](#) in image pixels, respectively. If the image has no [intrinsic dimensions](#), then the *concrete object size* must be used instead, as determined using the CSS "[Concrete Object Size Resolution](#)" algorithm, with the *specified size* having neither a definite width nor height, nor any additional constraints, the object's intrinsic properties being those of the *image* argument, and the [default object size](#) being the size of the [output bitmap](#)<sup>p636</sup>. [\[CSSIMAGES\]](#)<sup>p1265</sup>

The source rectangle is the rectangle whose corners are the four points (*sx*, *sy*), (*sx*+*sw*, *sy*), (*sx*+*sw*, *sy*+*sh*), (*sx*, *sy*+*sh*).

The destination rectangle is the rectangle whose corners are the four points (*dx*, *dy*), (*dx*+*dw*, *dy*), (*dx*+*dw*, *dy*+*dh*), (*dx*, *dy*+*dh*).

When the source rectangle is outside the source image, the source rectangle must be clipped to the source image and the destination rectangle must be clipped in the same proportion.

#### Note

*When the destination rectangle is outside the destination image (the [output bitmap](#)<sup>p636</sup>), the pixels that land outside the [output bitmap](#)<sup>p636</sup> are discarded, as if the destination was an infinite canvas whose rendering was clipped to the dimensions of the [output bitmap](#)<sup>p636</sup>.*

- If one of the *sw* or *sh* arguments is zero, then return. Nothing is painted.
- Paint the region of the *image* argument specified by the source rectangle on the region of the rendering context's [output bitmap](#)<sup>p636</sup> specified by the destination rectangle, after applying the [current transformation matrix](#)<sup>p652</sup> to the destination rectangle.

The image data must be processed in the original direction, even if the dimensions given are negative.

When scaling up, if the [imageSmoothingEnabled](#)<sup>p673</sup> attribute is set to true, the user agent should attempt to apply a smoothing algorithm to the image data when it is scaled. User agents which support multiple filtering algorithms may use the value of the [imageSmoothingQuality](#)<sup>p673</sup> attribute to guide the choice of filtering algorithm when the [imageSmoothingEnabled](#)<sup>p673</sup> attribute is set to true. Otherwise, the image must be rendered using nearest-neighbor interpolation.

#### Note

*This specification does not define the precise algorithm to use when scaling an image down, or when scaling an image up when the [imageSmoothingEnabled](#)<sup>p673</sup> attribute is set to true.*

#### Note

*When a [canvas](#)<sup>p627</sup> element is drawn onto itself, the [drawing model](#)<sup>p675</sup> requires the source to be copied before the image is drawn, so it is possible to copy parts of a [canvas](#)<sup>p627</sup> element onto overlapping parts of itself.*

If the original image data is a bitmap image, then the value painted at a point in the destination rectangle is computed by filtering the original image data. The user agent may use any filtering algorithm (for example bilinear interpolation or nearest-neighbor). When the filtering algorithm requires a pixel value from outside the original image data, it must instead use the value from the nearest edge pixel. (That is, the filter uses 'clamp-to-edge' behavior.) When the filtering algorithm requires a pixel value from outside the source rectangle but inside the original image data, then the value from the original image data must be used.

#### Note

*Thus, scaling an image in parts or in whole will have the same effect. This does mean that when sprites coming from a single sprite sheet are to be scaled, adjacent images in the sprite sheet can interfere. This can be avoided by ensuring each sprite in the sheet is surrounded by a border of [transparent black](#), or by copying sprites to be scaled into temporary [canvas](#)<sup>p627</sup> elements and drawing the scaled sprites from there.*

Images are painted without affecting the current path, and are subject to [shadow effects](#)<sup>p673</sup>, [global alpha](#)<sup>p672</sup>, the [clipping region](#)<sup>p663</sup>, and [global composition operators](#)<sup>p672</sup>.

7. If *image* is [not origin-clean](#)<sup>p655</sup>, then set the [CanvasRenderingContext2D](#)<sup>p632</sup>'s [origin-clean](#)<sup>p629</sup> flag to false.

#### 4.12.5.1.15 Pixel manipulation §<sup>p66</sup> 8

For web developers (non-normative)

***imagedata* = new [ImageData](#)<sup>p668</sup>(*sw*, *sh*)**

***imagedata* = *context* . [createImageData](#)<sup>p668</sup>(*sw*, *sh*)**

Returns an [ImageData](#)<sup>p635</sup> object with the given dimensions. All the pixels in the returned object are [transparent black](#).

Throws an ["IndexSizeError"](#) [DOMException](#) if either of the width or height arguments are zero.

***imagedata* = *context* . [createImageData](#)<sup>p668</sup>(*imagedata*)**

Returns an [ImageData](#)<sup>p635</sup> object with the same dimensions as the argument. All the pixels in the returned object are [transparent black](#).

***imagedata* = new [ImageData](#)<sup>p668</sup>(*data*, *sw* [, *sh* ] )**

Returns an [ImageData](#)<sup>p635</sup> object using the data provided in the [Uint8ClampedArray](#) argument, interpreted using the given dimensions.

As each pixel in the data is represented by four numbers, the length of the data needs to be a multiple of four times the given width. If the height is provided as well, then the length needs to be exactly the width times the height times 4.

Throws an ["IndexSizeError"](#) [DOMException](#) if the given data and dimensions can't be interpreted consistently, or if either dimension is zero.

***imagedata* = *context* . [getImageData](#)<sup>p669</sup>(*sx*, *sy*, *sw*, *sh*)**

Returns an [ImageData](#)<sup>p635</sup> object containing the image data for the given rectangle of the bitmap.

Throws an ["IndexSizeError"](#) [DOMException](#) if the either of the width or height arguments are zero.

***imagedata* . [width](#)<sup>p669</sup>**

***imagedata* . [height](#)<sup>p669</sup>**

Returns the actual dimensions of the data in the [ImageData](#)<sup>p635</sup> object, in pixels.

***imagedata* . [data](#)<sup>p669</sup>**

Returns the one-dimensional array containing the data in RGBA order, as integers in the range 0 to 255.

***context* . [putImageData](#)<sup>p670</sup>(*imagedata*, *dx*, *dy* [, *dirtyX*, *dirtyY*, *dirtyWidth*, *dirtyHeight* ] )**

Paints the data from the given [ImageData](#)<sup>p635</sup> object onto the bitmap. If a dirty rectangle is provided, only the pixels from that rectangle are painted.

The [globalAlpha](#)<sup>p672</sup> and [globalCompositeOperation](#)<sup>p672</sup> attributes, as well as the shadow attributes, are ignored for the purposes of this method call; pixels in the canvas are replaced wholesale, with no composition, alpha blending, no shadows, etc.

Throws an ["InvalidStateError"](#) [DOMException](#) if the *imagedata* object's [data](#)<sup>p669</sup> attribute value's [\[\[ViewedArrayBuffer\]\]](#) internal slot is detached.

Objects that implement the [CanvasImageData](#)<sup>p634</sup> interface provide the following methods for reading and writing pixel data to the bitmap.

The [ImageData\(\)](#) constructors and the [createImageData\(\)](#) methods are used to instantiate new [ImageData](#)<sup>p635</sup> objects.

MDN

When the [ImageData\(\)](#)<sup>p668</sup> constructor is invoked with two numeric arguments *sw* and *sh*, it must run these steps:

1. If one or both of *sw* and *sh* are zero, then throw an ["IndexSizeError"](#) [DOMException](#).
2. [Create an ImageData object](#)<sup>p669</sup> with parameter *pixelsPerRow* set to *sw*, and *rows* set to *sh*.
3. Initialize the image data of the newly created [ImageData](#)<sup>p635</sup> object to [transparent black](#).
4. Return the newly created [ImageData](#)<sup>p635</sup> object.

When the [ImageData\(\)](#)<sup>p668</sup> constructor is invoked with its first argument being an [Uint8ClampedArray](#) *source* and its second and optional third arguments being numeric arguments *sw* and *sh*, it must run these steps:

1. Let *length* be the number of bytes in *source*.

- If *length* is not a nonzero integral multiple of four, then throw an ["InvalidStateError" DOMException](#).
- Let *length* be *length* divided by four.
- If *length* is not an integral multiple of *sw*, then throw an ["IndexSizeError" DOMException](#).

#### Note

*At this step, the length is guaranteed to be greater than zero (otherwise the second step above would have aborted the steps), so if sw is zero, this step will throw the exception and return.*

- Let *height* be *length* divided by *sw*.
- If the *sh* argument was not omitted, and its value is not equal to *height*, then throw an ["IndexSizeError" DOMException](#).
- [Create an ImageData object](#)<sup>p669</sup>, with parameter *pixelsPerRow* set to *sw*, *rows* set to *sh*, and using *source*. Return the newly created [ImageData](#)<sup>p635</sup> object.

#### Note

*The resulting object's data is not a copy of source, it's the actual [Uint8ClampedArray](#) object passed as the first argument to the constructor.*

When the [createImageData\(\)](#)<sup>p668</sup> method is invoked with two numeric arguments *sw* and *sh*, it must [create an ImageData object](#)<sup>p669</sup>, with parameter *pixelsPerRow* set to the absolute magnitude of *sw*, and parameter *rows* set to the absolute magnitude of *sh*. Initialize the image data of the new [ImageData](#)<sup>p635</sup> object to [transparent black](#). If both *sw* and *sh* are nonzero, then return the new [ImageData](#)<sup>p635</sup> object. If one or both of *sw* and *sh* are zero, then throw an ["IndexSizeError" DOMException](#) instead.

When the [createImageData\(\)](#)<sup>p668</sup> method is invoked with a single *imagedata* argument, it must [create an ImageData object](#)<sup>p669</sup>, with parameter *pixelsPerRow* set to the value of the [width](#)<sup>p669</sup> attribute of the [ImageData](#)<sup>p635</sup> object passed as the argument, and the *rows* parameter set to the value of the [height](#)<sup>p669</sup> attribute. Initialize the image data of the new [ImageData](#)<sup>p635</sup> object to [transparent black](#). Return the newly created [ImageData](#)<sup>p635</sup> object.

The [getImageData\(\*sx\*, \*sy\*, \*sw\*, \*sh\*\)](#) method, when invoked, must, if either the *sw* or *sh* arguments are zero, throw an ["IndexSizeError" DOMException](#); otherwise, if the [CanvasRenderingContext2D](#)<sup>p632</sup>'s [origin-clean](#)<sup>p629</sup> flag is set to false, it must throw a ["SecurityError" DOMException](#); otherwise, it must [create an ImageData object](#)<sup>p669</sup>, with parameter *pixelsPerRow* set to *sw*, and parameter *rows* set to *sh*. Set the pixel values of the image data of the newly created [ImageData](#)<sup>p635</sup> object to represent the [output bitmap](#)<sup>p636</sup> for the area of that bitmap denoted by the rectangle whose corners are the four points (*sx*, *sy*), (*sx*+*sw*, *sy*), (*sx*+*sw*, *sy*+*sh*), (*sx*, *sy*+*sh*), in the bitmap's coordinate space units. Pixels outside the [output bitmap](#)<sup>p636</sup> must be set to [transparent black](#). Pixel values must not be premultiplied by alpha. MDN

When the user agent is required to **create an ImageData object**, given a positive integer number of rows *rows*, a positive integer number of pixels per row *pixelsPerRow*, and an optional [Uint8ClampedArray](#) *source*, it must run these steps:

- Let *imageData* be a new uninitialized [ImageData](#)<sup>p635</sup> object. MDN
- If *source* is specified, then assign the **data** attribute of *imageData* to *source*.
- If *source* is not specified, then initialize the **data**<sup>p669</sup> attribute of *imageData* to a new [Uint8ClampedArray](#) object. The [Uint8ClampedArray](#) object must use a new [Canvas Pixel ArrayBuffer](#)<sup>p670</sup> for its storage, and must have a zero start offset and a length equal to the length of its storage, in bytes. The [Canvas Pixel ArrayBuffer](#)<sup>p670</sup> must have the correct size to store *rows* × *pixelsPerRow* pixels.

If the [Canvas Pixel ArrayBuffer](#)<sup>p670</sup> cannot be allocated, then rethrow the [RangeError](#) thrown by JavaScript, and return.

- Initialize the **width** attribute of *imageData* to *pixelsPerRow*.
- Initialize the **height** attribute of *imageData* to *rows*.
- Return *imageData*.

[ImageData](#)<sup>p635</sup> objects are [serializable objects](#)<sup>p99</sup>. Their [serialization steps](#)<sup>p99</sup>, given *value* and *serialized*, are:

- Set *serialized*.[[Data]] to the [sub-serialization](#)<sup>p104</sup> of the value of *value*'s **data**<sup>p669</sup> attribute.
- Set *serialized*.[[Width]] to the value of *value*'s **width**<sup>p669</sup> attribute.

3. Set `serialized.[[Height]]` to the value of `value`'s `height`<sup>p669</sup> attribute.

Their `deserialization steps`<sup>p100</sup>, given `serialized` and `value`, are:

1. Initialize `value`'s `data`<sup>p669</sup> attribute to the `sub-deserialization`<sup>p107</sup> of `serialized.[[Data]]`.
2. Initialize `value`'s `width`<sup>p669</sup> attribute to `serialized.[[Width]]`.
3. Initialize `value`'s `height`<sup>p669</sup> attribute to `serialized.[[Height]]`.

A **Canvas Pixel ArrayBuffer** is an `ArrayBuffer` whose data is represented in left-to-right order, row by row top to bottom, starting with the top left, with each pixel's red, green, blue, and alpha components being given in that order for each pixel. Each component of each pixel represented in this array must be in the range 0..255, representing the 8 bit value for that component. The components must be assigned consecutive indices starting with 0 for the top left pixel's red component.

The `putImageData()` method writes data from `ImageData`<sup>p635</sup> structures back to the rendering context's `output bitmap`<sup>p636</sup>. Its arguments are: `imagedata`, `dx`, `dy`, `dirtyX`, `dirtyY`, `dirtyWidth`, and `dirtyHeight`. 

When the last four arguments to this method are omitted, they must be assumed to have the values 0, 0, the `width`<sup>p669</sup> member of the `imagedata` structure, and the `height`<sup>p669</sup> member of the `imagedata` structure, respectively.

The method, when invoked, must act as follows:

1. Let `buffer` be `imagedata`'s `data`<sup>p669</sup> attribute value's `[[ViewedArrayBuffer]]` internal slot.
2. If `IsDetachedBuffer(buffer)` is true, then throw an `"InvalidStateError" DOMException`.
3. If `dirtyWidth` is negative, then let `dirtyX` be `dirtyX+dirtyWidth`, and let `dirtyWidth` be equal to the absolute magnitude of `dirtyWidth`.  
If `dirtyHeight` is negative, then let `dirtyY` be `dirtyY+dirtyHeight`, and let `dirtyHeight` be equal to the absolute magnitude of `dirtyHeight`.
4. If `dirtyX` is negative, then let `dirtyWidth` be `dirtyWidth+dirtyX`, and let `dirtyX` be zero.  
If `dirtyY` is negative, then let `dirtyHeight` be `dirtyHeight+dirtyY`, and let `dirtyY` be zero.
5. If `dirtyX+dirtyWidth` is greater than the `width`<sup>p669</sup> attribute of the `imagedata` argument, then let `dirtyWidth` be the value of that `width`<sup>p669</sup> attribute, minus the value of `dirtyX`.  
If `dirtyY+dirtyHeight` is greater than the `height`<sup>p669</sup> attribute of the `imagedata` argument, then let `dirtyHeight` be the value of that `height`<sup>p669</sup> attribute, minus the value of `dirtyY`.
6. If, after those changes, either `dirtyWidth` or `dirtyHeight` are negative or zero, then return without affecting any bitmaps.
7. For all integer values of `x` and `y` where `dirtyX ≤ x < dirtyX+dirtyWidth` and `dirtyY ≤ y < dirtyY+dirtyHeight`, copy the four channels of the pixel with coordinate `(x, y)` in the `imagedata` data structure's `Canvas Pixel ArrayBuffer`<sup>p670</sup> to the pixel with coordinate `(dx+x, dy+y)` in the rendering context's `output bitmap`<sup>p636</sup>.

#### Note

Due to the lossy nature of converting to and from premultiplied alpha color values, pixels that have just been set using `putImageData()`<sup>p670</sup> might be returned to an equivalent `getImageData()`<sup>p669</sup> as different values.

The current path, `transformation matrix`<sup>p652</sup>, `shadow attributes`<sup>p673</sup>, `global alpha`<sup>p672</sup>, the `clipping region`<sup>p663</sup>, and `global composition operator`<sup>p672</sup> must not affect the methods described in this section.

#### Example

In the following example, the script generates an `ImageData`<sup>p635</sup> object so that it can draw onto it.

```
// canvas is a reference to a <canvas> element
var context = canvas.getContext('2d');

// create a blank slate
var data = context.createImageData(canvas.width, canvas.height);
```

```

// create some plasma
FillPlasma(data, 'green'); // green plasma

// add a cloud to the plasma
AddCloud(data, data.width/2, data.height/2); // put a cloud in the middle

// paint the plasma+cloud on the canvas
context.putImageData(data, 0, 0);

// support methods
function FillPlasma(data, color) { ... }
function AddCloud(data, x, y) { ... }

```

## Example

Here is an example of using [getImageData\(\)](#)<sup>p669</sup> and [putImageData\(\)](#)<sup>p670</sup> to implement an edge detection filter.

```

<!DOCTYPE HTML>
<html lang="en">
<head>
<title>Edge detection demo</title>
<script>
var image = new Image();
function init() {
  image.onload = demo;
  image.src = "image.jpeg";
}
function demo() {
  var canvas = document.getElementsByTagName('canvas')[0];
  var context = canvas.getContext('2d');

  // draw the image onto the canvas
  context.drawImage(image, 0, 0);

  // get the image data to manipulate
  var input = context.getImageData(0, 0, canvas.width, canvas.height);

  // get an empty slate to put the data into
  var output = context.createImageData(canvas.width, canvas.height);

  // alias some variables for convenience
  // In this case input.width and input.height
  // match canvas.width and canvas.height
  // but we'll use the former to keep the code generic.
  var w = input.width, h = input.height;
  var inputData = input.data;
  var outputData = output.data;

  // edge detection
  for (var y = 1; y < h-1; y += 1) {
    for (var x = 1; x < w-1; x += 1) {
      for (var c = 0; c < 3; c += 1) {
        var i = (y*w + x)*4 + c;
        outputData[i] = 127 + -inputData[i - w*4 - 4] -  inputData[i - w*4] - inputData[i -
w*4 + 4] +
                                -inputData[i - 4]          + 8*inputData[i]          - inputData[i + 4]
+
                                -inputData[i + w*4 - 4] -  inputData[i + w*4] - inputData[i +
w*4 + 4];
      }
    }
  }

```

```

        outputData[(y*w + x)*4 + 3] = 255; // alpha
    }
}

// put the image data back after manipulation
context.putImageData(output, 0, 0);
}
</script>
</head>
<body onload="init()">
  <canvas></canvas>
</body>
</html>

```

#### 4.12.5.1.16 Compositing §<sup>p67</sup><sub>2</sub>

For web developers (non-normative)

**context . globalAlpha<sup>p672</sup> [ = value ]**

Returns the current alpha value applied to rendering operations.

Can be set, to change the alpha value. Values outside of the range 0.0 .. 1.0 are ignored.

**context . globalCompositeOperation<sup>p672</sup> [ = value ]**

Returns the current composition operation, from the values defined in *Compositing and Blending*. [\[COMPOSITE\]<sup>p1264</sup>](#).

Can be set, to change the composition operation. Unknown values are ignored.

All drawing operations on an object which implements the [CanvasCompositing<sup>p632</sup>](#) interface are affected by the global compositing attributes, [globalAlpha<sup>p672</sup>](#) and [globalCompositeOperation<sup>p672</sup>](#).

The [globalAlpha](#) attribute gives an alpha value that is applied to shapes and images before they are composited onto the [output bitmap<sup>p636</sup>](#). The value must be in the range from 0.0 (fully transparent) to 1.0 (no additional transparency). If an attempt is made to set the attribute to a value outside this range, including Infinity and Not-a-Number (NaN) values, then the attribute must retain its previous value. When the context is created, the [globalAlpha<sup>p672</sup>](#) attribute must initially have the value 1.0.

The [globalCompositeOperation](#) attribute sets the **current composition operator**, which controls how shapes and images are drawn onto the [output bitmap<sup>p636</sup>](#), once they have had [globalAlpha<sup>p672</sup>](#) and the current transformation matrix applied. The possible values are those defined in *Compositing and Blending*, and include the values **source-over** and **copy**. [\[COMPOSITE\]<sup>p1264</sup>](#)

These values are all case-sensitive — they must be used exactly as defined. User agents must not recognize values that are not a [case-sensitive<sup>p65</sup>](#) match for one of the values given in *Compositing and Blending*. [\[COMPOSITE\]<sup>p1264</sup>](#)

On setting, if the user agent does not recognize the specified value, it must be ignored, leaving the value of [globalCompositeOperation<sup>p672</sup>](#) unaffected. Otherwise, the attribute must be set to the given new value.

When the context is created, the [globalCompositeOperation<sup>p672</sup>](#) attribute must initially have the value **source-over<sup>p672</sup>**.

#### 4.12.5.1.17 Image smoothing §<sup>p67</sup><sub>2</sub>

For web developers (non-normative)

**context . imageSmoothingEnabled<sup>p673</sup> [ = value ]**

Returns whether pattern fills and the [drawImage\(\)<sup>p666</sup>](#) method will attempt to smooth images if their pixels don't line up exactly with the display, when scaling images up.

Can be set, to change whether images are smoothed (true) or not (false).

### **context . imageSmoothingQuality**<sup>p673</sup> [ = value ]

Returns the current image-smoothing-quality preference.

Can be set, to change the preferred quality of image smoothing. The possible values are "low"<sup>p638</sup>, "medium"<sup>p638</sup> and "high"<sup>p638</sup>. Unknown values are ignored.

Objects that implement the [CanvasImageSmoothing](#)<sup>p632</sup> interface have attributes that control how image smoothing is performed.

The **imageSmoothingEnabled** attribute, on getting, must return the last value it was set to. On setting, it must be set to the new value. When the object implementing the [CanvasImageSmoothing](#)<sup>p632</sup> interface is created, the attribute must be set to true.

The **imageSmoothingQuality** attribute, on getting, must return the last value it was set to. On setting, it must be set to the new value. When the object implementing the [CanvasImageSmoothing](#)<sup>p632</sup> interface is created, the attribute must be set to "low"<sup>p638</sup>.

#### 4.12.5.1.18 Shadows <sup>p67</sup><sub>3</sub>

All drawing operations on an object which implements the [CanvasShadowStyles](#)<sup>p633</sup> interface are affected by the four global shadow attributes.

#### For web developers (non-normative)

### **context . shadowColor**<sup>p673</sup> [ = value ]

Returns the current shadow color.

Can be set, to change the shadow color. Values that cannot be parsed as CSS colors are ignored.

### **context . shadowOffsetX**<sup>p673</sup> [ = value ]

### **context . shadowOffsetY**<sup>p673</sup> [ = value ]

Returns the current shadow offset.

Can be set, to change the shadow offset. Values that are not finite numbers are ignored.

### **context . shadowBlur**<sup>p673</sup> [ = value ]

Returns the current level of blur applied to shadows.

Can be set, to change the blur level. Values that are not finite numbers greater than or equal to zero are ignored.

The **shadowColor** attribute sets the color of the shadow. ✓ MDN

When the context is created, the [shadowColor](#)<sup>p673</sup> attribute initially must be [transparent black](#).

On getting, the [serialization of the color](#)<sup>p656</sup> must be returned.

On setting, the new value must be [parsed](#)<sup>p57</sup> with this [canvas](#)<sup>p627</sup> element and the color assigned. If parsing the value results in failure then it must be ignored, and the attribute must retain its previous value. [\[CSSCOLOR\]](#)<sup>p1265</sup>

The **shadowOffsetX** and **shadowOffsetY** attributes specify the distance that the shadow will be offset in the positive horizontal and positive vertical distance respectively. Their values are in coordinate space units. They are not affected by the current transformation matrix. ✓ MDN

When the context is created, the shadow offset attributes must initially have the value 0.

On getting, they must return their current value. On setting, the attribute being set must be set to the new value, except if the value is infinite or NaN, in which case the new value must be ignored.

The **shadowBlur** attribute specifies the level of the blurring effect. (The units do not map to coordinate space units, and are not affected by the current transformation matrix.) ✓ MDN

When the context is created, the [shadowBlur](#)<sup>p673</sup> attribute must initially have the value 0.

On getting, the attribute must return its current value. On setting the attribute must be set to the new value, except if the value is negative, infinite or NaN, in which case the new value must be ignored.

**Shadows are only drawn if** the opacity component of the alpha component of the color of [shadowColor<sup>p673</sup>](#) is nonzero and either the [shadowBlur<sup>p673</sup>](#) is nonzero, or the [shadowOffsetX<sup>p673</sup>](#) is nonzero, or the [shadowOffsetY<sup>p673</sup>](#) is nonzero.

[When shadows are drawn<sup>p674</sup>](#), they must be rendered as follows:

1. Let *A* be an infinite [transparent black](#) bitmap on which the source image for which a shadow is being created has been rendered.
2. Let *B* be an infinite [transparent black](#) bitmap, with a coordinate space and an origin identical to *A*.
3. Copy the alpha channel of *A* to *B*, offset by [shadowOffsetX<sup>p673</sup>](#) in the positive *x* direction, and [shadowOffsetY<sup>p673</sup>](#) in the positive *y* direction.
4. If [shadowBlur<sup>p673</sup>](#) is greater than 0:
  1. Let  $\sigma$  be half the value of [shadowBlur<sup>p673</sup>](#).
  2. Perform a 2D Gaussian Blur on *B*, using  $\sigma$  as the standard deviation.

User agents may limit values of  $\sigma$  to an implementation-specific maximum value to avoid exceeding hardware limitations during the Gaussian blur operation.

5. Set the red, green, and blue components of every pixel in *B* to the red, green, and blue components (respectively) of the color of [shadowColor<sup>p673</sup>](#).
6. Multiply the alpha component of every pixel in *B* by the alpha component of the color of [shadowColor<sup>p673</sup>](#).
7. The shadow is in the bitmap *B*, and is rendered as part of the [drawing model<sup>p675</sup>](#) described below.

If the current composition operation is [copy<sup>p672</sup>](#), then shadows effectively won't render (since the shape will overwrite the shadow).

#### 4.12.5.1.19 Filters S<sup>p67</sup><sub>4</sub>

MDN

All drawing operations on an object which implements the [CanvasFilters<sup>p633</sup>](#) interface are affected by the global **filter** attribute.

For web developers (non-normative)

**`context . filterp674 [ = value ]`**

Returns the current filter.

Can be set, to change the filter. Values that cannot be parsed as a [<filter-function-list>](#) value are ignored.

The [filter<sup>p674</sup>](#) attribute, on getting, must return the last value it was successfully set to. The value must not be re-serialized. On setting, if the new value is 'none' (not the empty string, null, or undefined), filters must be disabled for the context. Otherwise, the value must be parsed as a [<filter-function-list>](#) value. If the value cannot be parsed as a [<filter-function-list>](#) value, where using property-independent style sheet syntax like 'inherit' or 'initial' is considered an invalid value, then it must be ignored, and the attribute must retain its previous value. When creating the object implementing the [CanvasFilters<sup>p633</sup>](#) interface, the attribute must be set to 'none'.

A [<filter-function-list>](#) value consists of a sequence of one or more filter functions or references to SVG filters. The input to the filter is used as the input to the first item in the list. Subsequent items take the output of the previous item as their input. [\[FILTERS\]<sup>p1266</sup>](#)

Coordinates used in the value of the [filter<sup>p674</sup>](#) attribute are interpreted such that one pixel is equivalent to one SVG user space unit and to one canvas coordinate space unit. Filter coordinates are not affected by the [current transformation matrix<sup>p652</sup>](#). The current transformation matrix affects only the input to the filter. Filters are applied in the [output bitmap<sup>p636</sup>](#)'s coordinate space.

When the value of the [filter<sup>p674</sup>](#) attribute defines lengths using percentages or using 'em' or 'ex' units, these must be interpreted relative to the [computed value](#) of the 'font-size' property of the [font style source object<sup>p643</sup>](#) at the time that the attribute is set, if it is an element. If the [computed values](#) are undefined for a particular case (e.g. because the [font style source object<sup>p643</sup>](#) is not an element or is not [being rendered<sup>p1172</sup>](#)), then the relative keywords must be interpreted relative to the default value of the [font<sup>p644</sup>](#) attribute. The 'larger' and 'smaller' keywords are not supported.

If the value of the [filter<sup>p674</sup>](#) attribute refers to an SVG filter in the same document, and this SVG filter changes, then the changed filter is used for the next draw operation.

If the value of the [filter<sup>p674</sup>](#) attribute refers to an SVG filter in an external resource document and that document is not loaded when a drawing operation is invoked, then the drawing operation must proceed with no filtering.

#### 4.12.5.1.20 Working with externally-defined SVG filters §<sup>p67</sup><sub>5</sub>

*This section is non-normative.*

Since drawing is performed using filter value 'none' until an externally-defined filter has finished loading, authors might wish to determine whether such a filter has finished loading before proceeding with a drawing operation. One way to accomplish this is to load the externally-defined filter elsewhere within the same page in some element that sends a `load` event (for example, an [SVG use](#) element), and wait for the `load` event to be dispatched.

#### 4.12.5.1.21 Drawing model §<sup>p67</sup><sub>5</sub>

When a shape or image is painted, user agents must follow these steps, in the order given (or act as if they do):

1. Render the shape or image onto an infinite [transparent black](#) bitmap, creating image A, as described in the previous sections. For shapes, the current fill, stroke, and line styles must be honored, and the stroke must itself also be subjected to the current transformation matrix.
2. When the filter attribute is set to a value other than 'none' and all the externally-defined filters it references, if any, are in documents that are currently loaded, then use image A as the input to the [filter<sup>p674</sup>](#), creating image B. Otherwise, let B be an alias for A.
3. [When shadows are drawn<sup>p674</sup>](#), render the shadow from image B, using the current shadow styles, creating image C.
4. [When shadows are drawn<sup>p674</sup>](#), multiply the alpha component of every pixel in C by [globalAlpha<sup>p672</sup>](#).
5. [When shadows are drawn<sup>p674</sup>](#), composite C within the [clipping region<sup>p663</sup>](#) over the current [output bitmap<sup>p636</sup>](#) using the [current composition operator<sup>p672</sup>](#).
6. Multiply the alpha component of every pixel in B by [globalAlpha<sup>p672</sup>](#).
7. Composite B within the [clipping region<sup>p663</sup>](#) over the current [output bitmap<sup>p636</sup>](#) using the [current composition operator<sup>p672</sup>](#).

When compositing onto the [output bitmap<sup>p636</sup>](#), pixels that would fall outside of the [output bitmap<sup>p636</sup>](#) must be discarded.

#### 4.12.5.1.22 Best practices §<sup>p67</sup><sub>5</sub>

When a canvas is interactive, authors should include [focusable<sup>p765</sup>](#) elements in the element's fallback content corresponding to each [focusable<sup>p765</sup>](#) part of the canvas, as in the [example above<sup>p663</sup>](#).

When rendering focus rings, to ensure that focus rings have the appearance of native focus rings, authors should use the [drawFocusIfNeeded\(\)<sup>p665</sup>](#) method, passing it the element for which a ring is being drawn. This method only draws the focus ring if the element is [focused<sup>p764</sup>](#), so that it can simply be called whenever drawing the element, without checking whether the element is focused or not first.

In addition to drawing focus rings, authors should use the [scrollPathIntoView\(\)<sup>p666</sup>](#) method when an element in the canvas is focused, to make sure it is visible on the screen (if applicable).

Authors should avoid implementing text editing controls using the [canvas<sup>p627</sup>](#) element. Doing so has a large number of disadvantages:

- Mouse placement of the caret has to be reimplemented.
- Keyboard movement of the caret has to be reimplemented (possibly across lines, for multiline text input).
- Scrolling of the text control has to be implemented (horizontally for long lines, vertically for multiline input).
- Native features such as copy-and-paste have to be reimplemented.
- Native features such as spell-checking have to be reimplemented.

- Native features such as drag-and-drop have to be reimplemented.
- Native features such as page-wide text search have to be reimplemented.
- Native features specific to the user, for example custom text services, have to be reimplemented. This is close to impossible since each user might have different services installed, and there is an unbounded set of possible such services.
- Bidirectional text editing has to be reimplemented.
- For multiline text editing, line wrapping has to be implemented for all relevant languages.
- Text selection has to be reimplemented.
- Dragging of bidirectional text selections has to be reimplemented.
- Platform-native keyboard shortcuts have to be reimplemented.
- Platform-native input method editors (IMEs) have to be reimplemented.
- Undo and redo functionality has to be reimplemented.
- Accessibility features such as magnification following the caret or selection have to be reimplemented.

This is a huge amount of work, and authors are most strongly encouraged to avoid doing any of it by instead using the [input](#)<sup>p486</sup> element, the [textarea](#)<sup>p541</sup> element, or the [contenteditable](#)<sup>p780</sup> attribute.

#### 4.12.5.1.23 Examples <sup>§p67</sup><sub>6</sub>

*This section is non-normative.*

##### Example

Here is an example of a script that uses canvas to draw [pretty glowing lines](#).

```
<canvas width="800" height="450"></canvas>
<script>

var context = document.getElementsByTagName('canvas')[0].getContext('2d');

var lastX = context.canvas.width * Math.random();
var lastY = context.canvas.height * Math.random();
var hue = 0;
function line() {
  context.save();
  context.translate(context.canvas.width/2, context.canvas.height/2);
  context.scale(0.9, 0.9);
  context.translate(-context.canvas.width/2, -context.canvas.height/2);
  context.beginPath();
  context.lineWidth = 5 + Math.random() * 10;
  context.moveTo(lastX, lastY);
  lastX = context.canvas.width * Math.random();
  lastY = context.canvas.height * Math.random();
  context.bezierCurveTo(context.canvas.width * Math.random(),
                        context.canvas.height * Math.random(),
                        context.canvas.width * Math.random(),
                        context.canvas.height * Math.random(),
                        lastX, lastY);

  hue = hue + 10 * Math.random();
  context.strokeStyle = 'hsl(' + hue + ', 50%, 50%)';
  context.shadowColor = 'white';
  context.shadowBlur = 10;
  context.stroke();
  context.restore();
}
```

```

}
setInterval(line, 50);

function blank() {
  context.fillStyle = 'rgba(0,0,0,0.1)';
  context.fillRect(0, 0, context.canvas.width, context.canvas.height);
}
setInterval(blank, 40);

</script>

```

### Example

The 2D rendering context for [canvas<sup>p627</sup>](#) is often used for sprite-based games. The following example demonstrates this:

Walk Stop

Blue Robot Player Sprite by [JohnColburn](#). Licensed under the [Creative Commons Attribution Share-Alike 3.0 Unported license](#). This work is itself licensed under a [Creative Commons Attribution Share-Alike 3.0 Unported License](#).

```

<!DOCTYPE HTML>
<meta charset="utf-8">
<title>Blue Robot Demo</title>
<style>
  html { overflow: hidden; min-height: 200px; min-width: 380px; }
  body { height: 200px; position: relative; margin: 8px; }
  .buttons { position: absolute; bottom: 0px; left: 0px; margin: 4px; }
</style>
<canvas width="380" height="200"></canvas>

#### 4.12.5.2 The [ImageBitmap](#)<sup>p970</sup> rendering context [§ p68](#)<sub>0</sub>

##### 4.12.5.2.1 Introduction [§ p68](#)<sub>0</sub>

[ImageBitmapRenderingContext](#)<sup>p680</sup> is a performance-oriented interface that provides a low overhead method for displaying the contents of [ImageBitmap](#)<sup>p970</sup> objects. It uses transfer semantics to reduce overall memory consumption. It also streamlines performance by avoiding intermediate compositing, unlike the [drawImage\(\)](#)<sup>p666</sup> method of [CanvasRenderingContext2D](#)<sup>p632</sup>.

Using an [img](#)<sup>p314</sup> element as an intermediate for getting an image resource into a canvas, for example, would result in two copies of the decoded image existing in memory at the same time: the [img](#)<sup>p314</sup> element's copy, and the one in the canvas's backing store. This memory cost can be prohibitive when dealing with extremely large images. This can be avoided by using [ImageBitmapRenderingContext](#)<sup>p680</sup>.

##### Example

Using [ImageBitmapRenderingContext](#)<sup>p680</sup>, here is how to transcode an image to the JPEG format in a memory- and CPU-efficient way:

```

createImageBitmap(inputImageBlob).then(image => {
  const canvas = document.createElement('canvas');
  const context = canvas.getContext('bitmaprenderer');
  context.transferFromImageBitmap(image);

  canvas.toBlob(outputJPEGBlob => {
    // Do something with outputJPEGBlob.
  }, 'image/jpeg');
});

```

#### 4.12.5.2.2 The [ImageBitmapRenderingContext](#)<sup>p680</sup> interface [§ p68](#)<sub>0</sub>

MDN

```

IDL [Exposed=(Window,Worker)]
interface ImageBitmapRenderingContext {
  readonly attribute (HTMLCanvasElement or OffscreenCanvas) canvas;
  void transferFromImageBitmap(ImageBitmap? bitmap);
};

```

```
dictionary ImageBitmapRenderingContextSettings {
  boolean alpha = true;
};
```

#### For web developers (non-normative)

**context** = **canvas** . **getContext**<sup>p629</sup>('bitmaprenderer' [, { [ **alpha**<sup>p682</sup>: false ] } ] )

Returns an [ImageBitmapRenderingContext](#)<sup>p680</sup> object that is permanently bound to a particular [canvas](#)<sup>p627</sup> element.

If the [alpha](#)<sup>p682</sup> setting is provided and set to false, then the canvas is forced to always be opaque.

**context** . **canvas**<sup>p681</sup>

Returns the [canvas](#)<sup>p627</sup> element that the context is bound to.

**context** . **transferFromImageBitmap**<sup>p682</sup>(**imageBitmap**)

Transfers the underlying [bitmap data](#)<sup>p971</sup> from *imageBitmap* to *context*, and the bitmap becomes the contents of the [canvas](#)<sup>p627</sup> element to which *context* is bound.

**context** . **transferFromImageBitmap**<sup>p682</sup>(**null**)

Replaces contents of the [canvas](#)<sup>p627</sup> element to which *context* is bound with a [transparent black](#) bitmap whose size corresponds to the [width](#)<sup>p628</sup> and [height](#)<sup>p628</sup> content attributes of the [canvas](#)<sup>p627</sup> element.

The [canvas](#) attribute must return the value it was initialized to when the object was created.

An [ImageBitmapRenderingContext](#)<sup>p680</sup> object has an **output bitmap**, which is a reference to [bitmap data](#)<sup>p971</sup>.

An [ImageBitmapRenderingContext](#)<sup>p680</sup> object has a **bitmap mode**, which can be set to **valid** or **blank**. A value of [valid](#)<sup>p681</sup> indicates that the context's [output bitmap](#)<sup>p681</sup> refers to [bitmap data](#)<sup>p971</sup> that was acquired via [transferFromImageBitmap\(\)](#)<sup>p682</sup>. A value [blank](#)<sup>p681</sup> indicates that the context's [output bitmap](#)<sup>p681</sup> is a default transparent bitmap.

An [ImageBitmapRenderingContext](#)<sup>p680</sup> object also has an **alpha** flag, which can be set to true or false. When an [ImageBitmapRenderingContext](#)<sup>p680</sup> object has its [alpha](#)<sup>p681</sup> flag set to false, the contents of the [canvas](#)<sup>p627</sup> element to which the context is bound are obtained by compositing the context's [output bitmap](#)<sup>p681</sup> onto an [opaque black](#) bitmap of the same size using the source-over composite operation. If the [alpha](#)<sup>p681</sup> flag is set to true, then the [output bitmap](#)<sup>p681</sup> is used as the contents of the [canvas](#)<sup>p627</sup> element to which the context is bound. [\[COMPOSITE\]](#)<sup>p1264</sup>

#### Note

*The step of compositing over an [opaque black](#) bitmap ought to be elided whenever equivalent results can be obtained more efficiently by other means.*

When a user agent is required to **set an [ImageBitmapRenderingContext](#)'s output bitmap**, with a *context* argument that is an [ImageBitmapRenderingContext](#)<sup>p680</sup> object and an optional argument *bitmap* that refers to [bitmap data](#)<sup>p971</sup>, it must run these steps:

1. If a *bitmap* argument was not provided, then:
  1. Set *context*'s [bitmap mode](#)<sup>p681</sup> to [blank](#)<sup>p681</sup>.
  2. Let *canvas* be the [canvas](#)<sup>p627</sup> element to which *context* is bound.
  3. Set *context*'s [output bitmap](#)<sup>p681</sup> to be [transparent black](#) with an [intrinsic width](#) equal to [the numeric value](#)<sup>p628</sup> of *canvas*'s [width](#)<sup>p628</sup> attribute and an [intrinsic height](#) equal to [the numeric value](#)<sup>p628</sup> of *canvas*'s [height](#)<sup>p628</sup> attribute, those values being interpreted in [CSS pixels](#).
  4. Set the [output bitmap](#)<sup>p681</sup>'s [origin-clean](#)<sup>p629</sup> flag to true.
2. If a *bitmap* argument was provided, then:
  1. Set *context*'s [bitmap mode](#)<sup>p681</sup> to [valid](#)<sup>p681</sup>.
  2. Set *context*'s [output bitmap](#)<sup>p681</sup> to refer to the same underlying bitmap data as *bitmap*, without making a copy.

#### Note

*The [origin-clean](#)<sup>p629</sup> flag of bitmap is included in the bitmap data to be referenced by context's [output](#)*

The **ImageBitmapRenderingContext creation algorithm**, which is passed a *target* and *options*, consists of running these steps:

1. Let *settings* be the result of [converting](#) *options* to the dictionary type [ImageBitmapRenderingContextSettings<sup>p681</sup>](#). (This can throw an exception.)
2. Let *context* be a new [ImageBitmapRenderingContext<sup>p680</sup>](#) object.
3. Initialize *context*'s [canvas<sup>p637</sup>](#) attribute to point to *target*.
4. Set *context*'s [output bitmap<sup>p681</sup>](#) to the same bitmap as *target*'s bitmap (so that they are shared).
5. Run the steps to [set an ImageBitmapRenderingContext's output bitmap<sup>p681</sup>](#) with *context*.
6. Initialize *context*'s [alpha<sup>p681</sup>](#) flag to true.
7. Process each of the members of *settings* as follows:
  - alpha**  
If false, then set *context*'s [alpha<sup>p681</sup>](#) flag to false.
8. Return *context*.

The **transferFromImageBitmap(*imageBitmap*)** method, when invoked, must run these steps:

1. Let *bitmapContext* be the [ImageBitmapRenderingContext<sup>p680</sup>](#) object on which the [transferFromImageBitmap\(\)<sup>p682</sup>](#) method was called.
2. If *imageBitmap* is null, then run the steps to [set an ImageBitmapRenderingContext's output bitmap<sup>p681</sup>](#), with *bitmapContext* as the *context* argument and no *bitmap* argument, then return.
3. If the value of *imageBitmap*'s [\[\[Detached\]\]<sup>p101</sup>](#) internal slot is set to true, then throw an ["InvalidStateError" DOMException](#).
4. Run the steps to [set an ImageBitmapRenderingContext's output bitmap<sup>p681</sup>](#), with the *context* argument equal to *bitmapContext*, and the *bitmap* argument referring to *imageBitmap*'s underlying [bitmap data<sup>p971</sup>](#).
5. Set the value of *imageBitmap*'s [\[\[Detached\]\]<sup>p101</sup>](#) internal slot to true.
6. Unset *imageBitmap*'s [bitmap data<sup>p971</sup>](#).

#### 4.12.5.3 The [OffscreenCanvas<sup>p682</sup>](#) interface § <sup>p68</sup><sub>2</sub>

```

IDL
typedef (OffscreenCanvasRenderingContext2D or ImageBitmapRenderingContext or WebGLRenderingContext or
WebGL2RenderingContext) OffscreenRenderingContext;

dictionary ImageEncodeOptions {
  DOMString type = "image/png";
  unrestricted double quality;
};

enum OffscreenRenderingContextId { "2d", "bitmaprenderer", "webgl", "webgl2" };

[Exposed=(Window,Worker), Transferable]
interface OffscreenCanvas : EventTarget {
  constructor([EnforceRange] unsigned long long width, [EnforceRange] unsigned long long height);

  attribute [EnforceRange] unsigned long long width;
  attribute [EnforceRange] unsigned long long height;
};
    
```

Support:

- Chrome for Android
- Chrome
- Firefox
- Firefox for Android
- IE
- Opera
- Opera Mini
- Firefox for iOS

```

OffscreenRenderingContext? getContext(OffscreenRenderingContextId contextId, optional any options =
null);
ImageBitmap transferToImageBitmap();
Promise<Blob> convertToBlob(optional ImageEncodeOptions options = {});
};

```

## Note

[OffscreenCanvas](#)<sup>p682</sup> is an *EventTarget* so that WebGL can fire *webglcontextlost* and *webglcontextrestored* events at it. [\[WEBGL\]](#)<sup>p1271</sup>

[OffscreenCanvas](#)<sup>p682</sup> objects are used to create rendering contexts, much like an [HTMLCanvasElement](#)<sup>p627</sup>, but with no connection to the DOM. This makes it possible to use canvas rendering contexts in [workers](#)<sup>p1008</sup>.

An [OffscreenCanvas](#)<sup>p682</sup> object may hold a weak reference to a **placeholder canvas element**, which is typically in the DOM, whose embedded content is provided by the [OffscreenCanvas](#)<sup>p682</sup> object. The bitmap of the [OffscreenCanvas](#)<sup>p682</sup> object is pushed to the [placeholder canvas element](#)<sup>p683</sup> by calling the `commit()` method of the [OffscreenCanvas](#)<sup>p682</sup> object's rendering context. All rendering context types that can be created by an [OffscreenCanvas](#)<sup>p682</sup> object must implement a `commit()`<sup>p683</sup> method. The exact behavior of the commit method (e.g. whether it copies or transfers bitmaps) may vary, as defined by the rendering contexts' respective specifications. Only the [2D context for offscreen canvases](#)<sup>p686</sup> is defined in this specification.

## For web developers (non-normative)

**`offscreenCanvas = new OffscreenCanvas`**<sup>p683</sup>(*width*, *height*)

Returns a new [OffscreenCanvas](#)<sup>p682</sup> object that is not linked to a [placeholder canvas element](#)<sup>p683</sup>, and whose bitmap's size is determined by the *width* and *height* arguments.

**`context = offscreenCanvas . getContext`**<sup>p684</sup>(*contextId* [, *options* ] )

Returns an object that exposes an API for drawing on the [OffscreenCanvas](#)<sup>p682</sup> object. *contextId* specifies the desired API: "[2d](#)<sup>p684</sup>", "[bitmaprenderer](#)<sup>p684</sup>", "[webgl](#)<sup>p684</sup>", or "[webgl2](#)<sup>p684</sup>". *options* is handled by that API.

This specification defines the "[2d](#)<sup>p630</sup>" context below, which is similar but distinct from the "[2d](#)<sup>p684</sup>" context that is created from a [canvas](#)<sup>p627</sup> element. The WebGL specifications define the "[webgl](#)<sup>p684</sup>" and "[webgl2](#)<sup>p684</sup>" contexts. [\[WEBGL\]](#)<sup>p1271</sup>

Returns null if the canvas has already been initialized with another context type (e.g., trying to get a "[2d](#)<sup>p684</sup>" context after getting a "[webgl](#)<sup>p684</sup>" context).

An [OffscreenCanvas](#)<sup>p682</sup> object has an internal **bitmap** that is initialized when the object is created. The width and height of the [bitmap](#)<sup>p683</sup> are equal to the values of the [width](#)<sup>p684</sup> and [height](#)<sup>p684</sup> attributes of the [OffscreenCanvas](#)<sup>p682</sup> object. Initially, all the bitmap's pixels are [transparent black](#).

An [OffscreenCanvas](#)<sup>p682</sup> object can have a rendering context bound to it. Initially, it does not have a bound rendering context. To keep track of whether it has a rendering context or not, and what kind of rendering context it is, an [OffscreenCanvas](#)<sup>p682</sup> object also has a **context mode**, which is initially **none** but can be changed to either **2d**, **bitmaprenderer**, **webgl**, **webgl2**, or **detached** by algorithms defined in this specification.

The constructor **`OffscreenCanvas`**(*width*, *height*), when invoked, must create a new [OffscreenCanvas](#)<sup>p682</sup> object with its [bitmap](#)<sup>p683</sup> initialized to a rectangular array of [transparent black](#) pixels of the dimensions specified by *width* and *height*; and its [width](#)<sup>p684</sup> and [height](#)<sup>p684</sup> attributes initialized to *width* and *height* respectively.

[OffscreenCanvas](#)<sup>p682</sup> objects are [transferable](#)<sup>p100</sup>. Their [transfer steps](#)<sup>p101</sup>, given *value* and *dataHolder*, are as follows:

1. If *value*'s [context mode](#)<sup>p683</sup> is not equal to [none](#)<sup>p683</sup>, then throw an ["InvalidStateError" DOMException](#).
2. Set *value*'s [context mode](#)<sup>p683</sup> to [detached](#)<sup>p683</sup>.
3. Let *width* and *height* be the dimensions of *value*'s [bitmap](#)<sup>p683</sup>.
4. Unset *value*'s [bitmap](#)<sup>p683</sup>.
5. Set *dataHolder*.[[Width]] to *width* and *dataHolder*.[[Height]] to *height*.
6. Set *dataHolder*.[[PlaceholderCanvas]] to be a weak reference to *value*'s [placeholder canvas element](#)<sup>p683</sup>, if *value* has one, or null if it does not.

Their [transfer-receiving steps](#)<sup>p101</sup>, given *dataHolder* and *value*, are:

1. Initialize *value*'s [bitmap](#)<sup>p683</sup> to a rectangular array of [transparent black](#) pixels with width given by *dataHolder*.[\[\[Width\]\]](#) and height given by *dataHolder*.[\[\[Height\]\]](#).
2. If *dataHolder*.[\[\[PlaceholderCanvas\]\]](#) is not null, set *value*'s [placeholder canvas element](#)<sup>p683</sup> to *dataHolder*.[\[\[PlaceholderCanvas\]\]](#) (while maintaining the weak reference semantics).

The [getContext\(contextId, options\)](#) method of an [OffscreenCanvas](#)<sup>p682</sup> object, when invoked, must run these steps:

1. If *options* is not an [object](#), then set *options* to null.
2. Set *options* to the result of [converting options](#) to a JavaScript value.
3. Run the steps in the cell of the following table whose column header matches this [OffscreenCanvas](#)<sup>p682</sup> object's [context mode](#)<sup>p683</sup> and whose row header matches *contextId*:

	<a href="#">none</a> <sup>p683</sup>	<a href="#">2d</a> <sup>p683</sup>	<a href="#">bitmaprenderer</a> <sup>p683</sup>	<a href="#">webgl</a> <sup>p683</sup> or <a href="#">webgl2</a> <sup>p683</sup>	<a href="#">detached</a> <sup>p683</sup>
"2d"	Follow the <a href="#">offscreen 2D context creation algorithm</a> <sup>p686</sup> defined in the section below, passing it this <a href="#">OffscreenCanvas</a> <sup>p682</sup> object and <i>options</i> , to obtain an <a href="#">OffscreenCanvasRenderingContext2D</a> <sup>p686</sup> object; if this does not throw an exception, then set this <a href="#">OffscreenCanvas</a> <sup>p682</sup> object's <a href="#">context mode</a> <sup>p683</sup> to <a href="#">2d</a> <sup>p683</sup> , and return the new <a href="#">OffscreenCanvasRenderingContext2D</a> <sup>p686</sup> object.	Return the same object as was returned the last time the method was invoked with this same first argument.	Return null.	Return null.	Throw an <a href="#">"InvalidStateError"</a> <sup>p683</sup> <a href="#">DOMException</a> .
"bitmaprenderer"	Follow the <a href="#">ImageBitmapRenderingContext creation algorithm</a> <sup>p682</sup> defined in the section above, passing it this <a href="#">OffscreenCanvas</a> <sup>p682</sup> object and <i>options</i> , to obtain an <a href="#">ImageBitmapRenderingContext</a> <sup>p680</sup> object; if this does not throw an exception, then set this <a href="#">OffscreenCanvas</a> <sup>p682</sup> object's <a href="#">context mode</a> <sup>p683</sup> to <a href="#">bitmaprenderer</a> <sup>p683</sup> , and return the new <a href="#">ImageBitmapRenderingContext</a> <sup>p680</sup> object.	Return null.	Return the same object as was returned the last time the method was invoked with this same first argument.	Return null.	Throw an <a href="#">"InvalidStateError"</a> <sup>p683</sup> <a href="#">DOMException</a> .
"webgl" or "webgl2"	Follow the instructions given in the WebGL specifications' <i>Context Creation</i> sections to obtain either a <a href="#">WebGLRenderingContext</a> , <a href="#">WebGL2RenderingContext</a> , or null; if the returned value is null, then return null; otherwise, set this <a href="#">OffscreenCanvas</a> <sup>p682</sup> object's <a href="#">context mode</a> <sup>p683</sup> to <a href="#">webgl</a> <sup>p683</sup> or <a href="#">webgl2</a> <sup>p683</sup> , and return the <a href="#">WebGLRenderingContext</a> or <a href="#">WebGL2RenderingContext</a> object. <a href="#">[WEBGL]</a> <sup>p1271</sup>	Return null.	Return null.	Return the same value as was returned the last time the method was invoked with this same first argument.	Throw an <a href="#">"InvalidStateError"</a> <sup>p683</sup> <a href="#">DOMException</a> .

**For web developers (non-normative)**

**`offscreenCanvas . width`<sup>p684</sup> [ = value ]**

**`offscreenCanvas . height`<sup>p684</sup> [ = value ]**

These attributes return the dimensions of the [OffscreenCanvas](#)<sup>p682</sup> object's [bitmap](#)<sup>p683</sup>.

They can be set, to replace the [bitmap](#)<sup>p683</sup> with a new, [transparent black](#) bitmap of the specified dimensions (effectively resizing it).

If either the **width** or **height** attributes of an [OffscreenCanvas](#)<sup>p682</sup> object are set (to a new value or to the same value as before) and the [OffscreenCanvas](#)<sup>p682</sup> object's [context mode](#)<sup>p683</sup> is [2d](#)<sup>p683</sup>, then replace the [OffscreenCanvas](#)<sup>p682</sup> object's [bitmap](#)<sup>p683</sup> with a new [transparent black](#) bitmap and [reset the rendering context to its default state](#)<sup>p639</sup>. The new bitmap's dimensions are equal to the new values of the [width](#)<sup>p684</sup> and [height](#)<sup>p684</sup> attributes.

The resizing behavior for "[webgl](#)<sup>p684</sup>" and "[webgl2](#)<sup>p684</sup>" contexts is defined in the WebGL specifications. [\[WEBGL\]](#)<sup>p1271</sup>

**Note**

If an [OffscreenCanvas](#)<sup>p682</sup> object whose dimensions were changed has a [placeholder canvas element](#)<sup>p683</sup>, then the [placeholder](#)

[canvas element<sup>p683</sup>](#)'s [intrinsic size](#) will only be updated via the [commit\(\)<sup>p683</sup>](#) method of the [OffscreenCanvas<sup>p682</sup>](#) object's rendering context.

For web developers (non-normative)

### **promise = offscreenCanvas . convertToBlob<sup>p685</sup>( [options] )**

Returns a promise that will fulfill with a new [Blob](#) object representing a file containing the image in the [OffscreenCanvas<sup>p682</sup>](#) object.

The argument, if provided, is a dictionary that controls the encoding options of the image file to be created. The [type<sup>p685</sup>](#) field specifies the file format and has a default value of "[image/png<sup>p1262</sup>](#)"; that type is also used if the requested type isn't supported. If the image format supports variable quality (such as "[image/jpeg<sup>p1262</sup>](#)"), then the [quality<sup>p685</sup>](#) field is a number in the range 0.0 to 1.0 inclusive indicating the desired quality level for the resulting image.

### **canvas . transferToImageBitmap<sup>p685</sup>()**

Returns a newly created [ImageBitmap<sup>p970</sup>](#) object with the image in the [OffscreenCanvas<sup>p682</sup>](#) object. The image in the [OffscreenCanvas<sup>p682</sup>](#) object is replaced with a new blank image.

The [convertToBlob\(options\)](#) method, when invoked, must run the following steps:

1. If the value of this [OffscreenCanvas<sup>p682</sup>](#) object's [\[\[Detached\]\]<sup>p101</sup>](#) internal slot is set to true, then return a promise rejected with an ["InvalidStateError" DOMException](#).
2. If this [OffscreenCanvas<sup>p682</sup>](#) object's [context mode<sup>p683</sup>](#) is [2d<sup>p683</sup>](#) and the rendering context's [bitmap<sup>p686</sup>](#)'s [origin-clean<sup>p686</sup>](#) flag is set to false, then return a promise rejected with a ["SecurityError" DOMException](#).
3. If this [OffscreenCanvas<sup>p682</sup>](#) object's [bitmap<sup>p683</sup>](#) has no pixels (i.e., either its horizontal dimension or its vertical dimension is zero) then return a promise rejected with an ["IndexSizeError" DOMException](#).
4. Let *bitmap* be a copy of this [OffscreenCanvas<sup>p682</sup>](#) object's [bitmap<sup>p683</sup>](#).
5. Let *result* be a new promise object.
6. Run these steps [in parallel<sup>p41</sup>](#):
  1. Let *file* be [a serialization of bitmap as a file<sup>p688</sup>](#), with *options*'s **type** and **quality** if present.
  2. [Queue an element task<sup>p926</sup>](#) on the [canvas blob serialization task source<sup>p631</sup>](#) given the [canvas<sup>p627</sup>](#) element to run these steps:
    1. If *file* is null, then reject *result* with an ["EncodingError" DOMException](#).
    2. Otherwise, resolve *result* with a new [Blob](#) object, created in the [relevant Realm<sup>p913</sup>](#) of this [OffscreenCanvas<sup>p682</sup>](#) object, representing *file*. [\[FILEAPI\]<sup>p1266</sup>](#)
7. Return *result*.

The [transferToImageBitmap\(\)](#) method, when invoked, must run the following steps:

1. If the value of this [OffscreenCanvas<sup>p682</sup>](#) object's [\[\[Detached\]\]<sup>p101</sup>](#) internal slot is set to true, then throw an ["InvalidStateError" DOMException](#).
2. If this [OffscreenCanvas<sup>p682</sup>](#) object's [context mode<sup>p683</sup>](#) is set to [none<sup>p683</sup>](#), then throw an ["InvalidStateError" DOMException](#).
3. Let *image* be a newly created [ImageBitmap<sup>p970</sup>](#) object that references the same underlying bitmap data as this [OffscreenCanvas<sup>p682</sup>](#) object's [bitmap<sup>p683</sup>](#).
4. Set this [OffscreenCanvas<sup>p682</sup>](#) object's [bitmap<sup>p683</sup>](#) to reference a newly created bitmap of the same dimensions as the previous bitmap, and with its pixels initialized to [transparent black](#), or [opaque black](#) if the rendering context's [alpha<sup>p686</sup>](#) flag is set to false.

#### Note

This means that if the rendering context of this [OffscreenCanvas<sup>p682</sup>](#) is a [WebGLRenderingContext](#), the value of [preserveDrawingBuffer](#) will have no effect. [\[WEBGL\]<sup>p1271</sup>](#)

5. Return *image*.

#### 4.12.5.3.1 The offscreen 2D rendering context <sup>s p68</sup><sub>6</sub>

```
IDL [Exposed=(Window,Worker)]
interface OffscreenCanvasRenderingContext2D {
    void commit();
    readonly attribute OffscreenCanvas canvas;
};

OffscreenCanvasRenderingContext2D includes CanvasState;
OffscreenCanvasRenderingContext2D includes CanvasTransform;
OffscreenCanvasRenderingContext2D includes CanvasCompositing;
OffscreenCanvasRenderingContext2D includes CanvasImageSmoothing;
OffscreenCanvasRenderingContext2D includes CanvasFillStrokeStyles;
OffscreenCanvasRenderingContext2D includes CanvasShadowStyles;
OffscreenCanvasRenderingContext2D includes CanvasFilters;
OffscreenCanvasRenderingContext2D includes CanvasRect;
OffscreenCanvasRenderingContext2D includes CanvasDrawPath;
OffscreenCanvasRenderingContext2D includes CanvasText;
OffscreenCanvasRenderingContext2D includes CanvasDrawImage;
OffscreenCanvasRenderingContext2D includes CanvasImageData;
OffscreenCanvasRenderingContext2D includes CanvasPathDrawingStyles;
OffscreenCanvasRenderingContext2D includes CanvasTextDrawingStyles;
OffscreenCanvasRenderingContext2D includes CanvasPath;
```

The [OffscreenCanvasRenderingContext2D](#)<sup>p686</sup> object is a rendering context for drawing to the [bitmap](#)<sup>p683</sup> of an [OffscreenCanvas](#)<sup>p682</sup> object. It is similar to the [CanvasRenderingContext2D](#)<sup>p632</sup> object, with the following differences:

- there is no support for [user interface](#)<sup>p633</sup> features;
- its [canvas](#)<sup>p687</sup> attribute refers to an [OffscreenCanvas](#)<sup>p682</sup> object rather than a [canvas](#)<sup>p627</sup> element;
- it has a [commit\(\)](#)<sup>p687</sup> method for pushing the rendered image to the context's [OffscreenCanvas](#)<sup>p682</sup> object's [placeholder canvas element](#)<sup>p683</sup>.

An [OffscreenCanvasRenderingContext2D](#)<sup>p686</sup> object has a **bitmap** that is initialized when the object is created.

The [bitmap](#)<sup>p686</sup> has an **origin-clean** flag, which can be set to true or false. Initially, when one of these bitmaps is created, its [origin-clean](#)<sup>p686</sup> flag must be set to true.

An [OffscreenCanvasRenderingContext2D](#)<sup>p686</sup> object also has an **alpha** flag, which can be set to true or false. Initially, when the context is created, its alpha flag must be set to true. When an [OffscreenCanvasRenderingContext2D](#)<sup>p686</sup> object has its [alpha](#)<sup>p686</sup> flag set to false, then its alpha channel must be fixed to 1.0 (fully opaque) for all pixels, and attempts to change the alpha component of any pixel must be silently ignored.

An [OffscreenCanvasRenderingContext2D](#)<sup>p686</sup> object has an **associated OffscreenCanvas object**, which is the [OffscreenCanvas](#)<sup>p682</sup> object from which the [OffscreenCanvasRenderingContext2D](#)<sup>p686</sup> object was created.

For web developers (non-normative)

**[offscreenCanvasRenderingContext2D](#) . [commit](#)<sup>p687</sup>()**

Copies the rendering context's [bitmap](#)<sup>p686</sup> to the bitmap of the [placeholder canvas element](#)<sup>p683</sup> of the **associated OffscreenCanvas object**<sup>p686</sup>. The copy operation is synchronous. Calling this method is not needed for the transfer, since it happens automatically during the [event loop](#)<sup>p924</sup> execution.

**[offscreenCanvas](#) = [offscreenCanvasRenderingContext2D](#) . [canvas](#)<sup>p687</sup>**

Returns the **associated OffscreenCanvas object**<sup>p686</sup>.

The **offscreen 2D context creation algorithm**, which is passed a *target* (an [OffscreenCanvas](#)<sup>p682</sup> object) and optionally some arguments, consists of running the following steps:

1. If the algorithm was passed some arguments, let *arg* be the first such argument. Otherwise, let *arg* be undefined.
2. Let *settings* be the result of [converting options](#) to the dictionary type [CanvasRenderingContext2DSettings](#)<sup>p631</sup>. (This can throw an exception.).

- Let *context* be a new [OffscreenCanvasRenderingContext2D<sup>p686</sup>](#) object.
- Set *context*'s [associated OffscreenCanvas object<sup>p686</sup>](#) to *target*.
- Process each of the members of *settings* as follows:

**alpha<sup>p637</sup>**

If false, set *context*'s [alpha<sup>p686</sup>](#) flag to false.

- Set *context*'s [bitmap<sup>p686</sup>](#) to a newly created bitmap with the dimensions specified by the [width<sup>p684</sup>](#) and [height<sup>p684</sup>](#) attributes of *target*, and set *target*'s bitmap to the same bitmap (so that they are shared).
- If *context*'s [alpha<sup>p686</sup>](#) flag is set to true, initialize all the pixels of *context*'s [bitmap<sup>p686</sup>](#) to [transparent black](#). Otherwise, initialize the pixels to [opaque black](#).
- Return *context*.

The [commit\(\)](#) method, when invoked, must run the following steps:

- If this [OffscreenCanvasRenderingContext2D<sup>p686</sup>](#)'s [associated OffscreenCanvas object<sup>p686</sup>](#) does not have a [placeholder canvas element<sup>p683</sup>](#), then return.
- Let *image* be a copy of this [OffscreenCanvasRenderingContext2D<sup>p686</sup>](#)'s [bitmap<sup>p686</sup>](#), including the value of its [origin-clean<sup>p686</sup>](#) flag.
- [Queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given the [placeholder canvas element<sup>p683</sup>](#) to set the [placeholder canvas element<sup>p683</sup>](#)'s [output bitmap<sup>p636</sup>](#) to be a reference to *image*.

**Note**

If image has different dimensions than the bitmap previously referenced as the [placeholder canvas element<sup>p683</sup>](#)'s [output bitmap<sup>p636</sup>](#), then this task will result in a change in the [placeholder canvas element<sup>p683</sup>](#)'s [intrinsic size](#), which can affect document layout.

**Note**

Implementations are encouraged to short-circuit the graphics update steps of the [window event loop<sup>p924</sup>](#) for the purposes of updating the contents of a [placeholder canvas element<sup>p683</sup>](#) to the display. This could mean, for example, that the [commit\(\)<sup>p687</sup>](#) method can copy the bitmap contents directly to a graphics buffer that is mapped to the physical display location of the [placeholder canvas element<sup>p683</sup>](#). This or similar short-circuiting approaches can significantly reduce display latency, especially in cases where the [commit\(\)<sup>p687</sup>](#) method is invoked from a [worker event loop<sup>p924</sup>](#) and the [window event loop<sup>p924</sup>](#) of the [placeholder canvas element<sup>p683</sup>](#) is busy. However, such shortcuts can not have any script-observable side-effects. This means that the committed bitmap still needs to be sent to the [placeholder canvas element<sup>p683</sup>](#), in case the element is used as a [CanvasImageSource<sup>p631</sup>](#), as an [ImageBitmapSource<sup>p970</sup>](#), or in case [toDataURL\(\)<sup>p630</sup>](#) or [toBlob\(\)<sup>p631</sup>](#) are called on it.

The [canvas](#) attribute, on getting, must return this [OffscreenCanvasRenderingContext2D<sup>p686</sup>](#)'s [associated OffscreenCanvas object<sup>p686</sup>](#).

#### 4.12.5.4 Color spaces and color correction §<sup>p68</sup> 7

The [canvas<sup>p627</sup>](#) APIs must perform color correction at only two points: when rendering images with their own gamma correction and color space information onto a bitmap, to convert the image to the color space used by the bitmaps (e.g. using the 2D Context's [drawImage\(\)<sup>p666</sup>](#) method with an [HTML0rSVGImageElement<sup>p631</sup>](#) object), and when rendering the actual canvas bitmap to the output device.

**Note**

Thus, in the 2D context, colors used to draw shapes onto the canvas will exactly match colors obtained through the [getImageData\(\)<sup>p669</sup>](#) method.

The [toDataURL\(\)<sup>p630</sup>](#) method, when invoked, must not include color space information in the resources they return. Where the output format allows it, the color of pixels in resources created by [toDataURL\(\)<sup>p630</sup>](#) must match those returned by the [getImageData\(\)<sup>p669</sup>](#) method.

In user agents that support CSS, the color space used by a [canvas<sup>p627</sup>](#) element must match the color space used for processing any

colors for that element in CSS.

The gamma correction and color space information of images must be handled in such a way that an image rendered directly using an `img`<sup>p314</sup> element would use the same colors as one painted on a `canvas`<sup>p627</sup> element that is then itself rendered. Furthermore, the rendering of images that have no color correction information (such as those returned by the `toDataURL()`<sup>p630</sup> method) must be rendered with no color correction.

#### Note

*Thus, in the 2D context, calling the `drawImage()`<sup>p666</sup> method to render the output of the `toDataURL()`<sup>p630</sup> method to the canvas, given the appropriate dimensions, has no visible effect.*

#### 4.12.5.5 Serializing bitmaps to a file § p68<sub>8</sub>

When a user agent is to create a **serialization of the bitmap as a file**, given a *type* and an optional *quality*, it must create an image file in the format given by *type*. If an error occurs during the creation of the image file (e.g. an internal encoder error), then the result of the serialization is null. [\[PNG\]](#)<sup>p1268</sup>

The image file's pixel data must be the bitmap's pixel data scaled to one image pixel per coordinate space unit, and if the file format used supports encoding resolution metadata, the resolution must be given as 96dpi (one image pixel per [CSS pixel](#)).

If *type* is supplied, then it must be interpreted as a [MIME type](#) giving the format to use. If the type has any parameters, then it must be treated as not supported.

#### Example

For example, the value "`image/png`<sup>p1262</sup>" would mean to generate a PNG image, the value "`image/jpeg`<sup>p1262</sup>" would mean to generate a JPEG image, and the value "`image/svg+xml`<sup>p1262</sup>" would mean to generate an SVG image (which would require that the user agent track how the bitmap was generated, an unlikely, though potentially awesome, feature).

User agents must support PNG ("`image/png`<sup>p1262</sup>"). User agents may support other types. If the user agent does not support the requested type, then it must create the file using the PNG format. [\[PNG\]](#)<sup>p1268</sup>

User agents must [convert the provided type to ASCII lowercase](#) before establishing if they support that type.

For image types that do not support an alpha channel, the serialized image must be the bitmap image composited onto an [opaque black](#) background using the source-over operator.

If *type* is an image format that supports variable quality (such as "`image/jpeg`<sup>p1262</sup>"), *quality* is given, and *type* is not "`image/png`<sup>p1262</sup>", then, if `Type(quality)` is Number, and *quality* is in the range 0.0 to 1.0 inclusive, the user agent must treat *quality* as the desired quality level. Otherwise, the user agent must use its default quality value, as if the *quality* argument had not been given.

#### Note

*The use of type-testing here, instead of simply declaring quality as a Web IDL `double`, is a historical artifact.*

#### Note

*Different implementations can have slightly different interpretations of "quality". When the quality is not specified, an implementation-specific default is used that represents a reasonable compromise between compression ratio, image quality, and encoding time.*

#### 4.12.5.6 Security with `canvas`<sup>p627</sup> elements § p68<sub>8</sub>

*This section is non-normative.*

**Information leakage** can occur if scripts from one [origin](#)<sup>p829</sup> can access information (e.g. read pixels) from images from another origin (one that isn't the [same](#)<sup>p830</sup>).

To mitigate this, bitmaps used with `canvas`<sup>p627</sup> elements and `ImageBitmap`<sup>p979</sup> objects are defined to have a flag indicating whether they are [origin-clean](#)<sup>p629</sup>. All bitmaps start with their [origin-clean](#)<sup>p629</sup> set to true. The flag is set to false when cross-origin images are

used.

The [toDataURL\(\)](#)<sup>p630</sup>, [toBlob\(\)](#)<sup>p631</sup>, and [getImageData\(\)](#)<sup>p669</sup> methods check the flag and will throw a "SecurityError" [DOMException](#) rather than leak cross-origin data.

The value of the [origin-clean](#)<sup>p629</sup> flag is propagated from a source [canvas](#)<sup>p627</sup> element's bitmap to a new [ImageBitmap](#)<sup>p970</sup> object by [createImageBitmap\(\)](#)<sup>p972</sup>. Conversely, a destination [canvas](#)<sup>p627</sup> element's bitmap will have its [origin-clean](#)<sup>p629</sup> flags set to false by [drawImage](#)<sup>p666</sup> if the source image is an [ImageBitmap](#)<sup>p970</sup> object whose bitmap has its [origin-clean](#)<sup>p629</sup> flag set to false.

The flag can be reset in certain situations; for example, when changing the value of the [width](#)<sup>p628</sup> or the [height](#)<sup>p628</sup> content attribute of the [canvas](#)<sup>p627</sup> element to which a [CanvasRenderingContext2D](#)<sup>p632</sup> is bound, the bitmap is cleared and its [origin-clean](#)<sup>p629</sup> flag is reset.

When using an [ImageBitmapRenderingContext](#)<sup>p680</sup>, the value of the [origin-clean](#)<sup>p629</sup> flag is propagated from [ImageBitmap](#)<sup>p970</sup> objects when they are transferred to the [canvas](#)<sup>p627</sup> via [transferFromImageBitmap\(\)](#)<sup>p682</sup>.

## 4.13 Custom elements §<sup>p68</sup><sub>9</sub>

### 4.13.1 Introduction §<sup>p68</sup><sub>9</sub>

*This section is non-normative.*

[Custom elements](#)<sup>p696</sup> provide a way for authors to build their own fully-featured DOM elements. Although authors could always use non-standard elements in their documents, with application-specific behavior added after the fact by scripting or similar, such elements have historically been non-conforming and not very functional. By [defining](#)<sup>p699</sup> a custom element, authors can inform the parser how to properly construct an element and how elements of that class should react to changes.

Custom elements are part of a larger effort to "rationalise the platform", by explaining existing platform features (like the elements of HTML) in terms of lower-level author-exposed extensibility points (like custom element definition). Although today there are many limitations on the capabilities of custom elements—both functionally and semantically—that prevent them from fully explaining the behaviors of HTML's existing elements, we hope to shrink this gap over time.

#### 4.13.1.1 Creating an autonomous custom element §<sup>p68</sup><sub>9</sub>

*This section is non-normative.*

For the purposes of illustrating how to create an [autonomous custom element](#)<sup>p696</sup>, let's define a custom element that encapsulates rendering a small icon for a country flag. Our goal is to be able to use it like so:

```
<flag-icon country="nl"></flag-icon>
```

To do this, we first declare a class for the custom element, extending [HTMLElement](#)<sup>p121</sup>:

```
class FlagIcon extends HTMLElement {
  constructor() {
    super();
    this._countryCode = null;
  }

  static get observedAttributes() { return ["country"]; }

  attributeChangedCallback(name, oldValue, newValue) {
    // name will always be "country" due to observedAttributes
    this._countryCode = newValue;
    this._updateRendering();
  }

  connectedCallback() {
    this._updateRendering();
  }
}
```

```

get country() {
    return this._countryCode;
}
set country(v) {
    this.setAttribute("country", v);
}

_updateRendering() {
    // Left as an exercise for the reader. But, you'll probably want to
    // check this.ownerDocument.defaultView to see if we've been
    // inserted into a document with a browsing context, and avoid
    // doing any work if not.
}
}

```

We then need to use this class to define the element:

```
customElements.define("flag-icon", FlagIcon);
```

At this point, our above code will work! The parser, whenever it sees the `flag-icon` tag, will construct a new instance of our `FlagIcon` class, and tell our code about its new `country` attribute, which we then use to set the element's internal state and update its rendering (when appropriate).

You can also create `flag-icon` elements using the DOM API:

```

const flagIcon = document.createElement("flag-icon")
flagIcon.country = "jp"
document.body.appendChild(flagIcon)

```

Finally, we can also use the [custom element constructor](#)<sup>p696</sup> itself. That is, the above code is equivalent to:

```

const flagIcon = new FlagIcon()
flagIcon.country = "jp"
document.body.appendChild(flagIcon)

```

#### 4.13.1.2 Creating a form-associated custom element <sup>p699</sup>

*This section is non-normative.*

Adding a static `formAssociated` property, with a true value, makes an [autonomous custom element](#)<sup>p696</sup> a [form-associated custom element](#)<sup>p697</sup>. The [ElementInternals](#)<sup>p707</sup> interface helps you to implement functions and properties common to form control elements.

```

class MyCheckbox extends HTMLElement {
    static get formAssociated() { return true; }

    constructor() {
        super();
        this._internals = this.attachInternals();
        this._checked = false;
        this.addEventListener('click', this._onClick.bind(this));
    }

    get form() { return this._internals.form; }
    get name() { return this.getAttribute('name'); }
    get type() { return this.localName; }

    get checked() { return this._checked; }
    set checked(flag) {

```

```

    this._checked = !!flag;
    this._internals.setFormValue(this._checked ? 'on' : null);
  }

  _onClick(event) {
    this.checked = !this._checked;
  }
}
customElements.define('my-checkbox', MyCheckbox);

```

You can use the custom element `my-checkbox` like a built-in form-associated element. For example, putting it in [form](#)<sup>p479</sup> or [label](#)<sup>p483</sup> associates the `my-checkbox` element with them, and submitting the [form](#)<sup>p479</sup> will send data provided by `my-checkbox` implementation.

```

<form action="..." method="...">
  <label><my-checkbox name="agreed"></my-checkbox> I read the agreement.</label>
  <input type="submit">
</form>

```

#### 4.13.1.3 Creating a customized built-in element §<sup>p69</sup><sub>1</sub>

*This section is non-normative.*

[Customized built-in elements](#)<sup>p696</sup> are a distinct kind of [custom element](#)<sup>p696</sup>, which are defined slightly differently and used very differently compared to [autonomous custom elements](#)<sup>p696</sup>. They exist to allow reuse of behaviors from the existing elements of HTML, by extending those elements with new custom functionality. This is important since many of the existing behaviors of HTML elements can unfortunately not be duplicated by using purely [autonomous custom elements](#)<sup>p696</sup>. Instead, [customized built-in elements](#)<sup>p696</sup> allow the installation of custom construction behavior, lifecycle hooks, and prototype chain onto existing elements, essentially "mixing in" these capabilities on top of the already-existing element.

[Customized built-in elements](#)<sup>p696</sup> require a distinct syntax from [autonomous custom elements](#)<sup>p696</sup> because user agents and other software key off an element's local name in order to identify the element's semantics and behavior. That is, the concept of [customized built-in elements](#)<sup>p696</sup> building on top of existing behavior depends crucially on the extended elements retaining their original local name.

In this example, we'll be creating a [customized built-in element](#)<sup>p696</sup> named `plastic-button`, which behaves like a normal button but gets fancy animation effects added whenever you click on it. We start by defining a class, just like before, although this time we extend [HTMLButtonElement](#)<sup>p529</sup> instead of [HTMLElement](#)<sup>p121</sup>:

```

class PlasticButton extends HTMLButtonElement {
  constructor() {
    super();

    this.addEventListener("click", () => {
      // Draw some fancy animation effects!
    });
  }
}

```

When defining our custom element, we have to also specify the `extends` option:

```

customElements.define("plastic-button", PlasticButton, { extends: "button" });

```

In general, the name of the element being extended cannot be determined simply by looking at what element interface it extends, as many elements share the same interface (such as [q](#)<sup>p243</sup> and [blockquote](#)<sup>p213</sup> both sharing [HTMLQuoteElement](#)<sup>p214</sup>).

To construct our [customized built-in element](#)<sup>p696</sup> from parsed HTML source text, we use the `is`<sup>p696</sup> attribute on a [button](#)<sup>p528</sup> element:

```

<button is="plastic-button">Click Me!</button>

```

Trying to use a [customized built-in element](#)<sup>p696</sup> as an [autonomous custom element](#)<sup>p696</sup> will *not* work; that is, `<plastic-button>Click me?</plastic-button>` will simply create an [HTMLElement](#)<sup>p121</sup> with no special behavior.

If you need to create a customized built-in element programmatically, you can use the following form of [createElement\(\)](#):

```
const plasticButton = document.createElement("button", { is: "plastic-button" });
plasticButton.textContent = "Click me!";
```

And as before, the constructor will also work:

```
const plasticButton2 = new PlasticButton();
console.log(plasticButton2.localName); // will output "button"
console.assert(plasticButton2 instanceof PlasticButton);
console.assert(plasticButton2 instanceof HTMLElement);
```

Note that when creating a customized built-in element programmatically, the [is](#)<sup>p696</sup> attribute will not be present in the DOM, since it was not explicitly set. However, [it will be added to the output when serializing](#)<sup>p1156</sup>:

```
console.assert(!plasticButton.hasAttribute("is"));
console.log(plasticButton.outerHTML); // will output '<button is="plastic-button"></button>'
```

Regardless of how it is created, all of the ways in which [button](#)<sup>p528</sup> is special apply to such "plastic buttons" as well: their focus behavior, ability to participate in [form submission](#)<sup>p589</sup>, the [disabled](#)<sup>p563</sup> attribute, and so on.

[Customized built-in elements](#)<sup>p696</sup> are designed to allow extension of existing HTML elements that have useful user-agent supplied behavior or APIs. As such, they can only extend existing HTML elements defined in this specification, and cannot extend legacy elements such as [bgsound](#)<sup>p1212</sup>, [blink](#)<sup>p1213</sup>, [isindex](#)<sup>p1212</sup>, [keygen](#)<sup>p1212</sup>, [multicol](#)<sup>p1213</sup>, [nextid](#)<sup>p1212</sup>, or [spacer](#)<sup>p1213</sup> that have been defined to use [HTMLUnknownElement](#)<sup>p121</sup> as their [element interface](#).

One reason for this requirement is future-compatibility: if a [customized built-in element](#)<sup>p696</sup> was defined that extended a currently-unknown element, for example `combobox`, this would prevent this specification from defining a `combobox` element in the future, as consumers of the derived [customized built-in element](#)<sup>p696</sup> would have come to depend on their base element having no interesting user-agent-supplied behavior.

#### 4.13.1.4 Drawbacks of autonomous custom elements <sup>§ p69</sup><sub>2</sub>

*This section is non-normative.*

As specified below, and alluded to above, simply defining and using an element called `taco-button` does not mean that such elements [represent](#)<sup>p120</sup> buttons. That is, tools such as Web browsers, search engines, or accessibility technology will not automatically treat the resulting element as a button just based on its defined name.

To convey the desired button semantics to a variety of users, while still using an [autonomous custom element](#)<sup>p696</sup>, a number of techniques would need to be employed:

- The addition of the [tabindex](#)<sup>p766</sup> attribute would make the `taco-button` [focusable](#)<sup>p765</sup>. Note that if the `taco-button` were to become logically disabled, the [tabindex](#)<sup>p766</sup> attribute would need to be removed.
- The addition of various ARIA attributes helps convey semantics to accessibility technology. For example, setting the [role](#)<sup>p61</sup> attribute to `"button"` will convey the semantics that this is a button, enabling users to successfully interact with the control using usual button-like interactions in their accessibility technology. Setting the [aria-label](#) attribute is necessary to give the button an [accessible name](#), instead of having accessibility technology traverse its child text nodes and announce them. And setting [aria-disabled](#) to `"true"` when the button is logically disabled conveys to accessibility technology the button's disabled state.
- The addition of event handlers to handle commonly-expected button behaviors helps convey the semantics of the button to Web browser users. In this case, the most relevant event handler would be one that proxies appropriate [keydown](#) events to become [click](#) events, so that you can activate the button both with keyboard and by clicking.
- In addition to any default visual styling provided for `taco-button` elements, the visual styling will also need to be updated to reflect changes in logical state, such as becoming disabled; that is, whatever style sheet has rules for `taco-button` will also

need to have rules for `taco-button[disabled]`.

With these points in mind, a full-featured `taco-button` that took on the responsibility of conveying button semantics (including the ability to be disabled) might look something like this:

```
class TacoButton extends HTMLElement {
  static get observedAttributes() { return ["disabled"]; }

  constructor() {
    super();

    this.addEventListener("keydown", e => {
      if (e.keyCode === 32 || e.keyCode === 13) {
        this.dispatchEvent(new MouseEvent("click", {
          bubbles: true,
          cancelable: true
        }));
      }
    });

    this.addEventListener("click", e => {
      if (this.disabled) {
        e.preventDefault();
        e.stopPropagation();
      }
    });

    this._observer = new MutationObserver(() => {
      this.setAttribute("aria-label", this.textContent);
    });
  }

  connectedCallback() {
    this.setAttribute("role", "button");
    this.setAttribute("tabindex", "0");

    this._observer.observe(this, {
      childList: true,
      characterData: true,
      subtree: true
    });
  }

  disconnectedCallback() {
    this._observer.disconnect();
  }

  get disabled() {
    return this.hasAttribute("disabled");
  }

  set disabled(v) {
    if (v) {
      this.setAttribute("disabled", "");
    } else {
      this.removeAttribute("disabled");
    }
  }

  attributeChangedCallback() {
    // only is called for the disabled attribute due to observedAttributes
    if (this.disabled) {

```

```

    this.removeAttribute("tabindex");
    this.setAttribute("aria-disabled", "true");
  } else {
    this.setAttribute("tabindex", "0");
    this.setAttribute("aria-disabled", "false");
  }
}
}
}

```

Even with this rather-complicated element definition, the element is not a pleasure to use for consumers: it will be continually "sprouting" [tabindex<sup>p766</sup>](#) and [aria-\\*<sup>p61</sup>](#) attributes of its own volition. This is because as of now there is no way to specify default accessibility semantics or focus behavior for custom elements, forcing the use of these attributes to do so (even though they are usually reserved for allowing the consumer to override default behavior).

In contrast, a simple [customized built-in element<sup>p696</sup>](#), as shown in the previous section, would automatically inherit the semantics and behavior of the [button<sup>p528</sup>](#) element, with no need to implement these behaviors manually. In general, for any elements with nontrivial behavior and semantics that build on top of existing elements of HTML, [customized built-in elements<sup>p696</sup>](#) will be easier to develop, maintain, and consume.

#### 4.13.1.5 Upgrading elements after their creation §<sup>p69</sup><sub>4</sub>

*This section is non-normative.*

Because [element definition<sup>p699</sup>](#) can occur at any time, a non-custom element could be [created](#), and then later become a [custom element<sup>p696</sup>](#) after an appropriate [definition<sup>p698</sup>](#) is registered. We call this process "upgrading" the element, from a normal element into a custom element.

[Upgrades<sup>p702</sup>](#) enable scenarios where it may be preferable for [custom element definitions<sup>p698</sup>](#) to be registered after relevant elements have been initially created, such as by the parser. They allow progressive enhancement of the content in the custom element. For example, in the following HTML document the element definition for `img-viewer` is loaded asynchronously:

```

<!DOCTYPE html>
<html lang="en">
<title>Image viewer example</title>

<img-viewer filter="Kelvin">
  
</img-viewer>

<script src="js/elements/img-viewer.js" async></script>

```

The definition for the `img-viewer` element here is loaded using a [script<sup>p607</sup>](#) element marked with the [async<sup>p608</sup>](#) attribute, placed after the `<img-viewer>` tag in the markup. While the script is loading, the `img-viewer` element will be treated as an undefined element, similar to a [span<sup>p275</sup>](#). Once the script loads, it will define the `img-viewer` element, and the existing `img-viewer` element on the page will be upgraded, applying the custom element's definition (which presumably includes applying an image filter identified by the string "Kelvin", enhancing the image's visual appearance).

Note that [upgrades<sup>p702</sup>](#) only apply to elements in the document tree. (Formally, elements that are [connected](#).) An element that is not inserted into a document will stay un-upgraded. An example illustrates this point:

```

<!DOCTYPE html>
<html lang="en">
<title>Upgrade edge-cases example</title>

<example-element></example-element>

<script>
  "use strict";

```

```

const inDocument = document.querySelector("example-element");
const outOfDocument = document.createElement("example-element");

// Before the element definition, both are HTMLElement:
console.assert(inDocument instanceof HTMLElement);
console.assert(outOfDocument instanceof HTMLElement);

class ExampleElement extends HTMLElement {}
customElements.define("example-element", ExampleElement);

// After element definition, the in-document element was upgraded:
console.assert(inDocument instanceof ExampleElement);
console.assert(!(outOfDocument instanceof ExampleElement));

document.body.appendChild(outOfDocument);

// Now that we've moved the element into the document, it too was upgraded:
console.assert(outOfDocument instanceof ExampleElement);
</script>

```

#### 4.13.2 Requirements for custom element constructors and reactions § p69

When authoring [custom element constructors](#)<sup>p696</sup>, authors are bound by the following conformance requirements:

- A parameter-less call to `super()` must be the first statement in the constructor body, to establish the correct prototype chain and **this** value before any further code is run.
- A return statement must not appear anywhere inside the constructor body, unless it is a simple early-return (`return` or `return this`).
- The constructor must not use the [document.write\(\)](#)<sup>p950</sup> or [document.open\(\)](#)<sup>p949</sup> methods.
- The element's attributes and children must not be inspected, as in the non-[upgrade](#)<sup>p702</sup> case none will be present, and relying on upgrades makes the element less usable.
- The element must not gain any attributes or children, as this violates the expectations of consumers who use the [createElement](#) or [createElementNS](#) methods.
- In general, work should be deferred to `connectedCallback` as much as possible—especially work involving fetching resources or rendering. However, note that `connectedCallback` can be called more than once, so any initialization work that is truly one-time will need a guard to prevent it from running twice.
- In general, the constructor should be used to set up initial state and default values, and to set up event listeners and possibly a [shadow root](#).

Several of these requirements are checked during [element creation](#), either directly or indirectly, and failing to follow them will result in a custom element that cannot be instantiated by the parser or DOM APIs. This is true even if the work is done inside a constructor-initiated [microtask](#)<sup>p925</sup>, as a [microtask checkpoint](#)<sup>p929</sup> can occur immediately after construction.

When authoring [custom element reactions](#)<sup>p704</sup>, authors should avoid manipulating the node tree as this can lead to unexpected results.

#### Example

An element's `connectedCallback` can be queued before the element is disconnected, but as the callback queue is still processed, it results in a `connectedCallback` for an element that is no longer connected:

```

class CParent extends HTMLElement {
  connectedCallback() {
    this.firstChild.remove();
  }
}
customElements.define("c-parent", CParent);

```

```

class CChild extends HTMLElement {
  connectedCallback() {
    console.log("CChild connectedCallback: isConnected =", this.isConnected);
  }
}
customElements.define("c-child", CChild);

const parent = new CParent(),
      child = new CChild();
parent.append(child);
document.body.append(parent);

// Logs:
// CChild connectedCallback: isConnected = false

```

### 4.13.3 Core concepts §<sup>p69</sup><sub>6</sub>

A **custom element** is an element that is [custom](#). Informally, this means that its constructor and prototype are defined by the author, instead of by the user agent. This author-supplied constructor function is called the **custom element constructor**.

Two distinct types of [custom elements](#)<sup>p696</sup> can be defined:

1. An **autonomous custom element**, which is defined with no `extends` option. These types of custom elements have a local name equal to their [defined name](#)<sup>p698</sup>.
2. A **customized built-in element**, which is defined with an `extends` option. These types of custom elements have a local name equal to the value passed in their `extends` option, and their [defined name](#)<sup>p698</sup> is used as the value of the `is` attribute, which therefore must be a [valid custom element name](#)<sup>p697</sup>.

After a [custom element](#)<sup>p696</sup> is [created](#), changing the value of the `is`<sup>p696</sup> attribute does not change the element's behavior, as it is saved on the element as its [is value](#).

[Autonomous custom elements](#)<sup>p696</sup> have the following element definition:

#### Categories<sup>p125</sup>:

[Flow content](#)<sup>p128</sup>.  
[Phrasing content](#)<sup>p129</sup>.  
[Palpable content](#)<sup>p130</sup>.

For [form-associated custom elements](#)<sup>p697</sup>: [Listed](#)<sup>p479</sup>, [labelable](#)<sup>p479</sup>, [submittable](#)<sup>p479</sup>, and [resettable](#)<sup>p479</sup> [form-associated element](#)<sup>p479</sup>.

#### Contexts in which this element can be used<sup>p125</sup>:

Where [phrasing content](#)<sup>p129</sup> is expected.

#### Content model<sup>p125</sup>:

[Transparent](#)<sup>p130</sup>.

#### Content attributes<sup>p125</sup>:

[Global attributes](#)<sup>p133</sup>, except the `is`<sup>p696</sup> attribute  
`form`<sup>p559</sup>, for [form-associated custom elements](#)<sup>p697</sup> — Associates the element with a [form](#)<sup>p479</sup> element  
`disabled`<sup>p563</sup>, for [form-associated custom elements](#)<sup>p697</sup> — Whether the form control is disabled  
`readonly`<sup>p697</sup>, for [form-associated custom elements](#)<sup>p697</sup> — Affects [willValidate](#)<sup>p586</sup>, plus any behavior added by the custom element author  
`name`<sup>p561</sup>, for [form-associated custom elements](#)<sup>p697</sup> — Name of the element to use for [form submission](#)<sup>p588</sup> and in the [form.elements](#)<sup>p481</sup> API

Any other attribute that has no namespace (see prose).

## Accessibility considerations<sup>p126</sup>:

For [form-associated custom elements<sup>p697</sup>](#): [for authors](#); [for implementers](#).  
Otherwise: [for authors](#); [for implementers](#).

## DOM interface<sup>p126</sup>:

Supplied by the element's author (inherits from [HTMLElement<sup>p121</sup>](#))

An [autonomous custom element<sup>p696</sup>](#) does not have any special meaning: it [represents<sup>p120</sup>](#) its children. A [customized built-in element<sup>p696</sup>](#) inherits the semantics of the element that it extends.

Any namespace-less attribute that is relevant to the element's functioning, as determined by the element's author, may be specified on an [autonomous custom element<sup>p696</sup>](#), so long as the attribute name is [XML-compatible<sup>p43</sup>](#) and contains no [ASCII upper alphas](#). The exception is the [is<sup>p696</sup>](#) attribute, which must not be specified on an [autonomous custom element<sup>p696</sup>](#) (and which will have no effect if it is).

[Customized built-in elements<sup>p696</sup>](#) follow the normal requirements for attributes, based on the elements they extend. To add custom attribute-based behavior, use [data-\\*<sup>p142</sup>](#) attributes.

An [autonomous custom element<sup>p696</sup>](#) is called a **form-associated custom element** if the element is associated with a [custom element definition<sup>p698</sup>](#) whose [form-associated<sup>p698</sup>](#) field is set to true.

The [name<sup>p561</sup>](#) attribute represents the [form-associated custom element<sup>p697</sup>](#)'s name. The [disabled<sup>p563</sup>](#) attribute is used to make the [form-associated custom element<sup>p697</sup>](#) non-interactive and to prevent its [submission value<sup>p709</sup>](#) from being submitted. The [form<sup>p559</sup>](#) attribute is used to explicitly associate the [form-associated custom element<sup>p697</sup>](#) with its [form owner<sup>p559</sup>](#).

The [readonly](#) attribute of [form-associated custom elements<sup>p697</sup>](#) specifies that the element is [barred from constraint validation<sup>p583</sup>](#). User agents don't provide any other behavior for the attribute, but custom element authors should, where possible, use its presence to make their control non-editable in some appropriate fashion, similar to the behavior for the [readonly<sup>p515</sup>](#) attribute on built-in form controls.

**Constraint validation:** If the [readonly<sup>p697</sup>](#) attribute is specified on a [form-associated custom element<sup>p697</sup>](#), the element is [barred from constraint validation<sup>p583</sup>](#).

The [reset algorithm<sup>p597</sup>](#) for [form-associated custom elements<sup>p697</sup>](#) is to [enqueue a custom element callback reaction<sup>p706</sup>](#) with the element, callback name "formResetCallback", and an empty argument list.

A **valid custom element name** is a sequence of characters *name* that meets all of the following requirements:

- *name* must match the [PotentialCustomElementName<sup>p697</sup>](#) production:

**PotentialCustomElementName ::=**

[a-z] ([PCENChar<sup>p697</sup>](#))\* '-' ([PCENChar<sup>p697</sup>](#))\*

**PCENChar ::=**

"-" | "." | [0-9] | "\_" | [a-z] | #xB7 | [#xC0-#xD6] | [#xD8-#xF6] | [#xF8-#x37D] | [#x37F-#x1FFF] |  
[#x200C-#x200D] | [#x203F-#x2040] | [#x2070-#x218F] | [#x2C00-#x2FEF] | [#x3001-#xD7FF] |  
[#xF900-#xFDCF] | [#xFDF0-#xFFFD] | [#x10000-#xEFFFF]

This uses the [EBNF notation](#) from the [XML specification](#). [\[XML\]<sup>p1271</sup>](#)

- *name* must not be any of the following:

- annotation-xml
- color-profile
- font-face
- font-face-src
- font-face-uri
- font-face-format
- font-face-name
- missing-glyph

## Note

The list of names above is the summary of all hyphen-containing element names from the [applicable specifications<sup>p63</sup>](#), namely SVG 2 and MathML. [\[SVG\]<sup>p1270</sup>](#) [\[MATHML\]<sup>p1268</sup>](#)

## Note

These requirements ensure a number of goals for [valid custom element names](#)<sup>p697</sup>:

- They start with an [ASCII lower alpha](#), ensuring that the HTML parser will treat them as tags instead of as text.
- They do not contain any [ASCII upper alphas](#), ensuring that the user agent can always treat HTML elements ASCII-case-insensitively.
- They contain a hyphen, used for namespacing and to ensure forward compatibility (since no elements will be added to HTML, SVG, or MathML with hyphen-containing local names in the future).
- They can always be created with [createElement\(\)](#) and [createElementNS\(\)](#), which have restrictions that go beyond the parser's.

Apart from these restrictions, a large variety of names is allowed, to give maximum flexibility for use cases like `<math-α>` or `<emotion-😊>`.

A **custom element definition** describes a [custom element](#)<sup>p696</sup> and consists of:

### A name

A [valid custom element name](#)<sup>p697</sup>

### A local name

A local name

### A constructor

A Web IDL [Function](#) callback function type value wrapping the [custom element constructor](#)<sup>p696</sup>

### A list of observed attributes

A sequence<DOMString>

### A collection of lifecycle callbacks

A map, whose keys are the strings "connectedCallback", "disconnectedCallback", "adoptedCallback", "attributeChangedCallback", "formAssociatedCallback", "formDisabledCallback", "formResetCallback", and "formStateRestoreCallback". The corresponding values are either a Web IDL [Function](#) callback function type value, or null. By default the value of each entry is null.

### A construction stack

A list, initially empty, that is manipulated by the [upgrade an element](#)<sup>p702</sup> algorithm and the [HTML element constructors](#)<sup>p122</sup>. Each entry in the list will be either an element or an **already constructed marker**.

### A form-associated boolean

If this is true, user agent treats elements associated to this [custom element definition](#)<sup>p698</sup> as [form-associated custom elements](#)<sup>p697</sup>.

### A disable internals boolean

Controls [attachInternals\(\)](#)<sup>p709</sup>.

### A disable shadow boolean

Controls [attachShadow\(\)](#).

To **look up a custom element definition**, given a *document*, *namespace*, *localName*, and *is*, perform the following steps. They will return either a [custom element definition](#)<sup>p698</sup> or null:

1. If *namespace* is not the [HTML namespace](#), return null.
2. If *document*'s [browsing context](#)<sup>p804</sup> is null, return null.
3. Let *registry* be *document*'s [relevant global object](#)<sup>p913</sup>'s [CustomElementRegistry](#)<sup>p699</sup> object.
4. If there is [custom element definition](#)<sup>p698</sup> in *registry* with [name](#)<sup>p698</sup> and [local name](#)<sup>p698</sup> both equal to *localName*, return that [custom element definition](#)<sup>p698</sup>.
5. If there is a [custom element definition](#)<sup>p698</sup> in *registry* with [name](#)<sup>p698</sup> equal to *is* and [local name](#)<sup>p698</sup> equal to *localName*, return that [custom element definition](#)<sup>p698</sup>.
6. Return null.

#### 4.13.4 The [CustomElementRegistry](#)<sup>p699</sup> interface §<sup>p69</sup><sub>9</sub>

Each [Window](#)<sup>p816</sup> object is associated with a unique instance of a [CustomElementRegistry](#)<sup>p699</sup> object, allocated when the [Window](#)<sup>p816</sup> object is created.

#### Note

*Custom element registries are associated with [Window](#)<sup>p816</sup> objects, instead of [Document](#)<sup>p111</sup> objects, since each [custom element constructor](#)<sup>p696</sup> inherits from the [HTMLElement](#)<sup>p121</sup> interface, and there is exactly one [HTMLElement](#)<sup>p121</sup> interface per [Window](#)<sup>p816</sup> object.*

The `customElements` attribute of the [Window](#)<sup>p816</sup> interface must return the [CustomElementRegistry](#)<sup>p699</sup> object for that [Window](#)<sup>p816</sup> object.

```
IDL [Exposed=Window]
interface CustomElementRegistry {
  [CEReactions] void define(DOMString name, CustomElementConstructor constructor, optional
  ElementDefinitionOptions options = {});
  any get(DOMString name);
  Promise<void> whenDefined(DOMString name);
  [CEReactions] void upgrade(Node root);
};

callback CustomElementConstructor = HTMLElement ();

dictionary ElementDefinitionOptions {
  DOMString extends;
};
```

Every [CustomElementRegistry](#)<sup>p699</sup> has a set of [custom element definitions](#)<sup>p698</sup>, initially empty. In general, algorithms in this specification look up elements in the registry by any of [name](#)<sup>p698</sup>, [local name](#)<sup>p698</sup>, or [constructor](#)<sup>p698</sup>.

Every [CustomElementRegistry](#)<sup>p699</sup> also has an **element definition is running** flag which is used to prevent reentrant invocations of [element definition](#)<sup>p699</sup>. It is initially unset.

Every [CustomElementRegistry](#)<sup>p699</sup> also has a **when-defined promise map**, mapping [valid custom element names](#)<sup>p697</sup> to promises. It is used to implement the [whenDefined\(\)](#)<sup>p701</sup> method.

#### For web developers (non-normative)

##### `window . customElements`<sup>p699</sup> . `define`<sup>p699</sup>(*name*, *constructor*)

Defines a new [custom element](#)<sup>p696</sup>, mapping the given name to the given constructor as an [autonomous custom element](#)<sup>p696</sup>.

##### `window . customElements`<sup>p699</sup> . `define`<sup>p699</sup>(*name*, *constructor*, { *extends*: *baseLocalName* })

Defines a new [custom element](#)<sup>p696</sup>, mapping the given name to the given constructor as a [customized built-in element](#)<sup>p696</sup> for the [element type](#)<sup>p43</sup> identified by the supplied *baseLocalName*. A ["NotSupportedError" DOMException](#) will be thrown upon trying to extend a [custom element](#)<sup>p696</sup> or an unknown element.

##### `window . customElements`<sup>p699</sup> . `get`<sup>p701</sup>(*name*)

Retrieves the [custom element constructor](#)<sup>p696</sup> defined for the given [name](#)<sup>p698</sup>. Returns undefined if there is no [custom element definition](#)<sup>p698</sup> with the given [name](#)<sup>p698</sup>.

##### `window . customElements`<sup>p699</sup> . `whenDefined`<sup>p701</sup>(*name*)

Returns a promise that will be fulfilled when a [custom element](#)<sup>p696</sup> becomes defined with the given name. (If such a [custom element](#)<sup>p696</sup> is already defined, the returned promise will be immediately fulfilled.) Returns a promise rejected with a ["SyntaxError" DOMException](#) if not given a [valid custom element name](#)<sup>p697</sup>.

##### `window . customElements`<sup>p699</sup> . `upgrade`<sup>p702</sup>(*root*)

Tries to [upgrade](#)<sup>p704</sup> all [shadow-including inclusive descendant](#) elements of *root*, even if they are not [connected](#).

**Element definition** is a process of adding a [custom element definition](#)<sup>p698</sup> to the [CustomElementRegistry](#)<sup>p699</sup>. This is accomplished by the [define\(\)](#)<sup>p699</sup> method. When invoked, the `define(name, constructor, options)` method must run these steps:

1. If `IsConstructor(constructor)` is false, then throw a [TypeError](#).

2. If *name* is not a [valid custom element name](#)<sup>p697</sup>, then throw a `"SyntaxError"` `DOMException`.
3. If this [CustomElementRegistry](#)<sup>p699</sup> contains an entry with [name](#)<sup>p698</sup> *name*, then throw a `"NotSupportedError"` `DOMException`.
4. If this [CustomElementRegistry](#)<sup>p699</sup> contains an entry with [constructor](#)<sup>p698</sup> *constructor*, then throw a `"NotSupportedError"` `DOMException`.
5. Let *localName* be *name*.
6. Let *extends* be the value of the `extends` member of *options*, or null if no such member exists.
7. If *extends* is not null, then:
  1. If *extends* is a [valid custom element name](#)<sup>p697</sup>, then throw a `"NotSupportedError"` `DOMException`.
  2. If the [element interface](#) for *extends* and the [HTML namespace](#) is `HTMLUnknownElement`<sup>p121</sup> (e.g., if *extends* does not indicate an element definition in this specification), then throw a `"NotSupportedError"` `DOMException`.
  3. Set *localName* to *extends*.
8. If this [CustomElementRegistry](#)<sup>p699</sup>'s [element definition is running](#)<sup>p699</sup> flag is set, then throw a `"NotSupportedError"` `DOMException`.
9. Set this [CustomElementRegistry](#)<sup>p699</sup>'s [element definition is running](#)<sup>p699</sup> flag.
10. Let *formAssociated* be false.
11. Let *disableInternals* be false.
12. Let *disableShadow* be false.
13. Let *observedAttributes* be an empty `sequence<DOMString>`.
14. Run the following substeps while catching any exceptions:
  1. Let *prototype* be `Get(constructor, "prototype")`. Rethrow any exceptions.
  2. If `Type(prototype)` is not `Object`, then throw a `TypeError` exception.
  3. Let *lifecycleCallbacks* be a map with the keys `"connectedCallback"`, `"disconnectedCallback"`, `"adoptedCallback"`, and `"attributeChangedCallback"`, each of which belongs to an entry whose value is null.
  4. For each of the keys *callbackName* in *lifecycleCallbacks*, in the order listed in the previous step:
    1. Let *callbackValue* be `Get(prototype, callbackName)`. Rethrow any exceptions.
    2. If *callbackValue* is not undefined, then set the value of the entry in *lifecycleCallbacks* with key *callbackName* to the result of [converting](#) *callbackValue* to the Web IDL `Function` callback type. Rethrow any exceptions from the conversion.
  5. If the value of the entry in *lifecycleCallbacks* with key `"attributeChangedCallback"` is not null, then:
    1. Let *observedAttributesIterable* be `Get(constructor, "observedAttributes")`. Rethrow any exceptions.
    2. If *observedAttributesIterable* is not undefined, then set *observedAttributes* to the result of [converting](#) *observedAttributesIterable* to a `sequence<DOMString>`. Rethrow any exceptions from the conversion.
  6. Let *disabledFeatures* be an empty `sequence<DOMString>`.
  7. Let *disabledFeaturesIterable* be `Get(constructor, "disabledFeatures")`. Rethrow any exceptions.
  8. If *disabledFeaturesIterable* is not undefined, then set *disabledFeatures* to the result of [converting](#) *disabledFeaturesIterable* to a `sequence<DOMString>`. Rethrow any exceptions from the conversion.
  9. Set *disableInternals* to true if *disabledFeatures* [contains](#) `"internals"`.
  10. Set *disableShadow* to true if *disabledFeatures* [contains](#) `"shadow"`.
  11. Let *formAssociatedValue* be `Get(constructor, "formAssociated")`. Rethrow any exceptions.
  12. Set *formAssociated* to the result of [converting](#) *formAssociatedValue* to a `boolean`. Rethrow any exceptions from the

conversion.

13. If *formAssociated* is true, for each of "formAssociatedCallback", "formResetCallback", "formDisabledCallback", and "formStateRestoreCallback" *callbackName*:
  1. Let *callbackValue* be [Get\(prototype, callbackName\)](#). Rethrow any exceptions.
  2. If *callbackValue* is not undefined, then set the value of the entry in *lifecycleCallbacks* with key *callbackName* to the result of [converting](#) *callbackValue* to the Web IDL [Function](#) callback type. Rethrow any exceptions from the conversion.

Then, perform the following substep, regardless of whether the above steps threw an exception or not:

1. Unset this [CustomElementRegistry](#)<sup>p699</sup>'s [element definition is running](#)<sup>p699</sup> flag.

Finally, if the first set of substeps threw an exception, then rethrow that exception (thus terminating this algorithm). Otherwise, continue onward.

15. Let *definition* be a new [custom element definition](#)<sup>p698</sup> with [name](#)<sup>p698</sup> *name*, [local name](#)<sup>p698</sup> *localName*, [constructor](#)<sup>p698</sup> *constructor*, [observed attributes](#)<sup>p698</sup> *observedAttributes*, [lifecycle callbacks](#)<sup>p698</sup> *lifecycleCallbacks*, [form-associated](#)<sup>p698</sup> *formAssociated*, [disable internals](#)<sup>p698</sup> *disableInternals*, and [disable shadow](#)<sup>p698</sup> *disableShadow*.
16. Add *definition* to this [CustomElementRegistry](#)<sup>p699</sup>.
17. Let *document* be this [CustomElementRegistry](#)<sup>p699</sup>'s [relevant global object](#)<sup>p913</sup>'s [associated Document](#)<sup>p818</sup>.
18. Let *upgrade candidates* be all elements that are [shadow-including descendants](#) of *document*, whose namespace is the [HTML namespace](#) and whose local name is *localName*, in [shadow-including tree order](#). Additionally, if *extends* is non-null, only include elements whose [is value](#) is equal to *name*.
19. For each element *element* in *upgrade candidates*, [enqueue a custom element upgrade reaction](#)<sup>p706</sup> given *element* and *definition*.
20. If this [CustomElementRegistry](#)<sup>p699</sup>'s [when-defined promise map](#)<sup>p699</sup> contains an entry with key *name*:
  1. Let *promise* be the value of that entry.
  2. Resolve *promise* with undefined.
  3. Delete the entry with key *name* from this [CustomElementRegistry](#)<sup>p699</sup>'s [when-defined promise map](#)<sup>p699</sup>.

When invoked, the [get\(name\)](#) method must run these steps:

1. If this [CustomElementRegistry](#)<sup>p699</sup> contains an entry with [name](#)<sup>p698</sup> *name*, then return that entry's [constructor](#)<sup>p698</sup>.
2. Otherwise, return undefined.

When invoked, the [whenDefined\(name\)](#) method must run these steps:

1. If *name* is not a [valid custom element name](#)<sup>p697</sup>, then return a new promise rejected with a ["SyntaxError" DOMException](#).
2. If this [CustomElementRegistry](#)<sup>p699</sup> contains an entry with [name](#)<sup>p698</sup> *name*, then return a new promise resolved with undefined.
3. Let *map* be this [CustomElementRegistry](#)<sup>p699</sup>'s [when-defined promise map](#)<sup>p699</sup>.
4. If *map* does not contain an entry with key *name*, create an entry in *map* with key *name* and whose value is a new promise.
5. Let *promise* be the value of the entry in *map* with key *name*.
6. Return *promise*.

### Example

The [whenDefined\(\)](#)<sup>p701</sup> method can be used to avoid performing an action until all appropriate [custom elements](#)<sup>p696</sup> are [defined](#). In this example, we combine it with the [:defined](#)<sup>p717</sup> pseudo-class to hide a dynamically-loaded article's contents until we're sure that all of the [autonomous custom elements](#)<sup>p696</sup> it uses are defined.

```
articleContainer.hidden = true;
```

```

fetch(articleURL)
  .then(response => response.text())
  .then(text => {
    articleContainer.innerHTML = text;

    return Promise.all(
      [...articleContainer.querySelectorAll(":not(:defined)")]
        .map(el => customElements.whenDefined(el.localName))
    );
  })
  .then(() => {
    articleContainer.hidden = false;
  });

```

When invoked, the `upgrade(root)` method must run these steps:

MDN

1. Let *candidates* be a [list](#) of all of *root*'s [shadow-including inclusive descendant](#) elements, in [shadow-including tree order](#).
2. [For each candidate](#) of *candidates*, [try to upgrade](#)<sup>p704</sup> *candidate*.

#### Example

The `upgrade()`<sup>p702</sup> method allows upgrading of elements at will. Normally elements are automatically upgraded when they become [connected](#), but this method can be used if you need to upgrade before you're ready to connect the element.

```

const el = document.createElement("spider-man");

class SpiderMan extends HTMLElement {}
customElements.define("spider-man", SpiderMan);

console.assert(!(el instanceof SpiderMan)); // not yet upgraded

customElements.upgrade(el);
console.assert(el instanceof SpiderMan); // upgraded!

```

### 4.13.5 Upgrades <sup>§p70</sup><sub>2</sub>

To **upgrade an element**, given as input a [custom element definition](#)<sup>p698</sup> *definition* and an element *element*, run the following steps:

1. If *element*'s [custom element state](#) is not "undefined" or "uncustomized", then return.

#### Example

One scenario where this can occur due to reentrant invocation of this algorithm, as in the following example:

```

<!DOCTYPE html>
<x-foo id="a"></x-foo>
<x-foo id="b"></x-foo>

<script>
// Defining enqueues upgrade reactions for both "a" and "b"
customElements.define("x-foo", class extends HTMLElement {
  constructor() {
    super();

    const b = document.querySelector("#b");
    b.remove();
  }
});

```

```

// While this constructor is running for "a", "b" is still
// undefined, and so inserting it into the document will enqueue a
// second upgrade reaction for "b" in addition to the one enqueued
// by defining x-foo.
document.body.appendChild(b);
}
})
</script>

```

This step will thus bail out the algorithm early when [upgrade an element](#)<sup>p702</sup> is invoked with "b" a second time.

2. Set *element*'s [custom element definition](#) to *definition*.
3. Set *element*'s [custom element state](#) to "failed".

**Note**

*It will be set to "custom" [after the upgrade succeeds](#)<sup>p704</sup>. For now, we set it to "failed" so that any reentrant invocations will hit [the above early-exit step](#)<sup>p702</sup>.*

4. For each *attribute* in *element*'s [attribute list](#), in order, [enqueue a custom element callback reaction](#)<sup>p706</sup> with *element*, callback name "attributeChangedCallback", and an argument list containing *attribute*'s local name, null, *attribute*'s value, and *attribute*'s namespace.
5. If *element* is [connected](#), then [enqueue a custom element callback reaction](#)<sup>p706</sup> with *element*, callback name "connectedCallback", and an empty argument list.
6. Add *element* to the end of *definition*'s [construction stack](#)<sup>p698</sup>.
7. Let *C* be *definition*'s [constructor](#)<sup>p698</sup>.
8. Run the following substeps while catching any exceptions:
  1. If *definition*'s [disable shadow](#)<sup>p698</sup> is true and *element*'s [shadow root](#) is non-null, then throw a ["NotSupportedError" DOMException](#).

**Note**

*This is needed as [attachShadow\(\)](#) does not use [look up a custom element definition](#)<sup>p698</sup> while [attachInternals\(\)](#)<sup>p709</sup> does.*

2. Let *constructResult* be the result of [constructing](#) *C*, with no arguments.

**Note**

*If [non-conformantly](#)<sup>p695</sup> uses an API decorated with the [\[CEReactions\]](#)<sup>p706</sup> extended attribute, then the reactions enqueued at the beginning of this algorithm will execute during this step, before *C* finishes and control returns to this algorithm. Otherwise, they will execute after *C* and the rest of the upgrade process finishes.*

3. If [SameValue](#)(*constructResult*, *element*) is false, then throw a [TypeError](#).

**Note**

*This can occur if *C* constructs another instance of the same custom element before calling [super\(\)](#), or if *C* uses JavaScript's [return-override](#) feature to return an arbitrary [HTML element](#)<sup>p121</sup> object from the constructor.*

Then, perform the following substep, regardless of whether the above steps threw an exception or not:

1. Remove the last entry from the end of *definition*'s [construction stack](#)<sup>p698</sup>.

**Note**

*Assuming *C* calls [super\(\)](#) (as it will if it is [conformant](#)<sup>p695</sup>), and that the call succeeds, this will be the [already constructed marker](#)<sup>p698</sup> that replaced the *element* we pushed at the beginning of this algorithm. (The [HTML](#)*

[element constructor](#)<sup>p122</sup> carries out this replacement.)

If C does not call `super()` (i.e. it is not [conformant](#)<sup>p695</sup>), or if any step in the [HTML element constructor](#)<sup>p122</sup> throws, then this entry will still be element.

Finally, if the above steps threw an exception, then:

1. Set *element*'s [custom element definition](#) to null.
2. Empty *element*'s [custom element reaction queue](#)<sup>p705</sup>.
3. Rethrow the exception (thus terminating this algorithm).

#### Note

If the above steps threw an exception, then *element*'s [custom element state](#) will remain "failed".

9. If *element* is a [form-associated custom element](#)<sup>p697</sup>, then:
  1. [Reset the form owner](#)<sup>p560</sup> of *element*. If *element* is associated with a [form](#)<sup>p479</sup> element, then [enqueue a custom element callback reaction](#)<sup>p706</sup> with *element*, callback name "formAssociatedCallback", and « the associated [form](#)<sup>p479</sup> ».
  2. If *element* is [disabled](#)<sup>p563</sup>, then [enqueue a custom element callback reaction](#)<sup>p706</sup> with *element*, callback name "formDisabledCallback" and « true ».
10. Set *element*'s [custom element state](#) to "custom".

To **try to upgrade an element**, given as input an element *element*, run the following steps:

1. Let *definition* be the result of [looking up a custom element definition](#)<sup>p698</sup> given *element*'s [node document](#), *element*'s namespace, *element*'s local name, and *element*'s [is value](#).
2. If *definition* is not null, then [enqueue a custom element upgrade reaction](#)<sup>p706</sup> given *element* and *definition*.

### 4.13.6 Custom element reactions § p704

A [custom element](#)<sup>p696</sup> possesses the ability to respond to certain occurrences by running author code:

- When [upgraded](#)<sup>p702</sup>, its [constructor](#)<sup>p696</sup> is run, with no arguments.
- When it [becomes connected](#)<sup>p44</sup>, its `connectedCallback` is called, with no arguments.
- When it [becomes disconnected](#)<sup>p44</sup>, its `disconnectedCallback` is called, with no arguments.
- When it is [adopted](#) into a new document, its `adoptedCallback` is called, given the old document and new document as arguments.
- When any of its attributes are [changed](#), [appended](#), [removed](#), or [replaced](#), its `attributeChangedCallback` is called, given the attribute's local name, old value, new value, and namespace as arguments. (An attribute's old or new value is considered to be null when the attribute is added or removed, respectively.)
- When the user agent [resets the form owner](#)<sup>p560</sup> of a [form-associated custom element](#)<sup>p697</sup> and doing so changes the form owner, its `formAssociatedCallback` is called, given the new form owner (or null if no owner) as an argument.
- When the form owner of a [form-associated custom element](#)<sup>p697</sup> is [reset](#)<sup>p597</sup>, its `formResetCallback` is called.
- When the [disabled](#)<sup>p563</sup> state of a [form-associated custom element](#)<sup>p697</sup> is changed, its `formDisabledCallback` is called, given the new state as an argument.
- When user agent updates a [form-associated custom element](#)<sup>p697</sup>'s value on behalf of a user, its `formStateRestoreCallback` is called, given the new value and a string indicating a reason, "restore" or "autocomplete", as arguments.

We call these reactions collectively **custom element reactions**.

The way in which [custom element reactions](#)<sup>p704</sup> are invoked is done with special care, to avoid running author code during the middle

of delicate operations. Effectively, they are delayed until "just before returning to user script". This means that for most purposes they appear to execute synchronously, but in the case of complicated composite operations (like [cloning](#), or [range](#) manipulation), they will instead be delayed until after all the relevant user agent processing steps have completed, and then run together as a batch.

Additionally, the precise ordering of these reactions is managed via a somewhat-complicated stack-of-queues system, described below. The intention behind this system is to guarantee that [custom element reactions](#)<sup>p704</sup> always are invoked in the same order as their triggering actions, at least within the local context of a single [custom element](#)<sup>p696</sup>. (Because [custom element reaction](#)<sup>p704</sup> code can perform its own mutations, it is not possible to give a global ordering guarantee across multiple elements.)

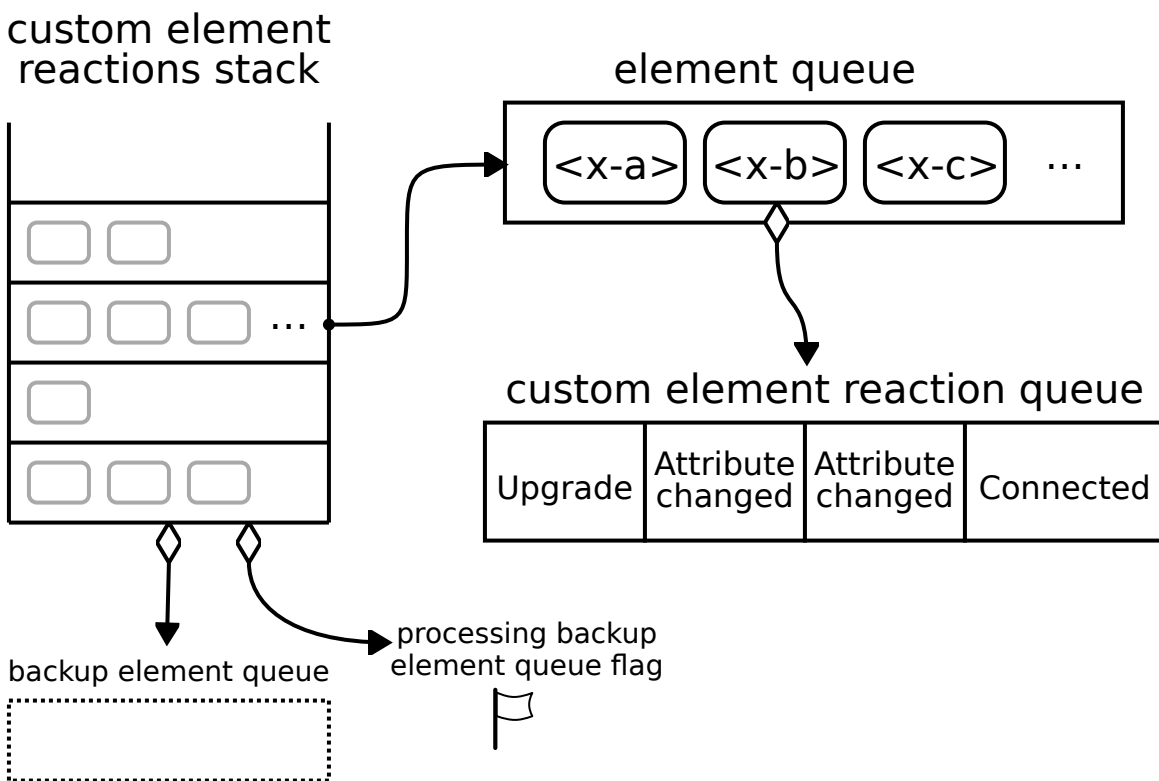

Each [similar-origin window agent](#)<sup>p919</sup> has a **custom element reactions stack**, which is initially empty. A [similar-origin window agent](#)<sup>p919</sup>'s **current element queue** is the [element queue](#)<sup>p705</sup> at the top of its [custom element reactions stack](#)<sup>p705</sup>. Each item in the stack is an **element queue**, which is initially empty as well. Each item in an [element queue](#)<sup>p705</sup> is an element. (The elements are not necessarily [custom](#) yet, since this queue is used for [upgrades](#)<sup>p702</sup> as well.)

Each [custom element reactions stack](#)<sup>p705</sup> has an associated **backup element queue**, which is an initially-empty [element queue](#)<sup>p705</sup>. Elements are pushed onto the [backup element queue](#)<sup>p705</sup> during operations that affect the DOM without going through an API decorated with [\[CEReactions\]](#)<sup>p706</sup>, or through the parser's [create an element for the token](#)<sup>p1107</sup> algorithm. An example of this is a user-initiated editing operation which modifies the descendants or attributes of an [editable](#) element. To prevent reentrancy when processing the [backup element queue](#)<sup>p705</sup>, each [custom element reactions stack](#)<sup>p705</sup> also has a **processing the backup element queue** flag, initially unset.

All elements have an associated **custom element reaction queue**, initially empty. Each item in the [custom element reaction queue](#)<sup>p705</sup> is of one of two types:

- An **upgrade reaction**, which will [upgrade](#)<sup>p702</sup> the custom element and contains a [custom element definition](#)<sup>p698</sup>; or
- A **callback reaction**, which will call a lifecycle callback, and contains a callback function as well as a list of arguments.

This is all summarized in the following schematic diagram:

To **enqueue an element on the appropriate element queue**, given an element *element*, run the following steps:

1. Let *reactionsStack* be *element*'s [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>.
2. If *reactionsStack* is empty, then:
  1. Add *element* to *reactionsStack*'s [backup element queue](#)<sup>p705</sup>.

2. If *reactionsStack*'s [processing the backup element queue](#)<sup>p705</sup> flag is set, then return.
3. Set *reactionsStack*'s [processing the backup element queue](#)<sup>p705</sup> flag.
4. [Queue a microtask](#)<sup>p926</sup> to perform the following steps:
  1. [Invoke custom element reactions](#)<sup>p706</sup> in *reactionsStack*'s [backup element queue](#)<sup>p705</sup>.
  2. Unset *reactionsStack*'s [processing the backup element queue](#)<sup>p705</sup> flag.
3. Otherwise, add *element* to *element*'s [relevant agent](#)<sup>p919</sup>'s [current element queue](#)<sup>p705</sup>.

To **enqueue a custom element callback reaction**, given a [custom element](#)<sup>p696</sup> *element*, a callback name *callbackName*, and a list of arguments *args*, run the following steps:

1. Let *definition* be *element*'s [custom element definition](#).
2. Let *callback* be the value of the entry in *definition*'s [lifecycle callbacks](#)<sup>p698</sup> with key *callbackName*.
3. If *callback* is null, then return
4. If *callbackName* is "attributeChangedCallback", then:
  1. Let *attributeName* be the first element of *args*.
  2. If *definition*'s [observed attributes](#)<sup>p698</sup> does not contain *attributeName*, then return.
5. Add a new [callback reaction](#)<sup>p705</sup> to *element*'s [custom element reaction queue](#)<sup>p705</sup>, with callback function *callback* and arguments *args*.
6. [Enqueue an element on the appropriate element queue](#)<sup>p705</sup> given *element*.

To **enqueue a custom element upgrade reaction**, given an element *element* and [custom element definition](#)<sup>p698</sup> *definition*, run the following steps:

1. Add a new [upgrade reaction](#)<sup>p705</sup> to *element*'s [custom element reaction queue](#)<sup>p705</sup>, with [custom element definition](#)<sup>p698</sup> *definition*.
2. [Enqueue an element on the appropriate element queue](#)<sup>p705</sup> given *element*.

To **invoke custom element reactions** in an [element queue](#)<sup>p705</sup> *queue*, run the following steps:

1. For each [custom element](#)<sup>p696</sup> *element* in *queue*:
  1. Let *reactions* be *element*'s [custom element reaction queue](#)<sup>p705</sup>.
  2. Repeat until *reactions* is empty:
    1. Remove the first element of *reactions*, and let *reaction* be that element. Switch on *reaction*'s type:
      - ↪ [upgrade reaction](#)<sup>p705</sup>  
[Upgrade](#)<sup>p702</sup> *element* using *reaction*'s [custom element definition](#)<sup>p698</sup>.
      - ↪ [callback reaction](#)<sup>p705</sup>  
[Invoke](#) *reaction*'s callback function with *reaction*'s arguments, and with *element* as the [callback this value](#).

If this throws an exception, catch it, and [report the exception](#)<sup>p922</sup>.

To ensure [custom element reactions](#)<sup>p704</sup> are triggered appropriately, we introduce the **[CEReactions]** IDL [extended attribute](#). It indicates that the relevant algorithm is to be supplemented with additional steps in order to appropriately track and invoke [custom element reactions](#)<sup>p704</sup>.

The **[CEReactions]**<sup>p706</sup> extended attribute must take no arguments, and must not appear on anything other than an operation, attribute, setter, or deleter. Additionally, it must not appear on readonly attributes.

Operations, attributes, setters, or deleters annotated with the **[CEReactions]**<sup>p706</sup> extended attribute must run the following steps in place of the ones specified in their description:

1. [Push](#) a new [element queue](#)<sup>p705</sup> onto this object's [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>.
2. Run the originally-specified steps for this construct, catching any exceptions. If the steps return a value, let *value* be the returned value. If they throw an exception, let *exception* be the thrown exception.
3. Let *queue* be the result of [popping](#) from this object's [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>.
4. [Invoke custom element reactions](#)<sup>p706</sup> in *queue*.
5. If an exception *exception* was thrown by the original steps, rethrow *exception*.
6. If a value *value* was returned from the original steps, return *value*.

#### Note

The intent behind this extended attribute is somewhat subtle. One way of accomplishing its goals would be to say that every operation, attribute, setter, and deleter on the platform must have these steps inserted, and to allow implementers to optimize away unnecessary cases (where no DOM mutation is possible that could cause [custom element reactions](#)<sup>p704</sup> to occur).

However, in practice this imprecision could lead to non-interoperable implementations of [custom element reactions](#)<sup>p704</sup>, as some implementations might forget to invoke these steps in some cases. Instead, we settled on the approach of explicitly annotating all relevant IDL constructs, as a way of ensuring interoperable behavior and helping implementations easily pinpoint all cases where these steps are necessary.

Any nonstandard APIs introduced by the user agent that could modify the DOM in such a way as to cause [enqueueing a custom element callback reaction](#)<sup>p706</sup> or [enqueueing a custom element upgrade reaction](#)<sup>p706</sup>, for example by modifying any attributes or child elements, must also be decorated with the [\[CEReactions\]](#)<sup>p706</sup> attribute.

#### Note

As of the time of this writing, the following nonstandard or not-yet-standardized APIs are known to fall into this category:

- [HTMLInputElement](#)<sup>p121</sup>'s *outerText* IDL attribute
- [HTMLInputElement](#)<sup>p487</sup>'s *webkitdirectory* and *incremental* IDL attributes
- [HTMLLinkElement](#)<sup>p155</sup>'s *disabled* and *scope* IDL attributes
- [ShadowRoot](#)'s *innerHTML* IDL attribute

### 4.13.7 The [ElementInternals](#)<sup>p707</sup> interface § p707

For web developers (non-normative)

**[element.attachInternals\(\)](#)**<sup>p709</sup>

Returns an [ElementInternals](#)<sup>p707</sup> object targeting the [custom element](#)<sup>p696</sup> *element*. Throws an exception if *element* is not a [custom element](#)<sup>p696</sup>, if the "internals" feature was disabled as part of the element definition, or if it is called twice on the same element.

```
IDL [Exposed=Window]
interface ElementInternals {
  // Form-associated custom elements

  void setFormValue((File or USVString or FormData)? value,
                   optional (File or USVString or FormData)? state);

  readonly attribute HTMLFormElement? form;

  void setValidity(optional ValidityStateFlags flags = {},
                  optional DOMString message,
                  optional HTMLInputElement anchor);
  readonly attribute boolean willValidate;
```

```

readonly attribute ValidityState validity;
readonly attribute DOMString validationMessage;
boolean checkValidity();
boolean reportValidity();

readonly attribute NodeList labels;
};

dictionary ValidityStateFlags {
  boolean valueMissing = false;
  boolean typeMismatch = false;
  boolean patternMismatch = false;
  boolean tooLong = false;
  boolean tooShort = false;
  boolean rangeUnderflow = false;
  boolean rangeOverflow = false;
  boolean stepMismatch = false;
  boolean badInput = false;
  boolean customError = false;
};

```

### For web developers (non-normative)

#### ***internals* . [setFormValue](#)<sup>p709</sup>(value)**

Sets both the [state](#)<sup>p709</sup> and [submission value](#)<sup>p709</sup> of *internals*'s [target element](#)<sup>p708</sup> to *value*.

If *value* is null, the element won't participate in form submission.

#### ***internals* . [setFormValue](#)<sup>p709</sup>(value, state)**

Sets the [submission value](#)<sup>p709</sup> of *internals*'s [target element](#)<sup>p708</sup> to *value*, and its [state](#)<sup>p709</sup> to *state*.

If *value* is null, the element won't participate in form submission.

#### ***internals* . [form](#)<sup>p561</sup>**

Returns the [form owner](#)<sup>p559</sup> of *internals*'s [target element](#)<sup>p708</sup>.

#### ***internals* . [setValidity](#)<sup>p710</sup>(flags, message [, anchor ])**

Marks *internals*'s [target element](#)<sup>p708</sup> as suffering from the constraints indicated by the *flags* argument, and sets the element's validation message to *message*. If *anchor* is specified, the user agent might use it to indicate problems with the constraints of *internals*'s [target element](#)<sup>p708</sup> when the [form owner](#)<sup>p559</sup> is validated interactively or [reportValidity\(\)](#)<sup>p588</sup> is called.

#### ***internals* . [setValidity](#)<sup>p710</sup>({})**

Marks *internals*'s [target element](#)<sup>p708</sup> as [satisfying its constraints](#)<sup>p584</sup>.

#### ***internals* . [willValidate](#)<sup>p586</sup>**

Returns true if *internals*'s [target element](#)<sup>p708</sup> will be validated when the form is submitted; false otherwise.

#### ***internals* . [validity](#)<sup>p586</sup>**

Returns the [ValidityState](#)<sup>p586</sup> object for *internals*'s [target element](#)<sup>p708</sup>.

#### ***internals* . [validationMessage](#)<sup>p710</sup>**

Returns the error message that would be shown to the user if *internals*'s [target element](#)<sup>p708</sup> was to be checked for validity.

#### **valid = *internals* . [checkValidity](#)<sup>p587</sup>()**

Returns true if *internals*'s [target element](#)<sup>p708</sup> has no validity problems; false otherwise. Fires an [invalid](#)<sup>p1260</sup> event at the element in the latter case.

#### **valid = *internals* . [reportValidity](#)<sup>p588</sup>()**

Returns true if *internals*'s [target element](#)<sup>p708</sup> has no validity problems; otherwise, returns false, fires an [invalid](#)<sup>p1260</sup> event at the element, and (if the event isn't canceled) reports the problem to the user.

#### ***internals* . [labels](#)<sup>p485</sup>**

Returns a [NodeList](#) of all the [label](#)<sup>p483</sup> elements that *internals*'s [target element](#)<sup>p708</sup> is associated with.

Each [ElementInternals](#)<sup>p707</sup> has a **target element**, which is a [custom element](#)<sup>p696</sup>. [ElementInternals](#)<sup>p707</sup> provides various operations and attributes to allow control over internal features which the user agent provides to all elements.

Each [HTMLElement](#)<sup>p121</sup> has an **attached internals** boolean, initially false.

The [attachInternals\(\)](#) method on an [HTMLElement](#)<sup>p121</sup> *element*, when invoked, must run the following steps:

1. If *element*'s [is value](#) is not null, then throw a ["NotSupportedError" DOMException](#).
2. Let *definition* be the result of [looking up a custom element definition](#)<sup>p698</sup> given *element*'s [node document](#), its namespace, its local name, and null as [is value](#).
3. If *definition* is null, then throw an ["NotSupportedError" DOMException](#).
4. If *definition*'s [disable internals](#)<sup>p698</sup> is true, then throw a ["NotSupportedError" DOMException](#).
5. If *element*'s [attached internals](#)<sup>p709</sup> is true, then throw an ["NotSupportedError" DOMException](#).
6. Set *element*'s [attached internals](#)<sup>p709</sup> to true.
7. Create a new [ElementInternals](#)<sup>p707</sup> instance [targeting](#)<sup>p708</sup> *element*, and return it.

Each [form-associated custom element](#)<sup>p697</sup> has **submission value**. It is used to provide one or more [entries](#) on form submission, and The initial value of [submission value](#)<sup>p709</sup> is null, and [submission value](#)<sup>p709</sup> can be null, a string, a [File](#), or a [list](#) of [entries](#).

Each [form-associated custom element](#)<sup>p697</sup> has **state**. It is information with which the user agent can restore a user's input for the element. The initial value of [state](#)<sup>p709</sup> is null, and [state](#)<sup>p709</sup> can be null, a string, a [File](#), or a [list](#) of [entries](#).

The [setFormValue\(\)](#)<sup>p709</sup> method is used by the custom element author to set the element's [submission value](#)<sup>p709</sup> and [state](#)<sup>p709</sup>, thus communicating these to the user agent.

When the user agent believes it is a good idea to restore a [form-associated custom element](#)<sup>p697</sup>'s [state](#)<sup>p709</sup>, for example after navigation or restarting the user agent, they may [enqueue a custom element callback reaction](#)<sup>p706</sup> with that element, callback name "formStateRestoreCallback", and an argument list containing the state to be restored, and "restore".

If the user agent has a form-filling assist feature, then when the feature is invoked, it may [enqueue a custom element callback reaction](#)<sup>p706</sup> with a [form-associated custom element](#)<sup>p697</sup>, callback name "formStateRestoreCallback", and an argument list containing the state value determined by history of state value and some heuristics, and "autocomplete".

In general, the [state](#)<sup>p709</sup> is information specified by a user, and the [submission value](#)<sup>p709</sup> is a value after canonicalization or sanitization, suitable for submission to the server. The following examples makes this concrete:

#### Example

Suppose that we have a [form-associated custom element](#)<sup>p697</sup> which asks a user to specify a date. The user specifies "3/15/2019", but the control wishes to submit "2019-03-15" to the server. "3/15/2019" would be a [state](#)<sup>p709</sup> of the element, and "2019-03-15" would be a [submission value](#)<sup>p709</sup>.

#### Example

Suppose you develop a custom element emulating a the behavior of the existing [checkbox](#)<sup>p506</sup> [input](#)<sup>p486</sup> type. Its [submission value](#)<sup>p709</sup> would be the value of its value content attribute, or the string "on". Its [state](#)<sup>p709</sup> would be one of "checked", "unchecked", "checked/indeterminate", or "unchecked/indeterminate".

The [setFormValue\(value, state\)](#) method of the [ElementInternals](#)<sup>p707</sup> interface must run the following steps:

1. Let *element* be this [ElementInternals](#)<sup>p707</sup>'s [target element](#)<sup>p708</sup>.
2. If *element* is not a [form-associated custom element](#)<sup>p697</sup>, then throw a ["NotSupportedError" DOMException](#).
3. Set [target element](#)<sup>p708</sup>'s [submission value](#)<sup>p709</sup> to *value* if *value* is not a [FormData](#) object, or to a [clone](#) of the entry list associated with *value* otherwise.
4. If the *state* argument of the function is omitted, set *element*'s [state](#)<sup>p709</sup> to its [submission value](#)<sup>p709</sup>.
5. Otherwise, if *state* is a [FormData](#) object, set *element*'s [state](#)<sup>p709</sup> to [clone](#) of the entry list associated with *state*.
6. Otherwise, set *element*'s [state](#)<sup>p709</sup> to *state*.

Each [form-associated custom element](#)<sup>p697</sup> has validity flags named `valueMissing`, `typeMismatch`, `patternMismatch`, `tooLong`, `tooShort`, `rangeUnderflow`, `rangeOverflow`, `stepMismatch`, and `customError`. They are false initially.

Each [form-associated custom element](#)<sup>p697</sup> has a **validation message** string. It is the empty string initially.

Each [form-associated custom element](#)<sup>p697</sup> has a **validation anchor** element. It is null initially.

The `setValidity(flags, message, anchor)` method of the [ElementInternals](#)<sup>p707</sup> interface must run the following steps:

1. Let *element* be this [ElementInternals](#)<sup>p707</sup>'s [target element](#)<sup>p708</sup>.
2. If *element* is not a [form-associated custom element](#)<sup>p697</sup>, then throw a `"NotSupportedError"` `DOMException`.
3. If *flags* contains one or more true values and *message* is not given or is the empty string, then throw a `TypeError`.
4. For each entry *flag* → *value* of *flags*, set *element*'s validity flag with the name *flag* to *value*.
5. Set *element*'s [validation message](#)<sup>p710</sup> to the empty string if *message* is not given or all of *element*'s validity flags are false, or to *message* otherwise.
6. If *element*'s `customError` validity flag is true, then set *element*'s [custom validity error message](#)<sup>p583</sup> to *element*'s [validation message](#)<sup>p710</sup>. Otherwise, set *element*'s [custom validity error message](#)<sup>p583</sup> to the empty string.
7. Set *element*'s [validation anchor](#)<sup>p710</sup> to null if *anchor* is not given. Otherwise, if *anchor* is not a [shadow-including descendant](#) of *element*, then throw a `"NotFoundError"` `DOMException`. Otherwise, set *element*'s [validation anchor](#)<sup>p710</sup> to *anchor*.

The `validationMessage` attribute of [ElementInternals](#)<sup>p707</sup> interface, on getting, must return the [validation message](#)<sup>p710</sup> of this [ElementInternals](#)<sup>p707</sup>'s [target element](#)<sup>p708</sup>.

When **entry construction algorithm** for a [form-associated custom element](#)<sup>p697</sup> is invoked, given an element *element* and a list *entry list*, run the following steps:

1. If *element*'s [submission value](#)<sup>p709</sup> is a [list of entries](#), then [append](#) each item of *element*'s [submission value](#)<sup>p709</sup> to *entry list*, and return.

#### Note

*In this case, user agent does not refer to the [name](#)<sup>p561</sup> content attribute value. An implementation of [form-associated custom element](#)<sup>p697</sup> is responsible to decide names of [entries](#). They can be the [name](#)<sup>p561</sup> content attribute value, they can be strings based on the [name](#)<sup>p561</sup> content attribute value, or they can be unrelated to the [name](#)<sup>p561</sup> content attribute.*

2. If the element does not have a [name](#)<sup>p561</sup> attribute specified, or its [name](#)<sup>p561</sup> attribute's value is the empty string, then return.
3. If the element's [submission value](#)<sup>p709</sup> is not null, [append an entry](#)<sup>p594</sup> to *entry list* with the [name](#)<sup>p561</sup> attribute value and the [submission value](#)<sup>p709</sup>.

## 4.14 Common idioms without dedicated elements §<sup>p71</sup><sub>0</sub>

### 4.14.1 Bread crumb navigation §<sup>p71</sup><sub>0</sub>

This specification does not provide a machine-readable way of describing bread-crumbs navigation menus. Authors are encouraged to just use a series of links in a paragraph. The [nav](#)<sup>p180</sup> element can be used to mark the section containing these paragraphs as being navigation blocks.

#### Example

In the following example, the current page can be reached via two paths.

```
<nav>
  <p>
    <a href="/">Main</a> ▶
    <a href="/products/">Products</a> ▶
    <a href="/products/dishwashers/">Dishwashers</a> ▶
  <a>Second hand</a>
```

```

</p>
<p>
  <a href="/">Main</a> ▶
  <a href="/second-hand/">Second hand</a> ▶
  <a>Dishwashers</a>
</p>
</nav>

```

#### 4.14.2 Tag clouds § p71

This specification does not define any markup specifically for marking up lists of keywords that apply to a group of pages (also known as *tag clouds*). In general, authors are encouraged to either mark up such lists using [ul](#)<sup>p218</sup> elements with explicit inline counts that are then hidden and turned into a presentational effect using a style sheet, or to use SVG.

##### Example

Here, three tags are included in a short tag cloud:

```

<style>
.tag-cloud > li > span { display: none; }
.tag-cloud > li { display: inline; }
.tag-cloud-1 { font-size: 0.7em; }
.tag-cloud-2 { font-size: 0.9em; }
.tag-cloud-3 { font-size: 1.1em; }
.tag-cloud-4 { font-size: 1.3em; }
.tag-cloud-5 { font-size: 1.5em; }

@media speech {
  .tag-cloud > li > span { display:inline }
}
</style>
...
<ul class="tag-cloud">
  <li class="tag-cloud-4"><a title="28 instances" href="/t/apple">apple</a> <span>(popular)</span>
  <li class="tag-cloud-2"><a title="6 instances" href="/t/kiwi">kiwi</a> <span>(rare)</span>
  <li class="tag-cloud-5"><a title="41 instances" href="/t/pear">pear</a> <span>(very
popular)</span>
</ul>

```

The actual frequency of each tag is given using the [title](#)<sup>p136</sup> attribute. A CSS style sheet is provided to convert the markup into a cloud of differently-sized words, but for user agents that do not support CSS or are not visual, the markup contains annotations like "(popular)" or "(rare)" to categorize the various tags by frequency, thus enabling all users to benefit from the information.

The [ul](#)<sup>p218</sup> element is used (rather than [ol](#)<sup>p216</sup>) because the order is not particularly important: while the list is in fact ordered alphabetically, it would convey the same information if ordered by, say, the length of the tag.

The [tag](#)<sup>p302</sup> [rel](#)<sup>p279</sup>-keyword is *not* used on these [a](#)<sup>p234</sup> elements because they do not represent tags that apply to the page itself; they are just part of an index listing the tags themselves.

#### 4.14.3 Conversations § p71

This specification does not define a specific element for marking up conversations, meeting minutes, chat transcripts, dialogues in screenplays, instant message logs, and other situations where different players take turns in discourse.

Instead, authors are encouraged to mark up conversations using [p](#)<sup>p207</sup> elements and punctuation. Authors who need to mark the speaker for styling purposes are encouraged to use [span](#)<sup>p275</sup> or [b](#)<sup>p268</sup>. Paragraphs with their text wrapped in the [i](#)<sup>p267</sup> element can be

used for marking up stage directions.

#### Example

This example demonstrates this using an extract from Abbot and Costello's famous sketch, *Who's on first*:

```
<p> Costello: Look, you gotta first baseman?  
<p> Abbott: Certainly.  
<p> Costello: Who's playing first?  
<p> Abbott: That's right.  
<p> Costello becomes exasperated.  
<p> Costello: When you pay off the first baseman every month, who gets the money?  
<p> Abbott: Every dollar of it.
```

#### Example

The following extract shows how an IM conversation log could be marked up, using the [data<sup>p254</sup>](#) element to provide Unix timestamps for each line. Note that the timestamps are provided in a format that the [time<sup>p256</sup>](#) element does not support, so the [data<sup>p254</sup>](#) element is used instead (namely, Unix `time_t` timestamps). Had the author wished to mark up the data using one of the date and time formats supported by the [time<sup>p256</sup>](#) element, that element could have been used instead of [data<sup>p254</sup>](#). This could be advantageous as it would allow data analysis tools to detect the timestamps unambiguously, without coordination with the page author.

```
<p> <data value="1319898155">14:22</data> <b>egof</b> I'm not that nerdy, I've only seen 30% of  
the star trek episodes  
<p> <data value="1319898192">14:23</data> <b>kaj</b> if you know what percentage of the star trek  
episodes you have seen, you are inarguably nerdy  
<p> <data value="1319898200">14:23</data> <b>egof</b> it's unarguably  
<p> <data value="1319898228">14:23</data> <i>* kaj blinks</i>  
<p> <data value="1319898260">14:24</data> <b>kaj</b> you are not helping your case
```

#### Example

HTML does not have a good way to mark up graphs, so descriptions of interactive conversations from games are more difficult to mark up. This example shows one possible convention using [dl<sup>p222</sup>](#) elements to list the possible responses at each point in the conversation. Another option to consider is describing the conversation in the form of a DOT file, and outputting the result as an SVG image to place in the document. [\[DOT\]<sup>p1266</sup>](#)

```
<p> Next, you meet a fisher. You can say one of several greetings:  
<dl>  
<dt> "Hello there!"  
<dd>  
<p> She responds with "Hello, how may I help you?"; you can respond with:  
<dl>  
<dt> "I would like to buy a fish."  
<dd> <p> She sells you a fish and the conversation finishes.  
<dt> "Can I borrow your boat?"  
<dd>  
<p> She is surprised and asks "What are you offering in return?".  
<dl>  
<dt> "Five gold." (if you have enough)  
<dt> "Ten gold." (if you have enough)  
<dt> "Fifteen gold." (if you have enough)  
<dd> <p> She lends you her boat. The conversation ends.  
<dt> "A fish." (if you have one)  
<dt> "A newspaper." (if you have one)  
<dt> "A pebble." (if you have one)  
<dd> <p> "No thanks", she replies. Your conversation options  
at this point are the same as they were after asking to borrow  
her boat, minus any options you've suggested before.  
</dl>  
</dd>
```

```

</dl>
</dd>
<dt> "Vote for me in the next election!"
<dd> <p> She turns away. The conversation finishes.
<dt> "Madam, are you aware that your fish are running away?"
<dd>
<p> She looks at you skeptically and says "Fish cannot run, miss".
<dl>
<dt> "You got me!"
<dd> <p> The fisher sighs and the conversation ends.
<dt> "Only kidding."
<dd> <p> "Good one!" she retorts. Your conversation options at this
point are the same as those following "Hello there!" above.
<dt> "Oh, then what are they doing?"
<dd> <p> She looks at her fish, giving you an opportunity to steal
her boat, which you do. The conversation ends.
</dl>
</dd>
</dl>

```

### Example

In some games, conversations are simpler: each character merely has a fixed set of lines that they say. In this example, a game FAQ/walkthrough lists some of the known possible responses for each character:

```

<section>
<h1>Dialogue</h1>
<p><small>Some characters repeat their lines in order each time you interact
with them, others randomly pick from amongst their lines. Those who respond in
order have numbered entries in the lists below.</small>
<h2>The Shopkeeper</h2>
<ul>
<li>How may I help you?
<li>Fresh apples!
<li>A loaf of bread for madam?
</ul>
<h2>The pilot</h2>
<p>Before the accident:
<ul>
<li>I'm about to fly out, sorry!
<li>Sorry, I'm just waiting for flight clearance and then I'll be off!
</ul>
<p>After the accident:
<ol>
<li>I'm about to fly out, sorry!
<li>Ok, I'm not leaving right now, my plane is being cleaned.
<li>Ok, it's not being cleaned, it needs a minor repair first.
<li>Ok, ok, stop bothering me! Truth is, I had a crash.
</ol>
<h2>Clan Leader</h2>
<p>During the first clan meeting:
<ul>
<li>Hey, have you seen my daughter? I bet she's up to something nefarious again...
<li>Nice weather we're having today, eh?
<li>The name is Bailey, Jeff Bailey. How can I help you today?
<li>A glass of water? Fresh from the well!
</ul>
<p>After the earthquake:
<ol>
<li>Everyone is safe in the shelter, we just have to put out the fire!

```

```
<li>I'll go and tell the fire brigade, you keep hosing it down!
</li>
</ol>
</section>
```

#### 4.14.4 Footnotes <sup>p71</sup><sub>4</sub>

HTML does not have a dedicated mechanism for marking up footnotes. Here are the suggested alternatives.

For short inline annotations, the [title<sup>p136</sup>](#) attribute could be used.

##### Example

In this example, two parts of a dialogue are annotated with footnote-like content using the [title<sup>p136</sup>](#) attribute.

```
<p> <b>Customer</b>: Hello! I wish to register a complaint. Hello. Miss?
<p> <b>Shopkeeper</b>: <span title="Colloquial pronunciation of 'What do you'
>Watcha</span> mean, miss?
<p> <b>Customer</b>: Uh, I'm sorry, I have a cold. I wish to make a complaint.
<p> <b>Shopkeeper</b>: Sorry, <span title="This is, of course, a lie.">we're
closing for lunch</span>.
```

##### Note

Unfortunately, relying on the [title<sup>p136</sup>](#) attribute is currently discouraged as many user agents do not expose the attribute in an accessible manner as required by this specification (e.g. requiring a pointing device such as a mouse to cause a tooltip to appear, which excludes keyboard-only users and touch-only users, such as anyone with a modern phone or tablet).

##### Note

If the [title<sup>p136</sup>](#) attribute is used, CSS can be used to draw the reader's attention to the elements with the attribute.

##### Example

For example, the following CSS places a dashed line below elements that have a [title<sup>p136</sup>](#) attribute.

```
CSS [title] { border-bottom: thin dashed; }
```

For longer annotations, the [a<sup>p234</sup>](#) element should be used, pointing to an element later in the document. The convention is that the contents of the link be a number in square brackets.

##### Example

In this example, a footnote in the dialogue links to a paragraph below the dialogue. The paragraph then reciprocally links back to the dialogue, allowing the user to return to the location of the footnote.

```
<p> Announcer: Number 16: The <i>hand</i>.
<p> Interviewer: Good evening. I have with me in the studio tonight
Mr Norman St John Polevaulter, who for the past few years has been
contradicting people. Mr Polevaulter, why <em>do</em> you
contradict people?
<p> Norman: I don't. <sup><a href="#fn1" id="r1">[1]</a></sup>
<p> Interviewer: You told me you did!
...
<section>
  <p id="fn1"><a href="#r1">[1]</a> This is, naturally, a lie,
```

```
but paradoxically if it were true he could not say so without
contradicting the interviewer and thus making it false.</p>
</section>
```

For side notes, longer annotations that apply to entire sections of the text rather than just specific words or sentences, the [aside<sup>p183</sup>](#) element should be used.

#### Example

In this example, a sidebar is given after a dialogue, giving it some context.

```
<p> <span class="speaker">Customer</span>: I will not buy this record, it is scratched.
<p> <span class="speaker">Shopkeeper</span>: I'm sorry?
<p> <span class="speaker">Customer</span>: I will not buy this record, it is scratched.
<p> <span class="speaker">Shopkeeper</span>: No no no, this's'a tobacconist's.
<aside>
  <p>In 1970, the British Empire lay in ruins, and foreign
  nationalists frequented the streets – many of them Hungarians
  (not the streets – the foreign nationals). Sadly, Alexander
  Yalt has been publishing incompetently-written phrase books.
</aside>
```

For figures or tables, footnotes can be included in the relevant [figcaption<sup>p231</sup>](#) or [caption<sup>p451</sup>](#) element, or in surrounding prose.

#### Example

In this example, a table has cells with footnotes that are given in prose. A [figure<sup>p228</sup>](#) element is used to give a single legend to the combination of the table and its footnotes.

```
<figure>
  <figcaption>Table 1. Alternative activities for knights.</figcaption>
  <table>
    <tr>
      <th> Activity
      <th> Location
      <th> Cost
    </tr>
    <tr>
      <td> Dance
      <td> Wherever possible
      <td> £0<sup><a href="#fn1">1</a></sup>
    </tr>
    <tr>
      <td> Routines, chorus scenes<sup><a href="#fn2">2</a></sup>
      <td> Undisclosed
      <td> Undisclosed
    </tr>
    <tr>
      <td> Dining<sup><a href="#fn3">3</a></sup>
      <td> Camelot
      <td> Cost of ham, jam, and spam<sup><a href="#fn4">4</a></sup>
    </tr>
  </table>
  <p id="fn1">1. Assumed.</p>
  <p id="fn2">2. Footwork impeccable.</p>
  <p id="fn3">3. Quality described as "well".</p>
  <p id="fn4">4. A lot.</p>
</figure>
```

## 4.15 Disabled elements §<sup>p71</sup><sub>6</sub>

An element is said to be **actually disabled** if it is one of the following:

- a [button<sup>p528</sup>](#) element that is [disabled<sup>p563</sup>](#)
- an [input<sup>p486</sup>](#) element that is [disabled<sup>p563</sup>](#)
- a [select<sup>p530</sup>](#) element that is [disabled<sup>p563</sup>](#)
- a [textarea<sup>p541</sup>](#) element that is [disabled<sup>p563</sup>](#)
- an [optgroup<sup>p537</sup>](#) element that has a [disabled<sup>p538</sup>](#) attribute
- an [option<sup>p539</sup>](#) element that is [disabled<sup>p539</sup>](#)
- a [fieldset<sup>p555</sup>](#) element that is a [disabled fieldset<sup>p556</sup>](#)
- a [form-associated custom element<sup>p697</sup>](#) that is [disabled<sup>p563</sup>](#)

### Note

*This definition is used to determine what elements are [focusable<sup>p765</sup>](#) and which elements match the [:enabled<sup>p719</sup>](#) and [:disabled<sup>p719</sup>](#) pseudo classes.*

## 4.16 Matching HTML elements using selectors and CSS §<sup>p71</sup><sub>6</sub>

### 4.16.1 Case-sensitivity of the CSS `'attr()'` function §<sup>p71</sup><sub>6</sub>

*CSS Values and Units* leaves the case-sensitivity of attribute names for the purpose of the `'attr()'` function to be defined by the host language. [\[CSSVALUES\]<sup>p1266</sup>](#)

When comparing the attribute name part of a CSS `'attr()'` function to the names of namespace-less attributes on [HTML elements<sup>p43</sup>](#) in [HTML documents](#), the name part of the CSS `'attr()'` function must first be [converted to ASCII lowercase](#). The same function when compared to other attributes must be compared according to its original case. In both cases, the comparison is [case-sensitive<sup>p65</sup>](#).

### Note

*This is the same as comparing the name part of a CSS [attribute selector](#), specified in the next section.*

### 4.16.2 Case-sensitivity of selectors §<sup>p71</sup><sub>6</sub>

*Selectors* leaves the case-sensitivity of element names, attribute names, and attribute values to be defined by the host language. [\[SELECTORS\]<sup>p1270</sup>](#)

When comparing a CSS element [type selector](#) to the names of [HTML elements<sup>p43</sup>](#) in [HTML documents](#), the CSS element [type selector](#) must first be [converted to ASCII lowercase](#). The same selector when compared to other elements must be compared according to its original case. In both cases, the comparison is [case-sensitive<sup>p65</sup>](#).

When comparing the name part of a CSS [attribute selector](#) to the names of attributes on [HTML elements<sup>p43</sup>](#) in [HTML documents](#), the name part of the CSS [attribute selector](#) must first be [converted to ASCII lowercase](#). The same selector when compared to other attributes must be compared according to its original case. In both cases, the comparison is [case-sensitive<sup>p65</sup>](#).

[Attribute selectors](#) on an [HTML element<sup>p43</sup>](#) in an [HTML document](#) must treat the *values* of attributes with the following names as [ASCII case-insensitive](#):

- accept
- accept-charset
- align
- alink
- axis
- bgcolor
- charset

- checked
- clear
- codetype
- color
- compact
- declare
- defer
- dir
- direction
- disabled
- enctype
- face
- frame
- hreflang
- http-equiv
- lang
- language
- link
- media
- method
- multiple
- nohref
- noresize
- noshade
- nowrap
- readonly
- rel
- rev
- rules
- scope
- scrolling
- selected
- shape
- target
- text
- type
- valign
- valuetype
- vlink

#### Example

For example, the selector `[bgcolor="#ffffff"]` will match any HTML element with a `bgcolor` attribute with values including `#ffffff`, `#FFFFFF` and `#fffFFF`. This happens even if `bgcolor` has no effect for a given element (e.g., [div](#)<sup>p233</sup>).

The selector `[type=a s]` will match any HTML element with a `type` attribute whose value is `a`, but not whose value is `A`, due to the `s` flag.

All other attribute values and everything else must be treated as entirely [case-sensitive](#)<sup>p65</sup> for the purposes of selector matching. This includes:

- [IDs](#) and [classes](#) in [no-quirks mode](#) and [limited-quirks mode](#)
- the names of elements not in the [HTML namespace](#)
- the names of [HTML elements](#)<sup>p43</sup> in [XML documents](#)
- the names of attributes of elements not in the [HTML namespace](#)
- the names of attributes of [HTML elements](#)<sup>p43</sup> in [XML documents](#)
- the names of attributes that themselves have namespaces

#### Note

*Selectors defines that ID and class selectors (such as `#foo` and `.bar`), when matched against elements in documents that are in [quirks mode](#), will be matched in an [ASCII case-insensitive](#) manner. However, this does not apply for attribute selectors with `"id"` or `"class"` as the name part. The selector `[class="foobar"]` will treat its value as [case-sensitive](#)<sup>p65</sup> even in [quirks mode](#).*

### 4.16.3 Pseudo-classes §<sup>p71</sup>

MDN

There are a number of dynamic selectors that can be used with HTML. This section defines when these selectors match HTML elements. [\[SELECTORS\]](#)<sup>p1270</sup> [\[CSSUI\]](#)<sup>p1266</sup>

#### **`:defined`**

✓ MDN

The [:defined](#)<sup>p717</sup> [pseudo-class](#) must match any element that is [defined](#).

## :link

## :visited

All [a<sup>p234</sup>](#) elements that have an [href<sup>p279</sup>](#) attribute, all [area<sup>p437</sup>](#) elements that have an [href<sup>p279</sup>](#) attribute, and all [link<sup>p154</sup>](#) elements that have an [href<sup>p155</sup>](#) attribute, must match one of [:link<sup>p718</sup>](#) and [:visited<sup>p718</sup>](#).

Other specifications might apply more specific rules regarding how these elements are to match these [pseudo-classes](#), to mitigate some privacy concerns that apply with straightforward implementations of this requirement.

## :active

The [:active<sup>p718</sup>](#) [pseudo-class](#) is defined to match an element “while an element is **being activated** by the user”.

To determine whether a particular element is [being activated<sup>p718</sup>](#) for the purposes of defining the [:active<sup>p718</sup>](#) [pseudo-class](#) only, an HTML user agent must use the first relevant entry in the following list.

### If the element has a descendant that is currently matching the [:active<sup>p718</sup>](#) [pseudo-class](#)

The element is [being activated<sup>p718</sup>](#).

### If the element is the [labeled control<sup>p484</sup>](#) of a [label<sup>p483</sup>](#) element that is currently matching [:active<sup>p718</sup>](#)

The element is [being activated<sup>p718</sup>](#).

### If the element is a [button<sup>p528</sup>](#) element

### If the element is an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Submit Button<sup>p511</sup>](#), [Image Button<sup>p511</sup>](#), [Reset Button<sup>p513</sup>](#), or [Button<sup>p514</sup>](#) state

The element is [being activated<sup>p718</sup>](#) if it is [in a formal activation state<sup>p718</sup>](#) and it is not [disabled<sup>p563</sup>](#).

#### Example

For example, if the user is using a keyboard to push a [button<sup>p528</sup>](#) element by pressing the space bar, the element would match this [pseudo-class](#) in between the time that the element received the [keydown](#) event and the time the element received the [keyup](#) event.

### If the element is an [a<sup>p234</sup>](#) element that has an [href<sup>p279</sup>](#) attribute

### If the element is an [area<sup>p437</sup>](#) element that has an [href<sup>p279</sup>](#) attribute

### If the element is a [Link<sup>p154</sup>](#) element that has an [href<sup>p155</sup>](#) attribute

### If the element is [focusable<sup>p765</sup>](#)

The element is [being activated<sup>p718</sup>](#) if it is [in a formal activation state<sup>p718</sup>](#).

### If the element is [being actively pointed at<sup>p718</sup>](#)

The element is [being activated<sup>p718</sup>](#).

An element is said to be **in a formal activation state** between the time the user begins to indicate an intent to trigger the element's [activation behavior](#) and either the time the user stops indicating an intent to trigger the element's [activation behavior](#), or the time the element's [activation behavior](#) has finished running, whichever ever comes first.

An element is said to be **being actively pointed at** while the user indicates the element using a pointing device while that pointing device is in the "down" state (e.g. for a mouse, between the time the mouse button is pressed and the time it is depressed; for a finger in a multitouch environment, while the finger is touching the display surface).

## :hover

The [:hover<sup>p718</sup>](#) [pseudo-class](#) is defined to match an element “while the user *designates* an element with a pointing device”. For the purposes of defining the [:hover<sup>p718</sup>](#) [pseudo-class](#) only, an HTML user agent must consider an element as being one that the user *designates* if it is:

- An element that the user indicates using a pointing device.
- An element that has a descendant that the user indicates using a pointing device.
- An element that is the [labeled control<sup>p484</sup>](#) of a [label<sup>p483</sup>](#) element that is currently matching [:hover<sup>p718</sup>](#).

#### Example

Consider in particular a fragment such as:

```
<p> <label for=c> <input id=a> </label> <span id=b> <input id=c> </span> </p>
```

If the user designates the element with ID "a" with their pointing device, then the [p<sup>p207</sup>](#) element (and all its ancestors not shown in the snippet above), the [label<sup>p483</sup>](#) element, the element with ID "a", and the element with ID "c" will match the [:hover<sup>p718</sup>](#) [pseudo-class](#). The element with ID "a" matches it from condition 1, the [label<sup>p483</sup>](#) and [p<sup>p207</sup>](#) elements match it because of condition 2 (one of their descendants is designated), and the element with ID "c" matches it through condition 3 (its [label<sup>p483</sup>](#) element matches [:hover<sup>p718</sup>](#)). However, the element with ID "b" does *not* match [:hover<sup>p718</sup>](#): its descendant is not designated, even though it matches [:hover<sup>p718</sup>](#).

### **:focus**

For the purposes of the CSS [:focus<sup>p719</sup>](#) [pseudo-class](#), an **element has the focus** when:

- its [top-level browsing context<sup>p807</sup>](#) has the system focus;
- it is not itself a [browsing context container<sup>p806</sup>](#); and
- at least one of the following is true:
  - it is one of the elements listed in the [focus chain<sup>p764</sup>](#) of the [currently focused area of the top-level browsing context<sup>p764</sup>](#), or
  - its [shadow root](#) *shadowRoot* is not null and *shadowRoot* is the [root](#) of at least one element that [has the focus<sup>p719</sup>](#).

### **:target**

For the purposes of the CSS [:target<sup>p719</sup>](#) [pseudo-class](#), the [Document<sup>p111</sup>](#)'s *target elements* are a list containing the [Document<sup>p111</sup>](#)'s [target element<sup>p864</sup>](#), if it is not null, or containing no elements, if it is. [\[SELECTORS\]<sup>p1270</sup>](#)

### **:enabled**

The [:enabled<sup>p719</sup>](#) [pseudo-class](#) must match any [button<sup>p528</sup>](#), [input<sup>p486</sup>](#), [select<sup>p530</sup>](#), [textarea<sup>p541</sup>](#), [optgroup<sup>p537</sup>](#), [option<sup>p539</sup>](#), [fieldset<sup>p555</sup>](#) element, or [form-associated custom element<sup>p697</sup>](#) that is not [actually disabled<sup>p716</sup>](#).

### **:disabled**

The [:disabled<sup>p719</sup>](#) [pseudo-class](#) must match any element that is [actually disabled<sup>p716</sup>](#).

### **:checked**

The [:checked<sup>p719</sup>](#) [pseudo-class](#) must match any element falling into one of the following categories:

- [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute is in the [Checkbox<sup>p506</sup>](#) state and whose [checkedness<sup>p559</sup>](#) state is true
- [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute is in the [Radio Button<sup>p507</sup>](#) state and whose [checkedness<sup>p559</sup>](#) state is true
- [option<sup>p539</sup>](#) elements whose [selectedness<sup>p540</sup>](#) is true

### **:indeterminate**

The [:indeterminate<sup>p719</sup>](#) [pseudo-class](#) must match any element falling into one of the following categories:

- [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute is in the [Checkbox<sup>p506</sup>](#) state and whose [indeterminate<sup>p492</sup>](#) IDL attribute is set to true
- [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute is in the [Radio Button<sup>p507</sup>](#) state and whose [radio button group<sup>p507</sup>](#) contains no [input<sup>p486</sup>](#) elements whose [checkedness<sup>p559</sup>](#) state is true.
- [progress<sup>p548</sup>](#) elements with no [value<sup>p549</sup>](#) content attribute

### **:default**

The [:default<sup>p719</sup>](#) [pseudo-class](#) must match any element falling into one of the following categories:

- [Submit buttons<sup>p479</sup>](#) that are [default buttons<sup>p589</sup>](#) of their [form owner<sup>p559</sup>](#).
- [input<sup>p486</sup>](#) elements to which the [checked<sup>p490</sup>](#) attribute applies and that have a [checked<sup>p490</sup>](#) attribute
- [option<sup>p539</sup>](#) elements that have a [selected<sup>p540</sup>](#) attribute

### **:placeholder-shown**

The [:placeholder-shown](#)<sup>p720</sup> [pseudo-class](#) must match any element falling into one of the following categories:

- [input](#)<sup>p486</sup> elements that have a [placeholder](#)<sup>p523</sup> attribute whose value is currently being presented to the user.
- [textarea](#)<sup>p541</sup> elements that have a [placeholder](#)<sup>p544</sup> attribute whose value is currently being presented to the user.

### **:valid**

The [:valid](#)<sup>p720</sup> [pseudo-class](#) must match any element falling into one of the following categories:

- elements that are [candidates for constraint validation](#)<sup>p583</sup> and that [satisfy their constraints](#)<sup>p584</sup>
- [form](#)<sup>p479</sup> elements that are not the [form owner](#)<sup>p559</sup> of any elements that themselves are [candidates for constraint validation](#)<sup>p583</sup> but do not [satisfy their constraints](#)<sup>p584</sup>
- [fieldset](#)<sup>p555</sup> elements that have no descendant elements that themselves are [candidates for constraint validation](#)<sup>p583</sup> but do not [satisfy their constraints](#)<sup>p584</sup>

### **:invalid**

The [:invalid](#)<sup>p720</sup> [pseudo-class](#) must match any element falling into one of the following categories:

- elements that are [candidates for constraint validation](#)<sup>p583</sup> but that do not [satisfy their constraints](#)<sup>p584</sup>
- [form](#)<sup>p479</sup> elements that are the [form owner](#)<sup>p559</sup> of one or more elements that themselves are [candidates for constraint validation](#)<sup>p583</sup> but do not [satisfy their constraints](#)<sup>p584</sup>
- [fieldset](#)<sup>p555</sup> elements that have one or more descendant elements that themselves are [candidates for constraint validation](#)<sup>p583</sup> but do not [satisfy their constraints](#)<sup>p584</sup>

### **:in-range**

The [:in-range](#)<sup>p720</sup> [pseudo-class](#) must match all elements that are [candidates for constraint validation](#)<sup>p583</sup>, [have range limitations](#)<sup>p520</sup>, and that are neither [suffering from an underflow](#)<sup>p583</sup> nor [suffering from an overflow](#)<sup>p584</sup>.

### **:out-of-range**

The [:out-of-range](#)<sup>p720</sup> [pseudo-class](#) must match all elements that are [candidates for constraint validation](#)<sup>p583</sup>, [have range limitations](#)<sup>p520</sup>, and that are either [suffering from an underflow](#)<sup>p583</sup> or [suffering from an overflow](#)<sup>p584</sup>.

### **:required**

The [:required](#)<sup>p720</sup> [pseudo-class](#) must match any element falling into one of the following categories:

- [input](#)<sup>p486</sup> elements that are [required](#)<sup>p516</sup>
- [select](#)<sup>p530</sup> elements that have a [required](#)<sup>p532</sup> attribute
- [textarea](#)<sup>p541</sup> elements that have a [required](#)<sup>p544</sup> attribute

### **:optional**

The [:optional](#)<sup>p720</sup> [pseudo-class](#) must match any element falling into one of the following categories:

- [input](#)<sup>p486</sup> elements to which the [required](#)<sup>p516</sup> attribute applies that are not [required](#)<sup>p516</sup>
- [select](#)<sup>p530</sup> elements that do not have a [required](#)<sup>p532</sup> attribute
- [textarea](#)<sup>p541</sup> elements that do not have a [required](#)<sup>p544</sup> attribute

### **:read-only**

### **:read-write**

The [:read-write](#)<sup>p720</sup> [pseudo-class](#) must match any element falling into one of the following categories, which for the purposes of Selectors are thus considered *user-alterable*: [\[SELECTORS\]](#)<sup>p1270</sup>

- [input](#)<sup>p486</sup> elements to which the [readonly](#)<sup>p515</sup> attribute applies, and that are [mutable](#)<sup>p559</sup> (i.e. that do not have the [readonly](#)<sup>p515</sup> attribute specified and that are not [disabled](#)<sup>p563</sup>)
- [textarea](#)<sup>p541</sup> elements that do not have a [readonly](#)<sup>p542</sup> attribute, and that are not [disabled](#)<sup>p563</sup>
- elements that are [editing hosts](#)<sup>p782</sup> or [editable](#) and are neither [input](#)<sup>p486</sup> elements nor [textarea](#)<sup>p541</sup> elements

The [:read-only](#)<sup>p720</sup> [pseudo-class](#) must match all other [HTML elements](#)<sup>p43</sup>.

### **:dir(ltr)**

The [:dir\(ltr\)](#)<sup>p721</sup> [pseudo-class](#) must match all elements whose [directionality](#)<sup>p139</sup> is 'ltr'<sup>p139</sup>.

### **:dir(rtl)**

The [:dir\(rtl\)](#)<sup>p721</sup> [pseudo-class](#) must match all elements whose [directionality](#)<sup>p139</sup> is 'rtl'<sup>p139</sup>.

#### Note

*This specification does not define when an element matches the `:lang()` dynamic [pseudo-class](#), as it is defined in sufficient detail in a language-agnostic fashion in [Selectors](#). [\[SELECTORS\]](#)<sup>p1270</sup>*

## 5 Microdata §<sup>p72</sup><sub>2</sub>

### 5.1 Introduction §<sup>p72</sup><sub>2</sub>

#### 5.1.1 Overview §<sup>p72</sup><sub>2</sub>

*This section is non-normative.*

Sometimes, it is desirable to annotate content with specific machine-readable labels, e.g. to allow generic scripts to provide services that are customized to the page, or to enable content from a variety of cooperating authors to be processed by a single script in a consistent manner.

For this purpose, authors can use the microdata features described in this section. Microdata allows nested groups of name-value pairs to be added to documents, in parallel with the existing content.

#### 5.1.2 The basic syntax §<sup>p72</sup><sub>2</sub>

*This section is non-normative.*

At a high level, microdata consists of a group of name-value pairs. The groups are called [items<sup>p727</sup>](#), and each name-value pair is a property. Items and properties are represented by regular elements.

To create an item, the [itemscope<sup>p727</sup>](#) attribute is used.

To add a property to an item, the [itemprop<sup>p729</sup>](#) attribute is used on one of the [item's<sup>p727</sup>](#) descendants.

#### Example

Here there are two items, each of which has the property "name":

```
<div itemscope>
  <p>My name is <span itemprop="name">Elizabeth</span>.</p>
</div>

<div itemscope>
  <p>My name is <span itemprop="name">Daniel</span>.</p>
</div>
```

Markup without the microdata-related attributes does not have any effect on the microdata model.

#### Example

These two examples are exactly equivalent, at a microdata level, as the previous two examples respectively:

```
<div itemscope>
  <p>My <em>name</em> is <span itemprop="name">E<strong>liz</strong>abeth</span>.</p>
</div>

<section>
  <div itemscope>
    <aside>
      <p>My name is <span itemprop="name"><a href="/?user=daniel">Daniel</a></span>.</p>
    </aside>
  </div>
</section>
```

Properties generally have values that are strings.

### Example

Here the item has three properties:

```
<div itemscope>
  <p>My name is <span itemprop="name">Neil</span>.</p>
  <p>My band is called <span itemprop="band">Four Parts Water</span>.</p>
  <p>I am <span itemprop="nationality">British</span>.</p>
</div>
```

When a string value is a [URL](#), it is expressed using the [a<sup>p234</sup>](#) element and its [href<sup>p279</sup>](#) attribute, the [img<sup>p314</sup>](#) element and its [src<sup>p315</sup>](#) attribute, or other elements that link to or embed external resources.

### Example

In this example, the item has one property, "image", whose value is a URL:

```
<div itemscope>
  
</div>
```

When a string value is in some machine-readable format unsuitable for human consumption, it is expressed using the [value<sup>p255</sup>](#) attribute of the [data<sup>p254</sup>](#) element, with the human-readable version given in the element's contents.

### Example

Here, there is an item with a property whose value is a product ID. The ID is not human-friendly, so the product's name is used the human-visible text instead of the ID.

```
<h1 itemscope>
  <data itemprop="product-id" value="9678A0U879">The Instigator 2000</data>
</h1>
```

For numeric data, the [meter<sup>p550</sup>](#) element and its [value<sup>p551</sup>](#) attribute can be used instead.

### Example

Here a rating is given using a [meter<sup>p550</sup>](#) element.

```
<div itemscope itemtype="http://schema.org/Product">
  <span itemprop="name">Panasonic White 60L Refrigerator</span>
  
  <div itemprop="aggregateRating"
    itemscope itemtype="http://schema.org/AggregateRating">
    <meter itemprop="ratingValue" min=0 value=3.5 max=5>Rated 3.5/5</meter>
    (based on <span itemprop="reviewCount">11</span> customer reviews)
  </div>
</div>
```

Similarly, for date- and time-related data, the [time<sup>p256</sup>](#) element and its [datetime<sup>p256</sup>](#) attribute can be used instead.

### Example

In this example, the item has one property, "birthday", whose value is a date:

```
<div itemscope>
  I was born on <time itemprop="birthday" datetime="2009-05-10">May 10th 2009</time>.
</div>
```

Properties can also themselves be groups of name-value pairs, by putting the [itemscope<sup>p727</sup>](#) attribute on the element that declares the property.

Items that are not part of others are called [top-level microdata items](#)<sup>p732</sup>.

#### Example

In this example, the outer item represents a person, and the inner one represents a band:

```
<div itemscope>
  <p>Name: <span itemprop="name">Amanda</span></p>
  <p>Band: <span itemprop="band" itemscope> <span itemprop="name">Jazz Band</span> (<span
itemprop="size">12</span> players)</span></p>
</div>
```

The outer item here has two properties, "name" and "band". The "name" is "Amanda", and the "band" is an item in its own right, with two properties, "name" and "size". The "name" of the band is "Jazz Band", and the "size" is "12".

The outer item in this example is a top-level microdata item.

Properties that are not descendants of the element with the [itemscope](#)<sup>p727</sup> attribute can be associated with the [item](#)<sup>p727</sup> using the [itemref](#)<sup>p728</sup> attribute. This attribute takes a list of IDs of elements to crawl in addition to crawling the children of the element with the [itemscope](#)<sup>p727</sup> attribute.

#### Example

This example is the same as the previous one, but all the properties are separated from their [items](#)<sup>p727</sup>:

```
<div itemscope id="amanda" itemref="a b"></div>
<p id="a">Name: <span itemprop="name">Amanda</span></p>
<div id="b" itemprop="band" itemscope itemref="c"></div>
<div id="c">
  <p>Band: <span itemprop="name">Jazz Band</span></p>
  <p>Size: <span itemprop="size">12</span> players</p>
</div>
```

This gives the same result as the previous example. The first item has two properties, "name", set to "Amanda", and "band", set to another item. That second item has two further properties, "name", set to "Jazz Band", and "size", set to "12".

An [item](#)<sup>p727</sup> can have multiple properties with the same name and different values.

#### Example

This example describes an ice cream, with two flavors:

```
<div itemscope>
  <p>Flavors in my favorite ice cream:</p>
  <ul>
    <li itemprop="flavor">Lemon sorbet</li>
    <li itemprop="flavor">Apricot sorbet</li>
  </ul>
</div>
```

This thus results in an item with two properties, both "flavor", having the values "Lemon sorbet" and "Apricot sorbet".

An element introducing a property can also introduce multiple properties at once, to avoid duplication when some of the properties have the same value.

#### Example

Here we see an item with two properties, "favorite-color" and "favorite-fruit", both set to the value "orange":

```
<div itemscope>
  <span itemprop="favorite-color favorite-fruit">orange</span>
</div>
```

It's important to note that there is no relationship between the microdata and the content of the document where the microdata is marked up.

#### Example

There is no semantic difference, for instance, between the following two examples:

```
<figure>
  
  <figcaption><span itemscope><span itemprop="name">The Castle</span></span> (1986)</figcaption>
</figure>

<span itemscope><meta itemprop="name" content="The Castle"></span>
<figure>
  
  <figcaption>The Castle (1986)</figcaption>
</figure>
```

Both have a figure with a caption, and both, completely unrelated to the figure, have an item with a name-value pair with the name "name" and the value "The Castle". The only difference is that if the user drags the caption out of the document, in the former case, the item will be included in the drag-and-drop data. In neither case is the image in any way associated with the item.

### 5.1.3 Typed items §<sup>p72</sup><sub>5</sub>

*This section is non-normative.*

The examples in the previous section show how information could be marked up on a page that doesn't expect its microdata to be re-used. Microdata is most useful, though, when it is used in contexts where other authors and readers are able to cooperate to make new uses of the markup.

For this purpose, it is necessary to give each [item<sup>p727</sup>](#) a type, such as "https://example.com/person", or "https://example.org/cat", or "https://band.example.net/". Types are identified as [URLs](#).

The type for an [item<sup>p727</sup>](#) is given as the value of an [itemtype<sup>p727</sup>](#) attribute on the same element as the [itemscope<sup>p727</sup>](#) attribute.

#### Example

Here, the item's type is "https://example.org/animals#cat":

```
<section itemscope itemtype="https://example.org/animals#cat">
  <h1 itemprop="name">Hedral</h1>
  <p itemprop="desc">Hedral is a male american domestic
  shorthair, with a fluffy black fur with white paws and belly.</p>
  
</section>
```

In this example the "https://example.org/animals#cat" item has three properties, a "name" ("Hedral"), a "desc" ("Hedral is..."), and an "img" ("hedral.jpeg").

The type gives the context for the properties, thus selecting a vocabulary: a property named "class" given for an item with the type "https://census.example/person" might refer to the economic class of an individual, while a property named "class" given for an item with the type "https://example.com/school/teacher" might refer to the classroom a teacher has been assigned. Several types can share a vocabulary. For example, the types "https://example.org/people/teacher" and "https://example.org/people/engineer" could be defined to use the same vocabulary (though maybe some properties would not be especially useful in both cases, e.g. maybe the "https://example.org/people/engineer" type might not typically be used with the "classroom" property). Multiple types defined to use the same vocabulary can be given for a single item by listing the URLs as a space-separated list in the attribute's value. An item cannot be given two types if they do not use the same vocabulary, however.

#### 5.1.4 Global identifiers for items <sup>§<sup>p72</sup></sup><sub>6</sub>

*This section is non-normative.*

Sometimes, an [item<sup>p727</sup>](#) gives information about a topic that has a global identifier. For example, books can be identified by their ISBN number.

Vocabularies (as identified by the [itemtype<sup>p727</sup>](#) attribute) can be designed such that [items<sup>p727</sup>](#) get associated with their global identifier in an unambiguous way by expressing the global identifiers as [URLs](#) given in an [itemid<sup>p728</sup>](#) attribute.

The exact meaning of the [URLs](#) given in [itemid<sup>p728</sup>](#) attributes depends on the vocabulary used.

##### Example

Here, an item is talking about a particular book:

```
<dl itemscope
  itemtype="https://vocab.example.net/book"
  itemid="urn:isbn:0-330-34032-8">
  <dt>Title
  <dd itemprop="title">The Reality Dysfunction
  <dt>Author
  <dd itemprop="author">Peter F. Hamilton
  <dt>Publication date
  <dd><time itemprop="pubdate" datetimes="1996-01-26">26 January 1996</time>
</dl>
```

The "https://vocab.example.net/book" vocabulary in this example would define that the [itemid<sup>p728</sup>](#) attribute takes a [urn: URL](#) pointing to the ISBN of the book.

#### 5.1.5 Selecting names when defining vocabularies <sup>§<sup>p72</sup></sup><sub>6</sub>

*This section is non-normative.*

Using microdata means using a vocabulary. For some purposes, an ad-hoc vocabulary is adequate. For others, a vocabulary will need to be designed. Where possible, authors are encouraged to re-use existing vocabularies, as this makes content re-use easier.

When designing new vocabularies, identifiers can be created either using [URLs](#), or, for properties, as plain words (with no dots or colons). For URLs, conflicts with other vocabularies can be avoided by only using identifiers that correspond to pages that the author has control over.

##### Example

For instance, if Jon and Adam both write content at example.com, at <https://example.com/~jon/...> and <https://example.com/~adam/...> respectively, then they could select identifiers of the form "https://example.com/~jon/name" and "https://example.com/~adam/name" respectively.

Properties whose names are just plain words can only be used within the context of the types for which they are intended; properties named using URLs can be reused in items of any type. If an item has no type, and is not part of another item, then if its properties have names that are just plain words, they are not intended to be globally unique, and are instead only intended for limited use. Generally speaking, authors are encouraged to use either properties with globally unique names (URLs) or ensure that their items are typed.

##### Example

Here, an item is an "https://example.org/animals#cat", and most of the properties have names that are words defined in the context of that type. There are also a few additional properties whose names come from other vocabularies.

```
<section itemscope itemtype="https://example.org/animals#cat">
  <h1 itemprop="name https://example.com/fn">Hedral</h1>
  <p itemprop="desc">Hedral is a male american domestic
```

```

shorthair, with a fluffy <span
itemprop="https://example.com/color">black</span> fur with <span
itemprop="https://example.com/color">white</span> paws and belly.</p>

</section>

```

This example has one item with the type "https://example.org/animals#cat" and the following properties:

Property	Value
name	Hedral
https://example.com/fn	Hedral
desc	Hedral is a male american domestic shorthair, with a fluffy black fur with white paws and belly.
https://example.com/color	black
https://example.com/color	white
img	.../hedral.jpeg

## 5.2 Encoding microdata <sup>§ p72</sup><sub>7</sub>

### 5.2.1 The microdata model <sup>§ p72</sup><sub>7</sub>

The microdata model consists of groups of name-value pairs known as [items](#)<sup>p727</sup>.

Each group is known as an [item](#)<sup>p727</sup>. Each [item](#)<sup>p727</sup> can have [item types](#)<sup>p727</sup>, a [global identifier](#)<sup>p728</sup> (if the vocabulary specified by the [item types](#)<sup>p727</sup> [support global identifiers for items](#)<sup>p728</sup>), and a list of name-value pairs. Each name in the name-value pair is known as a [property](#)<sup>p732</sup>, and each [property](#)<sup>p732</sup> has one or more [values](#)<sup>p731</sup>. Each [value](#)<sup>p731</sup> is either a string or itself a group of name-value pairs (an [item](#)<sup>p727</sup>). The names are unordered relative to each other, but if a particular name has multiple values, they do have a relative order.

### 5.2.2 Items <sup>§ p72</sup><sub>7</sub>

Every [HTML element](#)<sup>p43</sup> may have an [itemscope](#) attribute specified. The [itemscope](#)<sup>p727</sup> attribute is a [boolean attribute](#)<sup>p65</sup>. ✓ MDN

An element with the [itemscope](#)<sup>p727</sup> attribute specified creates a new **item**, a group of name-value pairs.

Elements with an [itemscope](#)<sup>p727</sup> attribute may have an [itemtype](#) attribute specified, to give the [item types](#)<sup>p727</sup> of the [item](#)<sup>p727</sup>. ✓ MDN

The [itemtype](#)<sup>p727</sup> attribute, if specified, must have a value that is an [unordered set of unique space-separated tokens](#)<sup>p65</sup> that are [case-sensitive](#)<sup>p65</sup>, each of which is a [valid URL string](#) that is an [absolute URL](#), and all of which are defined to use the same vocabulary. The attribute's value must have at least one token.

The **item types** of an [item](#)<sup>p727</sup> are the tokens obtained by [splitting the element's itemtype attribute's value on ASCII whitespace](#). If the [itemtype](#)<sup>p727</sup> attribute is missing or parsing it in this way finds no tokens, the [item](#)<sup>p727</sup> is said to have no [item types](#)<sup>p727</sup>.

The [item types](#)<sup>p727</sup> must all be types defined in [applicable specifications](#)<sup>p63</sup> and must all be defined to use the same vocabulary.

Except if otherwise specified by that specification, the [URLs](#) given as the [item types](#)<sup>p727</sup> should not be automatically dereferenced.

#### Note

*A specification could define that its [item type](#)<sup>p727</sup> can be dereferenced to provide the user with help information, for example. In fact, vocabulary authors are encouraged to provide useful information at the given [URL](#).*

[Item types](#)<sup>p727</sup> are opaque identifiers, and user agents must not dereference unknown [item types](#)<sup>p727</sup>, or otherwise deconstruct them, in order to determine how to process [items](#)<sup>p727</sup> that use them.

The [itemtype](#)<sup>p727</sup> attribute must not be specified on elements that do not have an [itemscope](#)<sup>p727</sup> attribute specified.

An [item<sup>p727</sup>](#) is said to be a **typed item** when either it has an [item type<sup>p727</sup>](#), or it is the [value<sup>p731</sup>](#) of a [property<sup>p732</sup>](#) of a [typed item<sup>p728</sup>](#). The **relevant types** for a [typed item<sup>p728</sup>](#) is the [item<sup>p727</sup>](#)'s [item types<sup>p727</sup>](#), if it has any, or else is the [relevant types<sup>p728</sup>](#) of the [item<sup>p727</sup>](#) for which it is a [property<sup>p732</sup>](#)'s [value<sup>p731</sup>](#).

Elements with an [itemscope<sup>p727</sup>](#) attribute and an [itemtype<sup>p727</sup>](#) attribute that references a vocabulary that is defined to **support global identifiers for items** may also have an [itemid](#) attribute specified, to give a global identifier for the [item<sup>p727</sup>](#), so that it can be related to other [items<sup>p727</sup>](#) on pages elsewhere on the Web.

The [itemid<sup>p728</sup>](#) attribute, if specified, must have a value that is a [valid URL potentially surrounded by spaces<sup>p86</sup>](#).

The **global identifier** of an [item<sup>p727</sup>](#) is the value of its element's [itemid<sup>p728</sup>](#) attribute, if it has one, [parsed<sup>p87</sup>](#) relative to the [node document](#) of the element on which the attribute is specified. If the [itemid<sup>p728</sup>](#) attribute is missing or if resolving it fails, it is said to have no [global identifier<sup>p728</sup>](#).

The [itemid<sup>p728</sup>](#) attribute must not be specified on elements that do not have both an [itemscope<sup>p727</sup>](#) attribute and an [itemtype<sup>p727</sup>](#) attribute specified, and must not be specified on elements with an [itemscope<sup>p727</sup>](#) attribute whose [itemtype<sup>p727</sup>](#) attribute specifies a vocabulary that does not [support global identifiers for items<sup>p728</sup>](#), as defined by that vocabulary's specification.

The exact meaning of a [global identifier<sup>p728</sup>](#) is determined by the vocabulary's specification. It is up to such specifications to define whether multiple items with the same global identifier (whether on the same page or on different pages) are allowed to exist, and what the processing rules for that vocabulary are with respect to handling the case of multiple items with the same ID.

Elements with an [itemscope<sup>p727</sup>](#) attribute may have an [itemref](#) attribute specified, to give a list of additional elements to crawl to find the name-value pairs of the [item<sup>p727</sup>](#).

The [itemref<sup>p728</sup>](#) attribute, if specified, must have a value that is an [unordered set of unique space-separated tokens<sup>p85</sup>](#) that are [case-sensitive<sup>p65</sup>](#), consisting of [IDs](#) of elements in the same [tree](#).

The [itemref<sup>p728</sup>](#) attribute must not be specified on elements that do not have an [itemscope<sup>p727</sup>](#) attribute specified.

#### Note

The [itemref<sup>p728</sup>](#) attribute is not part of the microdata data model. It is merely a syntactic construct to aid authors in adding annotations to pages where the data to be annotated does not follow a convenient tree structure. For example, it allows authors to mark up data in a table so that each column defines a separate [item<sup>p727</sup>](#), while keeping the properties in the cells.

#### Example

This example shows a simple vocabulary used to describe the products of a model railway manufacturer. The vocabulary has just five property names:

##### **product-code**

An integer that names the product in the manufacturer's catalog.

##### **name**

A brief description of the product.

##### **scale**

One of "HO", "1", or "Z" (potentially with leading or trailing whitespace), indicating the scale of the product.

##### **digital**

If present, one of "Digital", "Delta", or "Systems" (potentially with leading or trailing whitespace) indicating that the product has a digital decoder of the given type.

##### **track-type**

For track-specific products, one of "K", "M", "C" (potentially with leading or trailing whitespace) indicating the type of track for which the product is intended.

This vocabulary has four defined [item types<sup>p727</sup>](#):

##### **https://md.example.com/loco**

Rolling stock with an engine

### <https://md.example.com/passengers>

Passenger rolling stock

### <https://md.example.com/track>

Track pieces

### <https://md.example.com/lighting>

Equipment with lighting

Each [item<sup>p727</sup>](#) that uses this vocabulary can be given one or more of these types, depending on what the product is.

Thus, a locomotive might be marked up as:

```
<dl itemscope itemtype="https://md.example.com/loco
                        https://md.example.com/lighting">
  <dt>Name:
  <dd itemprop="name">Tank Locomotive (DB 80)
  <dt>Product code:
  <dd itemprop="product-code">33041
  <dt>Scale:
  <dd itemprop="scale">H0
  <dt>Digital:
  <dd itemprop="digital">Delta
</dl>
```

A turnout lantern retrofit kit might be marked up as:

```
<dl itemscope itemtype="https://md.example.com/track
                        https://md.example.com/lighting">
  <dt>Name:
  <dd itemprop="name">Turnout Lantern Kit
  <dt>Product code:
  <dd itemprop="product-code">74470
  <dt>Purpose:
  <dd>For retrofitting 2 <span itemprop="track-type">C</span> Track
  turnouts. <meta itemprop="scale" content="H0">
</dl>
```

A passenger car with no lighting might be marked up as:

```
<dl itemscope itemtype="https://md.example.com/passengers">
  <dt>Name:
  <dd itemprop="name">Express Train Passenger Car (DB Am 203)
  <dt>Product code:
  <dd itemprop="product-code">8710
  <dt>Scale:
  <dd itemprop="scale">Z
</dl>
```

Great care is necessary when creating new vocabularies. Often, a hierarchical approach to types can be taken that results in a vocabulary where each item only ever has a single type, which is generally much simpler to manage.

## 5.2.3 Names: the `itemprop` attribute §<sup>p72</sup><sub>9</sub>

Every [HTML element<sup>p43</sup>](#) may have an [`itemprop`<sup>p729</sup>](#) attribute specified, if doing so [adds one or more properties<sup>p732</sup>](#) to one or more [items<sup>p727</sup>](#) (as defined below).

The [`itemprop`<sup>p729</sup>](#) attribute, if specified, must have a value that is an [unordered set of unique space-separated tokens<sup>p85</sup>](#) that are [case-](#)

[sensitive](#)<sup>p65</sup>, representing the names of the name-value pairs that it adds. The attribute's value must have at least one token.

Each token must be either:

- If the item is a [typed item](#)<sup>p728</sup>: a **defined property name** allowed in this situation according to the specification that defines the [relevant types](#)<sup>p728</sup> for the item, or
- A [valid URL string](#) that is an [absolute URL](#) defined as an item property name allowed in this situation by a vocabulary specification, or
- A [valid URL string](#) that is an [absolute URL](#), used as a proprietary item property name (i.e. one used by the author for private purposes, not defined in a public specification), or
- If the item is not a [typed item](#)<sup>p728</sup>: a string that contains no U+002E FULL STOP characters (.) and no U+003A COLON characters (:), used as a proprietary item property name (i.e. one used by the author for private purposes, not defined in a public specification).

Specifications that introduce [defined property names](#)<sup>p730</sup> must ensure all such property names contain no U+002E FULL STOP characters (.), no U+003A COLON characters (:), and no [ASCII whitespace](#).

#### Note

*The rules above disallow U+003A COLON characters (:) in non-URL values because otherwise they could not be distinguished from URLs. Values with U+002E FULL STOP characters (.) are reserved for future extensions. [ASCII whitespace](#) are disallowed because otherwise the values would be parsed as multiple tokens.*

When an element with an [itemprop](#)<sup>p729</sup> attribute [adds a property](#)<sup>p732</sup> to multiple [items](#)<sup>p727</sup>, the requirement above regarding the tokens applies for each [item](#)<sup>p727</sup> individually.

The **property names** of an element are the tokens that the element's [itemprop](#)<sup>p729</sup> attribute is found to contain when its value is [split on ASCII whitespace](#), with the order preserved but with duplicates removed (leaving only the first occurrence of each name).

Within an [item](#)<sup>p727</sup>, the properties are unordered with respect to each other, except for properties with the same name, which are ordered in the order they are given by the algorithm that defines [the properties of an item](#)<sup>p732</sup>.

#### Example

In the following example, the "a" property has the values "1" and "2", *in that order*, but whether the "a" property comes before the "b" property or not is not important:

```
<div itemscope>
  <p itemprop="a">1</p>
  <p itemprop="a">2</p>
  <p itemprop="b">test</p>
</div>
```

Thus, the following is equivalent:

```
<div itemscope>
  <p itemprop="b">test</p>
  <p itemprop="a">1</p>
  <p itemprop="a">2</p>
</div>
```

As is the following:

```
<div itemscope>
  <p itemprop="a">1</p>
  <p itemprop="b">test</p>
  <p itemprop="a">2</p>
</div>
```

And the following:

```

<div id="x">
  <p itemprop="a">1</p>
</div>
<div itemscope itemref="x">
  <p itemprop="b">test</p>
  <p itemprop="a">2</p>
</div>

```

## 5.2.4 Values <sup>§p73</sup><sub>1</sub>

The **property value** of a name-value pair added by an element with an [itemprop<sup>p729</sup>](#) attribute is as given for the first matching case in the following list:

↪ **If the element also has an [itemscope<sup>p727</sup>](#) attribute**

The value is the [item<sup>p727</sup>](#) created by the element.

↪ **If the element is a [meta<sup>p160</sup>](#) element**

The value is the value of the element's [content<sup>p161</sup>](#) attribute, if any, or the empty string if there is no such attribute.

↪ **If the element is an [audio<sup>p377</sup>](#), [embed<sup>p363</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [source<sup>p311</sup>](#), [track<sup>p379</sup>](#), or [video<sup>p373</sup>](#) element**

The value is the [resulting URL string<sup>p87</sup>](#) that results from [parsing<sup>p87</sup>](#) the value of the element's `src` attribute relative to the [node document](#) of the element at the time the attribute is set, or the empty string if there is no such attribute or if [parsing<sup>p87</sup>](#) it results in an error.

↪ **If the element is an [a<sup>p234</sup>](#), [area<sup>p437</sup>](#), or [link<sup>p154</sup>](#) element**

The value is the [resulting URL string<sup>p87</sup>](#) that results from [parsing<sup>p87</sup>](#) the value of the element's `href` attribute relative to the [node document](#) of the element at the time the attribute is set, or the empty string if there is no such attribute or if [parsing<sup>p87</sup>](#) it results in an error.

↪ **If the element is an [object<sup>p367</sup>](#) element**

The value is the [resulting URL string<sup>p87</sup>](#) that results from [parsing<sup>p87</sup>](#) the value of the element's `data` attribute relative to the [node document](#) of the element at the time the attribute is set, or the empty string if there is no such attribute or if [parsing<sup>p87</sup>](#) it results in an error.

↪ **If the element is a [data<sup>p254</sup>](#) element**

The value is the value of the element's [value<sup>p255</sup>](#) attribute, if it has one, or the empty string otherwise.

↪ **If the element is a [meter<sup>p550</sup>](#) element**

The value is the value of the element's [value<sup>p551</sup>](#) attribute, if it has one, or the empty string otherwise.

↪ **If the element is a [time<sup>p256</sup>](#) element**

The value is the element's [datetime value<sup>p256</sup>](#).

↪ **Otherwise**

The value is the element's [descendant text content](#).

The **URL property elements** are the [a<sup>p234</sup>](#), [area<sup>p437</sup>](#), [audio<sup>p377</sup>](#), [embed<sup>p363</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [link<sup>p154</sup>](#), [object<sup>p367</sup>](#), [source<sup>p311</sup>](#), [track<sup>p379</sup>](#), and [video<sup>p373</sup>](#) elements.

If a property's [value<sup>p731</sup>](#), as defined by the property's definition, is an [absolute URL](#), the property must be specified using a [URL property element<sup>p731</sup>](#).

### Note

*These requirements do not apply just because a property value happens to match the syntax for a URL. They only apply if the property is explicitly defined as taking such a value.*

## Example

For example, a book about the first moon landing could be called "mission:moon". A "title" property from a vocabulary that defines a title as being a string would not expect the title to be given in an [a<sup>p234</sup>](#) element, even though it looks like a [URL](#). On the other hand, if there was a (rather narrowly scoped!) vocabulary for "books whose titles look like URLs" which had a "title" property defined to take a URL, then the property *would* expect the title to be given in an [a<sup>p234</sup>](#) element (or one of the other [URL property elements<sup>p731</sup>](#)), because of the requirement above.

## 5.2.5 Associating names with items §<sup>p73</sup> 2

To find **the properties of an item** defined by the element *root*, the user agent must run the following steps. These steps are also used to flag [microdata errors<sup>p732</sup>](#).

1. Let *results*, *memory*, and *pending* be empty lists of elements.
2. Add the element *root* to *memory*.
3. Add the child elements of *root*, if any, to *pending*.
4. If *root* has an [itemref<sup>p728</sup>](#) attribute, [split the value of that itemref attribute on ASCII whitespace](#). For each resulting token *ID*, if there is an element in the [tree](#) of *root* with the [ID](#) *ID*, then add the first such element to *pending*.
5. While *pending* is not empty:
  1. Remove an element from *pending* and let *current* be that element.
  2. If *current* is already in *memory*, there is a [microdata error<sup>p732</sup>](#); continue.
  3. Add *current* to *memory*.
  4. If *current* does not have an [itemscope<sup>p727</sup>](#) attribute, then: add all the child elements of *current* to *pending*.
  5. If *current* has an [itemprop<sup>p729</sup>](#) attribute specified and has one or more [property names<sup>p730</sup>](#), then add *current* to *results*.
6. Sort *results* in [tree order](#).
7. Return *results*.

A document must not contain any [items<sup>p727</sup>](#) for which the algorithm to find [the properties of an item<sup>p732</sup>](#) finds any **microdata errors**.

An [item<sup>p727</sup>](#) is a **top-level microdata item** if its element does not have an [itemprop<sup>p729</sup>](#) attribute.

All [itemref<sup>p728</sup>](#) attributes in a [Document<sup>p111</sup>](#) must be such that there are no cycles in the graph formed from representing each [item<sup>p727</sup>](#) in the [Document<sup>p111</sup>](#) as a node in the graph and each [property<sup>p732</sup>](#) of an item whose [value<sup>p731</sup>](#) is another item as an edge in the graph connecting those two items.

A document must not contain any elements that have an [itemprop<sup>p729</sup>](#) attribute that would not be found to be a property of any of the [items<sup>p727</sup>](#) in that document were their [properties<sup>p732</sup>](#) all to be determined.

## Example

In this example, a single license statement is applied to two works, using [itemref<sup>p728</sup>](#) from the items representing the works:

```
<!DOCTYPE HTML>
<html lang="en">
  <head>
    <title>Photo gallery</title>
  </head>
  <body>
    <h1>My photos</h1>
    <figure itemscope itemtype="http://n.whatwg.org/work" itemref="licenses">
      
      <figcaption itemprop="title">The house I found.</figcaption>
    </figure>
  </body>
</html>
```

```

</figure>
<figure itemscope itemtype="http://n.whatwg.org/work" itemref="licenses">
  
  <figcaption itemprop="title">The mailbox.</figcaption>
</figure>
<footer>
  <p id="licenses">All images licensed under the <a itemprop="license"
href="http://www.opensource.org/licenses/mit-license.php">MIT
license</a>.</p>
</footer>
</body>
</html>

```

The above results in two items with the type "http://n.whatwg.org/work", one with:

```

work
  images/house.jpeg
title
  The house I found.
license
  http://www.opensource.org/licenses/mit-license.php

```

...and one with:

```

work
  images/mailbox.jpeg
title
  The mailbox.
license
  http://www.opensource.org/licenses/mit-license.php

```

### 5.2.6 Microdata and other namespaces §<sup>p73</sup><sub>3</sub>

Currently, the [itemscope<sup>p727</sup>](#), [itemprop<sup>p729</sup>](#), and other microdata attributes are only defined for [HTML elements<sup>p43</sup>](#). This means that attributes with the literal names "itemscope", "itemprop", etc, do not cause microdata processing to occur on elements in other namespaces, such as SVG.

#### Example

Thus, in the following example there is only one item, not two.

```

<p itemscope></p> <!-- this is an item (with no properties and no type) -->
<svg itemscope></svg> <!-- this is not, it's just an SVG svg element with an invalid unknown
attribute -->

```

### 5.3 Sample microdata vocabularies §<sup>p73</sup><sub>3</sub>

The vocabularies in this section are primarily intended to demonstrate how a vocabulary is specified, though they are also usable in their own right.

### 5.3.1 vCard §<sup>p73</sup><sub>4</sub>

An item with the [item type<sup>p727</sup>](#) <http://microformats.org/profile/hcard> represents a person's or organization's contact information.

This vocabulary does not [support global identifiers for items<sup>p728</sup>](#).

The following are the type's [defined property names<sup>p730</sup>](#). They are based on the vocabulary defined in *vCard Format Specification* (vCard) and its extensions, where more information on how to interpret the values can be found. [\[RFC6350\]<sup>p1269</sup>](#)

#### **kind**

Describes what kind of contact the item represents.

The [value<sup>p731</sup>](#) must be text that, when compared in a [case-sensitive<sup>p65</sup>](#) manner, is equal to one of the [kind strings<sup>p741</sup>](#).

A single property with the name [kind<sup>p734</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **fn**

Gives the formatted text corresponding to the name of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Exactly one property with the name [fn<sup>p734</sup>](#) must be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **n**

Gives the structured name of the person or organization.

The [value<sup>p731</sup>](#) must be an [item<sup>p727</sup>](#) with zero or more of each of the [family-name<sup>p734</sup>](#), [given-name<sup>p734</sup>](#), [additional-name<sup>p734</sup>](#), [honorific-prefix<sup>p734</sup>](#), and [honorific-suffix<sup>p735</sup>](#) properties.

Exactly one property with the name [n<sup>p734</sup>](#) must be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **family-name (inside n<sup>p734</sup>)**

Gives the family name of the person, or the full name of the organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [family-name<sup>p734</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of the [n<sup>p734</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **given-name (inside n<sup>p734</sup>)**

Gives the given-name of the person.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [given-name<sup>p734</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of the [n<sup>p734</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **additional-name (inside n<sup>p734</sup>)**

Gives the any additional names of the person.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [additional-name<sup>p734</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of the [n<sup>p734</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **honorific-prefix (inside n<sup>p734</sup>)**

Gives the honorific prefix of the person.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [honorific-prefix<sup>p734</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of the

[n<sup>p734</sup>](#) property of an [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **honorific-suffix (inside [n<sup>p734</sup>](#))**

Gives the honorific suffix of the person.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [honorific-suffix<sup>p735</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of the [n<sup>p734</sup>](#) property of an [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **nickname**

Gives the nickname of the person or organization.

#### Note

*The nickname is the descriptive name given instead of or in addition to the one belonging to a person, place, or thing. It can also be used to specify a familiar form of a proper name specified by the [fn<sup>p734</sup>](#) or [n<sup>p734</sup>](#) properties.*

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [nickname<sup>p735</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **photo**

Gives a photograph of the person or organization.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [photo<sup>p735</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **bday**

Gives the birth date of the person or organization.

The [value<sup>p731</sup>](#) must be a [valid date string<sup>p73</sup>](#).

A single property with the name [bday<sup>p735</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **anniversary**

Gives the birth date of the person or organization.

The [value<sup>p731</sup>](#) must be a [valid date string<sup>p73</sup>](#).

A single property with the name [anniversary<sup>p735</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **sex**

Gives the biological sex of the person.

The [value<sup>p731</sup>](#) must be one of F, meaning "female", M, meaning "male", N, meaning "none or not applicable", O, meaning "other", or U, meaning "unknown".

A single property with the name [sex<sup>p735</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### **gender-identity**

Gives the gender identity of the person.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [gender-identity<sup>p735</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

## adr

Gives the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be an [item<sup>p727</sup>](#) with zero or more [type<sup>p736</sup>](#), [post-office-box<sup>p736</sup>](#), [extended-address<sup>p736</sup>](#), and [street-address<sup>p736</sup>](#) properties, and optionally a [locality<sup>p736</sup>](#) property, optionally a [region<sup>p736</sup>](#) property, optionally a [postal-code<sup>p737</sup>](#) property, and optionally a [country-name<sup>p737</sup>](#) property.

If no [type<sup>p736</sup>](#) properties are present within an [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard), then the [address-type-string<sup>p741</sup>](#) [work<sup>p741</sup>](#) is implied.

Any number of properties with the name [adr<sup>p736</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### type (inside [adr<sup>p736</sup>](#))

Gives the type of delivery address.

The [value<sup>p731</sup>](#) must be text that, when compared in a [case-sensitive<sup>p65</sup>](#) manner, is equal to one of the [address-type-strings<sup>p741</sup>](#).

Any number of properties with the name [type<sup>p736</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard), but within each such [adr<sup>p736</sup>](#) property [item<sup>p727</sup>](#) there must only be one [type<sup>p736</sup>](#) property per distinct value.

### post-office-box (inside [adr<sup>p736</sup>](#))

Gives the post office box component of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [post-office-box<sup>p736</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### Note

*vCard urges authors not to use this field.*

### extended-address (inside [adr<sup>p736</sup>](#))

Gives an additional component of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [extended-address<sup>p736</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### Note

*vCard urges authors not to use this field.*

### street-address (inside [adr<sup>p736</sup>](#))

Gives the street address component of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [street-address<sup>p736</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### locality (inside [adr<sup>p736</sup>](#))

Gives the locality component (e.g. city) of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [locality<sup>p736</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### region (inside [adr<sup>p736</sup>](#))

Gives the region component (e.g. state or province) of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [region<sup>p736</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **postal-code (inside [adr<sup>p736</sup>](#))**

Gives the postal code component of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [postal-code<sup>p737</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **country-name (inside [adr<sup>p736</sup>](#))**

Gives the country name component of the delivery address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [country-name<sup>p737</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [adr<sup>p736</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **tel**

Gives the telephone number of the person or organization.

The [value<sup>p731</sup>](#) must be either text that can be interpreted as a telephone number as defined in the CCITT specifications E.163 and X.121, or an [item<sup>p727</sup>](#) with zero or more [type<sup>p737</sup>](#) properties and exactly one [value<sup>p737</sup>](#) property. [\[E163\]<sup>p1266</sup>](#) [\[X121\]<sup>p1271</sup>](#)

If no [type<sup>p737</sup>](#) properties are present within an [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of a [tel<sup>p737</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard), or if the [value<sup>p731</sup>](#) of such a [tel<sup>p737</sup>](#) property is text, then the [telephone type string<sup>p741</sup>](#) [voice<sup>p741</sup>](#) is implied.

Any number of properties with the name [tel<sup>p737</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **type (inside [tel<sup>p737</sup>](#))**

Gives the type of telephone number.

The [value<sup>p731</sup>](#) must be text that, when compared in a [case-sensitive<sup>p65</sup>](#) manner, is equal to one of the [telephone type strings<sup>p741</sup>](#).

Any number of properties with the name [type<sup>p737</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of a [tel<sup>p737</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard), but within each such [tel<sup>p737</sup>](#) property [item<sup>p727</sup>](#) there must only be one [type<sup>p737</sup>](#) property per distinct value.

#### **value (inside [tel<sup>p737</sup>](#))**

Gives the actual telephone number of the person or organization.

The [value<sup>p731</sup>](#) must be text that can be interpreted as a telephone number as defined in the CCITT specifications E.163 and X.121. [\[E163\]<sup>p1266</sup>](#) [\[X121\]<sup>p1271</sup>](#)

Exactly one property with the name [value<sup>p737</sup>](#) must be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of a [tel<sup>p737</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **email**

Gives the e-mail address of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [email<sup>p737</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **imp**

Gives a [URL](#) for instant messaging and presence protocol communications with the person or organization.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [impp<sup>p737</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### Lang

Gives a language understood by the person or organization.

The [value<sup>p731</sup>](#) must be a valid BCP 47 language tag. [\[BCP47\]<sup>p1264</sup>](#).

Any number of properties with the name [lang<sup>p738</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### tz

Gives the time zone of the person or organization.

The [value<sup>p731</sup>](#) must be text and must match the following syntax:

1. Either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
2. A [valid non-negative integer<sup>p67</sup>](#) that is exactly two digits long and that represents a number in the range 00..23.
3. A U+003A COLON character (:).
4. A [valid non-negative integer<sup>p67</sup>](#) that is exactly two digits long and that represents a number in the range 00..59.

Any number of properties with the name [tz<sup>p738</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### geo

Gives the geographical position of the person or organization.

The [value<sup>p731</sup>](#) must be text and must match the following syntax:

1. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
2. One or more [ASCII digits](#).
3. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits](#).
4. A U+003B SEMICOLON character (;).
5. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
6. One or more [ASCII digits](#).
7. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits](#).

The optional components marked with an asterisk (\*) should be included, and should have six digits each.

### Note

*The value specifies latitude and longitude, in that order (i.e., "LAT LON" ordering), in decimal degrees. The longitude represents the location east and west of the prime meridian as a positive or negative real number, respectively. The latitude represents the location north and south of the equator as a positive or negative real number, respectively.*

Any number of properties with the name [geo<sup>p738</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### title

Gives the job title, functional position or function of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [title<sup>p738</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcard<sup>p734</sup>>.

### role

Gives the role, occupation, or business category of the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [role<sup>p738</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### **Logo**

Gives the logo of the person or organization.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [logo<sup>p739</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### **agent**

Gives the contact information of another person who will act on behalf of the person or organization.

The [value<sup>p731</sup>](#) must be either an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard), or an [absolute URL](#), or text.

Any number of properties with the name [agent<sup>p739</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### **org**

Gives the name and units of the organization.

The [value<sup>p731</sup>](#) must be either text or an [item<sup>p727</sup>](#) with one [organization-name<sup>p739</sup>](#) property and zero or more [organization-unit<sup>p739</sup>](#) properties.

Any number of properties with the name [org<sup>p739</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **organization-name (inside [org<sup>p739</sup>](#))**

Gives the name of the organization.

The [value<sup>p731</sup>](#) must be text.

Exactly one property with the name [organization-name<sup>p739</sup>](#) must be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of an [org<sup>p739</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **organization-unit (inside [org<sup>p739</sup>](#))**

Gives the name of the organization unit.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [organization-unit<sup>p739</sup>](#) may be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of the [org<sup>p739</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

### **member**

Gives a [URL](#) that represents a member of the group.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [member<sup>p739</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard) if the [item<sup>p727</sup>](#) also has a property with the name [kind<sup>p734</sup>](#) whose value is "[group<sup>p741</sup>](#)".

### **related**

Gives a relationship to another entity.

The [value<sup>p731</sup>](#) must be an [item<sup>p727</sup>](#) with one [url<sup>p739</sup>](#) property and one [rel<sup>p740</sup>](#) properties.

Any number of properties with the name [related<sup>p739</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).

#### **url (inside [related<sup>p739</sup>](#))**

Gives the [URL](#) for the related entity.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Exactly one property with the name [url<sup>p739</sup>](#) must be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of a [related<sup>p739</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **rel (inside [related<sup>p739</sup>](#))**

Gives the relationship between the entity and the related entity.

The [value<sup>p731</sup>](#) must be text that, when compared in a [case-sensitive<sup>p65</sup>](#) manner, is equal to one of the [relationship strings<sup>p741</sup>](#).

Exactly one property with the name [rel<sup>p740</sup>](#) must be present within the [item<sup>p727</sup>](#) that forms the [value<sup>p731</sup>](#) of a [related<sup>p739</sup>](#) property of an [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **categories**

Gives the name of a category or tag that the person or organization could be classified as.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [categories<sup>p740</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **note**

Gives supplemental information or a comment about the person or organization.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [note<sup>p740</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **rev**

Gives the revision date and time of the contact information.

The [value<sup>p731</sup>](#) must be text that is a [valid global date and time string<sup>p77</sup>](#).

### **Note**

*The value distinguishes the current revision of the information for other renditions of the information.*

Any number of properties with the name [rev<sup>p740</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **sound**

Gives a sound file relating to the person or organization.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [sound<sup>p740</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **uid**

Gives a globally unique identifier corresponding to the person or organization.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [uid<sup>p740</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

### **url**

Gives a [URL](#) relating to the person or organization.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [url<sup>p740</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcard<sup>p734</sup>](#).

The **kind strings** are:

***individual***

Indicates a single entity (e.g. a person).

***group***

Indicates multiple entities (e.g. a mailing list).

***org***

Indicates a single entity that is not a person (e.g. a company).

***location***

Indicates a geographical place (e.g. an office building).

The **address type strings** are:

***home***

Indicates a delivery address for a residence.

***work***

Indicates a delivery address for a place of work.

The **telephone type strings** are:

***home***

Indicates a residential number.

***work***

Indicates a telephone number for a place of work.

***text***

Indicates that the telephone number supports text messages (SMS).

***voice***

Indicates a voice telephone number.

***fax***

Indicates a facsimile telephone number.

***cell***

Indicates a cellular telephone number.

***video***

Indicates a video conferencing telephone number.

***pager***

Indicates a paging device telephone number.

***textphone***

Indicates a telecommunication device for people with hearing or speech difficulties.

The **relationship strings** are:

***emergency***

An emergency contact.

***agent***

Another entity that acts on behalf of this entity.

**contact**  
**acquaintance**  
**friend**  
**met**  
**worker**  
**colleague**  
**resident**  
**neighbor**  
**child**  
**parent**  
**sibling**  
**spouse**  
**kin**  
**muse**  
**crush**  
**date**  
**sweetheart**  
**me**

Has the meaning defined in XFN. [\[XFN\]<sup>p1271</sup>](#)

### 5.3.1.1 Conversion to vCard <sup>p74</sup><sub>2</sub>

Given a list of nodes *nodes* in a [Document<sup>p111</sup>](#), a user agent must run the following algorithm to **extract any vCard data represented by those nodes** (only the first vCard is returned):

1. If none of the nodes in *nodes* are [items<sup>p727</sup>](#) with the [item type<sup>p727</sup>](#) [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard), then there is no vCard. Abort the algorithm, returning nothing.
2. Let *node* be the first node in *nodes* that is an [item<sup>p727</sup>](#) with the [item type<sup>p727</sup>](#) [http://microformats.org/profile/hcard<sup>p734</sup>](http://microformats.org/profile/hcard).
3. Let *output* be an empty string.
4. [Add a vCard line<sup>p744</sup>](#) with the type "BEGIN" and the value "VCARD" to *output*.
5. [Add a vCard line<sup>p744</sup>](#) with the type "PROFILE" and the value "VCARD" to *output*.
6. [Add a vCard line<sup>p744</sup>](#) with the type "VERSION" and the value "4.0" to *output*.
7. [Add a vCard line<sup>p744</sup>](#) with the type "SOURCE" and the result of [escaping the vCard text string<sup>p745</sup>](#) that is the document's URL as the value to *output*.
8. If [the title element<sup>p114</sup>](#) is not null, [add a vCard line<sup>p744</sup>](#) with the type "NAME" and with the result of [escaping the vCard text string<sup>p745</sup>](#) obtained from the [the title element<sup>p114</sup>](#)'s [descendant text content](#) as the value to *output*.
9. Let *sex* be the empty string.
10. Let *gender-identity* be the empty string.
11. For each element *element* that is [a property of the item<sup>p732</sup>](#) *node*: for each name *name* in *element*'s [property names<sup>p730</sup>](#), run the following substeps:
  1. Let *parameters* be an empty set of name-value pairs.
  2. Run the appropriate set of substeps from the following list. The steps will set a variable *value*, which is used in the next step.

**If the property's [value<sup>p731</sup>](#) is an [item<sup>p727</sup>](#) *subitem* and name is [n<sup>p734</sup>](#)**

1. Let *value* be the empty string.
2. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [family-name<sup>p734</sup>](#) in *subitem*.

3. Append a U+003B SEMICOLON character (;) to *value*.
4. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [given-name<sup>p734</sup>](#) in *subitem*.
5. Append a U+003B SEMICOLON character (;) to *value*.
6. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [additional-name<sup>p734</sup>](#) in *subitem*.
7. Append a U+003B SEMICOLON character (;) to *value*.
8. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [honorific-prefix<sup>p734</sup>](#) in *subitem*.
9. Append a U+003B SEMICOLON character (;) to *value*.
10. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [honorific-suffix<sup>p735</sup>](#) in *subitem*.

**If the property's [value<sup>p731</sup>](#) is an [item<sup>p727</sup>](#) *subitem* and *name* is [adr<sup>p736</sup>](#)**

1. Let *value* be the empty string.
2. Append to *value* the result of [collecting vCard subproperties<sup>p745</sup>](#) named [post-office-box<sup>p736</sup>](#) in *subitem*.
3. Append a U+003B SEMICOLON character (;) to *value*.
4. Append to *value* the result of [collecting vCard subproperties<sup>p745</sup>](#) named [extended-address<sup>p736</sup>](#) in *subitem*.
5. Append a U+003B SEMICOLON character (;) to *value*.
6. Append to *value* the result of [collecting vCard subproperties<sup>p745</sup>](#) named [street-address<sup>p736</sup>](#) in *subitem*.
7. Append a U+003B SEMICOLON character (;) to *value*.
8. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [locality<sup>p736</sup>](#) in *subitem*.
9. Append a U+003B SEMICOLON character (;) to *value*.
10. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [region<sup>p736</sup>](#) in *subitem*.
11. Append a U+003B SEMICOLON character (;) to *value*.
12. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [postal-code<sup>p737</sup>](#) in *subitem*.
13. Append a U+003B SEMICOLON character (;) to *value*.
14. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [country-name<sup>p737</sup>](#) in *subitem*.
15. If there is a property named [type<sup>p736</sup>](#) in *subitem*, and the first such property has a [value<sup>p731</sup>](#) that is not an [item<sup>p727</sup>](#) and whose value consists only of [ASCII alphanumerics](#), then add a parameter named "TYPE" whose value is the [value<sup>p731</sup>](#) of that property to *parameters*.

**If the property's [value<sup>p731</sup>](#) is an [item<sup>p727</sup>](#) *subitem* and *name* is [org<sup>p739</sup>](#)**

1. Let *value* be the empty string.
2. Append to *value* the result of [collecting the first vCard subproperty<sup>p745</sup>](#) named [organization-name<sup>p739</sup>](#) in *subitem*.
3. For each property named [organization-unit<sup>p739</sup>](#) in *subitem*, run the following steps:
  1. If the [value<sup>p731</sup>](#) of the property is an [item<sup>p727</sup>](#), then skip this property.

2. Append a U+003B SEMICOLON character (;) to *value*.
3. Append the result of [escaping the vCard text string](#)<sup>p745</sup> given by the [value](#)<sup>p731</sup> of the property to *value*.

**If the property's [value](#)<sup>p731</sup> is an [item](#)<sup>p727</sup> *subitem* with the [item type](#)<sup>p727</sup> <http://microformats.org/profile/hcard><sup>p734</sup> and [name](#) is [related](#)<sup>p739</sup>**

1. Let *value* be the empty string.
2. If there is a property named [url](#)<sup>p739</sup> in *subitem*, and its element is a [URL property element](#)<sup>p731</sup>, then append the result of [escaping the vCard text string](#)<sup>p745</sup> given by the [value](#)<sup>p731</sup> of the first such property to *value*, and add a parameter with the name "VALUE" and the value "URI" to *parameters*.
3. If there is a property named [rel](#)<sup>p740</sup> in *subitem*, and the first such property has a [value](#)<sup>p731</sup> that is not an [item](#)<sup>p727</sup> and whose value consists only of [ASCII alphanumerics](#), then add a parameter named "RELATION" whose value is the [value](#)<sup>p731</sup> of that property to *parameters*.

**If the property's [value](#)<sup>p731</sup> is an [item](#)<sup>p727</sup> and [name](#) is none of the above**

1. Let *value* be the result of [collecting the first vCard subproperty](#)<sup>p745</sup> named *value* in *subitem*.
2. If there is a property named *type* in *subitem*, and the first such property has a [value](#)<sup>p731</sup> that is not an [item](#)<sup>p727</sup> and whose value consists only of [ASCII alphanumeric](#), then add a parameter named "TYPE" whose value is the [value](#)<sup>p731</sup> of that property to *parameters*.

**If the property's [value](#)<sup>p731</sup> is not an [item](#)<sup>p727</sup> and its [name](#) is [sex](#)<sup>p735</sup>**

If this is the first such property to be found, set *sex* to the property's [value](#)<sup>p731</sup>.

**If the property's [value](#)<sup>p731</sup> is not an [item](#)<sup>p727</sup> and its [name](#) is [gender-identity](#)<sup>p735</sup>**

If this is the first such property to be found, set *gender-identity* to the property's [value](#)<sup>p731</sup>.

**Otherwise (the property's [value](#)<sup>p731</sup> is not an [item](#)<sup>p727</sup>)**

1. Let *value* be the property's [value](#)<sup>p731</sup>.
2. If *element* is one of the [URL property elements](#)<sup>p731</sup>, add a parameter with the name "VALUE" and the value "URI" to *parameters*.
3. Otherwise, if *name* is [bday](#)<sup>p735</sup> or [anniversary](#)<sup>p735</sup> and the *value* is a [valid date string](#)<sup>p73</sup>, add a parameter with the name "VALUE" and the value "DATE" to *parameters*.
4. Otherwise, if *name* is [rev](#)<sup>p740</sup> and the *value* is a [valid global date and time string](#)<sup>p77</sup>, add a parameter with the name "VALUE" and the value "DATE-TIME" to *parameters*.
5. Prefix every U+005C REVERSE SOLIDUS character (\) in *value* with another U+005C REVERSE SOLIDUS character (\).
6. Prefix every U+002C COMMA character (,) in *value* with a U+005C REVERSE SOLIDUS character (\).
7. Unless *name* is [geo](#)<sup>p738</sup>, prefix every U+003B SEMICOLON character (;) in *value* with a U+005C REVERSE SOLIDUS character (\).
8. Replace every U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF) in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
9. Replace every remaining U+000D CARRIAGE RETURN (CR) or U+000A LINE FEED (LF) character in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).

3. [Add a vCard line](#)<sup>p744</sup> with the type *name*, the parameters *parameters*, and the value *value* to *output*.

12. If either *sex* or *gender-identity* has a value that is not the empty string, [add a vCard line](#)<sup>p744</sup> with the type "GENDER" and the value consisting of the concatenation of *sex*, a U+003B SEMICOLON character (;), and *gender-identity* to *output*.

13. [Add a vCard line](#)<sup>p744</sup> with the type "END" and the value "VCARD" to *output*.

When the above algorithm says that the user agent is to **add a vCard line** consisting of a type *type*, optionally some parameters, and a value *value* to a string *output*, it must run the following steps:

1. Let *line* be an empty string.
2. Append *type*, [converted to ASCII uppercase](#), to *line*.
3. If there are any parameters, then for each parameter, in the order that they were added, run these substeps:
  1. Append a U+003B SEMICOLON character (;) to *line*.
  2. Append the parameter's name to *line*.
  3. Append a U+003D EQUALS SIGN character (=) to *line*.
  4. Append the parameter's value to *line*.
4. Append a U+003A COLON character (:) to *line*.
5. Append *value* to *line*.
6. Let *maximum length* be 75.
7. While *line*'s [code point length](#) is greater than *maximum length*:
  1. Append the first *maximum length* code points of *line* to *output*.
  2. Remove the first *maximum length* code points from *line*.
  3. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
  4. Append a U+000A LINE FEED character (LF) to *output*.
  5. Append a U+0020 SPACE character to *output*.
  6. Let *maximum length* be 74.
8. Append (what remains of) *line* to *output*.
9. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
10. Append a U+000A LINE FEED character (LF) to *output*.

When the steps above require the user agent to obtain the result of **collecting vCard subproperties** named *subname* in *subitem*, the user agent must run the following steps:

1. Let *value* be the empty string.
2. For each property named *subname* in the item *subitem*, run the following substeps:
  1. If the [value<sup>p731</sup>](#) of the property is itself an [item<sup>p727</sup>](#), then skip this property.
  2. If this is not the first property named *subname* in *subitem* (ignoring any that were skipped by the previous step), then append a U+002C COMMA character (,) to *value*.
  3. Append the result of [escaping the vCard text string<sup>p745</sup>](#) given by the [value<sup>p731</sup>](#) of the property to *value*.
3. Return *value*.

When the steps above require the user agent to obtain the result of **collecting the first vCard subproperty** named *subname* in *subitem*, the user agent must run the following steps:

1. If there are no properties named *subname* in *subitem*, then return the empty string.
2. If the [value<sup>p731</sup>](#) of the first property named *subname* in *subitem* is an [item<sup>p727</sup>](#), then return the empty string.
3. Return the result of [escaping the vCard text string<sup>p745</sup>](#) given by the [value<sup>p731</sup>](#) of the first property named *subname* in *subitem*.

When the above algorithms say the user agent is to **escape the vCard text string** *value*, the user agent must use the following steps:

1. Prefix every U+005C REVERSE SOLIDUS character (\) in *value* with another U+005C REVERSE SOLIDUS character (\).
2. Prefix every U+002C COMMA character (,) in *value* with a U+005C REVERSE SOLIDUS character (\).

3. Prefix every U+003B SEMICOLON character (;) in *value* with a U+005C REVERSE SOLIDUS character (\).
4. Replace every U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF) in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
5. Replace every remaining U+000D CARRIAGE RETURN (CR) or U+000A LINE FEED (LF) character in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
6. Return the mutated *value*.

#### Note

This algorithm can generate invalid vCard output, if the input does not conform to the rules described for the <http://microformats.org/profile/hcard><sup>p734</sup> item type<sup>p727</sup> and defined property names<sup>p730</sup>.

### 5.3.1.2 Examples <sup>§ p74</sup><sub>6</sub>

This section is non-normative.

#### Example

Here is a long example vCard for a fictional character called "Jack Bauer":

```
<section id="jack" itemscope itemtype="http://microformats.org/profile/hcard">
  <h1 itemprop="fn">
    <span itemprop="n" itemscope>
      <span itemprop="given-name">Jack</span>
      <span itemprop="family-name">Bauer</span>
    </span>
  </h1>
  
  <p itemprop="org" itemscope>
    <span itemprop="organization-name">Counter-Terrorist Unit</span>
    (<span itemprop="organization-unit">Los Angeles Division</span>)
  </p>
  <p>
    <span itemprop="adr" itemscope>
      <span itemprop="street-address">10201 W. Pico Blvd.</span><br>
      <span itemprop="locality">Los Angeles</span>,
      <span itemprop="region">CA</span>
      <span itemprop="postal-code">90064</span><br>
      <span itemprop="country-name">United States</span><br>
    </span>
    <span itemprop="geo">34.052339; -118.410623</span>
  </p>
  <h2>Assorted Contact Methods</h2>
  <ul>
    <li itemprop="tel" itemscope>
      <span itemprop="value">+1 (310) 597 3781</span> <span itemprop="type">work</span>
      <meta itemprop="type" content="voice">
    </li>
    <li><a itemprop="url" href="https://en.wikipedia.org/wiki/Jack_Bauer">I'm on Wikipedia</a>
    so you can leave a message on my user talk page.</li>
    <li><a itemprop="url" href="http://www.jackbauerfacts.com/">Jack Bauer Facts</a></li>
    <li itemprop="email"><a
href="mailto:j.bauer@la.ctu.gov.invalid">j.bauer@la.ctu.gov.invalid</a></li>
    <li itemprop="tel" itemscope>
      <span itemprop="value">+1 (310) 555 3781</span> <span>
      <meta itemprop="type" content="cell">mobile phone</span>
    </li>
  </ul>
  <ins datetime="2008-07-20 21:00:00+01:00">
```

```

<meta itemprop="rev" content="2008-07-20 21:00:00+01:00">
<p itemprop="tel" itemscope><strong>Update!</strong>
My new <span itemprop="type">home</span> phone number is
<span itemprop="value">01632 960 123</span>.</p>
</ins>
</section>

```

The odd line wrapping is needed because newlines are meaningful in microdata: newlines would be preserved in a conversion to, for example, the vCard format.

### Example

This example shows a site's contact details (using the [address](#)<sup>p193</sup> element) containing an address with two street components:

```

<address itemscope itemType="http://microformats.org/profile/hcard">
<strong itemprop="fn"><span itemprop="n" itemscope><span itemprop="given-name">Alfred</span>
<span itemprop="family-name">Person</span></span></strong> <br>
<span itemprop="adr" itemscope>
<span itemprop="street-address">1600 Amphitheatre Parkway</span> <br>
<span itemprop="street-address">Building 43, Second Floor</span> <br>
<span itemprop="locality">Mountain View</span>,
<span itemprop="region">CA</span> <span itemprop="postal-code">94043</span>
</span>
</address>

```

### Example

The vCard vocabulary can be used to just mark up people's names:

```

<span itemscope itemType="http://microformats.org/profile/hcard"
><span itemprop="fn"><span itemprop="n" itemscope><span itemprop="given-name"
>George</span> <span itemprop="family-name">Washington</span></span></span>
</span></span>

```

This creates a single item with a two name-value pairs, one with the name "fn" and the value "George Washington", and the other with the name "n" and a second item as its value, the second item having the two name-value pairs "given-name" and "family-name" with the values "George" and "Washington" respectively. This is defined to map to the following vCard:

```

BEGIN:VCARD
PROFILE:VCARD
VERSION:4.0
SOURCE:document's address
FN:George Washington
N:Washington;George;;
END:VCARD

```

## 5.3.2 vEvent <sup>p74</sup>

An item with the [item type](#)<sup>p727</sup> <http://microformats.org/profile/hcalendar#vevent> represents an event.

This vocabulary does not [support global identifiers for items](#)<sup>p728</sup>.

The following are the type's [defined property names](#)<sup>p730</sup>. They are based on the vocabulary defined in *Internet Calendaring and Scheduling Core Object Specification (iCalendar)*, where more information on how to interpret the values can be found. [\[RFC5545\]](#)<sup>p1269</sup>

### Note

*Only the parts of the iCalendar vocabulary relating to events are used here; this vocabulary cannot express a complete iCalendar*

*instance.*

### **attach**

Gives the address of an associated document for the event.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [attach<sup>p748</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### **categories**

Gives the name of a category or tag that the event could be classified as.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [categories<sup>p748</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### **class**

Gives the access classification of the information regarding the event.

The [value<sup>p731</sup>](#) must be text with one of the following values:

- public
- private
- confidential

### **⚠Warning!**

***This is merely advisory and cannot be considered a confidentiality measure.***

A single property with the name [class<sup>p748</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### **comment**

Gives a comment regarding the event.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [comment<sup>p748</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### **description**

Gives a detailed description of the event.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [description<sup>p748</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### **geo**

Gives the geographical position of the event.

The [value<sup>p731</sup>](#) must be text and must match the following syntax:

1. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
2. One or more [ASCII digits](#).
3. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits](#).
4. A U+003B SEMICOLON character (;).
5. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).

6. One or more [ASCII digits](#).
7. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits](#).

The optional components marked with an asterisk (\*) should be included, and should have six digits each.

#### Note

*The value specifies latitude and longitude, in that order (i.e., "LAT LON" ordering), in decimal degrees. The longitude represents the location east and west of the prime meridian as a positive or negative real number, respectively. The latitude represents the location north and south of the equator as a positive or negative real number, respectively.*

A single property with the name [geo](#)<sup>p748</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>.

#### location

Gives the location of the event.

The [value](#)<sup>p731</sup> must be text.

A single property with the name [location](#)<sup>p749</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>.

#### resources

Gives a resource that will be needed for the event.

The [value](#)<sup>p731</sup> must be text.

Any number of properties with the name [resources](#)<sup>p749</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>.

#### status

Gives the confirmation status of the event.

The [value](#)<sup>p731</sup> must be text with one of the following values:

- tentative
- confirmed
- cancelled

A single property with the name [status](#)<sup>p749</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>.

#### summary

Gives a short summary of the event.

The [value](#)<sup>p731</sup> must be text.

User agents should replace U+000A LINE FEED (LF) characters in the [value](#)<sup>p731</sup> by U+0020 SPACE characters when using the value.

A single property with the name [summary](#)<sup>p749</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>.

#### dtend

Gives the date and time by which the event ends.

If the property with the name [dtend](#)<sup>p749</sup> is present within an [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup> that has a property with the name [dtstart](#)<sup>p750</sup> whose value is a [valid date string](#)<sup>p73</sup>, then the [value](#)<sup>p731</sup> of the property with the name [dtend](#)<sup>p749</sup> must be text that is a [valid date string](#)<sup>p73</sup> also. Otherwise, the [value](#)<sup>p731</sup> of the property must be text that is a [valid global date and time string](#)<sup>p77</sup>.

In either case, the [value](#)<sup>p731</sup> be later in time than the value of the [dtstart](#)<sup>p750</sup> property of the same [item](#)<sup>p727</sup>.

#### Note

*The time given by the [dtend](#)<sup>p749</sup> property is not inclusive. For day-long events, therefore, the [dtend](#)<sup>p749</sup> property's [value](#)<sup>p731</sup> will*

*be the day after the end of the event.*

A single property with the name [dtend<sup>p749</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>, so long as that <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>> does not have a property with the name [duration<sup>p750</sup>](#).

### **dtstart**

Gives the date and time at which the event starts.

The [value<sup>p731</sup>](#) must be text that is either a [valid date string<sup>p73</sup>](#) or a [valid global date and time string<sup>p77</sup>](#).

Exactly one property with the name [dtstart<sup>p750</sup>](#) must be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>.

### **duration**

Gives the duration of the event.

The [value<sup>p731</sup>](#) must be text that is a [valid vevent duration string<sup>p751</sup>](#).

The duration represented is the sum of all the durations represented by integers in the value.

A single property with the name [duration<sup>p750</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>, so long as that <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>> does not have a property with the name [dtend<sup>p749</sup>](#).

### **transp**

Gives whether the event is to be considered as consuming time on a calendar, for the purpose of free-busy time searches.

The [value<sup>p731</sup>](#) must be text with one of the following values:

- opaque
- transparent

A single property with the name [transp<sup>p750</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>.

### **contact**

Gives the contact information for the event.

The [value<sup>p731</sup>](#) must be text.

Any number of properties with the name [contact<sup>p750</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>.

### **url**

Gives a [URL](#) for the event.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

A single property with the name [url<sup>p750</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>.

### **uid**

Gives a globally unique identifier corresponding to the event.

The [value<sup>p731</sup>](#) must be text.

A single property with the name [uid<sup>p750</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>>.

### **exdate**

Gives a date and time at which the event does not occur despite the recurrence rules.

The [value<sup>p731</sup>](#) must be text that is either a [valid date string<sup>p73</sup>](#) or a [valid global date and time string<sup>p77</sup>](#).

Any number of properties with the name [exdate<sup>p750</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### ***rdate***

Gives a date and time at which the event recurs.

The [value<sup>p731</sup>](#) must be text that is one of the following:

- A [valid date string<sup>p73</sup>](#).
- A [valid global date and time string<sup>p77</sup>](#).
- A [valid global date and time string<sup>p77</sup>](#) followed by a U+002F SOLIDUS character (/) followed by a second [valid global date and time string<sup>p77</sup>](#) representing a later time.
- A [valid global date and time string<sup>p77</sup>](#) followed by a U+002F SOLIDUS character (/) followed by a [valid vevent duration string<sup>p751</sup>](#).

Any number of properties with the name [rdate<sup>p751</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### ***rrule***

Gives a rule for finding dates and times at which the event occurs.

The [value<sup>p731</sup>](#) must be text that matches the RECUR value type defined in *iCalendar*. [\[RFC5545\]<sup>p1269</sup>](#)

A single property with the name [rrule<sup>p751</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### ***created***

Gives the date and time at which the event information was first created in a calendaring system.

The [value<sup>p731</sup>](#) must be text that is a [valid global date and time string<sup>p77</sup>](#).

A single property with the name [created<sup>p751</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### ***last-modified***

Gives the date and time at which the event information was last modified in a calendaring system.

The [value<sup>p731</sup>](#) must be text that is a [valid global date and time string<sup>p77</sup>](#).

A single property with the name [last-modified<sup>p751</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

### ***sequence***

Gives a revision number for the event information.

The [value<sup>p731</sup>](#) must be text that is a [valid non-negative integer<sup>p67</sup>](#).

A single property with the name [sequence<sup>p751</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://microformats.org/profile/hcalendar#vevent<sup>p747</sup>](http://microformats.org/profile/hcalendar#vevent).

A string is a **valid vevent duration string** if it matches the following pattern:

1. A U+0050 LATIN CAPITAL LETTER P character (P).
2. One of the following:
  - A [valid non-negative integer<sup>p67</sup>](#) followed by a U+0057 LATIN CAPITAL LETTER W character (W). The integer represents a duration of that number of weeks.
  - At least one, and possible both in this order, of the following:
    1. A [valid non-negative integer<sup>p67</sup>](#) followed by a U+0044 LATIN CAPITAL LETTER D character (D). The integer represents a duration of that number of days.

2. A U+0054 LATIN CAPITAL LETTER T character (T) followed by any one of the following, or the first and second of the following in that order, or the second and third of the following in that order, or all three of the following in this order:
  1. A [valid non-negative integer](#)<sup>p67</sup> followed by a U+0048 LATIN CAPITAL LETTER H character (H). The integer represents a duration of that number of hours.
  2. A [valid non-negative integer](#)<sup>p67</sup> followed by a U+004D LATIN CAPITAL LETTER M character (M). The integer represents a duration of that number of minutes.
  3. A [valid non-negative integer](#)<sup>p67</sup> followed by a U+0053 LATIN CAPITAL LETTER S character (S). The integer represents a duration of that number of seconds.

### 5.3.2.1 Conversion to iCalendar §<sup>p75</sup> 2

Given a list of nodes *nodes* in a [Document](#)<sup>p111</sup>, a user agent must run the following algorithm to **extract any vEvent data represented by those nodes**:

1. If none of the nodes in *nodes* are [items](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>, then there is no vEvent data. Abort the algorithm, returning nothing.
2. Let *output* be an empty string.
3. [Add an iCalendar line](#)<sup>p753</sup> with the type "BEGIN" and the value "VCALENDAR" to *output*.
4. [Add an iCalendar line](#)<sup>p753</sup> with the type "PROID" and the value equal to a user-agent-specific string representing the user agent to *output*.
5. [Add an iCalendar line](#)<sup>p753</sup> with the type "VERSION" and the value "2.0" to *output*.
6. For each node *node* in *nodes* that is an [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>, run the following steps:
  1. [Add an iCalendar line](#)<sup>p753</sup> with the type "BEGIN" and the value "VEVENT" to *output*.
  2. [Add an iCalendar line](#)<sup>p753</sup> with the type "DTSTAMP" and a value consisting of an iCalendar DATE-TIME string representing the current date and time, with the annotation "VALUE=DATE-TIME", to *output*. [\[RFC5545\]](#)<sup>p1269</sup>
  3. For each element *element* that is a [property of the item](#)<sup>p732</sup> *node*: for each name *name* in *element*'s [property names](#)<sup>p730</sup>, run the appropriate set of substeps from the following list:

**If the property's [value](#)<sup>p731</sup> is an [item](#)<sup>p727</sup>**

Skip the property.

**If the property is [dtend](#)<sup>p749</sup>**

**If the property is [dtstart](#)<sup>p750</sup>**

**If the property is [exdate](#)<sup>p750</sup>**

**If the property is [rdate](#)<sup>p751</sup>**

**If the property is [created](#)<sup>p751</sup>**

**If the property is [last-modified](#)<sup>p751</sup>**

Let *value* be the result of stripping all U+002D HYPHEN-MINUS (-) and U+003A COLON (:) characters from the property's [value](#)<sup>p731</sup>.

If the property's [value](#)<sup>p731</sup> is a [valid date string](#)<sup>p73</sup> then [add an iCalendar line](#)<sup>p753</sup> with the type *name* and the value *value* to *output*, with the annotation "VALUE=DATE".

Otherwise, if the property's [value](#)<sup>p731</sup> is a [valid global date and time string](#)<sup>p77</sup> then [add an iCalendar line](#)<sup>p753</sup> with the type *name* and the value *value* to *output*, with the annotation "VALUE=DATE-TIME".

Otherwise skip the property.

**Otherwise**

[Add an iCalendar line](#)<sup>p753</sup> with the type *name* and the property's [value](#)<sup>p731</sup> to *output*.

4. [Add an iCalendar line](#)<sup>p753</sup> with the type "END" and the value "VEVENT" to *output*.

7. [Add an iCalendar line](#)<sup>p753</sup> with the type "END" and the value "VCALENDAR" to *output*.

When the above algorithm says that the user agent is to **add an iCalendar line** consisting of a type *type*, a value *value*, and optionally an annotation, to a string *output*, it must run the following steps:

1. Let *line* be an empty string.
2. Append *type*, [converted to ASCII uppercase](#), to *line*.
3. If there is an annotation:
  1. Append a U+003B SEMICOLON character (;) to *line*.
  2. Append the annotation to *line*.
4. Append a U+003A COLON character (:) to *line*.
5. Prefix every U+005C REVERSE SOLIDUS character (\) in *value* with another U+005C REVERSE SOLIDUS character (\).
6. Prefix every U+002C COMMA character (,) in *value* with a U+005C REVERSE SOLIDUS character (\).
7. Prefix every U+003B SEMICOLON character (;) in *value* with a U+005C REVERSE SOLIDUS character (\).
8. Replace every U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF) in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
9. Replace every remaining U+000D CARRIAGE RETURN (CR) or U+000A LINE FEED (LF) character in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
10. Append *value* to *line*.
11. Let *maximum length* be 75.
12. While *line*'s [code point length](#) is greater than *maximum length*:
  1. Append the first *maximum length* code points of *line* to *output*.
  2. Remove the first *maximum length* code points from *line*.
  3. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
  4. Append a U+000A LINE FEED character (LF) to *output*.
  5. Append a U+0020 SPACE character to *output*.
  6. Let *maximum length* be 74.
13. Append (what remains of) *line* to *output*.
14. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
15. Append a U+000A LINE FEED character (LF) to *output*.

#### Note

This algorithm can generate invalid iCalendar output, if the input does not conform to the rules described for the <http://microformats.org/profile/hcalendar#vevent><sup>p747</sup>, [item type](#)<sup>p727</sup> and [defined property names](#)<sup>p730</sup>.

### 5.3.2.2 Examples §<sup>p75</sup><sub>3</sub>

This section is non-normative.

#### Example

Here is an example of a page that uses the vEvent vocabulary to mark up an event:

```
<body itemscope itemtype="http://microformats.org/profile/hcalendar#vevent">
  ...
```

```

<h1 itemprop="summary">Bluesday Tuesday: Money Road</h1>
...
<time itemprop="dtstart" datetime="2009-05-05T19:00:00Z">May 5th @ 7pm</time>
(until <time itemprop="dtend" datetime="2009-05-05T21:00:00Z">9pm</time>)
...
<a href="http://livebrum.co.uk/2009/05/05/bluesday-tuesday-money-road"
  rel="bookmark" itemprop="url">Link to this page</a>
...
<p>Location: <span itemprop="location">The RoadHouse</span></p>
...
<p><input type="button" value="Add to Calendar"
  onclick="location = getCalendar(this)"></p>
...
<meta itemprop="description" content="via livebrum.co.uk">
</body>

```

The `getCalendar()` function is left as an exercise for the reader.

The same page could offer some markup, such as the following, for copy-and-pasting into blogs:

```

<div itemscope itemtype="http://microformats.org/profile/hcalendar#vevent">
  <p>I'm going to
  <strong itemprop="summary">Bluesday Tuesday: Money Road</strong>,
  <time itemprop="dtstart" datetime="2009-05-05T19:00:00Z">May 5th at 7pm</time>
  to <time itemprop="dtend" datetime="2009-05-05T21:00:00Z">9pm</time>,
  at <span itemprop="location">The RoadHouse</span>!</p>
  <p><a href="http://livebrum.co.uk/2009/05/05/bluesday-tuesday-money-road"
    itemprop="url">See this event on livebrum.co.uk</a>.</p>
  <meta itemprop="description" content="via livebrum.co.uk">
</div>

```

### 5.3.3 Licensing works <sup>§p75</sup><sub>4</sub>

An item with the [item type](#)<sup>p727</sup> <http://n.whatwg.org/work> represents a work (e.g. an article, an image, a video, a song, etc). This type is primarily intended to allow authors to include licensing information for works.

The following are the type's [defined property names](#)<sup>p730</sup>.

#### **work**

Identifies the work being described.

The [value](#)<sup>p731</sup> must be an [absolute URL](#).

Exactly one property with the name [work](#)<sup>p754</sup> must be present within each [item](#)<sup>p727</sup> with the type <http://n.whatwg.org/work><sup>p754</sup>.

#### **title**

Gives the name of the work.

A single property with the name [title](#)<sup>p754</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://n.whatwg.org/work><sup>p754</sup>.

#### **author**

Gives the name or contact information of one of the authors or creators of the work.

The [value](#)<sup>p731</sup> must be either an [item](#)<sup>p727</sup> with the type <http://microformats.org/profile/hcard><sup>p734</sup>, or text.

Any number of properties with the name [author](#)<sup>p754</sup> may be present within each [item](#)<sup>p727</sup> with the type <http://n.whatwg.org/work><sup>p754</sup>.

## License

Identifies one of the licenses under which the work is available.

The [value<sup>p731</sup>](#) must be an [absolute URL](#).

Any number of properties with the name [license<sup>p755</sup>](#) may be present within each [item<sup>p727</sup>](#) with the type [http://n.whatwg.org/work<sup>p754</sup>](#).

### 5.3.3.1 Examples §<sup>p75</sup><sub>5</sub>

*This section is non-normative.*

#### Example

This example shows an embedded image entitled *My Pond*, licensed under the Creative Commons Attribution-Share Alike 4.0 International License and the MIT license simultaneously.

```
<figure itemscope itemtype="http://n.whatwg.org/work">
  
  <figcaption>
    <p><cite itemprop="title">My Pond</cite></p>
    <p><small>Licensed under the <a itemprop="license"
      href="https://creativecommons.org/licenses/by-sa/4.0/">Creative
      Commons Attribution-Share Alike 4.0 International License</a>
      and the <a itemprop="license"
      href="http://www.opensource.org/licenses/mit-license.php">MIT
      license</a>.</small>
    </figcaption>
  </figure>
```

## 5.4 Converting HTML to other formats §<sup>p75</sup><sub>5</sub>

### 5.4.1 JSON §<sup>p75</sup><sub>5</sub>

Given a list of nodes *nodes* in a [Document<sup>p111</sup>](#), a user agent must run the following algorithm to **extract the microdata from those nodes into a JSON form**:

1. Let *result* be an empty object.
2. Let *items* be an empty array.
3. For each *node* in *nodes*, check if the element is a [top-level microdata item<sup>p732</sup>](#), and if it is then [get the object<sup>p755</sup>](#) for that element and add it to *items*.
4. Add an entry to *result* called "items" whose value is the array *items*.
5. Return the result of serializing *result* to JSON in the shortest possible way (meaning no whitespace between tokens, no unnecessary zero digits in numbers, and only using Unicode escapes in strings for characters that do not have a dedicated escape sequence), and with a lowercase "e" used, when appropriate, in the representation of any numbers. [\[JSON\]<sup>p1267</sup>](#)

#### Note

*This algorithm returns an object with a single property that is an array, instead of just returning an array, so that it is possible to extend the algorithm in the future if necessary.*

When the user agent is to **get the object** for an item *item*, optionally with a list of elements *memory*, it must run the following substeps:

1. Let *result* be an empty object.

2. If no *memory* was passed to the algorithm, let *memory* be an empty list.
3. Add *item* to *memory*.
4. If the *item* has any [item types](#)<sup>p727</sup>, add an entry to *result* called "type" whose value is an array listing the [item types](#)<sup>p727</sup> of *item*, in the order they were specified on the [itemtype](#)<sup>p727</sup> attribute.
5. If the *item* has a [global identifier](#)<sup>p728</sup>, add an entry to *result* called "id" whose value is the [global identifier](#)<sup>p728</sup> of *item*.
6. Let *properties* be an empty object.
7. For each element *element* that has one or more [property names](#)<sup>p730</sup> and is one of [the properties of the item](#)<sup>p732</sup> *item*, in the order those elements are given by the algorithm that returns [the properties of an item](#)<sup>p732</sup>, run the following substeps:
  1. Let *value* be the [property value](#)<sup>p731</sup> of *element*.
  2. If *value* is an [item](#)<sup>p727</sup>, then: If *value* is in *memory*, then let *value* be the string "ERROR". Otherwise, [get the object](#)<sup>p755</sup> for *value*, passing a copy of *memory*, and then replace *value* with the object returned from those steps.
  3. For each name *name* in *element*'s [property names](#)<sup>p730</sup>, run the following substeps:
    1. If there is no entry named *name* in *properties*, then add an entry named *name* to *properties* whose value is an empty array.
    2. Append *value* to the entry named *name* in *properties*.
8. Add an entry to *result* called "properties" whose value is the object *properties*.
9. Return *result*.

### Example

For example, take this markup:

```

<!DOCTYPE HTML>
<html lang="en">
<title>My Blog</title>
<article itemscope itemtype="http://schema.org/BlogPosting">
  <header>
    <h1 itemprop="headline">Progress report</h1>
    <p><time itemprop="datePublished" datetime="2013-08-29">today</time></p>
    <link itemprop="url" href="?comments=0">
  </header>
  <p>All in all, he's doing well with his swim lessons. The biggest thing was he had trouble putting his head in, but we got it down.</p>
  <section>
    <h1>Comments</h1>
    <article itemprop="comment" itemscope itemtype="http://schema.org/UserComments" id="c1">
      <link itemprop="url" href="#c1">
      <footer>
        <p>Posted by: <span itemprop="creator" itemscope itemtype="http://schema.org/Person">
          <span itemprop="name">Greg</span>
        </span></p>
        <p><time itemprop="commentTime" datetime="2013-08-29">15 minutes ago</time></p>
      </footer>
    <p>Ha!</p>
  </article>
  <article itemprop="comment" itemscope itemtype="http://schema.org/UserComments" id="c2">
    <link itemprop="url" href="#c2">
    <footer>
      <p>Posted by: <span itemprop="creator" itemscope itemtype="http://schema.org/Person">
        <span itemprop="name">Charlotte</span>
      </span></p>
      <p><time itemprop="commentTime" datetime="2013-08-29">5 minutes ago</time></p>
    </footer>
  <p>When you say "we got it down"...</p>

```

```
</article>
</section>
</article>
```

It would be turned into the following JSON by the algorithm above (supposing that the page's URL was <https://blog.example.com/progress-report>):

```
{
  "items": [
    {
      "type": [ "http://schema.org/BlogPosting" ],
      "properties": {
        "headline": [ "Progress report" ],
        "datePublished": [ "2013-08-29" ],
        "url": [ "https://blog.example.com/progress-report?comments=0" ],
        "comment": [
          {
            "type": [ "http://schema.org/UserComments" ],
            "properties": {
              "url": [ "https://blog.example.com/progress-report#c1" ],
              "creator": [
                {
                  "type": [ "http://schema.org/Person" ],
                  "properties": {
                    "name": [ "Greg" ]
                  }
                }
              ],
              "commentTime": [ "2013-08-29" ]
            }
          },
          {
            "type": [ "http://schema.org/UserComments" ],
            "properties": {
              "url": [ "https://blog.example.com/progress-report#c2" ],
              "creator": [
                {
                  "type": [ "http://schema.org/Person" ],
                  "properties": {
                    "name": [ "Charlotte" ]
                  }
                }
              ],
              "commentTime": [ "2013-08-29" ]
            }
          }
        ]
      }
    }
  ]
}
```

## 6 User interaction §<sup>p75</sup><sub>8</sub>

### 6.1 The `hidden` attribute §<sup>p75</sup><sub>8</sub>

All [HTML elements](#)<sup>p43</sup> may have the `hidden`<sup>p758</sup> content attribute set. The `hidden`<sup>p758</sup> attribute is a [boolean attribute](#)<sup>p65</sup>. When specified on an element, it indicates that the element is not yet, or is no longer, directly relevant to the page's current state, or that it is being used to declare content to be reused by other parts of the page as opposed to being directly accessed by the user. User agents should not render elements that have the `hidden`<sup>p758</sup> attribute specified. This requirement may be implemented indirectly through the style layer. For example, an HTML+CSS user agent could implement these requirements [using the rules suggested in the Rendering section](#)<sup>p1173</sup>.

#### Note

*Because this attribute is typically implemented using CSS, it's also possible to override it using CSS. For instance, a rule that applies 'display: block' to all elements will cancel the effects of the `hidden`<sup>p758</sup> attribute. Authors therefore have to take care when writing their style sheets to make sure that the attribute is still styled as expected.*

#### Example

In the following skeletal example, the attribute is used to hide the Web game's main screen until the user logs in:

```
<h1>The Example Game</h1>
<section id="login">
  <h2>Login</h2>
  <form>
    ...
    <!-- calls login() once the user's credentials have been checked -->
  </form>
  <script>
    function login() {
      // switch screens
      document.getElementById('login').hidden = true;
      document.getElementById('game').hidden = false;
    }
  </script>
</section>
<section id="game" hidden>
  ...
</section>
```

The `hidden`<sup>p758</sup> attribute must not be used to hide content that could legitimately be shown in another presentation. For example, it is incorrect to use `hidden`<sup>p758</sup> to hide panels in a tabbed dialog, because the tabbed interface is merely a kind of overflow presentation — one could equally well just show all the form controls in one big page with a scrollbar. It is similarly incorrect to use this attribute to hide content just from one presentation — if something is marked `hidden`<sup>p758</sup>, it is hidden from all presentations, including, for instance, screen readers.

Elements that are not themselves `hidden`<sup>p758</sup> must not [hyperlink](#)<sup>p279</sup> to elements that are `hidden`<sup>p758</sup>. The `for` attributes of [Label](#)<sup>p483</sup> and [output](#)<sup>p546</sup> elements that are not themselves `hidden`<sup>p758</sup> must similarly not refer to elements that are `hidden`<sup>p758</sup>. In both cases, such references would cause user confusion.

Elements and scripts may, however, refer to elements that are `hidden`<sup>p758</sup> in other contexts.

#### Example

For example, it would be incorrect to use the `href`<sup>p279</sup> attribute to link to a section marked with the `hidden`<sup>p758</sup> attribute. If the content is not applicable or relevant, then there is no reason to link to it.

It would be fine, however, to use the ARIA `aria-describedby` attribute to refer to descriptions that are themselves `hidden`<sup>p758</sup>. While hiding the descriptions implies that they are not useful alone, they could be written in such a way that they are useful in the

specific context of being referenced from the elements that they describe.

Similarly, a [canvas<sup>p627</sup>](#) element with the [hidden<sup>p758</sup>](#) attribute could be used by a scripted graphics engine as an off-screen buffer, and a form control could refer to a hidden [form<sup>p479</sup>](#) element using its [form<sup>p559</sup>](#) attribute.

Elements in a section hidden by the [hidden<sup>p758</sup>](#) attribute are still active, e.g. scripts and form controls in such sections still execute and submit respectively. Only their presentation to the user changes.

The [hidden](#) IDL attribute must [reflect<sup>p91</sup>](#) the content attribute of the same name.

## 6.2 Inert subtrees §<sup>p75</sup> 9

### Note

*This section **does not** define or create any content attribute named "inert". This section merely defines an abstract concept of [inertness<sup>p759</sup>](#).*

A node (in particular elements and text nodes) can be marked as **inert**. When a node is [inert<sup>p759</sup>](#), then the user agent must act as if the node was absent for the purposes of targeting user interaction events, may ignore the node for the purposes of text search user interfaces (commonly known as "find in page"), and may prevent the user from selecting text in that node. User agents should allow the user to override the restrictions on search and text selection, however.

### Example

For example, consider a page that consists of just a single [inert<sup>p759</sup>](#) paragraph positioned in the middle of a [body<sup>p174</sup>](#). If a user moves their pointing device from the [body<sup>p174</sup>](#) over to the [inert<sup>p759</sup>](#) paragraph and clicks on the paragraph, no [mouseover](#) event would be fired, and the [mousemove](#) and [click](#) events would be fired on the [body<sup>p174</sup>](#) element rather than the paragraph.

### Note

*When a node is inert, it generally cannot be focused. Inert nodes that are [commands<sup>p600</sup>](#) will also get disabled.*

While a [browsing context container<sup>p806</sup>](#) is marked as [inert<sup>p759</sup>](#), its [nested browsing context<sup>p806</sup>](#)'s [active document<sup>p804</sup>](#), and all nodes in that [Document<sup>p111</sup>](#), must be marked as [inert<sup>p759</sup>](#).

An element is **expressly inert** if it is [inert<sup>p759</sup>](#) and its [node document](#) is not [inert<sup>p759</sup>](#).

A [Document<sup>p111</sup>](#) document is **blocked by a modal dialog** subject if *subject* is the topmost [dialog<sup>p603</sup>](#) element in *document*'s [top layer](#). While *document* is so blocked, every node that is [connected](#) to *document*, with the exception of the *subject* element and its [shadow-including descendants](#), must be marked [inert<sup>p759</sup>](#). (The elements excepted by this paragraph can additionally be marked [inert<sup>p759</sup>](#) through other means; being part of a modal dialog does not "protect" a node from being marked [inert<sup>p759</sup>](#).)

### Note

*The [dialog<sup>p603</sup>](#) element's [showModal\(\)<sup>p605</sup>](#) method causes this mechanism to trigger, by [adding the dialog<sup>p603</sup>](#) element to its [node document's top layer](#).*

## 6.3 Tracking user activation §<sup>p75</sup> 9

To prevent abuse of certain APIs that could be annoying to users (e.g., opening popups or vibrating phones), user agents allow these APIs only when the user is actively interacting with the web page or has interacted with the page at least once. This "active interaction" state is maintained through the mechanisms defined in this section.

### 6.3.1 Data model <sup>§ p76</sup><sub>0</sub>

For the purpose of tracking user activation, each [Window<sup>p816</sup>](#)  $W$  has a **last activation timestamp**. This is a number indicating the last time  $W$  got an [activation notification<sup>p760</sup>](#). It corresponds to a `DOMHighResTimeStamp` value except for two cases: positive infinity indicates that  $W$  has never been activated, while negative infinity indicates that a [user activation-gated API<sup>p761</sup>](#) has [consumed<sup>p761</sup>](#) the last user activation of  $W$ . The initial value is positive infinity.

A user agent also defines a **transient activation duration**, which is a constant number indicating how long a user activation is available for certain [user activation-gated APIs<sup>p761</sup>](#) (e.g., for opening popups).

#### Note

The [transient activation duration<sup>p760</sup>](#) is expected to be at most a few seconds, so that the user can possibly perceive the link between an interaction with the page and the page calling the activation-gated API.

These two values imply two boolean user activation states for  $W$ :

#### Sticky activation

When the [current high resolution time](#) is greater than or equal to the [last activation timestamp<sup>p760</sup>](#) in  $W$ ,  $W$  is said to have [sticky activation<sup>p760</sup>](#).

This is  $W$ 's historical activation state, indicating whether the user has ever interacted in  $W$ . It starts false, then changes to true (and never changes back to false) when  $W$  gets the very first [activation notification<sup>p760</sup>](#).

#### Transient activation

When the [current high resolution time](#) is greater than or equal to the [last activation timestamp<sup>p760</sup>](#) in  $W$ , and less than the [last activation timestamp<sup>p760</sup>](#) in  $W$  plus the [transient activation duration<sup>p760</sup>](#), then  $W$  is said to have [transient activation<sup>p760</sup>](#).

This is  $W$ 's current activation state, indicating whether the user has interacted in  $W$  recently. This starts with a false value, and remains true for a limited time after every [activation notification<sup>p760</sup>](#)  $W$  gets.

The [transient activation<sup>p760</sup>](#) state is considered **expired** if it becomes false because the [transient activation duration<sup>p760</sup>](#) time has elapsed since the last user activation. Note that it can become false even before the expiry time through an [activation consumption<sup>p761</sup>](#).

### 6.3.2 Processing model <sup>§ p76</sup><sub>0</sub>

When a user interaction in a [browsing context<sup>p804</sup>](#)  $B$  causes firing of an [activation triggering input event<sup>p760</sup>](#) in  $B$ 's [active document<sup>p804</sup>](#)  $D$ , the user agent must perform the following **activation notification** steps *before dispatching* the event:

- Let *browsingContexts* be a list consisting of:
  - $B$ ,
  - all [ancestor browsing contexts<sup>p807</sup>](#) of  $B$ , and
  - all the [descendant browsing contexts<sup>p807</sup>](#) of  $D$  that have [active documents<sup>p804</sup>](#) from the [same origin<sup>p830</sup>](#) as that of  $D$ .
- Let *windows* be the list of [Window<sup>p816</sup>](#) objects constructed by taking the `[[Window]]` internal slot value of *browsingContext*'s [WindowProxy<sup>p826</sup>](#) object for each *browsingContext* in *browsingContexts*.
- For each *window* in *windows*, set *window*'s [last activation timestamp<sup>p760</sup>](#) to the [current high resolution time](#).

An **activation triggering input event** is any event whose `isTrusted` attribute is true and whose `type` is one of:

- [change<sup>p1260</sup>](#)
- [click](#)
- [contextmenu<sup>p1260</sup>](#)
- [dblclick](#)
- [mouseup](#)
- [pointerup](#)
- [reset<sup>p1261</sup>](#)
- [submit<sup>p1261</sup>](#)
- [touchend](#)

The event set is inconsistent across major browsers. See [issue #3849](#).

[Activation consuming APIs](#)<sup>p761</sup> defined in this and other specifications can **consume user activation** by performing the following steps, given a [Window](#)<sup>p816</sup> *W*:

1. If *W*'s [browsing context](#)<sup>p818</sup> is null, then return.
2. Let *top* be *W*'s [browsing context](#)<sup>p818</sup>'s [top-level browsing context](#)<sup>p807</sup>.
3. Let *browsingContexts* be the [list of the descendant browsing contexts](#)<sup>p807</sup> of *top*'s [active document](#)<sup>p804</sup>.
4. [Append](#) *top* to *browsingContexts*.
5. Let *windows* be the list of [Window](#)<sup>p816</sup> objects constructed by taking the [[Window]] internal slot value of *browsingContext*'s [WindowProxy](#)<sup>p826</sup> object for each *browsingContext* of *browsingContexts*.
6. [For each](#) *window* in *windows*, if *window*'s [last activation timestamp](#)<sup>p760</sup> is not positive infinity, then set *window*'s [last activation timestamp](#)<sup>p760</sup> to negative infinity.

The spec is not clear about how to traverse a tree of documents. See [issue #5020](#).

#### Note

Note the asymmetry in the sets of [browsing contexts](#)<sup>p804</sup> in the page that are affected by an [activation notification](#)<sup>p760</sup> vs an [activation consumption](#)<sup>p761</sup>: an activation consumption changes (to false) the [transient activation](#)<sup>p760</sup> states for all browsing contexts in the page, but an activation notification changes (to true) the states for a subset of those browsing contexts. The exhaustive nature of consumption here is deliberate: it prevents malicious sites from making multiple calls to an [activation consuming API](#)<sup>p761</sup> from a single user activation (possibly by exploiting a deep hierarchy of [iframe](#)<sup>p355</sup>s).

### 6.3.3 APIs gated by user activation §<sup>p76</sup><sub>1</sub>

APIs that are dependent on user activation are classified into three different levels. The levels are as follows, sorted by their "strength of dependence" on user activation (from weakest to strongest):

#### **Sticky activation-gated APIs**

These APIs require the [sticky activation](#)<sup>p760</sup> state to be true, so they are blocked until the very first user activation.

#### **Transient activation-gated APIs**

These APIs require the [transient activation](#)<sup>p760</sup> state to be true, but they don't [consume](#)<sup>p761</sup> it, so multiple calls are allowed per user activation until the transient state [expires](#)<sup>p760</sup>.

#### **Transient activation-consuming APIs**

These APIs require the [transient activation](#)<sup>p760</sup> state to be true, and they [consume user activation](#)<sup>p761</sup> in each call to prevent multiple calls per user activation.

## 6.4 Activation behavior of elements §<sup>p76</sup><sub>1</sub>

Certain elements in HTML have an [activation behavior](#), which means that the user can activate them. This is always caused by a [click](#) event.

The user agent should allow the user to manually trigger elements that have an [activation behavior](#), for instance using keyboard or voice input, or through mouse clicks. When the user triggers an element with a defined [activation behavior](#) in a manner other than clicking it, the default action of the interaction event must be to [fire a click event](#)<sup>p945</sup> at the element.

For web developers (non-normative)

## `element.clickp762()`

Acts as if the element was clicked.

Each element has an associated **click in progress flag**, which is initially unset.

The `click()` method must run the following steps:

1. If this element is a form control that is [disabled<sup>p563</sup>](#), then return.
2. If this element's [click in progress flag<sup>p762</sup>](#) is set, then return.
3. Set this element's [click in progress flag<sup>p762</sup>](#).
4. [Fire a synthetic mouse event<sup>p945</sup>](#) named `click` at this element, with the *not trusted flag* set.
5. Unset this element's [click in progress flag<sup>p762</sup>](#).

## 6.5 Focus <sup>p76</sup><sub>2</sub>

### 6.5.1 Introduction <sup>p76</sup><sub>2</sub>

*This section is non-normative.*

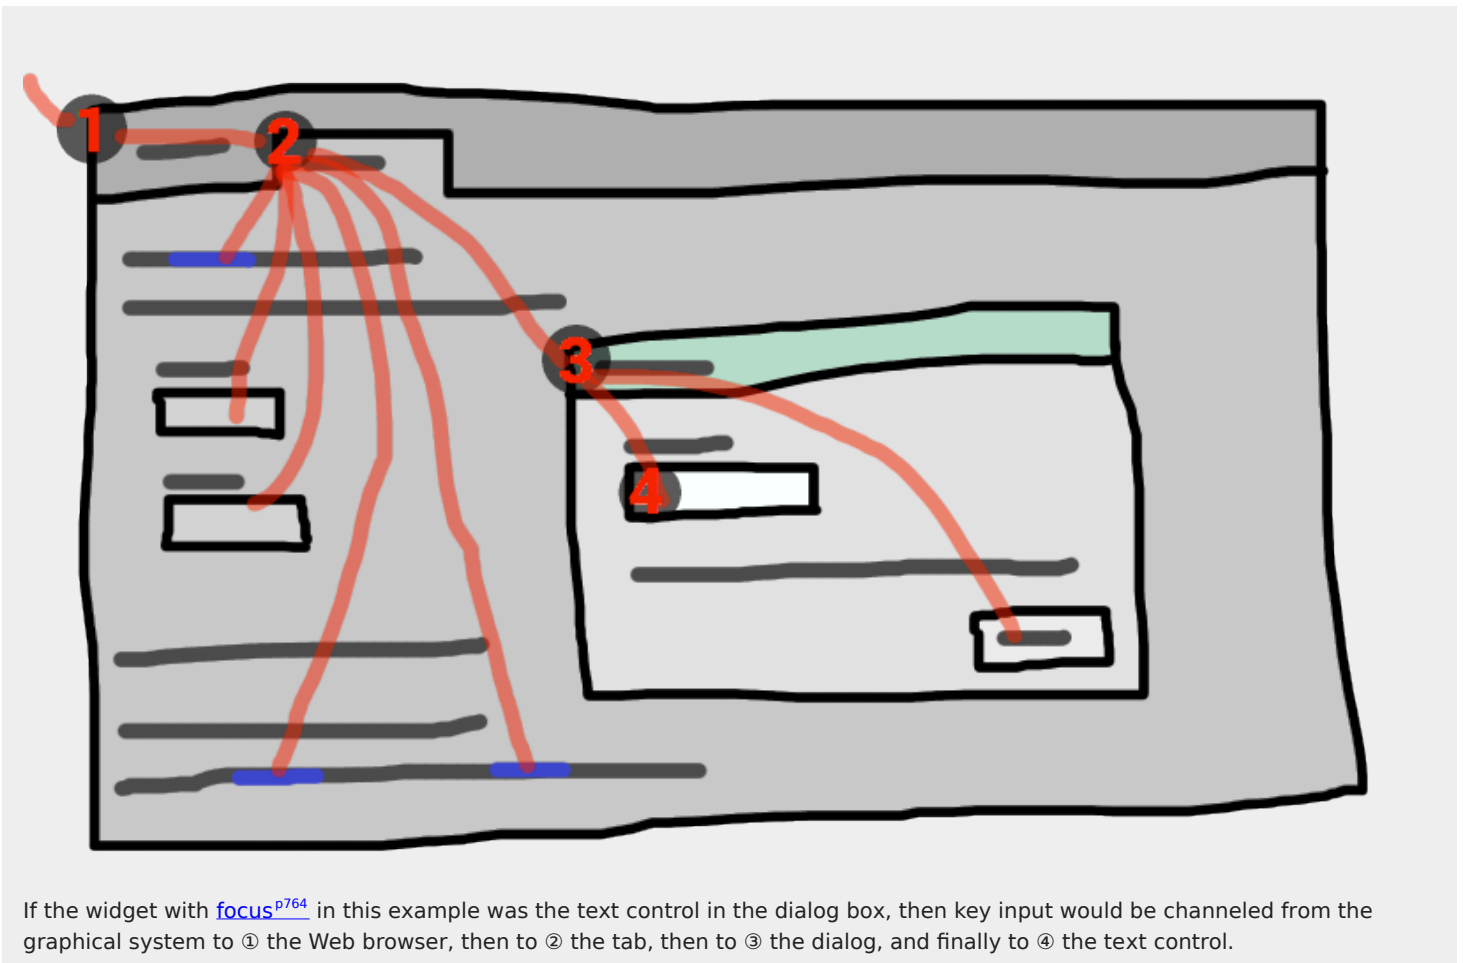

An HTML user interface typically consists of multiple interactive widgets, such as form controls, scrollable regions, links, dialog boxes, browser tabs, and so forth. These widgets form a hierarchy, with some (e.g. browser tabs, dialog boxes) containing others (e.g. links, form controls).

When interacting with an interface using a keyboard, key input is channeled from the system, through the hierarchy of interactive widgets, to an active widget, which is said to be [focused<sup>p764</sup>](#).

#### Example

Consider an HTML application running in a browser tab running in a graphical environment. Suppose this application had a page with some text controls and links, and was currently showing a modal dialog, which itself had a text control and a button.

The hierarchy of focusable widgets, in this scenario, would include the browser window, which would have, amongst its children, the browser tab containing the HTML application. The tab itself would have as its children the various links and text controls, as well as the dialog. The dialog itself would have as its children the text control and the button.

Keyboard events are always targeted at this [focused](#)<sup>p764</sup> element.

### 6.5.2 Data model § p76 3

The term **focusable area** is used to refer to regions of the interface that can become the target of keyboard input. Focusable areas can be elements, parts of elements, or other regions managed by the user agent.

Each [focusable area](#)<sup>p763</sup> has a **DOM anchor**, which is a [Node](#) object that represents the position of the [focusable area](#)<sup>p763</sup> in the DOM. (When the [focusable area](#)<sup>p763</sup> is itself a [Node](#), it is its own [DOM anchor](#)<sup>p763</sup>.) The [DOM anchor](#)<sup>p763</sup> is used in some APIs as a substitute for the [focusable area](#)<sup>p763</sup> when there is no other DOM object to represent the [focusable area](#)<sup>p763</sup>.

The following table describes what objects can be [focusable areas](#)<sup>p763</sup>. The cells in the left column describe objects that can be [focusable areas](#)<sup>p763</sup>; the cells in the right column describe the [DOM anchors](#)<sup>p763</sup> for those elements. (The cells that span both columns are non-normative examples.)

<a href="#">Focusable area</a> <sup>p763</sup>	<a href="#">DOM anchor</a> <sup>p763</sup>
<b>Examples</b>	
<b>Elements that meet all the following criteria:</b> <ul style="list-style-type: none"> <li>the element's <a href="#">tabindex value</a><sup>p767</sup> is non-null, or the element is determined by the user agent to be focusable;</li> <li>the element is either not a <a href="#">shadow host</a>, or has a <a href="#">shadow root</a> whose <a href="#">delegates focus</a> is false;</li> <li>the element is not <a href="#">actually disabled</a><sup>p716</sup>;</li> <li>the element is not <a href="#">expressly inert</a><sup>p759</sup>;</li> <li>the element is either <a href="#">being rendered</a><sup>p1172</sup> or <a href="#">being used as relevant canvas fallback content</a><sup>p628</sup>.</li> </ul>	The element itself.
<a href="#">iframe</a> <sup>p355</sup> , <a href="#">&lt;input type=text&gt;</a> <sup>p492</sup> , sometimes <a href="#">&lt;a href=""&gt;</a> <sup>p234</sup> (depending on platform conventions).	
<b>The shapes of <a href="#">area</a><sup>p437</sup> elements in an <a href="#">image map</a><sup>p439</sup> associated with an <a href="#">img</a><sup>p314</sup> element that is <a href="#">being rendered</a><sup>p1172</sup> and is not <a href="#">expressly inert</a><sup>p759</sup>.</b>	The <a href="#">img</a> <sup>p314</sup> element.

## Examples

In the following example, the [area<sup>p437</sup>](#) element creates two shapes, one on each image. The [DOM anchor<sup>p763</sup>](#) of the first shape is the first [img<sup>p314</sup>](#) element, and the [DOM anchor<sup>p763</sup>](#) of the second shape is the second [img<sup>p314</sup>](#) element.

```
<map id=wallmap><area alt="Enter Door" coords="10,10,100,200" href="door.html"></map>
...

...

```

The user-agent provided subwidgets of elements that are [being rendered<sup>p1172</sup>](#) and are not [actually disabled<sup>p716</sup>](#) or [expressly inert<sup>p759</sup>](#).

The element for which the [focusable area<sup>p763</sup>](#) is a subwidget.

The [controls in the user interface that is exposed to the user<sup>p429</sup>](#) for a [video<sup>p373</sup>](#) element, the up and down buttons in a spin-control version of [<input type=number><sup>p502</sup>](#), the two range control widgets in a [<input type=range multiple><sup>p503</sup>](#), the part of a [details<sup>p597</sup>](#) element's rendering that enabled the element to be opened or closed using keyboard input.

The scrollable regions of elements that are [being rendered<sup>p1172</sup>](#) and are not [expressly inert<sup>p759</sup>](#).

The element for which the box that the scrollable region scrolls was created.

The CSS ['overflow'](#) property's ['scroll'](#) value typically creates a scrollable region.

The [viewport](#) of a [Document<sup>p111</sup>](#) that has a non-null [browsing context<sup>p804</sup>](#) and is not [inert<sup>p759</sup>](#).

The [Document<sup>p111</sup>](#) for which the [viewport](#) was created.

The contents of an [iframe<sup>p355</sup>](#).

Any other element or part of an element determined by the user agent to be a focusable area, especially to aid with accessibility or to better match platform conventions.

The element.

## Example

A user agent could make all list item bullets [sequentially focusable<sup>p765</sup>](#), so that a user can more easily navigate lists.

## Example

Similarly, a user agent could make all elements with [title<sup>p136</sup>](#) attributes [sequentially focusable<sup>p765</sup>](#), so that their advisory information can be accessed.

## Note

A [browsing context container<sup>p806</sup>](#) (e.g. an [iframe<sup>p355</sup>](#)) is a [focusable area<sup>p763</sup>](#), but key events routed to a [browsing context container<sup>p806</sup>](#) get immediately routed to its [nested browsing context<sup>p806</sup>](#)'s [active document<sup>p804</sup>](#). Similarly, in sequential focus navigation a [browsing context container<sup>p806</sup>](#) essentially acts merely as a placeholder for its [nested browsing context<sup>p806</sup>](#)'s [active document<sup>p804</sup>](#).

One [focusable area<sup>p763</sup>](#) in each [Document<sup>p111</sup>](#) is designated the **focused area of the document**. Which control is so designated changes over time, based on algorithms in this specification.

The **currently focused area of a top-level browsing context** *topLevel/BC* at any particular time is the [focusable area<sup>p763</sup>](#) returned by this algorithm:

1. Let *candidate* be *topLevel/BC*'s [active document<sup>p804</sup>](#).
2. If the designated [focused area of the document<sup>p764</sup>](#) is a [browsing context container<sup>p806</sup>](#) with a non-null [nested browsing context<sup>p806</sup>](#), then let *candidate* be the [active document<sup>p804</sup>](#) of that [browsing context container<sup>p806</sup>](#)'s [nested browsing context<sup>p806</sup>](#), and redo this step.
3. If *candidate* has a [focused area<sup>p764</sup>](#), set *candidate* to *candidate*'s [focused area<sup>p764</sup>](#).
4. Return *candidate*.

An element that is the [DOM anchor<sup>p763</sup>](#) of a [focusable area<sup>p763</sup>](#) is said to **gain focus** when that [focusable area<sup>p763</sup>](#) becomes the [currently focused area of a top-level browsing context<sup>p764</sup>](#). When an element is the [DOM anchor<sup>p763</sup>](#) of a [focusable area<sup>p763</sup>](#) of the [currently focused area of a top-level browsing context<sup>p764</sup>](#), it is **focused**.

The **focus chain** of a [focusable area<sup>p763</sup>](#) *subject* is the ordered list constructed as follows:

1. Let *current object* be *subject*.
2. Let *output* be an empty list.

3. Loop: Append *current object* to *output*.

4. If *current object* is an [area<sup>p437</sup>](#) element's shape, append that [area<sup>p437</sup>](#) element to *output*.

Otherwise, if *current object* is a [focusable area<sup>p763</sup>](#) whose [DOM anchor<sup>p763</sup>](#) is an element that is not *current object* itself, append that [DOM anchor<sup>p763</sup>](#) element to *output*.

5. If *current object* is a [Document<sup>p111</sup>](#) whose [browsing context<sup>p804</sup>](#) is a [child browsing context<sup>p806</sup>](#), then set *current object* to *current object*'s [browsing context<sup>p804</sup>](#)'s [container<sup>p806</sup>](#) and return to the step labeled *loop*.

6. Return *output*.

#### Note

The chain starts with *subject* and (if *subject* is or can be the [currently focused area of a top-level browsing context<sup>p764</sup>](#)) continues up the focus hierarchy up to the [Document<sup>p111</sup>](#) of the [top-level browsing context<sup>p807</sup>](#).

All elements that are [focusable areas<sup>p763</sup>](#) are said to be **focusable**.

There are two special types of focusability for [focusable areas<sup>p763</sup>](#):

- A [focusable area<sup>p763</sup>](#) is said to be **sequentially focusable** if it is included in its [Document<sup>p111</sup>](#)'s [sequential focus navigation order<sup>p772</sup>](#) and the user agent determines that it is sequentially focusable.
- A [focusable area<sup>p763</sup>](#) is said to be **click focusable** if the user agent determines that it is click focusable. User agents should consider focusable areas with non-null [tabindex values<sup>p767</sup>](#) to be click focusable.

#### Note

Elements which are not [focusable<sup>p765</sup>](#) are not [focusable areas<sup>p763</sup>](#), and thus not [sequentially focusable<sup>p765</sup>](#) and not [click focusable<sup>p765</sup>](#).

#### Note

Being [focusable<sup>p765</sup>](#) is a statement about whether an element can be focused programmatically, e.g. via the [focus\(\)<sup>p775</sup>](#) method or [autofocus<sup>p775</sup>](#) attribute. In contrast, [sequentially focusable<sup>p765</sup>](#) and [click focusable<sup>p765</sup>](#) govern how the user agent responds to user interaction: respectively, to [sequential focus navigation<sup>p772</sup>](#) and as [activation behavior<sup>p0</sup>](#).

The user agent might determine that an element is not [sequentially focusable<sup>p765</sup>](#) even if it is [focusable<sup>p765</sup>](#) and is included in its [Document<sup>p111</sup>](#)'s [sequential focus navigation order<sup>p772</sup>](#), according to user preferences. For example, macOS users can set the user agent to skip non-form control elements, or can skip links when doing [sequential focus navigation<sup>p772</sup>](#) with just the Tab key (as opposed to using both the Option and Tab keys).

Similarly, the user agent might determine that an element is not [click focusable<sup>p765</sup>](#) even if it is [focusable<sup>p765</sup>](#). For example, in some user agents, clicking on a non-editable form control does not focus it, i.e. the user agent has determined that such controls are not click focusable.

Thus, an element can be [focusable<sup>p765</sup>](#), but neither [sequentially focusable<sup>p765</sup>](#) nor [click focusable<sup>p765</sup>](#). For example, in some user agents, a non-editable form-control with a negative-integer [tabindex value<sup>p767</sup>](#) would not be focusable via user interaction, only via programmatic APIs.

When a user [activates<sup>p761</sup>](#) a [click focusable<sup>p765</sup>](#) [focusable area<sup>p763</sup>](#), the user agent must run the [focusing steps<sup>p769</sup>](#) on the [focusable area<sup>p763</sup>](#) with *focus trigger* set to "click".

#### Note

Note that focusing is not an [activation behavior](#), i.e. calling the [click\(\)<sup>p762</sup>](#) method on an element or dispatching a synthetic [click](#) event on it won't cause the element to get focused.

A node is a **focus navigation scope owner** if it is a [document<sup>p111</sup>](#), a [shadow host](#) or a [slot<sup>p626</sup>](#).

Each [focus navigation scope owner<sup>p765</sup>](#) has a **focus navigation scope**, which is a list of elements. Its contents are determined as follows:

Every element *element* has an **associated focus navigation owner**, which is either null or a [focus navigation scope owner<sup>p765</sup>](#). It is

determined by the following algorithm:

1. If *element*'s parent is null, then return null.
2. If *element*'s parent is a [shadow host](#), then return *element*'s [assigned slot](#).
3. If *element*'s parent is a [shadow root](#), then return the parent's [host](#).
4. If *element*'s parent is the [document element](#), then return the parent's [node document](#).
5. Return *element*'s parent's [associated focus navigation owner](#)<sup>p765</sup>.

Then, the contents of a given [focus navigation scope owner](#)<sup>p765</sup> *owner*'s [focus navigation scope](#)<sup>p765</sup> are all elements whose [associated focus navigation owner](#)<sup>p765</sup> is *owner*.

#### Note

*The order of elements within a [focus navigation scope](#)<sup>p765</sup> does not impact any of the algorithms in this specification. Ordering only becomes important for the [tabindex-ordered focus navigation scope](#)<sup>p766</sup> and [flattened tabindex-ordered focus navigation scope](#)<sup>p766</sup> concepts defined below.*

A **tabindex-ordered focus navigation scope** is a list of [focusable areas](#)<sup>p763</sup> and [focus navigation scope owners](#)<sup>p765</sup>. Every [focus navigation scope owner](#)<sup>p765</sup> *owner* has [tabindex-ordered focus navigation scope](#)<sup>p766</sup>, whose contents are determined as follows:

- It contains all elements in *owner*'s [focus navigation scope](#)<sup>p765</sup> that are themselves [focus navigation scope owners](#)<sup>p765</sup>, except the elements whose [tabindex value](#)<sup>p767</sup> is a negative integer.
- It contains all of the [focusable areas](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element in *owner*'s [focus navigation scope](#)<sup>p765</sup>, except the [focusable areas](#)<sup>p763</sup> whose [tabindex value](#)<sup>p767</sup> is a negative integer.

The order within a [tabindex-ordered focus navigation scope](#)<sup>p766</sup> is determined by each element's [tabindex value](#)<sup>p767</sup>, as described in the section below.

#### Note

*The rules there do not give a precise ordering, as they are composed mostly of "should" statements and relative orderings.*

A **flattened tabindex-ordered focus navigation scope** is a list of [focusable areas](#)<sup>p763</sup>. Every [focus navigation scope owner](#)<sup>p765</sup> *owner* owns a distinct [flattened tabindex-ordered focus navigation scope](#)<sup>p766</sup>, whose contents are determined by the following algorithm:

1. Let *result* be a [clone](#) of *owner*'s [tabindex-ordered focus navigation scope](#)<sup>p766</sup>.
2. For each *item* of *result*:
  1. If *item* is not a [focus navigation scope owner](#)<sup>p765</sup>, then [continue](#).
  2. If *item* is not a [focusable area](#)<sup>p763</sup>, then replace *item* with all of the items in *item*'s [flattened tabindex-ordered focus navigation scope](#)<sup>p766</sup>.
  3. Otherwise, insert the contents of *item*'s [flattened tabindex-ordered focus navigation scope](#)<sup>p766</sup> after *item*.

### 6.5.3 The [tabindex](#)<sup>p766</sup> attribute § p766

The [tabindex](#) content attribute allows authors to make an element and regions that have the element as its [DOM anchor](#)<sup>p763</sup> be [focusable areas](#)<sup>p763</sup>, allow or prevent them from being [sequentially focusable](#)<sup>p765</sup>, and determine their relative ordering for [sequential focus navigation](#)<sup>p772</sup>. MDN

The name "tab index" comes from the common use of the Tab key to navigate through the focusable elements. The term "tabbing" refers to moving forward through [sequentially focusable](#)<sup>p765</sup> [focusable areas](#)<sup>p763</sup>.

The [tabindex](#)<sup>p766</sup> attribute, if specified, must have a value that is a [valid integer](#)<sup>p66</sup>. Positive numbers specify the relative position of the element's [focusable areas](#)<sup>p763</sup> in the [sequential focus navigation order](#)<sup>p772</sup>, and negative numbers indicate that the control is not [sequentially focusable](#)<sup>p765</sup>.

Developers should use caution when using values other than 0 or -1 for their [tabindex<sup>p766</sup>](#) attributes as this is complicated to do correctly.

## Note

The following provides a non-normative summary of the behaviors of the possible [tabindex<sup>p766</sup>](#) attribute values. The below processing model gives the more precise rules.

### omitted (or non-integer values)

The user agent will decide whether the element is [focusable<sup>p765</sup>](#), and if it is, whether it is [sequentially focusable<sup>p765</sup>](#) or [click focusable<sup>p765</sup>](#) (or both).

### -1 (or other negative integer values)

Causes the element to be [focusable<sup>p765</sup>](#), and indicates that the author would prefer the element to be [click focusable<sup>p765</sup>](#) but not [sequentially focusable<sup>p765</sup>](#). The user agent might ignore this preference for click and sequential focusability, e.g., for specific element types according to platform conventions, or for keyboard-only users.

### 0

Causes the element to be [focusable<sup>p765</sup>](#), and indicates that the author would prefer the element to be both [click focusable<sup>p765</sup>](#) and [sequentially focusable<sup>p765</sup>](#). The user agent might ignore this preference for click and sequential focusability.

### positive integer values

Behaves the same as 0, but in addition creates a relative ordering within a [tabindex-ordered focus navigation scope<sup>p766</sup>](#), so that elements with higher [tabindex<sup>p766</sup>](#) attribute value come later.

Note that the [tabindex<sup>p766</sup>](#) attribute cannot be used to make an element non-focusable. The only way a page author can do that is by [disabling<sup>p716</sup>](#) the element, or making it [inert<sup>p759</sup>](#).

The **tabindex value** of an element is the value of its [tabindex<sup>p766</sup>](#) attribute, parsed using the [rules for parsing integers<sup>p66</sup>](#). If parsing fails or the attribute is not specified, then the [tabindex value<sup>p767</sup>](#) is null.

The [tabindex value<sup>p767</sup>](#) of a [focusable area<sup>p763</sup>](#) is the [tabindex value<sup>p767</sup>](#) of its [DOM anchor<sup>p763</sup>](#).

The [tabindex value<sup>p767</sup>](#) of an element must be interpreted as follows:

### If the value is null

The user agent should follow platform conventions to determine if the element should be considered as a [focusable area<sup>p763</sup>](#) and if so, whether the element and any [focusable areas<sup>p763</sup>](#) that have the element as their [DOM anchor<sup>p763</sup>](#) are [sequentially focusable<sup>p765</sup>](#), and if so, what their relative position in their [tabindex-ordered focus navigation scope<sup>p766</sup>](#) is to be. If the element is a [focus navigation scope owner<sup>p765</sup>](#), it must be included in its [tabindex-ordered focus navigation scope<sup>p766</sup>](#) even if it is not a [focusable area<sup>p763</sup>](#).

The relative ordering within a [tabindex-ordered focus navigation scope<sup>p766</sup>](#) for elements and [focusable areas<sup>p763</sup>](#) that belong to the same [focus navigation scope<sup>p765</sup>](#) and whose [tabindex value<sup>p767</sup>](#) is null should be in [shadow-including tree order](#).

Modulo platform conventions, it is suggested that the following elements should be considered as [focusable areas<sup>p763</sup>](#):

- [a<sup>p234</sup>](#) elements that have an [href<sup>p279</sup>](#) attribute
- [link<sup>p154</sup>](#) elements that have an [href<sup>p155</sup>](#) attribute
- [button<sup>p528</sup>](#) elements
- [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute are not in the [Hidden<sup>p492</sup>](#) state
- [select<sup>p530</sup>](#) elements
- [textarea<sup>p541</sup>](#) elements
- [summary<sup>p600</sup>](#) elements that are the first [summary<sup>p600</sup>](#) element child of a [details<sup>p597</sup>](#) element
- Elements with a [draggable<sup>p802</sup>](#) attribute set, if that would enable the user agent to allow the user to begin a drag operations for those elements without the use of a pointing device
- [Editing hosts<sup>p782</sup>](#)

- [Browsing context containers](#)<sup>p806</sup>

### If the value is a negative integer

The user agent must consider the element as a [focusable area](#)<sup>p763</sup>, but should omit the element from any [tabindex-ordered focus navigation scope](#)<sup>p766</sup>.

#### Note

*One valid reason to ignore the requirement that sequential focus navigation not allow the author to lead to the element would be if the user's only mechanism for moving the focus is sequential focus navigation. For instance, a keyboard-only user would be unable to click on a text control with a negative [tabindex](#)<sup>p766</sup>, so that user's user agent would be well justified in allowing the user to tab to the control regardless.*

### If the value is a zero

The user agent must allow the element to be considered as a [focusable area](#)<sup>p763</sup> and should allow the element and any [focusable areas](#)<sup>p763</sup> that have the element as their [DOM anchor](#)<sup>p763</sup> to be [sequentially focusable](#)<sup>p765</sup>.

The relative ordering within a [tabindex-ordered focus navigation scope](#)<sup>p766</sup> for elements and [focusable areas](#)<sup>p763</sup> that belong to the same [focus navigation scope](#)<sup>p765</sup> and whose [tabindex value](#)<sup>p767</sup> is zero should be in [shadow-including tree order](#).

### If the value is greater than zero

The user agent must allow the element to be considered as a [focusable area](#)<sup>p763</sup> and should allow the element and any [focusable areas](#)<sup>p763</sup> that have the element as their [DOM anchor](#)<sup>p763</sup> to be [sequentially focusable](#)<sup>p765</sup>, and should place the element — referenced as *candidate* below — and the aforementioned [focusable areas](#)<sup>p763</sup> in the [tabindex-ordered focus navigation scope](#)<sup>p766</sup> where the element is a part of so that, relative to other elements and [focusable areas](#)<sup>p763</sup> that belong to the same [focus navigation scope](#)<sup>p765</sup>, they are:

- before any [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element whose [tabindex](#)<sup>p766</sup> attribute has been omitted or whose value, when parsed, returns an error,
- before any [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element whose [tabindex](#)<sup>p766</sup> attribute has a value equal to or less than zero,
- after any [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element whose [tabindex](#)<sup>p766</sup> attribute has a value greater than zero but less than the value of the [tabindex](#)<sup>p766</sup> attribute on *candidate*,
- after any [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element whose [tabindex](#)<sup>p766</sup> attribute has a value equal to the value of the [tabindex](#)<sup>p766</sup> attribute on *candidate* but that is located earlier than *candidate* in [shadow-including tree order](#),
- before any [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element whose [tabindex](#)<sup>p766</sup> attribute has a value equal to the value of the [tabindex](#)<sup>p766</sup> attribute on *candidate* but that is located later than *candidate* in [shadow-including tree order](#), and
- before any [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is an element whose [tabindex](#)<sup>p766</sup> attribute has a value greater than the value of the [tabindex](#)<sup>p766</sup> attribute on *candidate*.

The [tabIndex](#) IDL attribute must [reflect](#)<sup>p91</sup> the value of the [tabindex](#)<sup>p766</sup> content attribute. The default value is 0 if the element is an [a](#)<sup>p234</sup>, [area](#)<sup>p437</sup>, [button](#)<sup>p528</sup>, [frame](#)<sup>p1220</sup>, [iframe](#)<sup>p355</sup>, [input](#)<sup>p486</sup>, [object](#)<sup>p367</sup>, [select](#)<sup>p530</sup>, [textarea](#)<sup>p541</sup>, or [SVG a](#) element, or is a [summary](#)<sup>p600</sup> element that is a [summary for its parent details](#)<sup>p600</sup>. The default value is  $-1$  otherwise.

#### Note

*The varying default value based on element type is a historical artifact.*

## 6.5.4 Processing model <sup>p76</sup><sub>8</sub>

To **get the focusable area** for a *focus target* that is either an element that is not a [focusable area](#)<sup>p763</sup>, or is a [browsing context](#)<sup>p804</sup>, given an optional string *focus trigger*, run the first matching set of steps from the following list:

- ↪ If *focus target* is an [area](#)<sup>p437</sup> element with one or more shapes that are [focusable areas](#)<sup>p763</sup>

Return the shape corresponding to the first [img](#)<sup>p314</sup> element in [tree order](#) that uses the image map to which the [area](#)<sup>p437</sup> element belongs.

- ↪ **If *focus target* is an element with one or more scrollable regions that are [focusable areas](#)<sup>p763</sup>**  
Return the element's first scrollable region, according to a pre-order, depth-first traversal of the [flat tree](#). [[CSSSCOPING](#)]<sup>p1265</sup>
- ↪ **If *focus target* is the [document element](#) of its [Document](#)<sup>p111</sup>**  
Return the [Document](#)<sup>p111</sup>'s [viewport](#).
- ↪ **If *focus target* is a [browsing context](#)<sup>p804</sup>**  
Return the [browsing context](#)<sup>p804</sup>'s [active document](#)<sup>p804</sup>.
- ↪ **If *focus target* is a [browsing context container](#)<sup>p806</sup> with a non-null [nested browsing context](#)<sup>p806</sup>**  
Return the [browsing context container](#)<sup>p806</sup>'s [nested browsing context](#)<sup>p806</sup>'s [active document](#)<sup>p804</sup>.
- ↪ **If *focus target* is a [shadow host](#) whose [shadow root](#)'s [delegates focus](#) is true**
  1. If *focus target* is a [shadow-including inclusive ancestor](#) of the [currently focused area of a top-level browsing context](#)<sup>p764</sup>'s [DOM anchor](#)<sup>p763</sup>, then return null.
  2. Otherwise:
    1. If *focus trigger* is "click", then let *possible focus delegates* be the list of all [click focusable](#)<sup>p765</sup> [focusable areas](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is a descendant of *focus target* in the [flat tree](#).
    2. Otherwise, let *possible focus delegates* be the list of all [focusable areas](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is a descendant of *focus target* in the [flat tree](#).
    3. Return the first [focusable area](#)<sup>p763</sup> in [tree order](#) of their [DOM anchors](#)<sup>p763</sup> in *possible focus delegates*, or null if *possible focus delegates* is empty.

#### Note

For [sequential focusability](#)<sup>p765</sup>, the handling of [shadow hosts](#) and [delegates focus](#) is done when constructing the [sequential focus navigation order](#)<sup>p772</sup>. That is, the [focusing steps](#)<sup>p769</sup> will never be called on such [shadow hosts](#) as part of sequential focus navigation.

#### ↪ Otherwise

Return null.

The **focusing steps** for an object *new focus target* that is either a [focusable area](#)<sup>p763</sup>, or an element that is not a [focusable area](#)<sup>p763</sup>, or a [browsing context](#)<sup>p804</sup>, are as follows. They can optionally be run with a *fallback target* and a string *focus trigger*.

1. If *new focus target* is not a [focusable area](#)<sup>p763</sup>, then set *new focus target* to the result of [getting the focusable area](#)<sup>p768</sup> for *new focus target*, given *focus trigger* if it was passed.
2. If *new focus target* is null, then:
  1. If no *fallback target* was specified, then return.
  2. Otherwise, set *new focus target* to the *fallback target*.
3. If *new focus target* is a [browsing context container](#)<sup>p806</sup> with non-null [nested browsing context](#)<sup>p806</sup>, then set *new focus target* to the [nested browsing context](#)<sup>p806</sup>'s [active document](#)<sup>p804</sup>, and redo this step.
4. If *new focus target* is a [focusable area](#)<sup>p763</sup> and its [DOM anchor](#)<sup>p763</sup> is [inert](#)<sup>p759</sup>, then return.
5. If *new focus target* is the [currently focused area of a top-level browsing context](#)<sup>p764</sup>, then return.
6. Let *old chain* be the [focus chain](#)<sup>p764</sup> of the [currently focused area of the top-level browsing context](#)<sup>p764</sup> in which *new focus target* finds itself.
7. Let *new chain* be the [focus chain](#)<sup>p764</sup> of *new focus target*.
8. Run the [focus update steps](#)<sup>p770</sup> with *old chain*, *new chain*, and *new focus target* respectively.

User agents must [immediately](#)<sup>p41</sup> run the [focusing steps](#)<sup>p769</sup> for a [focusable area](#)<sup>p763</sup> or [browsing context](#)<sup>p804</sup> *candidate* whenever the user attempts to move the focus to *candidate*.

The **unfocusing steps** for an object *old focus target* that is either a [focusable area](#)<sup>p763</sup> or an element that is not a [focusable area](#)<sup>p763</sup>

are as follows:

1. If *old focus target* is [inert](#)<sup>p759</sup>, then return.
2. If *old focus target* is an [area](#)<sup>p437</sup> element and one of its shapes is the [currently focused area of a top-level browsing context](#)<sup>p764</sup>, or, if *old focus target* is an element with one or more scrollable regions, and one of them is the [currently focused area of a top-level browsing context](#)<sup>p764</sup>, then let *old focus target* be that [currently focused area of a top-level browsing context](#)<sup>p764</sup>.
3. Let *old chain* be the [focus chain](#)<sup>p764</sup> of the [currently focused area of a top-level browsing context](#)<sup>p764</sup>.
4. If *old focus target* is not one of the entries in *old chain*, then return.
5. If *old focus target* is a [focusable area](#)<sup>p763</sup>, then let *new focus target* be its [Document](#)<sup>p111</sup>'s [viewport](#).  
Otherwise, let *new focus target* be null.
6. If *new focus target* is not null, then run the [focusing steps](#)<sup>p769</sup> for *new focus target*.

When the [currently focused area of a top-level browsing context](#)<sup>p764</sup> is somehow unfocused without another element being explicitly focused in its stead, the user agent must [immediately](#)<sup>p41</sup> run the [unfocusing steps](#)<sup>p769</sup> for that object.

#### Note

The [unfocusing steps](#)<sup>p769</sup> do not always result in the focus changing, even when applied to the [currently focused area of a top-level browsing context](#)<sup>p764</sup>. For example, if the [currently focused area of a top-level browsing context](#)<sup>p764</sup> is a [viewport](#), then it will usually keep its focus regardless until another [focusable area](#)<sup>p763</sup> is explicitly focused with the [focusing steps](#)<sup>p769</sup>.

**Focus fixup rule:** When the designated [focused area of the document](#)<sup>p764</sup> is removed from that [Document](#)<sup>p111</sup> in some way (e.g. it stops being a [focusable area](#)<sup>p763</sup>, it is removed from the DOM, it becomes [expressly inert](#)<sup>p759</sup>, etc.), designate the [Document](#)<sup>p111</sup>'s [viewport](#) to be the new [focused area of the document](#)<sup>p764</sup>.

#### Example

For example, this might happen because an element is removed from its [Document](#)<sup>p111</sup>, or has a [hidden](#)<sup>p758</sup> attribute added. It might also happen to an [input](#)<sup>p486</sup> element when the element gets [disabled](#)<sup>p563</sup>.

#### Example

In a [Document](#)<sup>p111</sup> whose [focused area](#)<sup>p764</sup> is a [button](#)<sup>p528</sup> element, removing, disabling, or hiding that button would cause the page's new [focused area](#)<sup>p764</sup> to be the [viewport](#) of the [Document](#)<sup>p111</sup>. This would, in turn, be reflected through the [activeElement](#)<sup>p774</sup> API as the [body element](#)<sup>p115</sup>.

The **focus update steps**, given an *old chain*, a *new chain*, and a *new focus target* respectively, are as follows:

1. If the last entry in *old chain* and the last entry in *new chain* are the same, pop the last entry from *old chain* and the last entry from *new chain* and redo this step.
2. For each entry *entry* in *old chain*, in order, run these substeps:
  1. If *entry* is an [input](#)<sup>p486</sup> element, and the [change](#)<sup>p1260</sup> event [applies](#)<sup>p489</sup> to the element, and the element does not have a defined [activation behavior](#), and the user has changed the element's [value](#)<sup>p559</sup> or its list of [selected files](#)<sup>p508</sup> while the control was focused without committing that change (such that it is different to what it was when the control was first focused), then [fire an event](#) named [change](#)<sup>p1260</sup> at the element, with the [bubbles](#) attribute initialized to true.
  2. If *entry* is an element, let *blur event target* be *entry*.  
If *entry* is a [Document](#)<sup>p111</sup> object, let *blur event target* be that [Document](#)<sup>p111</sup> object's [relevant global object](#)<sup>p913</sup>.  
Otherwise, let *blur event target* be null.
  3. If *entry* is the last entry in *old chain*, and *entry* is an [Element](#), and the last entry in *new chain* is also an [Element](#), then let *related blur target* be the last entry in *new chain*. Otherwise, let *related blur target* be null.

4. If *blur event target* is not null, [fire a focus event](#)<sup>p771</sup> named [blur](#)<sup>p1260</sup> at *blur event target*, with *related blur target* as the related target.

**Note**

*In some cases, e.g. if entry is an [area](#)<sup>p437</sup> element's shape, a scrollable region, or a [viewport](#), no event is fired.*

3. Apply any relevant platform-specific conventions for focusing *new focus target*. (For example, some platforms select the contents of a text control when that control is focused.)
4. For each entry *entry* in *new chain*, in reverse order, run these substeps:
  1. If *entry* is a [focusable area](#)<sup>p763</sup>: designate *entry* as the [focused area of the document](#)<sup>p764</sup>.
  2. If *entry* is an element, let *focus event target* be *entry*.  
If *entry* is a [Document](#)<sup>p111</sup> object, let *focus event target* be that [Document](#)<sup>p111</sup> object's [relevant global object](#)<sup>p913</sup>.  
Otherwise, let *focus event target* be null.
  3. If *entry* is the last entry in *new chain*, and *entry* is an [Element](#), and the last entry in *old chain* is also an [Element](#), then let *related focus target* be the last entry in *old chain*. Otherwise, let *related focus target* be null.
  4. If *focus event target* is not null, [fire a focus event](#)<sup>p771</sup> named [focus](#)<sup>p1260</sup> at *focus event target*, with *related focus target* as the related target.

**Note**

*In some cases, e.g. if entry is an [area](#)<sup>p437</sup> element's shape, a scrollable region, or a [viewport](#), no event is fired.*

To **fire a focus event** named *e* at an element *t* with a given related target *r*, [fire an event](#) named *e* at *t*, using [FocusEvent](#), with the [relatedTarget](#) attribute initialized to *r*, the [view](#) attribute initialized to *t*'s [node document](#)'s [relevant global object](#)<sup>p913</sup>, and the [composed flag](#) set.

When a key event is to be routed in a [top-level browsing context](#)<sup>p807</sup>, the user agent must run the following steps:

1. Let *target area* be the [currently focused area of the top-level browsing context](#)<sup>p764</sup>.
2. If *target area* is a [focusable area](#)<sup>p763</sup>, let *target node* be *target area*'s [DOM anchor](#)<sup>p763</sup>. Otherwise, *target area* is a [dialog](#)<sup>p603</sup>; let *target node* be *target area*.
3. If *target node* is a [Document](#)<sup>p111</sup> that has a [body element](#)<sup>p115</sup>, then let *target node* be [the body element](#)<sup>p115</sup> of that [Document](#)<sup>p111</sup>.  
Otherwise, if *target node* is a [Document](#)<sup>p111</sup> object that has a non-null [document element](#), then let *target node* be that [document element](#).
4. If *target node* is not [inert](#)<sup>p759</sup>, then:

**Note**

*It is possible for the [currently focused area of a top-level browsing context](#)<sup>p764</sup> to be [inert](#)<sup>p759</sup>, for example if a [modal dialog is shown](#)<sup>p605</sup>, and then that [dialog](#)<sup>p603</sup> element is made [inert](#)<sup>p759</sup>. It is likely to be the result of a logic error in the application, though.*

1. Let *canHandle* be the result of [dispatching](#) the key event at *target node*.
2. If *canHandle* is true, then let *target area* handle the key event. This might include [firing a click event](#)<sup>p945</sup> at *target node*.

The **has focus steps**, given a [Document](#)<sup>p111</sup> object *target*, are as follows:

1. Let *candidate* be *target*'s [top-level browsing context](#)<sup>p807</sup>'s [active document](#)<sup>p804</sup>.
2. While true:
  1. If *candidate* is *target*, then return true.

2. If the [focused area](#)<sup>p764</sup> of *candidate* is a [browsing context container](#)<sup>p806</sup> with a non-null [nested browsing context](#)<sup>p806</sup>, then set *candidate* to the [active document](#)<sup>p804</sup> of that [browsing context container](#)<sup>p806</sup>'s [nested browsing context](#)<sup>p806</sup>.
3. Otherwise, return false.

### 6.5.5 Sequential focus navigation §<sup>p77</sup><sub>2</sub>

Each [Document](#)<sup>p111</sup> has a **sequential focus navigation order**, which orders some or all of the [focusable areas](#)<sup>p763</sup> in the [Document](#)<sup>p111</sup> relative to each other. Its contents and ordering are given by the [flattened tabindex-ordered focus navigation scope](#)<sup>p766</sup> of the [Document](#)<sup>p111</sup>.

#### Note

*Per the rules defining the [flattened tabindex-ordered focus navigation scope](#)<sup>p766</sup>, the ordering is not necessarily related to the [tree order](#) of the [Document](#)<sup>p111</sup>.*

If a [focusable area](#)<sup>p763</sup> is omitted from the [sequential focus navigation order](#)<sup>p772</sup> of its [Document](#)<sup>p111</sup>, then it is unreachable via [sequential focus navigation](#)<sup>p772</sup>.

There can also be a **sequential focus navigation starting point**. It is initially unset. The user agent may set it when the user indicates that it should be moved.

#### Example

For example, the user agent could set it to the position of the user's click if the user clicks on the document contents.

When the user requests that focus move from the [currently focused area of a top-level browsing context](#)<sup>p764</sup> to the next or previous [focusable area](#)<sup>p763</sup> (e.g. as the default action of pressing the tab key), or when the user requests that focus sequentially move to a [top-level browsing context](#)<sup>p807</sup> in the first place (e.g. from the browser's location bar), the user agent must use the following algorithm:

1. Let *starting point* be the [currently focused area of a top-level browsing context](#)<sup>p764</sup>, if the user requested to move focus sequentially from there, or else the [top-level browsing context](#)<sup>p807</sup> itself, if the user instead requested to move focus from outside the [top-level browsing context](#)<sup>p807</sup>.
2. If there is a [sequential focus navigation starting point](#)<sup>p772</sup> defined and it is inside *starting point*, then let *starting point* be the [sequential focus navigation starting point](#)<sup>p772</sup> instead.
3. Let *direction* be *forward* if the user requested the *next* control, and *backward* if the user requested the *previous* control.

#### Note

*Typically, pressing `tab` requests the next control, and pressing `shift+tab` requests the previous control.*

4. *Loop*: Let *selection mechanism* be *sequential* if the *starting point* is a [browsing context](#)<sup>p804</sup> or if *starting point* is in its [Document](#)<sup>p111</sup>'s [sequential focus navigation order](#)<sup>p772</sup>.  
Otherwise, *starting point* is not in its [Document](#)<sup>p111</sup>'s [sequential focus navigation order](#)<sup>p772</sup>; let *selection mechanism* be *DOM*.
5. Let *candidate* be the result of running the [sequential navigation search algorithm](#)<sup>p773</sup> with *starting point*, *direction*, and *selection mechanism* as the arguments.
6. If *candidate* is not null, then run the [focusing steps](#)<sup>p769</sup> for *candidate* and return.
7. Otherwise, unset the [sequential focus navigation starting point](#)<sup>p772</sup>.
8. If *starting point* is the [top-level browsing context](#)<sup>p807</sup>, or a [focusable area](#)<sup>p763</sup> in the [top-level browsing context](#)<sup>p807</sup>, the user agent should transfer focus to its own controls appropriately (if any), honouring *direction*, and then return.

#### Example

For example, if *direction* is *backward*, then the last [sequentially focusable](#)<sup>p765</sup> control before the browser's rendering area would be the control to focus.

If the user agent has no [sequentially focusable](#)<sup>p765</sup> controls — a kiosk-mode browser, for instance — then the user agent may instead restart these steps with the *starting point* being the [top-level browsing context](#)<sup>p807</sup> itself.

- Otherwise, *starting point* is a [focusable area](#)<sup>p763</sup> in a [child browsing context](#)<sup>p806</sup>. Set *starting point* to that [child browsing context](#)<sup>p806</sup>'s [container](#)<sup>p806</sup> and return to the step labeled *loop*.

The **sequential navigation search algorithm** consists of the following steps. This algorithm takes three arguments: *starting point*, *direction*, and *selection mechanism*.

- Pick the appropriate cell from the following table, and follow the instructions in that cell.

The appropriate cell is the one that is from the column whose header describes *direction* and from the first row whose header describes *starting point* and *selection mechanism*.

	<i>direction is forward</i>	<i>direction is backward</i>
<i>starting point is a browsing context</i> <sup>p804</sup>	Let <i>candidate</i> be the first <a href="#">suitable sequentially focusable area</a> <sup>p773</sup> in <i>starting point</i> 's <a href="#">active document</a> <sup>p804</sup> , if any; or else null	Let <i>candidate</i> be the last <a href="#">suitable sequentially focusable area</a> <sup>p773</sup> in <i>starting point</i> 's <a href="#">active document</a> <sup>p804</sup> , if any; or else null
<i>selection mechanism is DOM</i>	Let <i>candidate</i> be the first <a href="#">suitable sequentially focusable area</a> <sup>p773</sup> in the <a href="#">home document</a> <sup>p773</sup> following <i>starting point</i> , if any; or else null	Let <i>candidate</i> be the last <a href="#">suitable sequentially focusable area</a> <sup>p773</sup> in the <a href="#">home document</a> <sup>p773</sup> preceding <i>starting point</i> , if any; or else null
<i>selection mechanism is sequential</i>	Let <i>candidate</i> be the first <a href="#">suitable sequentially focusable area</a> <sup>p773</sup> in the <a href="#">home sequential focus navigation order</a> <sup>p773</sup> following <i>starting point</i> , if any; or else null	Let <i>candidate</i> be the last <a href="#">suitable sequentially focusable area</a> <sup>p773</sup> in the <a href="#">home sequential focus navigation order</a> <sup>p773</sup> preceding <i>starting point</i> , if any; or else null

A **suitable sequentially focusable area** is a [focusable area](#)<sup>p763</sup> whose [DOM anchor](#)<sup>p763</sup> is not [inert](#)<sup>p759</sup> and is [sequentially focusable](#)<sup>p765</sup>.

The **home document** is the [Document](#)<sup>p111</sup> to which *starting point* belongs.

The **home sequential focus navigation order** is the [sequential focus navigation order](#)<sup>p772</sup> to which *starting point* belongs.

#### Note

The [home sequential focus navigation order](#)<sup>p773</sup> is the [home document](#)<sup>p773</sup>'s [sequential focus navigation order](#)<sup>p772</sup>, but is only used when the *starting point* is in that [sequential focus navigation order](#)<sup>p772</sup> (when it's not, selection mechanism will be DOM).

- If *candidate* is a [browsing context container](#)<sup>p806</sup> with a non-null [nested browsing context](#)<sup>p806</sup>, then let *new candidate* be the result of running the [sequential navigation search algorithm](#)<sup>p773</sup> with *candidate*'s [nested browsing context](#)<sup>p806</sup> as the first argument, *direction* as the second, and *sequential* as the third.

If *new candidate* is null, then let *starting point* be *candidate*, and return to the top of this algorithm. Otherwise, let *candidate* be *new candidate*.

- Return *candidate*.

## 6.5.6 Focus management APIs <sup>p773</sup>

```
IDL dictionary FocusOptions {
  boolean preventScroll = false;
};
```

### For web developers (non-normative)

#### `documentOrShadowRoot.activeElement`<sup>p774</sup>

Returns the deepest element in the document through which or to which key events are being routed. This is, roughly speaking, the focused element in the document.

For the purposes of this API, when a [child browsing context](#)<sup>p806</sup> is focused, its [container](#)<sup>p806</sup> is [focused](#)<sup>p764</sup> in the [parent browsing context](#)<sup>p807</sup>. For example, if the user moves the focus to a text control in an [iframe](#)<sup>p355</sup>, the [iframe](#)<sup>p355</sup> is the element returned by the `activeElement`<sup>p774</sup> API in the [iframe](#)<sup>p355</sup>'s [node document](#).

Similarly, when the focused element is in a different [node tree](#) than `documentOrShadowRoot`, the element returned will be the [host](#) that's located in the same [node tree](#) as `documentOrShadowRoot` if `documentOrShadowRoot` is a [shadow-including inclusive ancestor](#) of the focused element, and null if not.

### **document . hasFocus**<sup>p774</sup> ()

Returns true if key events are being routed through or to the document; otherwise, returns false. Roughly speaking, this corresponds to the document, or a document nested inside this one, being focused.

### **window . focus**<sup>p774</sup> ()

Moves the focus to the window's [browsing context](#)<sup>p818</sup>, if any.

### **element . focus**<sup>p775</sup> ([ { **preventScroll**<sup>p775</sup>: true } ])

Moves the focus to the element.

If the element is a [browsing context container](#)<sup>p806</sup>, moves the focus to its [nested browsing context](#)<sup>p806</sup> instead.

By default, this method also scrolls the element into view. Providing the [preventScroll](#)<sup>p775</sup> option and setting it to true prevents this behavior.

### **element . blur**<sup>p775</sup> ()

Moves the focus to the [viewport](#). Use of this method is discouraged; if you want to focus the [viewport](#), call the [focus\(\)](#)<sup>p775</sup> method on the [Document](#)<sup>p111</sup>'s [document element](#).

Do not use this method to hide the focus ring if you find the focus ring unsightly. Instead, use a CSS rule to override the 'outline' property, and provide a different way to show what element is focused. Be aware that if an alternative focusing style isn't made available, the page will be significantly less usable for people who primarily navigate pages using a keyboard, or those with reduced vision who use focus outlines to help them navigate the page.

#### Example

For example, to hide the outline from links and instead use a yellow background to indicate focus, you could use:

```
CSS :link:focus, :visited:focus { outline: none; background: yellow; color: black; }
```

The **activeElement** attribute's getter must run these steps:

1. Let *candidate* be the [DOM anchor](#)<sup>p763</sup> of the [focused area](#)<sup>p764</sup> of this [DocumentOrShadowRoot](#)<sup>p112</sup>'s [node document](#).
2. Set *candidate* to the result of [retargeting](#) *candidate* against this [DocumentOrShadowRoot](#)<sup>p112</sup>.
3. If *candidate*'s [root](#) is not this [DocumentOrShadowRoot](#)<sup>p112</sup>, then return null.
4. If *candidate* is not a [Document](#)<sup>p111</sup> object, then return *candidate*.
5. If *candidate* has a [body element](#)<sup>p115</sup>, then return that [body element](#)<sup>p115</sup>.
6. If *candidate*'s [document element](#) is non-null, then return that [document element](#).
7. Return null.

The **hasFocus()** method on the [Document](#)<sup>p111</sup> object, when invoked, must return the result of running the [has focus steps](#)<sup>p771</sup> with the [Document](#)<sup>p111</sup> object as the argument.

The **focus()** method, when invoked, must run these steps:

1. Let *current* be this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup>.
2. If *current* is null, then return.
3. Run the [focusing steps](#)<sup>p769</sup> with *current*.
4. If *current* is a [top-level browsing context](#)<sup>p807</sup>, user agents are encouraged to trigger some sort of notification to indicate to the user that the page is attempting to gain focus.

The **blur()** method, when invoked, provides a hint to the user agent that the script believes the user probably is not currently interested in the contents of this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup>, if non-null, but that the contents might become interesting again in the future.

User agents are encouraged to ignore calls to this [blur\(\)](#)<sup>p774</sup> method entirely.

## Note

Historically, the [focus\(\)](#)<sup>p774</sup> and [blur\(\)](#)<sup>p774</sup> methods actually affected the system-level focus of the system widget (e.g., tab or window) that contained the [browsing context](#)<sup>p804</sup>, but hostile sites widely abuse this behavior to the user's detriment.

The [focus\(options\)](#) method on elements, when invoked, must run the following steps:

1. If the element is marked as [locked for focus](#)<sup>p775</sup>, then return.
2. Mark the element as **locked for focus**.
3. Run the [focusing steps](#)<sup>p769</sup> for the element.
4. If the value of the **preventScroll** dictionary member of *options* is false, then [scroll the element into view](#) with scroll behavior "auto", block flow direction position set to an [implementation-defined](#) value, and inline base direction position set to an [implementation-defined](#) value.
5. Unmark the element as [locked for focus](#)<sup>p775</sup>.

The [blur\(\)](#) method, when invoked, should run the [unfocusing steps](#)<sup>p769</sup> for the element on which the method was called. User agents may selectively or uniformly ignore calls to this method for usability reasons.

## Example

For example, if the [blur\(\)](#)<sup>p775</sup> method is unwisely being used to remove the focus ring for aesthetics reasons, the page would become unusable by keyboard users. Ignoring calls to this method would thus allow keyboard users to interact with the page.

## 6.5.7 The [autofocus](#)<sup>p775</sup> attribute § p777

The **autofocus** content attribute allows the author to indicate that an element is to be focused as soon as the page is loaded or as soon as the [dialog](#)<sup>p603</sup> within which it finds itself is shown, allowing the user to just start typing without having to manually focus the main element.

The [autofocus](#)<sup>p775</sup> attribute is a [boolean attribute](#)<sup>p65</sup>.

An element's **nearest ancestor autofocus scoping root element** is the element itself if the element is a [dialog](#)<sup>p603</sup> element, or else is the element's nearest ancestor [dialog](#)<sup>p603</sup> element, if any, or else is the element's last [inclusive ancestor](#) element.

There must not be two elements with the same [nearest ancestor autofocus scoping root element](#)<sup>p775</sup> that both have the [autofocus](#)<sup>p775</sup> attribute specified.

Each [Document](#)<sup>p111</sup> has an **autofocus candidates list**, initially empty.

Each [Document](#)<sup>p111</sup> has an **autofocus processed flag** boolean, initially false.

When an element with the [autofocus](#)<sup>p775</sup> attribute specified is [inserted into a document](#)<sup>p43</sup>, run the following steps:

1. If the user has indicated (for example, by starting to type in a form control) that they do not wish focus to be changed, then optionally return.
2. Let *target* be the element's [node document](#).
3. If *target*'s [browsing context](#)<sup>p804</sup> is null, then return.
4. If *target*'s [active sandboxing flag set](#)<sup>p835</sup> has the [sandboxed automatic features browsing context flag](#)<sup>p834</sup>, then return.
5. Let *topDocument* be the [active document](#)<sup>p804</sup> of *target*'s [browsing context](#)<sup>p804</sup>'s [top-level browsing context](#)<sup>p807</sup>.
6. If *target*'s [origin](#)<sup>p829</sup> is not the [same](#)<sup>p830</sup> as the [origin](#)<sup>p829</sup> of *topDocument*, then return.
7. If *topDocument*'s [autofocus processed flag](#)<sup>p775</sup> is false, then [remove](#) the element from *topDocument*'s [autofocus candidates](#)<sup>p775</sup>, and [append](#) the element to *topDocument*'s [autofocus candidates](#)<sup>p775</sup>.

## Note

We do not check if an element is a [focusable area](#)<sup>p763</sup> before storing it in the [autofocus candidates](#)<sup>p775</sup> list, because even if it is not

a focusable area when it is inserted, it could become one by the time [flush autofocus candidates](#)<sup>p776</sup> sees it.

To **flush autofocus candidates** for a document *topDocument*, run these steps:

1. If *topDocument*'s [autofocus processed flag](#)<sup>p775</sup> is true, then return.
2. Let *candidates* be *topDocument*'s [autofocus candidates](#)<sup>p775</sup>.
3. If *candidates* is [empty](#), then return.
4. If *topDocument*'s [focused area](#)<sup>p764</sup> is not *topDocument* itself, or *topDocument*'s [URL](#)'s [fragment](#) is not empty, then:
  1. [Empty candidates](#).
  2. Set *topDocument*'s [autofocus processed flag](#)<sup>p775</sup> to true.
  3. Return.
5. While *candidates* is not [empty](#):
  1. Let *element* be *candidates*[0].
  2. Let *doc* be *element*'s [node document](#).
  3. If *doc* is not [fully active](#)<sup>p807</sup>, then [remove](#) *element* from *candidates*, and [continue](#).
  4. If *doc*'s [browsing context](#)<sup>p804</sup>'s [top-level browsing context](#)<sup>p807</sup> is not same as *topDocument*'s [browsing context](#)<sup>p804</sup>, then [remove](#) *element* from *candidates*, and [continue](#).
  5. If *doc*'s [script-blocking style sheet counter](#)<sup>p174</sup> is greater than 0, then return.

#### Note

*In this case, element is the currently-best candidate, but doc is not ready for autofocusing. We'll try again next time [flush autofocus candidates](#)<sup>p776</sup> is called.*

6. [Remove](#) *element* from *candidates*.
7. Let *inclusiveAncestorDocuments* be a [list](#) consisting of *doc*, plus the [active documents](#)<sup>p804</sup> of each of *doc*'s [browsing context](#)<sup>p804</sup>'s [ancestor browsing contexts](#)<sup>p807</sup>.
8. If [URL](#)'s [fragment](#) of any [Document](#)<sup>p111</sup> in *inclusiveAncestorDocuments* is not empty, then [continue](#).
9. Let *target* be *element*.
10. If *target* is not a [focusable area](#)<sup>p763</sup>, then set *target* to the result of [getting the focusable area](#)<sup>p768</sup> for *target*.

#### Note

*[Autofocus candidates](#)<sup>p775</sup> can [contain](#) elements which are not [focusable areas](#)<sup>p763</sup>. In addition to the special cases handled in the [get the focusable area](#)<sup>p768</sup> algorithm, this can happen because a non-[focusable area](#)<sup>p763</sup> element with an [autofocus](#)<sup>p775</sup> attribute was [inserted into a document](#)<sup>p43</sup> and it never became focusable, or because the element was focusable but its status changed while it was stored in [autofocus candidates](#)<sup>p775</sup>.*

11. If *target* is not null, then:
  1. [Empty candidates](#).
  2. Set *topDocument*'s [autofocus processed flag](#)<sup>p775</sup> to true.
  3. Run the [focusing steps](#)<sup>p769</sup> for *target*.

#### Note

*This handles the automatic focusing during document load. The [show\(\)](#)<sup>p604</sup> and [showModal\(\)](#)<sup>p605</sup> methods of [dialog](#)<sup>p603</sup> elements also processes the [autofocus](#)<sup>p775</sup> attribute.*

## Note

Focusing the element does not imply that the user agent has to focus the browser window if it has lost focus.

The **autofocus** IDL attribute must [reflect](#)<sup>p91</sup> the content attribute of the same name.

## Example

In the following snippet, the text control would be focused when the document was loaded.

```
<input maxlength="256" name="q" value="" autofocus>
<input type="submit" value="Search">
```

## Example

The **autofocus**<sup>p775</sup> attribute applies to all elements, not just to form controls. This allows examples such as the following:

```
<div contenteditable autofocus>Edit <strong>me!</strong></div>
```

## 6.6 Assigning keyboard shortcuts <sup>§p77</sup><sub>7</sub>

### 6.6.1 Introduction <sup>§p77</sup><sub>7</sub>

*This section is non-normative.*

Each element that can be activated or focused can be assigned a single key combination to activate it, using the **accesskey**<sup>p778</sup> attribute.

The exact shortcut is determined by the user agent, based on information about the user's keyboard, what keyboard shortcuts already exist on the platform, and what other shortcuts have been specified on the page, using the information provided in the **accesskey**<sup>p778</sup> attribute as a guide.

In order to ensure that a relevant keyboard shortcut is available on a wide variety of input devices, the author can provide a number of alternatives in the **accesskey**<sup>p778</sup> attribute.

Each alternative consists of a single character, such as a letter or digit.

User agents can provide users with a list of the keyboard shortcuts, but authors are encouraged to do so also. The **accessKeyLabel**<sup>p779</sup> IDL attribute returns a string representing the actual key combination assigned by the user agent.

## Example

In this example, an author has provided a button that can be invoked using a shortcut key. To support full keyboards, the author has provided "C" as a possible key. To support devices equipped only with numeric keypads, the author has provided "1" as another possibly key.

```
<input type=button value=Collect onclick="collect()"
accesskey="C 1" id=c>
```

## Example

To tell the user what the shortcut key is, the author has this script here opted to explicitly add the key combination to the button's label:

```
function addShortcutKeyLabel(button) {
  if (button.accessKeyLabel != '')
    button.value += ' (' + button.accessKeyLabel + ')';
}
addShortcutKeyLabel(document.getElementById('c'));
```

Browsers on different platforms will show different labels, even for the same key combination, based on the convention prevalent on that platform. For example, if the key combination is the Control key, the Shift key, and the letter C, a Windows browser might display "Ctrl+Shift+C", whereas a Mac browser might display "⌘⇧C", while an Emacs browser might just display "C-C". Similarly, if the key combination is the Alt key and the Escape key, Windows might use "Alt+Esc", Mac might use "⌘↵", and an Emacs browser might use "M-ESC" or "ESC ESC".

In general, therefore, it is unwise to attempt to parse the value returned from the `accessKeyLabel`<sup>p779</sup> IDL attribute.

## 6.6.2 The `accesskey` attribute <sup>§ p77</sup><sub>8</sub>

All [HTML elements](#)<sup>p43</sup> may have the `accesskey`<sup>p778</sup> content attribute set. The `accesskey`<sup>p778</sup> attribute's value is used by the user agent as a guide for creating a keyboard shortcut that activates or focuses the element.

If specified, the value must be an [ordered set of unique space-separated tokens](#)<sup>p85</sup> that are [case-sensitive](#)<sup>p65</sup>, each of which must be exactly one code point in length.

### Example

In the following example, a variety of links are given with access keys so that keyboard users familiar with the site can more quickly navigate to the relevant pages:

```
<nav>
  <p>
    <a title="Consortium Activities" accesskey="A" href="/Consortium/activities">Activities</a> |
    <a title="Technical Reports and Recommendations" accesskey="T" href="/TR/">Technical Reports</a>
  |
    <a title="Alphabetical Site Index" accesskey="S" href="/Consortium/siteindex">Site Index</a> |
    <a title="About This Site" accesskey="B" href="/Consortium/">About Consortium</a> |
    <a title="Contact Consortium" accesskey="C" href="/Consortium/contact">Contact</a>
  </p>
</nav>
```

### Example

In the following example, the search field is given two possible access keys, "s" and "0" (in that order). A user agent on a device with a full keyboard might pick Ctrl+Alt+S as the shortcut key, while a user agent on a small device with just a numeric keypad might pick just the plain unadorned key 0:

```
<form action="/search">
  <label>Search: <input type="search" name="q" accesskey="s 0"></label>
  <input type="submit">
</form>
```

### Example

In the following example, a button has possible access keys described. A script then tries to update the button's label to advertise the key combination the user agent selected.

```
<input type=submit accesskey="N @ 1" value="Compose">
...
<script>
  function labelButton(button) {
    if (button.accessKeyLabel)
      button.value += ' (' + button.accessKeyLabel + ')';
  }
  var inputs = document.getElementsByTagName('input');
  for (var i = 0; i < inputs.length; i += 1) {
```

```

    if (inputs[i].type == "submit")
      labelButton(inputs[i]);
  }
</script>

```

On one user agent, the button's label might become "Compose (#N)". On another, it might become "Compose (Alt+⇧+1)". If the user agent doesn't assign a key, it will be just "Compose". The exact string depends on what the [assigned access key](#)<sup>p779</sup> is, and on how the user agent represents that key combination.

### 6.6.3 Processing model <sup>p779</sup>

An element's **assigned access key** is a key combination derived from the element's [accesskey](#)<sup>p778</sup> content attribute. Initially, an element must not have an [assigned access key](#)<sup>p779</sup>.

Whenever an element's [accesskey](#)<sup>p778</sup> attribute is set, changed, or removed, the user agent must update the element's [assigned access key](#)<sup>p779</sup> by running the following steps:

1. If the element has no [accesskey](#)<sup>p778</sup> attribute, then skip to the *fallback* step below.
2. Otherwise, [split the attribute's value on ASCII whitespace](#), and let *keys* be the resulting tokens.
3. For each value in *keys* in turn, in the order the tokens appeared in the attribute's value, run the following substeps:
  1. If the value is not a string exactly one code point in length, then skip the remainder of these steps for this value.
  2. If the value does not correspond to a key on the system's keyboard, then skip the remainder of these steps for this value.
  3. If the user agent can find a mix of zero or more modifier keys that, combined with the key that corresponds to the value given in the attribute, can be used as the access key, then the user agent may assign that combination of keys as the element's [assigned access key](#)<sup>p779</sup> and return.
4. *Fallback*: Optionally, the user agent may assign a key combination of its choosing as the element's [assigned access key](#)<sup>p779</sup> and then return.
5. If this step is reached, the element has no [assigned access key](#)<sup>p779</sup>.

Once a user agent has selected and assigned an access key for an element, the user agent should not change the element's [assigned access key](#)<sup>p779</sup> unless the [accesskey](#)<sup>p778</sup> content attribute is changed or the element is moved to another [Document](#)<sup>p111</sup>.

When the user presses the key combination corresponding to the [assigned access key](#)<sup>p779</sup> for an element, if the element [defines a command](#)<sup>p600</sup>, the command's [Hidden State](#)<sup>p601</sup> facet is false (visible), the command's [Disabled State](#)<sup>p601</sup> facet is also false (enabled), the element is [in a document](#) that has a non-null [browsing context](#)<sup>p804</sup>, and neither the element nor any of its ancestors has a [hidden](#)<sup>p758</sup> attribute specified, then the user agent must trigger the [Action](#)<sup>p601</sup> of the command.

#### Note

*User agents [might expose](#)<sup>p601</sup> elements that have an [accesskey](#)<sup>p778</sup> attribute in other ways as well, e.g. in a menu displayed in response to a specific key combination.*

The [accessKey](#) IDL attribute must [reflect](#)<sup>p91</sup> the [accesskey](#)<sup>p778</sup> content attribute.

The [accessKeyLabel](#) IDL attribute must return a string that represents the element's [assigned access key](#)<sup>p779</sup>, if any. If the element does not have one, then the IDL attribute must return the empty string.

## 6.7 Editing <sup>§ p78</sup>

### 6.7.1 Making document regions editable: The [contenteditable](#)<sup>p780</sup> content attribute <sup>§ p78</sup>

```
IDL interface mixin ElementContentEditable {
  [CEReactions] attribute DOMString contentEditable;
  [CEReactions] attribute DOMString enterKeyHint;
  readonly attribute boolean isContentEditable;
  [CEReactions] attribute DOMString inputMode;
};
```

The [contenteditable](#) content attribute is an [enumerated attribute](#)<sup>p66</sup> whose keywords are the empty string, `true`, and `false`. The empty string and the `true` keyword map to the *true* state. The `false` keyword maps to the *false* state. In addition, there is a third state, the *inherit* state, which is the [missing value default](#)<sup>p66</sup> and the [invalid value default](#)<sup>p66</sup>.

The *true* state indicates that the element is editable. The *inherit* state indicates that the element is editable if its parent is. The *false* state indicates that the element is not editable.

#### Example

For example, consider a page that has a [form](#)<sup>p479</sup> and a [textarea](#)<sup>p541</sup> to publish a new article, where the user is expected to write the article using HTML:

```
<form method=POST>
  <fieldset>
    <legend>New article</legend>
    <textarea name=article>&lt;p>Hello world.&lt;/p></textarea>
  </fieldset>
  <p><button>Publish</button></p>
</form>
```

When scripting is enabled, the [textarea](#)<sup>p541</sup> element could be replaced with a rich text control instead, using the [contenteditable](#)<sup>p780</sup> attribute:

```
<form method=POST>
  <fieldset>
    <legend>New article</legend>
    <textarea id=textarea name=article>&lt;p>Hello world.&lt;/p></textarea>
    <div id=div style="white-space: pre-wrap" hidden><p>Hello world.</p></div>
    <script>
      let textarea = document.getElementById("textarea");
      let div = document.getElementById("div");
      textarea.hidden = true;
      div.hidden = false;
      div.contentEditable = "true";
      div.oninput = (e) => {
        textarea.value = div.innerHTML;
      };
    </script>
  </fieldset>
  <p><button>Publish</button></p>
</form>
```

Features to enable, e.g., inserting links, can be implemented using the [document.execCommand\(\)](#) API, or using [Selection](#) APIs and other DOM APIs. [\[EXECCOMMAND\]](#)<sup>p1266</sup> [\[SELECTION\]](#)<sup>p1270</sup> [\[DOM\]](#)<sup>p1266</sup>

#### Example

The [contenteditable](#)<sup>p780</sup> attribute can also be used to great effect:

```
<!doctype html>
<html lang=en>
```

```
<title>Live CSS editing!</title>
<style style=white-space:pre contenteditable>
html { margin:.2em; font-size:2em; color:lime; background:purple }
head, title, style { display:block }
body { display:none }
</style>
```

For web developers (non-normative)

**element . contentEditable**<sup>p781</sup> [ = value ]

Returns "true", "false", or "inherit", based on the state of the [contenteditable](#)<sup>p780</sup> attribute.

Can be set, to change that state.

Throws a ["SyntaxError" DOMException](#) if the new value isn't one of those strings.

**element . isContentEditable**<sup>p781</sup>

Returns true if the element is editable; otherwise, returns false.

The [contentEditable](#) IDL attribute, on getting, must return the string "true" if the content attribute is set to the true state, "false" if the content attribute is set to the false state, and "inherit" otherwise. On setting, if the new value is an [ASCII case-insensitive](#) match for the string "inherit" then the content attribute must be removed, if the new value is an [ASCII case-insensitive](#) match for the string "true" then the content attribute must be set to the string "true", if the new value is an [ASCII case-insensitive](#) match for the string "false" then the content attribute must be set to the string "false", and otherwise the attribute setter must throw a ["SyntaxError" DOMException](#).

The [isContentEditable](#) IDL attribute, on getting, must return true if the element is either an [editing host](#)<sup>p782</sup> or [editable](#), and false otherwise.

## 6.7.2 Making entire documents editable: the [designMode](#)<sup>p781</sup> IDL attribute

Documents have a [designMode](#), which can be either enabled or disabled.

For web developers (non-normative)

**document . designMode**<sup>p781</sup> [ = value ]

Returns "on" if the document is editable, and "off" if it isn't.

Can be set, to change the document's current state. This focuses the document and resets the selection in that document.

The [designMode](#)<sup>p781</sup> IDL attribute on the [Document](#)<sup>p111</sup> object takes two values, "on" and "off". On setting, the new value must be compared in an [ASCII case-insensitive](#) manner to these two values; if it matches the "on" value, then [designMode](#)<sup>p781</sup> must be enabled, and if it matches the "off" value, then [designMode](#)<sup>p781</sup> must be disabled. Other values must be ignored.

On getting, if [designMode](#)<sup>p781</sup> is enabled, the IDL attribute must return the value "on"; otherwise it is disabled, and the attribute must return the value "off".

The last state set must persist until the document is destroyed or the state is changed. Initially, documents must have their [designMode](#)<sup>p781</sup> disabled.

When the [designMode](#)<sup>p781</sup> changes from being disabled to being enabled, the user agent must [immediately](#)<sup>p41</sup> reset the document's [active range](#)'s start and end boundary points to be at the start of the [Document](#)<sup>p111</sup> and then run the [focusing steps](#)<sup>p769</sup> for the [document element](#) of the [Document](#)<sup>p111</sup>, if non-null.

## 6.7.3 Best practices for in-page editors

Authors are encouraged to set the ['white-space'](#) property on [editing hosts](#)<sup>p782</sup> and on markup that was originally created through these editing mechanisms to the value 'pre-wrap'. Default HTML whitespace handling is not well suited to WYSIWYG editing, and line wrapping will not work correctly in some corner cases if ['white-space'](#) is left at its default value.

## Example

As an example of problems that occur if the default 'normal' value is used instead, consider the case of the user typing "yellow<sub>␣</sub>ball", with two spaces (here represented by "<sub>␣</sub>") between the words. With the editing rules in place for the default value of '[white-space](#)' ('normal'), the resulting markup will either consist of "yellow&nbsp; ball" or "yellow &nbsp;ball"; i.e., there will be a non-breaking space between the two words in addition to the regular space. This is necessary because the 'normal' value for '[white-space](#)' requires adjacent regular spaces to be collapsed together.

In the former case, "yellow<sub>␣</sub>" might wrap to the next line ("<sub>␣</sub>" being used here to represent a non-breaking space) even though "yellow" alone might fit at the end of the line; in the latter case, "<sub>␣</sub>ball", if wrapped to the start of the line, would have visible indentation from the non-breaking space.

When '[white-space](#)' is set to 'pre-wrap', however, the editing rules will instead simply put two regular spaces between the words, and should the two words be split at the end of a line, the spaces would be neatly removed from the rendering.

## 6.7.4 Editing APIs <sup>§ p78</sup><sub>2</sub>

An **editing host** is either an [HTML element](#)<sup>p43</sup> with its [contenteditable](#)<sup>p780</sup> attribute in the *true* state, or a [child HTML element](#)<sup>p43</sup> of a [Document](#)<sup>p111</sup> with [designMode](#)<sup>p781</sup> enabled.

The definition of the terms **active range**, **editing host of**, and **editable**, the user interface requirements of elements that are [editing hosts](#)<sup>p782</sup> or [editable](#), the [execCommand\(\)](#), [queryCommandEnabled\(\)](#), [queryCommandIndeterm\(\)](#), [queryCommandState\(\)](#), [queryCommandSupported\(\)](#), and [queryCommandValue\(\)](#) methods, text selections, and the **delete the selection** algorithm are defined in [execCommand](#). [[EXECCOMMAND](#)]<sup>p1266</sup>

## 6.7.5 Spelling and grammar checking <sup>§ p78</sup><sub>2</sub>

User agents can support the checking of spelling and grammar of editable text, either in form controls (such as the value of [textarea](#)<sup>p541</sup> elements), or in elements in an [editing host](#)<sup>p782</sup> (e.g. using [contenteditable](#)<sup>p780</sup>).

For each element, user agents must establish a **default behavior**, either through defaults or through preferences expressed by the user. There are three possible default behaviors for each element:

### **true-by-default**

The element will be checked for spelling and grammar if its contents are editable and spellchecking is not explicitly disabled through the [spellcheck](#)<sup>p782</sup> attribute.

### **false-by-default**

The element will never be checked for spelling and grammar unless spellchecking is explicitly enabled through the [spellcheck](#)<sup>p782</sup> attribute.

### **inherit-by-default**

The element's default behavior is the same as its parent element's. Elements that have no parent element cannot have this as their default behavior.

The [spellcheck](#) attribute is an [enumerated attribute](#)<sup>p66</sup> whose keywords are the empty string, *true* and *false*. The empty string and the *true* keyword map to the *true* state. The *false* keyword maps to the *false* state. In addition, there is a third state, the *default* state, which is the [missing value default](#)<sup>p66</sup> and the [invalid value default](#)<sup>p66</sup>.

## Note

*The true state indicates that the element is to have its spelling and grammar checked. The default state indicates that the element is to act according to a default behavior, possibly based on the parent element's own [spellcheck](#)<sup>p782</sup> state, as defined below. The false state indicates that the element is not to be checked.*

For web developers (non-normative)

### **`element . spellcheckp783 [ = value ]`**

Returns true if the element is to have its spelling and grammar checked; otherwise, returns false.

Can be set, to override the default and set the `spellcheckp782` content attribute.

The `spellcheck` IDL attribute, on getting, must return true if the element's `spellcheckp782` content attribute is in the *true* state, or if the element's `spellcheckp782` content attribute is in the *default* state and the element's `default behaviorp782` is `true-by-defaultp782`, or if the element's `spellcheckp782` content attribute is in the *default* state and the element's `default behaviorp782` is `inherit-by-defaultp782` and the element's parent element's `spellcheckp783` IDL attribute would return true; otherwise, if none of those conditions applies, then the attribute must instead return false.

### **Note**

*The `spellcheckp783` IDL attribute is not affected by user preferences that override the `spellcheckp782` content attribute, and therefore might not reflect the actual spellchecking state.*

On setting, if the new value is true, then the element's `spellcheckp782` content attribute must be set to the literal string "true", otherwise it must be set to the literal string "false".

User agents must only consider the following pieces of text as checkable for the purposes of this feature:

- The `valuep559` of `inputp486` elements whose `typep488` attributes are in the `Textp492`, `Searchp492`, `URLp494`, or `E-mailp495` states and that are `mutablep559` (i.e. that do not have the `readonlyp515` attribute specified and that are not `disabledp563`).
- The `valuep559` of `textareap541` elements that do not have a `readonlyp542` attribute and that are not `disabledp563`.
- Text in `Text` nodes that are children of `editing hostsp782` or `editable` elements.
- Text in attributes of `editable` elements.

For text that is part of a `Text` node, the element with which the text is associated is the element that is the immediate parent of the first character of the word, sentence, or other piece of text. For text in attributes, it is the attribute's element. For the values of `inputp486` and `textareap541` elements, it is the element itself.

To determine if a word, sentence, or other piece of text in an applicable element (as defined above) is to have spelling- and grammar-checking enabled, the UA must use the following algorithm:

1. If the user has disabled the checking for this text, then the checking is disabled.
2. Otherwise, if the user has forced the checking for this text to always be enabled, then the checking is enabled.
3. Otherwise, if the element with which the text is associated has a `spellcheckp782` content attribute, then: if that attribute is in the *true* state, then checking is enabled; otherwise, if that attribute is in the *false* state, then checking is disabled.
4. Otherwise, if there is an ancestor element with a `spellcheckp782` content attribute that is not in the *default* state, then: if the nearest such ancestor's `spellcheckp782` content attribute is in the *true* state, then checking is enabled; otherwise, checking is disabled.
5. Otherwise, if the element's `default behaviorp782` is `true-by-defaultp782`, then checking is enabled.
6. Otherwise, if the element's `default behaviorp782` is `false-by-defaultp782`, then checking is disabled.
7. Otherwise, if the element's parent element has *its* checking enabled, then checking is enabled.
8. Otherwise, checking is disabled.

If the checking is enabled for a word/sentence/text, the user agent should indicate spelling and grammar errors in that text. User agents should take into account the other semantics given in the document when suggesting spelling and grammar corrections. User agents may use the language of the element to determine what spelling and grammar rules to use, or may use the user's preferred language settings. UAs should use `inputp486` element attributes such as `patternp518` to ensure that the resulting value is valid, where possible.

If checking is disabled, the user agent should not indicate spelling or grammar errors for that text.

## Example

The element with ID "a" in the following example would be the one used to determine if the word "Hello" is checked for spelling errors. In this example, it would not be.

```
<div contenteditable="true">
  <span spellcheck="false" id="a">Hell</span><em>o!</em>
</div>
```

The element with ID "b" in the following example would have checking enabled (the leading space character in the attribute's value on the [input<sup>p486</sup>](#) element causes the attribute to be ignored, so the ancestor's value is used instead, regardless of the default).

```
<p spellcheck="true">
  <label>Name: <input spellcheck=" false" id="b"></label>
</p>
```

## Note

*This specification does not define the user interface for spelling and grammar checkers. A user agent could offer on-demand checking, could perform continuous checking while the checking is enabled, or could use other interfaces.*

## 6.7.6 Autocapitalization §<sup>p78</sup><sub>4</sub>

Some methods of entering text, for example virtual keyboards on mobile devices, and also voice input, often assist users by automatically capitalizing the first letter of sentences (when composing text in a language with this convention). A virtual keyboard that implements autocapitalization might automatically switch to showing uppercase letters (but allow the user to toggle it back to lowercase) when a letter that should be autocapitalized is about to be typed. Other types of input, for example voice input, may perform autocapitalization in a way that does not give users an option to intervene first. The [autocapitalize<sup>p784</sup>](#) attribute allows authors to control such behavior.

The [autocapitalize<sup>p784</sup>](#) attribute, as typically implemented, does not affect behavior when typing on a physical keyboard. (For this reason, as well as the ability for users to override the autocapitalization behavior in some cases or edit the text after initial input, the attribute must not be relied on for any sort of input validation.)

The [autocapitalize<sup>p784</sup>](#) attribute can be used on an [editing host<sup>p782</sup>](#) to control autocapitalization behavior for the hosted editable region, on an [input<sup>p486</sup>](#) or [textarea<sup>p541</sup>](#) element to control the behavior for inputting text into that element, or on a [form<sup>p479</sup>](#) element to control the default behavior for all [autocapitalize-inheriting elements<sup>p479</sup>](#) associated with the [form<sup>p479</sup>](#) element.

The [autocapitalize<sup>p784</sup>](#) attribute never causes autocapitalization to be enabled for [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute is in one of the [URL<sup>p494</sup>](#), [E-mail<sup>p495</sup>](#), or [Password<sup>p497</sup>](#) states. (This behavior is included in the [used autocapitalization hint<sup>p785</sup>](#) algorithm below.)

The autocapitalization processing model is based on selecting among five **autocapitalization hints**, defined as follows:

### **default**

The user agent and input method should use make their own determination of whether or not to enable autocapitalization.

### **none**

No autocapitalization should be applied (all letters should default to lowercase).

### **sentences**

The first letter of each sentence should default to a capital letter; all other letters should default to lowercase.

### **words**

The first letter of each word should default to a capital letter; all other letters should default to lowercase.

### **characters**

All letters should default to uppercase.

The **autocapitalize** attribute is an [enumerated attribute<sup>p66</sup>](#) whose states are the possible [autocapitalization hints<sup>p784</sup>](#). The [autocapitalization hint<sup>p784</sup>](#) specified by the attribute's state combines with other considerations to form the [used autocapitalization](#)

[hint<sup>p785</sup>](#), which informs the behavior of the user agent. The keywords for this attribute and their state mappings are as follows:

Keyword	State
off	<a href="#">none<sup>p784</sup></a>
none	
on	<a href="#">sentences<sup>p784</sup></a>
sentences	
words	<a href="#">words<sup>p784</sup></a>
characters	<a href="#">characters<sup>p784</sup></a>

The [invalid value default<sup>p66</sup>](#) is the [sentences<sup>p784</sup>](#) state. The [missing value default<sup>p66</sup>](#) is the [default<sup>p784</sup>](#) state.

For web developers (non-normative)

### **`element.autocapitalizep785 [ = value ]`**

Returns the current autocapitalization state for the element, or an empty string if it hasn't been set. Note that for [input<sup>p486</sup>](#) and [textarea<sup>p541</sup>](#) elements that inherit their state from a [form<sup>p479</sup>](#) element, this will return the autocapitalization state of the [form<sup>p479</sup>](#) element, but for an element in an editable region, this will not return the autocapitalization state of the editing host (unless this element is, in fact, the [editing host<sup>p782</sup>](#)).

Can be set, to set the [autocapitalize<sup>p784</sup>](#) content attribute (and thereby change the autocapitalization behavior for the element).

To compute the **own autocapitalization hint** of an element *element*, run the following steps:

1. If the [autocapitalize<sup>p784</sup>](#) content attribute is present on *element*, and its value is not the empty string, return the state of the attribute.
2. If *element* is an [autocapitalize-inheriting element<sup>p479</sup>](#) and has a non-null [form owner<sup>p559</sup>](#), return the [own autocapitalization hint<sup>p785</sup>](#) of *element*'s [form owner<sup>p559</sup>](#).
3. Return [default<sup>p784</sup>](#).

The **autocapitalize** IDL attribute, on getting, must return the string value corresponding to [own autocapitalization hint<sup>p785</sup>](#) of the element, with the exception that the [default<sup>p784</sup>](#) state maps to the empty string. On setting, it must set the [autocapitalize<sup>p784</sup>](#) content attribute to the given new value.

User agents that support customizable autocapitalization behavior for a text input method and wish to allow web developers to control this functionality should, during text input into an element, compute the **used autocapitalization hint** for the element. This will be an [autocapitalization hint<sup>p784</sup>](#) that describes the recommended autocapitalization behavior for text input into the element.

User agents or input methods may choose to ignore or override the [used autocapitalization hint<sup>p785</sup>](#) in certain circumstances.

The [used autocapitalization hint<sup>p785</sup>](#) for an element *element* is computed using the following algorithm:

1. If *element* is an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in one of the [URL<sup>p494</sup>](#), [E-mail<sup>p495</sup>](#), or [Password<sup>p497</sup>](#) states, then return [default<sup>p784</sup>](#).
2. If *element* is an [input<sup>p486</sup>](#) element or a [textarea<sup>p541</sup>](#) element, then return *element*'s [own autocapitalization hint<sup>p785</sup>](#).
3. If *element* is an [editing host<sup>p782</sup>](#) or an [editable](#) element, then return the [own autocapitalization hint<sup>p785</sup>](#) of the [editing host of element](#).
4. Assert: this step is never reached, since text input only occurs in elements that meet one of the above criteria.

## 6.7.7 Input modalities: the [inputmode<sup>p785</sup>](#) attribute §<sup>p78</sup><sub>5</sub>

User agents can support the [inputmode<sup>p785</sup>](#) attribute on form controls (such as the value of [textarea<sup>p541</sup>](#) elements), or in elements in an [editing host<sup>p782</sup>](#) (e.g., using [contenteditable<sup>p780</sup>](#)).

The **inputmode** content attribute is an [enumerated attribute<sup>p66</sup>](#) that specifies what kind of input mechanism would be most helpful for

users entering content.

Keyword	Description
<b>none</b>	The user agent should not display a virtual keyboard. This keyword is useful for content that renders its own keyboard control.
<b>text</b>	The user agent should display a virtual keyboard capable of text input in the user's locale.
<b>tel</b>	The user agent should display a virtual keyboard capable of telephone number input. This should include keys for the digits 0 to 9, the "#" character, and the "*" character. In some locales, this can also include alphabetic mnemonic labels (e.g., in the US, the key labeled "2" is historically also labeled with the letters A, B, and C).
<b>url</b>	The user agent should display a virtual keyboard capable of text input in the user's locale, with keys for aiding in the input of <a href="#">URLs</a> , such as that for the "/" and "." characters and for quick input of strings commonly found in domain names such as "www." or ".com".
<b>email</b>	The user agent should display a virtual keyboard capable of text input in the user's locale, with keys for aiding in the input of e-mail addresses, such as that for the "@" character and the "." character.
<b>numeric</b>	The user agent should display a virtual keyboard capable of numeric input. This keyword is useful for PIN entry.
<b>decimal</b>	The user agent should display a virtual keyboard capable of fractional numeric input. Numeric keys and the format separator for the locale should be shown.
<b>search</b>	The user agent should display a virtual keyboard optimized for search.

The **inputMode** IDL attribute must [reflect](#)<sup>p91</sup> the [inputmode](#)<sup>p785</sup> content attribute, [limited to only known values](#)<sup>p91</sup>.

When [inputmode](#)<sup>p785</sup> is unspecified (or is in a state not supported by the user agent), the user agent should determine the default virtual keyboard to be shown. Contextual information such as the [input type](#)<sup>p488</sup> or [pattern](#)<sup>p518</sup> attributes should be used to determine which type of virtual keyboard should be presented to the user.

### 6.7.8 Input modalities: the [enterkeyhint](#)<sup>p786</sup> attribute §<sup>p78</sup><sub>6</sub>

User agents can support the [enterkeyhint](#)<sup>p786</sup> attribute on form controls (such as the value of [textarea](#)<sup>p541</sup> elements), or in elements in an [editing host](#)<sup>p782</sup> (e.g., using [contenteditable](#)<sup>p780</sup>).

The **enterkeyhint** content attribute is an [enumerated attribute](#)<sup>p66</sup> that specifies what action label (or icon) to present for the enter key on virtual keyboards. This allows authors to customize the presentation of the enter key in order to make it more helpful for users.

Keyword	Description
<b>enter</b>	The user agent should present a cue for the operation 'enter', typically inserting a new line.
<b>done</b>	The user agent should present a cue for the operation 'done', typically meaning there is nothing more to input and the input method editor (IME) will be closed.
<b>go</b>	The user agent should present a cue for the operation 'go', typically meaning to take the user to the target of the text they typed.
<b>next</b>	The user agent should present a cue for the operation 'next', typically taking the user to the next field that will accept text.
<b>previous</b>	The user agent should present a cue for the operation 'previous', typically taking the user to the previous field that will accept text.
<b>search</b>	The user agent should present a cue for the operation 'search', typically taking the user to the results of searching for the text they have typed.
<b>send</b>	The user agent should present a cue for the operation 'send', typically delivering the text to its target.

The **enterKeyHint** IDL attribute must [reflect](#)<sup>p91</sup> the [enterkeyhint](#)<sup>p786</sup> content attribute, [limited to only known values](#)<sup>p91</sup>.

When [enterkeyhint](#)<sup>p786</sup> is unspecified (or is in a state not supported by the user agent), the user agent should determine the default action label (or icon) to present. Contextual information such as the [inputmode](#)<sup>p785</sup>, [type](#)<sup>p488</sup>, or [pattern](#)<sup>p518</sup> attributes should be used to determine which action label (or icon) to present on the virtual keyboard.

## 6.8 Drag and drop §<sup>p78</sup><sub>6</sub>

This section defines an event-based drag-and-drop mechanism.

This specification does not define exactly what a *drag-and-drop operation* actually is.

On a visual medium with a pointing device, a drag operation could be the default action of a [mousedown](#) event that is followed by a series of [mousemove](#) events, and the drop could be triggered by the mouse being released.

When using an input modality other than a pointing device, users would probably have to explicitly indicate their intention to perform a drag-and-drop operation, stating what they wish to drag and where they wish to drop it, respectively.

However it is implemented, drag-and-drop operations must have a starting point (e.g. where the mouse was clicked, or the start of the selection or element that was selected for the drag), may have any number of intermediate steps (elements that the mouse moves over during a drag, or elements that the user picks as possible drop points as they cycle through possibilities), and must either have an end point (the element above which the mouse button was released, or the element that was finally selected), or be canceled. The end point must be the last element selected as a possible drop point before the drop occurs (so if the operation is not canceled, there must be at least one element in the middle step).

## 6.8.1 Introduction §<sup>p78</sup><sub>7</sub>

*This section is non-normative.*

To make an element draggable, give the element a `draggablep802` attribute, and set an event listener for `dragstartp801` that stores the data being dragged.

The event handler typically needs to check that it's not a text selection that is being dragged, and then needs to store data into the `DataTransferp789` object and set the allowed effects (copy, move, link, or some combination).

For example:

```
<p>What fruits do you like?</p>
<ol ondragstart="dragStartHandler(event)">
  <li draggable="true" data-value="fruit-apple">Apples</li>
  <li draggable="true" data-value="fruit-orange">Oranges</li>
  <li draggable="true" data-value="fruit-pear">Pears</li>
</ol>
<script>
  var internalDNDType = 'text/x-example'; // set this to something specific to your site
  function dragStartHandler(event) {
    if (event.target instanceof HTMLLIElement) {
      // use the element's data-value="" attribute as the value to be moving;
      event.dataTransfer.setData(internalDNDType, event.target.dataset.value);
      event.dataTransfer.effectAllowed = 'move'; // only allow moves
    } else {
      event.preventDefault(); // don't allow selection to be dragged
    }
  }
</script>
```

To accept a drop, the drop target has to listen to the following events:

1. The `dragenterp801` event handler reports whether or not the drop target is potentially willing to accept the drop, by canceling the event.
2. The `dragoverp801` event handler specifies what feedback will be shown to the user, by setting the `dropEffectb791` attribute of the `DataTransferp789` associated with the event. This event also needs to be canceled.
3. The `dropp801` event handler has a final chance to accept or reject the drop. If the drop is accepted, the event handler must perform the drop operation on the target. This event needs to be canceled, so that the `dropEffectb791` attribute's value can be used by the source. Otherwise, the drop operation is rejected.

For example:

```
<p>Drop your favorite fruits below:</p>
<ol ondragenter="dragEnterHandler(event)" ondragover="dragOverHandler(event)"
  ondrop="dropHandler(event)">
</ol>
<script>
  var internalDNDType = 'text/x-example'; // set this to something specific to your site
  function dragEnterHandler(event) {
    var items = event.dataTransfer.items;
```

```

    for (var i = 0; i < items.length; ++i) {
        var item = items[i];
        if (item.kind == 'string' && item.type == internalDNDType) {
            event.preventDefault();
            return;
        }
    }
}
function dragOverHandler(event) {
    event.dataTransfer.dropEffect = 'move';
    event.preventDefault();
}
function dropHandler(event) {
    var li = document.createElement('li');
    var data = event.dataTransfer.getData(internalDNDType);
    if (data == 'fruit-apple') {
        li.textContent = 'Apples';
    } else if (data == 'fruit-orange') {
        li.textContent = 'Oranges';
    } else if (data == 'fruit-pear') {
        li.textContent = 'Pears';
    } else {
        li.textContent = 'Unknown Fruit';
    }
    event.target.appendChild(li);
}
</script>

```

To remove the original element (the one that was dragged) from the display, the `dragend`<sup>p801</sup> event can be used.

For our example here, that means updating the original markup to handle that event:

```

<p>What fruits do you like?</p>
<ol ondragstart="dragStartHandler(event)" ondragend="dragEndHandler(event)">
  ...as before...
</ol>
<script>
  function dragStartHandler(event) {
    // ...as before...
  }
  function dragEndHandler(event) {
    if (event.dataTransfer.dropEffect == 'move') {
      // remove the dragged element
      event.target.parentNode.removeChild(event.target);
    }
  }
</script>

```

### 6.8.2 The drag data store §<sup>p78</sup><sub>8</sub>

The data that underlies a drag-and-drop operation, known as the **drag data store**, consists of the following information:

- A **drag data store item list**, which is a list of items representing the dragged data, each consisting of the following information:

#### ***The drag data item kind***

The kind of data:

### **Text**

Text.

### **File**

Binary data with a file name.

### **The drag data item type string**

A Unicode string giving the type or format of the data, generally given by a [MIME type](#). Some values that are not [MIME types](#) are special-cased for legacy reasons. The API does not enforce the use of [MIME types](#); other values can be used as well. In all cases, however, the values are all [converted to ASCII lowercase](#) by the API.

There is a limit of one *text* item per [item type string](#)<sup>p789</sup>.

### **The actual data**

A Unicode or binary string, in some cases with a file name (itself a Unicode string), as per [the drag data item kind](#)<sup>p788</sup>.

The [drag data store item list](#)<sup>p788</sup> is ordered in the order that the items were added to the list; most recently added last.

- The following information, used to generate the UI feedback during the drag:
  - User-agent-defined default feedback information, known as the **drag data store default feedback**.
  - Optionally, a bitmap image and the coordinate of a point within that image, known as the **drag data store bitmap** and **drag data store hot spot coordinate**.
- A **drag data store mode**, which is one of the following:

#### **Read/write mode**

For the [dragstart](#)<sup>p801</sup> event. New data can be added to the [drag data store](#)<sup>p788</sup>.

#### **Read-only mode**

For the [drop](#)<sup>p801</sup> event. The list of items representing dragged data can be read, including the data. No new data can be added.

#### **Protected mode**

For all other events. The formats and kinds in the [drag data store](#)<sup>p788</sup> list of items representing dragged data can be enumerated, but the data itself is unavailable and no new data can be added.

- A **drag data store allowed effects state**, which is a string.

When a [drag data store](#)<sup>p788</sup> is **created**, it must be initialized such that its [drag data store item list](#)<sup>p788</sup> is empty, it has no [drag data store default feedback](#)<sup>p789</sup>, it has no [drag data store bitmap](#)<sup>p789</sup> and [drag data store hot spot coordinate](#)<sup>p789</sup>, its [drag data store mode](#)<sup>p789</sup> is [protected mode](#)<sup>p789</sup>, and its [drag data store allowed effects state](#)<sup>p789</sup> is the string "[uninitialized](#)<sup>p791</sup>".

### **6.8.3 The [DataTransfer](#)<sup>p789</sup> interface** §<sup>p78</sup><sub>9</sub>

[DataTransfer](#)<sup>p789</sup> objects are used to expose the [drag data store](#)<sup>p788</sup> that underlies a drag-and-drop operation.

```
IDL [Exposed=Window,
  Constructor]
interface DataTransfer {
  attribute DOMString dropEffect;
  attribute DOMString effectAllowed;

  [SameObject] readonly attribute DataTransferItemList items;

  void setDragImage(Element image, long x, long y);

  /* old interface */
  readonly attribute FrozenArray<DOMString> types;
  DOMString getData(DOMString format);
```

```

void setData(DOMString format, DOMString data);
void clearData(optional DOMString format);
[SameObject] readonly attribute FileList files;
};

```

For web developers (non-normative)

**`dataTransfer = new DataTransferp791()`**

Creates a new [DataTransfer<sup>p789</sup>](#) object with an empty [drag data store<sup>p788</sup>](#).

**`dataTransfer . dropEffectp791 [ = value ]`**

Returns the kind of operation that is currently selected. If the kind of operation isn't one of those that is allowed by the [effectAllowed<sup>p791</sup>](#) attribute, then the operation will fail.

Can be set, to change the selected operation.

The possible values are "[none<sup>p791</sup>](#)", "[copy<sup>p791</sup>](#)", "[link<sup>p791</sup>](#)", and "[move<sup>p791</sup>](#)".

**`dataTransfer . effectAllowedp791 [ = value ]`**

Returns the kinds of operations that are to be allowed.

Can be set (during the [dragstart<sup>p801</sup>](#) event), to change the allowed operations.

The possible values are "[none<sup>p791</sup>](#)", "[copy<sup>p791</sup>](#)", "[copyLink<sup>p791</sup>](#)", "[copyMove<sup>p791</sup>](#)", "[link<sup>p791</sup>](#)", "[linkMove<sup>p791</sup>](#)", "[move<sup>p791</sup>](#)", "[all<sup>p791</sup>](#)", and "[uninitialized<sup>p791</sup>](#)".

**`dataTransfer . itemsp791`**

Returns a [DataTransferItemList<sup>p792</sup>](#) object, with the drag data.

**`dataTransfer . setDragImagep791(element, x, y)`**

Uses the given element to update the drag feedback, replacing any previously specified feedback.

**`dataTransfer . typesp791`**

Returns a [frozen array](#) listing the formats that were set in the [dragstart<sup>p801</sup>](#) event. In addition, if any files are being dragged, then one of the types will be the string "Files".

**`data = dataTransfer . getDatap791(format)`**

Returns the specified data. If there is no such data, returns the empty string.

**`dataTransfer . setDatap791(format, data)`**

Adds the specified data.

**`dataTransfer . clearDatap792( [ format ] )`**

Removes the data of the specified formats. Removes all data if the argument is omitted.

**`dataTransfer . filesp792`**

Returns a [FileList](#) of the files being dragged, if any.

[DataTransfer<sup>p789</sup>](#) objects that are created as part of [drag-and-drop events<sup>p801</sup>](#) are only valid while those events are being fired.

A [DataTransfer<sup>p789</sup>](#) object is associated with a [drag data store<sup>p788</sup>](#) while it is valid.

A [DataTransfer<sup>p789</sup>](#) object has an associated **types array**, which is a [FrozenArray<DOMString>](#), initially empty. When the contents of the [DataTransfer<sup>p789</sup>](#) object's [drag data store item list<sup>p788</sup>](#) change, or when the [DataTransfer<sup>p789</sup>](#) object becomes no longer associated with a [drag data store<sup>p788</sup>](#), run the following steps:

1. Let *L* be an empty sequence.
2. If the [DataTransfer<sup>p789</sup>](#) object is still associated with a [drag data store<sup>p788</sup>](#), then:
  1. For each item in the [DataTransfer<sup>p789</sup>](#) object's [drag data store item list<sup>p788</sup>](#) whose [kind<sup>p788</sup>](#) is *text*, add an entry to *L* consisting of the item's [type string<sup>p789</sup>](#).
  2. If there are any items in the [DataTransfer<sup>p789</sup>](#) object's [drag data store item list<sup>p788</sup>](#) whose [kind<sup>p788</sup>](#) is *File*, then add an entry to *L* consisting of the string "Files". (This value can be distinguished from the other values because it is not lowercase.)
3. Set the [DataTransfer<sup>p789</sup>](#) object's [types array<sup>p790</sup>](#) to the result of [creating a frozen array](#) from *L*.

The `DataTransfer()` constructor, when invoked, must return a newly created `DataTransfer` object initialized as follows:

1. Set the `drag data store`'s `item list` to be an empty list.
2. Set the `drag data store`'s `mode` to `read/write mode`.
3. Set the `dropEffect` and `effectAllowed` to "none".

The `dropEffect` attribute controls the drag-and-drop feedback that the user is given during a drag-and-drop operation. When the `DataTransfer` object is created, the `dropEffect` attribute is set to a string value. On getting, it must return its current value. On setting, if the new value is one of "none", "copy", "link", or "move", then the attribute's current value must be set to the new value. Other values must be ignored.

The `effectAllowed` attribute is used in the drag-and-drop processing model to initialize the `dropEffect` attribute during the `dragenter` and `dragover` events. When the `DataTransfer` object is created, the `effectAllowed` attribute is set to a string value. On getting, it must return its current value. On setting, if `drag data store`'s `mode` is the `read/write mode` and the new value is one of "none", "copy", "copyLink", "copyMove", "link", "linkMove", "move", "all", or "uninitialized", then the attribute's current value must be set to the new value. Otherwise it must be left unchanged.

The `items` attribute must return a `DataTransferItemList` object associated with the `DataTransfer` object.

The `setDragImage(element, x, y)` method must run the following steps:

1. If the `DataTransfer` object is no longer associated with a `drag data store`, return. Nothing happens.
2. If the `drag data store`'s `mode` is not the `read/write mode`, return. Nothing happens.
3. If `element` is an `img` element, then set the `drag data store bitmap` to the element's image (at its `intrinsic size`); otherwise, set the `drag data store bitmap` to an image generated from the given element (the exact mechanism for doing so is not currently specified).
4. Set the `drag data store hot spot coordinate` to the given `x, y` coordinate.

The `types` attribute must return this `DataTransfer` object's `types array`.

The `getData(format)` method must run the following steps:

1. If the `DataTransfer` object is no longer associated with a `drag data store`, then return the empty string.
2. If the `drag data store`'s `mode` is the `protected mode`, then return the empty string.
3. Let `format` be the first argument, `converted to ASCII lowercase`.
4. Let `convert-to-URL` be false.
5. If `format` equals "text", change it to "text/plain".
6. If `format` equals "url", change it to "text/uri-list" and set `convert-to-URL` to true.
7. If there is no item in the `drag data store item list` whose `kind` is `text` and whose `type string` is equal to `format`, return the empty string.
8. Let `result` be the data of the item in the `drag data store item list` whose `kind` is `Plain Unicode string` and whose `type string` is equal to `format`.
9. If `convert-to-URL` is true, then parse `result` as appropriate for `text/uri-list` data, and then set `result` to the first URL from the list, if any, or the empty string otherwise. [RFC2483]
10. Return `result`.

The `setData(format, data)` method must run the following steps:

1. If the `DataTransfer` object is no longer associated with a `drag data store`, return. Nothing happens.
2. If the `drag data store`'s `mode` is not the `read/write mode`, return. Nothing happens.
3. Let `format` be the first argument, `converted to ASCII lowercase`.
4. If `format` equals "text", change it to "text/plain".

If *format* equals "url", change it to "text/uri-list".

- Remove the item in the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *text* and whose [type string](#)<sup>p789</sup> is equal to *format*, if there is one.
- Add an item to the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *text*, whose [type string](#)<sup>p789</sup> is equal to *format*, and whose data is the string given by the method's second argument.

The `clearData()` method must run the following steps:

- If the [DataTransfer](#)<sup>p789</sup> object is no longer associated with a [drag data store](#)<sup>p788</sup>, return. Nothing happens.
- If the [drag data store](#)<sup>p788</sup>'s [mode](#)<sup>p789</sup> is not the [read/write mode](#)<sup>p789</sup>, return. Nothing happens.
- If the method was called with no arguments, remove each item in the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *Plain Unicode string*, and return.
- Let *format* be the first argument, [converted to ASCII lowercase](#).
- If *format* equals "text", change it to "text/plain".  
If *format* equals "url", change it to "text/uri-list".
- Remove the item in the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *text* and whose [type string](#)<sup>p789</sup> is equal to *format*, if there is one.

#### Note

The `clearData()`<sup>p792</sup> method does not affect whether any files were included in the drag, so the [types](#)<sup>p791</sup> attribute's list might still not be empty after calling `clearData()`<sup>p792</sup> (it would still contain the "Files" string if any files were included in the drag).

The `files` attribute must return a [live](#)<sup>p44</sup> [FileList](#) sequence consisting of [File](#) objects representing the files found by the following steps. Furthermore, for a given [FileList](#) object and a given underlying file, the same [File](#) object must be used each time.

- Start with an empty list *L*.
- If the [DataTransfer](#)<sup>p789</sup> object is no longer associated with a [drag data store](#)<sup>p788</sup>, the [FileList](#) is empty. Return the empty list *L*.
- If the [drag data store](#)<sup>p788</sup>'s [mode](#)<sup>p789</sup> is the [protected mode](#)<sup>p789</sup>, Return the empty list *L*.
- For each item in the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *File*, add the item's data (the file, in particular its name and contents, as well as its [type](#)<sup>p789</sup>) to the list *L*.
- The files found by these steps are those in the list *L*.

#### Note

This version of the API does not expose the types of the files during the drag.

### 6.8.3.1 The [DataTransferItemList](#)<sup>p792</sup> interface §<sup>p79</sup><sub>2</sub>

Each [DataTransfer](#)<sup>p789</sup> object is associated with a [DataTransferItemList](#)<sup>p792</sup> object.

#### IDL

```
[Exposed=Window]
interface DataTransferItemList {
  readonly attribute unsigned long length;
  getter DataTransferItem (unsigned long index);
  DataTransferItem? add(DOMString data, DOMString type);
  DataTransferItem? add(File data);
  void remove(unsigned long index);
  void clear();
};
```

**`items . length`**<sup>p793</sup>

Returns the number of items in the [drag data store](#)<sup>p788</sup>.

**`items[index]`**

Returns the [DataTransferItem](#)<sup>p794</sup> object representing the *index*th entry in the [drag data store](#)<sup>p788</sup>.

**`items . remove`**<sup>p793</sup>(*index*)

Removes the *index*th entry in the [drag data store](#)<sup>p788</sup>.

**`items . clear`**<sup>p793</sup>()

Removes all the entries in the [drag data store](#)<sup>p788</sup>.

**`items . add`**<sup>p793</sup>(*data*)**`items . add`**<sup>p793</sup>(*data*, *type*)

Adds a new entry for the given data to the [drag data store](#)<sup>p788</sup>. If the data is plain text then a *type* string has to be provided also.

While the [DataTransferItemList](#)<sup>p792</sup> object's [DataTransfer](#)<sup>p789</sup> object is associated with a [drag data store](#)<sup>p788</sup>, the [DataTransferItemList](#)<sup>p792</sup> object's *mode* is the same as the [drag data store mode](#)<sup>p789</sup>. When the [DataTransferItemList](#)<sup>p792</sup> object's [DataTransfer](#)<sup>p789</sup> object is *not* associated with a [drag data store](#)<sup>p788</sup>, the [DataTransferItemList](#)<sup>p792</sup> object's *mode* is the *disabled mode*. The [drag data store](#)<sup>p788</sup> referenced in this section (which is used only when the [DataTransferItemList](#)<sup>p792</sup> object is not in the *disabled mode*) is the [drag data store](#)<sup>p788</sup> with which the [DataTransferItemList](#)<sup>p792</sup> object's [DataTransfer](#)<sup>p789</sup> object is associated.

The **length** attribute must return zero if the object is in the *disabled mode*; otherwise it must return the number of items in the [drag data store item list](#)<sup>p788</sup>.

When a [DataTransferItemList](#)<sup>p792</sup> object is not in the *disabled mode*, its [supported property indices](#) are the numbers in the range 0 .. *n*-1, where *n* is the number of items in the [drag data store item list](#)<sup>p788</sup>.

To [determine the value of an indexed property](#) *i* of a [DataTransferItemList](#)<sup>p792</sup> object, the user agent must return a [DataTransferItem](#)<sup>p794</sup> object representing the *i*th item in the [drag data store](#)<sup>p788</sup>. The same object must be returned each time a particular item is obtained from this [DataTransferItemList](#)<sup>p792</sup> object. The [DataTransferItem](#)<sup>p794</sup> object must be associated with the same [DataTransfer](#)<sup>p789</sup> object as the [DataTransferItemList](#)<sup>p792</sup> object when it is first created.

The **add()** method must run the following steps:

1. If the [DataTransferItemList](#)<sup>p792</sup> object is not in the [read/write mode](#)<sup>p789</sup>, return null.
2. Jump to the appropriate set of steps from the following list:

↪ **If the first argument to the method is a string**

If there is already an item in the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *text* and whose [type string](#)<sup>p789</sup> is equal to the value of the method's second argument, [converted to ASCII lowercase](#), then throw a **"NotSupportedError"** [DOMException](#).

Otherwise, add an item to the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *text*, whose [type string](#)<sup>p789</sup> is equal to the value of the method's second argument, [converted to ASCII lowercase](#), and whose data is the string given by the method's first argument.

↪ **If the first argument to the method is a File**

Add an item to the [drag data store item list](#)<sup>p788</sup> whose [kind](#)<sup>p788</sup> is *File*, whose [type string](#)<sup>p789</sup> is the *type* of the *File*, [converted to ASCII lowercase](#), and whose data is the same as the *File*'s data.

3. [Determine the value of the indexed property](#)<sup>p793</sup> corresponding to the newly added item, and return that value (a newly created [DataTransferItem](#)<sup>p794</sup> object).

The **remove()** method, when invoked with the argument *i*, must run these steps:

1. If the [DataTransferItemList](#)<sup>p792</sup> object is not in the [read/write mode](#)<sup>p789</sup>, throw an **"InvalidStateError"** [DOMException](#).
2. Remove the *i*th item from the [drag data store](#)<sup>p788</sup>.

The **clear()** method, if the [DataTransferItemList](#)<sup>p792</sup> object is in the [read/write mode](#)<sup>p789</sup>, must remove all the items from the [drag data store](#)<sup>p788</sup>. Otherwise, it must do nothing.

### 6.8.3.2 The [DataTransferItem](#)<sup>p794</sup> interface §<sup>p79</sup><sub>4</sub>

Each [DataTransferItem](#)<sup>p794</sup> object is associated with a [DataTransfer](#)<sup>p789</sup> object.

```
IDL [Exposed=Window]
interface DataTransferItem {
  readonly attribute DOMString kind;
  readonly attribute DOMString type;
  void getAsString(FunctionStringCallback? _callback);
  File? getAsFile();
};

callback FunctionStringCallback = void (DOMString data);
```

For web developers (non-normative)

#### **item . kind**<sup>p794</sup>

Returns [the drag data item kind](#)<sup>p788</sup>, one of: "string", "file".

#### **item . type**<sup>p794</sup>

Returns [the drag data item type string](#)<sup>p789</sup>.

#### **item . getAsString**<sup>p794</sup>(*callback*)

Invokes the callback with the string data as the argument, if [the drag data item kind](#)<sup>p788</sup> is *text*.

#### **file = item . getAsFile**<sup>p794</sup>()

Returns a [File](#) object, if [the drag data item kind](#)<sup>p788</sup> is *File*.

While the [DataTransferItem](#)<sup>p794</sup> object's [DataTransfer](#)<sup>p789</sup> object is associated with a [drag data store](#)<sup>p788</sup> and that [drag data store](#)<sup>p788</sup>'s [drag data store item list](#)<sup>p788</sup> still contains the item that the [DataTransferItem](#)<sup>p794</sup> object represents, the [DataTransferItem](#)<sup>p794</sup> object's *mode* is the same as the [drag data store mode](#)<sup>p789</sup>. When the [DataTransferItem](#)<sup>p794</sup> object's [DataTransfer](#)<sup>p789</sup> object is *not* associated with a [drag data store](#)<sup>p788</sup>, or if the item that the [DataTransferItem](#)<sup>p794</sup> object represents has been removed from the relevant [drag data store item list](#)<sup>p788</sup>, the [DataTransferItem](#)<sup>p794</sup> object's *mode* is the *disabled mode*. The [drag data store](#)<sup>p788</sup> referenced in this section (which is used only when the [DataTransferItem](#)<sup>p794</sup> object is not in the *disabled mode*) is the [drag data store](#)<sup>p788</sup> with which the [DataTransferItem](#)<sup>p794</sup> object's [DataTransfer](#)<sup>p789</sup> object is associated.

The **kind** attribute must return the empty string if the [DataTransferItem](#)<sup>p794</sup> object is in the *disabled mode*; otherwise it must return the string given in the cell from the second column of the following table from the row whose cell in the first column contains [the drag data item kind](#)<sup>p788</sup> of the item represented by the [DataTransferItem](#)<sup>p794</sup> object:

Kind	String
Text	"string"
File	"file"

The **type** attribute must return the empty string if the [DataTransferItem](#)<sup>p794</sup> object is in the *disabled mode*; otherwise it must return [the drag data item type string](#)<sup>p789</sup> of the item represented by the [DataTransferItem](#)<sup>p794</sup> object.

The **getAsString**(*callback*) method must run the following steps:

1. If the *callback* is null, return.
2. If the [DataTransferItem](#)<sup>p794</sup> object is not in the [read/write mode](#)<sup>p789</sup> or the [read-only mode](#)<sup>p789</sup>, return. The callback is never invoked.
3. If [the drag data item kind](#)<sup>p788</sup> is not *text*, then return. The callback is never invoked.
4. Otherwise, [queue a task](#)<sup>p925</sup> to invoke *callback*, passing the actual data of the item represented by the [DataTransferItem](#)<sup>p794</sup> object as the argument.

The **getAsFile**() method must run the following steps:

1. If the [DataTransferItem](#)<sup>p794</sup> object is not in the [read/write mode](#)<sup>p789</sup> or the [read-only mode](#)<sup>p789</sup>, then return null.
2. If [the drag data item kind](#)<sup>p788</sup> is not *File*, then return null.

- Return a new [File](#) object representing the actual data of the item represented by the [DataTransferItem](#)<sup>p794</sup> object.

### 6.8.4 The [DragEvent](#)<sup>p795</sup> interface §<sup>p79</sup><sub>5</sub>

The drag-and-drop processing model involves several events. They all use the [DragEvent](#)<sup>p795</sup> interface.

```
IDL [Exposed=Window,
  Constructor(DOMString type, optional DragEventInit eventInitDict = {})]
interface DragEvent : MouseEvent {
  readonly attribute DataTransfer? dataTransfer;
};

dictionary DragEventInit : MouseEventInit {
  DataTransfer? dataTransfer = null;
};
```

#### For web developers (non-normative)

##### **event . dataTransfer**<sup>p795</sup>

Returns the [DataTransfer](#)<sup>p789</sup> object for the event.

#### Note

Although, for consistency with other event interfaces, the [DragEvent](#)<sup>p795</sup> interface has a constructor, it is not particularly useful. In particular, there's no way to create a useful [DataTransfer](#)<sup>p789</sup> object from script, as [DataTransfer](#)<sup>p789</sup> objects have a processing and security model that is coordinated by the browser during drag-and-drops.

The **dataTransfer** attribute of the [DragEvent](#)<sup>p795</sup> interface must return the value it was initialized to. It represents the context information for the event.

When a user agent is required to **fire a DND event** named *e* at an element, using a particular [drag data store](#)<sup>p788</sup>, and optionally with a specific *related target*, the user agent must run the following steps:

- Let *dataDragStoreWasChanged* be false.
- If no specific *related target* was provided, set *related target* to null.
- Let *window* be the [relevant global object](#)<sup>p913</sup> of the [Document](#)<sup>p111</sup> object of the specified target element.
- If *e* is [dragstart](#)<sup>p801</sup>, then set the [drag data store mode](#)<sup>p789</sup> to the [read/write mode](#)<sup>p789</sup> and set *dataDragStoreWasChanged* to true.  
If *e* is [drop](#)<sup>p801</sup>, set the [drag data store mode](#)<sup>p789</sup> to the [read-only mode](#)<sup>p789</sup>.
- Let *dataTransfer* be a newly created [DataTransfer](#)<sup>p789</sup> object associated with the given [drag data store](#)<sup>p788</sup>.
- Set the [effectAllowed](#)<sup>p791</sup> attribute to the [drag data store](#)<sup>p788</sup>'s [drag data store allowed effects state](#)<sup>p789</sup>.
- Set the [dropEffect](#)<sup>p791</sup> attribute to "none"<sup>p791</sup> if *e* is [dragstart](#)<sup>p801</sup>, [drag](#)<sup>p801</sup>, [dragexit](#)<sup>p801</sup>, or [dragleave](#)<sup>p801</sup>; to the value corresponding to the [current drag operation](#)<sup>p799</sup> if *e* is [drop](#)<sup>p801</sup> or [dragend](#)<sup>p801</sup>; and to a value based on the [effectAllowed](#)<sup>p791</sup> attribute's value and the drag-and-drop source, as given by the following table, otherwise (i.e. if *e* is [dragenter](#)<sup>p801</sup> or [dragover](#)<sup>p801</sup>):

<a href="#">effectAllowed</a> <sup>p791</sup>	<a href="#">dropEffect</a> <sup>p791</sup>
"none" <sup>p791</sup>	"none" <sup>p791</sup>
"copy" <sup>p791</sup>	"copy" <sup>p791</sup>
"copyLink" <sup>p791</sup>	"copy" <sup>p791</sup> , or, if appropriate <sup>p796</sup> , "link" <sup>p791</sup>
"copyMove" <sup>p791</sup>	"copy" <sup>p791</sup> , or, if appropriate <sup>p796</sup> , "move" <sup>p791</sup>
"all" <sup>p791</sup>	"copy" <sup>p791</sup> , or, if appropriate <sup>p796</sup> , either "link" <sup>p791</sup> or "move" <sup>p791</sup>
"link" <sup>p791</sup>	"link" <sup>p791</sup>

<a href="#">effectAllowed</a> <sup>p791</sup>	<a href="#">dropEffect</a> <sup>p791</sup>
" <a href="#">linkMove</a> <sup>p791</sup> "	" <a href="#">link</a> <sup>p791</sup> ", or, if appropriate <sup>p796</sup> , " <a href="#">move</a> <sup>p791</sup> "
" <a href="#">move</a> <sup>p791</sup> "	" <a href="#">move</a> <sup>p791</sup> "
" <a href="#">uninitialized</a> <sup>p791</sup> " when what is being dragged is a selection from a text control	" <a href="#">move</a> <sup>p791</sup> ", or, if appropriate <sup>p796</sup> , either " <a href="#">copy</a> <sup>p791</sup> " or " <a href="#">link</a> <sup>p791</sup> "
" <a href="#">uninitialized</a> <sup>p791</sup> " when what is being dragged is a selection	" <a href="#">copy</a> <sup>p791</sup> ", or, if appropriate <sup>p796</sup> , either " <a href="#">link</a> <sup>p791</sup> " or " <a href="#">move</a> <sup>p791</sup> "
" <a href="#">uninitialized</a> <sup>p791</sup> " when what is being dragged is an <a href="#">a</a> <sup>p234</sup> element with an <a href="#">href</a> <sup>p279</sup> attribute	" <a href="#">link</a> <sup>p791</sup> ", or, if appropriate <sup>p796</sup> , either " <a href="#">copy</a> <sup>p791</sup> " or " <a href="#">move</a> <sup>p791</sup> "
Any other case	" <a href="#">copy</a> <sup>p791</sup> ", or, if appropriate <sup>p796</sup> , either " <a href="#">link</a> <sup>p791</sup> " or " <a href="#">move</a> <sup>p791</sup> "

Where the table above provides **possibly appropriate alternatives**, user agents may instead use the listed alternative values if platform conventions dictate that the user has requested those alternate effects.

### Example

For example, Windows platform conventions are such that dragging while holding the "alt" key indicates a preference for linking the data, rather than moving or copying it. Therefore, on a Windows system, if "[link](#)<sup>p791</sup>" is an option according to the table above while the "alt" key is depressed, the user agent could select that instead of "[copy](#)<sup>p791</sup>" or "[move](#)<sup>p791</sup>".

- Let *event* be the result of [creating an event](#) using [DragEvent](#)<sup>p795</sup>.
- Initialize *event*'s [type](#) attribute to *e*, its [bubbles](#) attribute to true, its [view](#) attribute to *window*, its [relatedTarget](#) attribute to *related target*, and its [dataTransfer](#)<sup>p795</sup> attribute to *dataTransfer*.
- If *e* is not [dragexit](#)<sup>p801</sup>, [dragleave](#)<sup>p801</sup>, or [dragend](#)<sup>p801</sup>, then initialize *event*'s [cancelable](#) attribute to true.
- Initialize *event*'s mouse and key attributes initialized according to the state of the input devices as they would be for user interaction events.  
  
If there is no relevant pointing device, then initialize *event*'s [screenX](#), [screenY](#), [clientX](#), [clientY](#), and [button](#) attributes to 0.
- [Dispatch](#) *event* at the specified target element.
- Set the [drag data store allowed effects state](#)<sup>p789</sup> to the current value of *dataTransfer*'s [effectAllowed](#)<sup>p791</sup> attribute. (It can only have changed value if *e* is [dragstart](#)<sup>p801</sup>.)
- If [dataDragStoreWasChanged](#) is true, then set the [drag data store mode](#)<sup>p789</sup> back to the [protected mode](#)<sup>p789</sup>.
- Break the association between *dataTransfer* and the [drag data store](#)<sup>p788</sup>.

## 6.8.5 Processing model <sup>p79</sup><sub>6</sub>

When the user attempts to begin a drag operation, the user agent must run the following steps. User agents must act as if these steps were run even if the drag actually started in another document or application and the user agent was not aware that the drag was occurring until it intersected with a document under the user agent's purview.

- Determine what is being dragged, as follows:

If the drag operation was invoked on a selection, then it is the selection that is being dragged.

Otherwise, if the drag operation was invoked on a [Document](#)<sup>p111</sup>, it is the first element, going up the ancestor chain, starting at the node that the user tried to drag, that has the IDL attribute [draggable](#)<sup>p802</sup> set to true. If there is no such element, then nothing is being dragged; return, the drag-and-drop operation is never started.

Otherwise, the drag operation was invoked outside the user agent's purview. What is being dragged is defined by the document or application where the drag was started.

### Note

[img](#)<sup>p314</sup> elements and [a](#)<sup>p234</sup> elements with an [href](#)<sup>p279</sup> attribute have their [draggable](#)<sup>p802</sup> attribute set to true by default.

- [Create a drag data store](#)<sup>p789</sup>. All the DND events fired subsequently by the steps in this section must use this [drag data store](#)<sup>p788</sup>.

3. Establish which DOM node is the **source node**, as follows:

If it is a selection that is being dragged, then the [source node<sup>p797</sup>](#) is the **Text** node that the user started the drag on (typically the **Text** node that the user originally clicked). If the user did not specify a particular node, for example if the user just told the user agent to begin a drag of "the selection", then the [source node<sup>p797</sup>](#) is the first **Text** node containing a part of the selection.

Otherwise, if it is an element that is being dragged, then the [source node<sup>p797</sup>](#) is the element that is being dragged.

Otherwise, the [source node<sup>p797</sup>](#) is part of another document or application. When this specification requires that an event be dispatched at the [source node<sup>p797</sup>](#) in this case, the user agent must instead follow the platform-specific conventions relevant to that situation.

#### Note

*Multiple events are fired on the [source node<sup>p797</sup>](#) during the course of the drag-and-drop operation.*

4. Determine the **list of dragged nodes**, as follows:

If it is a selection that is being dragged, then the [list of dragged nodes<sup>p797</sup>](#) contains, in [tree order](#), every node that is partially or completely included in the selection (including all their ancestors).

Otherwise, the [list of dragged nodes<sup>p797</sup>](#) contains only the [source node<sup>p797</sup>](#), if any.

5. If it is a selection that is being dragged, then add an item to the [drag data store item list<sup>p788</sup>](#), with its properties set as follows:

#### [The drag data item type string<sup>p789</sup>](#)

"text/plain"

#### [The drag data item kind<sup>p788</sup>](#)

Text

#### The actual data

The text of the selection

Otherwise, if any files are being dragged, then add one item per file to the [drag data store item list<sup>p788</sup>](#), with their properties set as follows:

#### [The drag data item type string<sup>p789</sup>](#)

The MIME type of the file, if known, or "[application/octet-stream](#)" otherwise.

#### [The drag data item kind<sup>p788</sup>](#)

File

#### The actual data

The file's contents and name.

#### Note

*Dragging files can currently only happen from outside a [browsing context<sup>p804</sup>](#), for example from a file system manager application.*

If the drag initiated outside of the application, the user agent must add items to the [drag data store item list<sup>p788</sup>](#) as appropriate for the data being dragged, honoring platform conventions where appropriate; however, if the platform conventions do not use [MIME types](#) to label dragged data, the user agent must make a best-effort attempt to map the types to MIME types, and, in any case, all the [drag data item type strings<sup>p789</sup>](#) must be [converted to ASCII lowercase](#).

User agents may also add one or more items representing the selection or dragged element(s) in other forms, e.g. as HTML.

6. If the [list of dragged nodes<sup>p797</sup>](#) is not empty, then [extract the microdata from those nodes into a JSON form<sup>p755</sup>](#), and add one item to the [drag data store item list<sup>p788</sup>](#), with its properties set as follows:

#### [The drag data item type string<sup>p789</sup>](#)

[application/microdata+json<sup>p1236</sup>](#)

#### [The drag data item kind<sup>p788</sup>](#)

Text

## The actual data

The resulting JSON string.

7. Run the following substeps:

1. Let *urls* be an empty list of [absolute URLs](#).

2. For each *node* in the [list of dragged nodes](#)<sup>p797</sup>:

### If the node is an [a](#)<sup>p234</sup> element with an [href](#)<sup>p279</sup> attribute

Add to *urls* the result of [parsing](#)<sup>p87</sup> the element's [href](#)<sup>p279</sup> content attribute relative to the element's [node document](#).

### If the node is an [img](#)<sup>p314</sup> element with a [src](#)<sup>p315</sup> attribute

Add to *urls* the result of [parsing](#)<sup>p87</sup> the element's [src](#)<sup>p315</sup> content attribute relative to the element's [node document](#).

3. If *urls* is still empty, then return.

4. Let *url string* be the result of concatenating the strings in *urls*, in the order they were added, separated by a U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF).

5. Add one item to the [drag data store item list](#)<sup>p788</sup>, with its properties set as follows:

### [The drag data item type string](#)<sup>p789</sup>

[text/uri-list](#)<sup>p1263</sup>

### [The drag data item kind](#)<sup>p788</sup>

Text

## The actual data

*url string*

8. Update the [drag data store default feedback](#)<sup>p789</sup> as appropriate for the user agent (if the user is dragging the selection, then the selection would likely be the basis for this feedback; if the user is dragging an element, then that element's rendering would be used; if the drag began outside the user agent, then the platform conventions for determining the drag feedback should be used).

9. [Fire a DND event](#)<sup>p795</sup> named [dragstart](#)<sup>p801</sup> at the [source node](#)<sup>p797</sup>.

If the event is canceled, then the drag-and-drop operation should not occur; return.

## Note

*Since events with no event listeners registered are, almost by definition, never canceled, drag-and-drop is always available to the user if the author does not specifically prevent it.*

10. [Initiate the drag-and-drop operation](#)<sup>p798</sup> in a manner consistent with platform conventions, and as described below.

The drag-and-drop feedback must be generated from the first of the following sources that is available:

1. The [drag data store bitmap](#)<sup>p789</sup>, if any. In this case, the [drag data store hot spot coordinate](#)<sup>p789</sup> should be used as hints for where to put the cursor relative to the resulting image. The values are expressed as distances in [CSS pixels](#) from the left side and from the top side of the image respectively. [\[CSS\]](#)<sup>p1264</sup>
2. The [drag data store default feedback](#)<sup>p789</sup>.

From the moment that the user agent is to **initiate the drag-and-drop operation**, until the end of the drag-and-drop operation, device input events (e.g. mouse and keyboard events) must be suppressed.

During the drag operation, the element directly indicated by the user as the drop target is called the **immediate user selection**. (Only elements can be selected by the user; other nodes must not be made available as drop targets.) However, the [immediate user selection](#)<sup>p798</sup> is not necessarily the **current target element**, which is the element currently selected for the drop part of the drag-and-drop operation.

The [immediate user selection](#)<sup>p798</sup> changes as the user selects different elements (either by pointing at them with a pointing device, or by selecting them in some other way). The [current target element](#)<sup>p798</sup> changes when the [immediate user selection](#)<sup>p798</sup> changes, based on the results of event listeners in the document, as described below.

Both the [current target element](#)<sup>p798</sup> and the [immediate user selection](#)<sup>p798</sup> can be null, which means no target element is selected. They can also both be elements in other (DOM-based) documents, or other (non-Web) programs altogether. (For example, a user could drag text to a word-processor.) The [current target element](#)<sup>p798</sup> is initially null.

In addition, there is also a **current drag operation**, which can take on the values "none", "copy", "link", and "move". Initially, it has the value "[none](#)<sup>p799</sup>". It is updated by the user agent as described in the steps below.

User agents must, as soon as the drag operation is [initiated](#)<sup>p798</sup> and every 350ms ( $\pm 200$ ms) thereafter for as long as the drag operation is ongoing, [queue a task](#)<sup>p925</sup> to perform the following steps in sequence:

1. If the user agent is still performing the previous iteration of the sequence (if any) when the next iteration becomes due, return for this iteration (effectively "skipping missed frames" of the drag-and-drop operation).
2. [Fire a DND event](#)<sup>p795</sup> named [drag](#)<sup>p801</sup> at the [source node](#)<sup>p797</sup>. If this event is canceled, the user agent must set the [current drag operation](#)<sup>p799</sup> to "[none](#)<sup>p799</sup>" (no drag operation).
3. If the [drag](#)<sup>p801</sup> event was not canceled and the user has not ended the drag-and-drop operation, check the state of the drag-and-drop operation, as follows:

1. If the user is indicating a different [immediate user selection](#)<sup>p798</sup> than during the last iteration (or if this is the first iteration), and if this [immediate user selection](#)<sup>p798</sup> is not the same as the [current target element](#)<sup>p798</sup>, then [fire a DND event](#)<sup>p795</sup> named [dragexit](#)<sup>p801</sup> at the [current target element](#)<sup>p798</sup>, and then update the [current target element](#)<sup>p798</sup> as follows:

↪ **If the new [immediate user selection](#)<sup>p798</sup> is null**

Set the [current target element](#)<sup>p798</sup> to null also.

↪ **If the new [immediate user selection](#)<sup>p798</sup> is in a non-DOM document or application**

Set the [current target element](#)<sup>p798</sup> to the [immediate user selection](#)<sup>p798</sup>.

↪ **Otherwise**

[Fire a DND event](#)<sup>p795</sup> named [dragenter](#)<sup>p801</sup> at the [immediate user selection](#)<sup>p798</sup>.

If the event is canceled, then set the [current target element](#)<sup>p798</sup> to the [immediate user selection](#)<sup>p798</sup>.

Otherwise, run the appropriate step from the following list:

↪ **If the [immediate user selection](#)<sup>p798</sup> is a text control (e.g., [textarea](#)<sup>p541</sup>, or an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Text](#)<sup>p492</sup> state) or an [editing host](#)<sup>p782</sup> or [editable](#) element, and the [drag data store item list](#)<sup>p788</sup> has an item with the [drag data item type string](#)<sup>p789</sup> "[text/plain](#)" and the [drag data item kind](#)<sup>p788</sup> [text](#)**

Set the [current target element](#)<sup>p798</sup> to the [immediate user selection](#)<sup>p798</sup> anyway.

↪ **If the [immediate user selection](#)<sup>p798</sup> is the [body element](#)<sup>p115</sup>**

Leave the [current target element](#)<sup>p798</sup> unchanged.

↪ **Otherwise**

[Fire a DND event](#)<sup>p795</sup> named [dragenter](#)<sup>p801</sup> at the [body element](#)<sup>p115</sup>, if there is one, or at the [Document](#)<sup>p111</sup> object, if not. Then, set the [current target element](#)<sup>p798</sup> to the [body element](#)<sup>p115</sup>, regardless of whether that event was canceled or not.

2. If the previous step caused the [current target element](#)<sup>p798</sup> to change, and if the previous target element was not null or a part of a non-DOM document, then [fire a DND event](#)<sup>p795</sup> named [dragleave](#)<sup>p801</sup> at the previous target element, with the new [current target element](#)<sup>p798</sup> as the specific *related target*.
3. If the [current target element](#)<sup>p798</sup> is a DOM element, then [fire a DND event](#)<sup>p795</sup> named [dragover](#)<sup>p801</sup> at this [current target element](#)<sup>p798</sup>.

If the [dragover](#)<sup>p801</sup> event is not canceled, run the appropriate step from the following list:

↪ **If the [current target element](#)<sup>p798</sup> is a text control (e.g., [textarea](#)<sup>p541</sup>, or an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Text](#)<sup>p492</sup> state) or an [editing host](#)<sup>p782</sup> or [editable](#) element, and the [drag data store item list](#)<sup>p788</sup> has an item with the [drag data item type string](#)<sup>p789</sup> "[text/plain](#)" and the [drag data item kind](#)<sup>p788</sup> [text](#)**

Set the [current drag operation](#)<sup>p799</sup> to either "[copy](#)<sup>p799</sup>" or "[move](#)<sup>p799</sup>", as appropriate given the platform

conventions.

↪ **Otherwise**

Reset the [current drag operation](#)<sup>p799</sup> to "[none](#)<sup>p799</sup>".

Otherwise (if the [dragover](#)<sup>p801</sup> event is canceled), set the [current drag operation](#)<sup>p799</sup> based on the values of the [effectAllowed](#)<sup>p791</sup> and [dropEffect](#)<sup>p791</sup> attributes of the [DragEvent](#)<sup>p795</sup> object's [dataTransfer](#)<sup>p795</sup> object as they stood after the event [dispatch](#) finished, as per the following table:

<a href="#">effectAllowed</a> <sup>p791</sup>	<a href="#">dropEffect</a> <sup>p791</sup>	Drag operation
" <a href="#">uninitialized</a> <sup>p791</sup> ", " <a href="#">copy</a> <sup>p791</sup> ", " <a href="#">copyLink</a> <sup>p791</sup> ", " <a href="#">copyMove</a> <sup>p791</sup> ", or " <a href="#">all</a> <sup>p791</sup> "	" <a href="#">copy</a> <sup>p791</sup> "	" <a href="#">copy</a> <sup>p799</sup> "
" <a href="#">uninitialized</a> <sup>p791</sup> ", " <a href="#">link</a> <sup>p791</sup> ", " <a href="#">copyLink</a> <sup>p791</sup> ", " <a href="#">linkMove</a> <sup>p791</sup> ", or " <a href="#">all</a> <sup>p791</sup> "	" <a href="#">link</a> <sup>p791</sup> "	" <a href="#">link</a> <sup>p799</sup> "
" <a href="#">uninitialized</a> <sup>p791</sup> ", " <a href="#">move</a> <sup>p791</sup> ", " <a href="#">copyMove</a> <sup>p791</sup> ", " <a href="#">linkMove</a> <sup>p791</sup> ", or " <a href="#">all</a> <sup>p791</sup> "	" <a href="#">move</a> <sup>p791</sup> "	" <a href="#">move</a> <sup>p799</sup> "
Any other case		" <a href="#">none</a> <sup>p799</sup> "

4. Otherwise, if the [current target element](#)<sup>p798</sup> is not a DOM element, use platform-specific mechanisms to determine what drag operation is being performed (none, copy, link, or move), and set the [current drag operation](#)<sup>p799</sup> accordingly.
5. Update the drag feedback (e.g. the mouse cursor) to match the [current drag operation](#)<sup>p799</sup>, as follows:

Drag operation	Feedback
" <a href="#">copy</a> <sup>p799</sup> "	Data will be copied if dropped here.
" <a href="#">link</a> <sup>p799</sup> "	Data will be linked if dropped here.
" <a href="#">move</a> <sup>p799</sup> "	Data will be moved if dropped here.
" <a href="#">none</a> <sup>p799</sup> "	No operation allowed, dropping here will cancel the drag-and-drop operation.

4. Otherwise, if the user ended the drag-and-drop operation (e.g. by releasing the mouse button in a mouse-driven drag-and-drop interface), or if the [drag](#)<sup>p801</sup> event was canceled, then this will be the last iteration. Run the following steps, then stop the drag-and-drop operation:
  1. If the [current drag operation](#)<sup>p799</sup> is "[none](#)<sup>p799</sup>" (no drag operation), or, if the user ended the drag-and-drop operation by canceling it (e.g. by hitting the Escape key), or if the [current target element](#)<sup>p798</sup> is null, then the drag operation failed. Run these substeps:
    1. Let *dropped* be false.
    2. If the [current target element](#)<sup>p798</sup> is a DOM element, [fire a DND event](#)<sup>p795</sup> named [dragleave](#)<sup>p801</sup> at it; otherwise, if it is not null, use platform-specific conventions for drag cancellation.
    3. Set the [current drag operation](#)<sup>p799</sup> to "[none](#)<sup>p799</sup>".

Otherwise, the drag operation might be a success; run these substeps:

1. Let *dropped* be true.
2. If the [current target element](#)<sup>p798</sup> is a DOM element, [fire a DND event](#)<sup>p795</sup> named [drop](#)<sup>p801</sup> at it; otherwise, use platform-specific conventions for indicating a drop.
3. If the event is canceled, set the [current drag operation](#)<sup>p799</sup> to the value of the [dropEffect](#)<sup>p791</sup> attribute of the [DragEvent](#)<sup>p795</sup> object's [dataTransfer](#)<sup>p795</sup> object as it stood after the event [dispatch](#) finished.

Otherwise, the event is not canceled; perform the event's default action, which depends on the exact target as follows:

- ↪ If the [current target element](#)<sup>p798</sup> is a text control (e.g., [textarea](#)<sup>p541</sup>, or an [input](#)<sup>p486</sup> element whose [type](#)<sup>p488</sup> attribute is in the [Text](#)<sup>p492</sup> state) or an [editing host](#)<sup>p782</sup> or [editable element](#), and the [drag data store item list](#)<sup>p788</sup> has an item with the [drag data item type string](#)<sup>p789</sup> "[text/plain](#)" and the [drag data item kind](#)<sup>p788</sup> [text](#)

Insert the actual data of the first item in the [drag data store item list](#)<sup>p788</sup> to have a [drag data item type string](#)<sup>p789</sup> of "[text/plain](#)" and a [drag data item kind](#)<sup>p788</sup> that is *text* into the text control or [editing host](#)<sup>p782</sup> or [editable element](#) in a manner consistent with platform-specific conventions (e.g. inserting it at the current mouse cursor position, or inserting it at the end of the field).

↔ **Otherwise**

Reset the [current drag operation<sup>p799</sup>](#) to "[none<sup>p799</sup>](#)".

2. [Fire a DND event<sup>p795</sup>](#) named [dragend<sup>p801</sup>](#) at the [source node<sup>p797</sup>](#).
3. Run the appropriate steps from the following list as the default action of the [dragend<sup>p801</sup>](#) event:
  - ↔ **If *dropped* is true, the [current target element<sup>p798</sup>](#) is a *text control* (see below), the [current drag operation<sup>p799</sup>](#) is "[move<sup>p799</sup>](#)", and the source of the drag-and-drop operation is a selection in the DOM that is entirely contained within an [editing host<sup>p782</sup>](#)**  
[Delete the selection.](#)
  - ↔ **If *dropped* is true, the [current target element<sup>p798</sup>](#) is a *text control* (see below), the [current drag operation<sup>p799</sup>](#) is "[move<sup>p799</sup>](#)", and the source of the drag-and-drop operation is a selection in a text control**  
 The user agent should delete the dragged selection from the relevant text control.
  - ↔ **If *dropped* is false or if the [current drag operation<sup>p799</sup>](#) is "[none<sup>p799</sup>](#)"**  
 The drag was canceled. If the platform conventions dictate that this be represented to the user (e.g. by animating the dragged selection going back to the source of the drag-and-drop operation), then do so.
  - ↔ **Otherwise**  
 The event has no default action.

For the purposes of this step, a *text control* is a [textarea<sup>p541</sup>](#) element or an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in one of the [Text<sup>p492</sup>](#), [Search<sup>p492</sup>](#), [Tel<sup>p493</sup>](#), [URL<sup>p494</sup>](#), [E-mail<sup>p495</sup>](#), [Password<sup>p497</sup>](#), or [Number<sup>p502</sup>](#) states.

**Note**  
 User agents are encouraged to consider how to react to drags near the edge of scrollable regions. For example, if a user drags a link to the bottom of the [viewport](#) on a long page, it might make sense to scroll the page so that the user can drop the link lower on the page.

**Note**  
 This model is independent of which [Document<sup>p111</sup>](#) object the nodes involved are from; the events are fired as described above and the rest of the processing model runs as described above, irrespective of how many documents are involved in the operation.

## 6.8.6 Events summary <sup>p80</sup><sub>1</sub>

This section is non-normative.

The following events are involved in the drag-and-drop model.

Event name	Target	Cancelable?	Drag data store mode <sup>p789</sup>	dropEffect <sup>p791</sup>	Default Action
dragstart	<a href="#">Source node<sup>p797</sup></a>	✓ Cancelable	<a href="#">Read/write mode<sup>p789</sup></a>	" <a href="#">none<sup>p791</sup></a> "	Initiate the drag-and-drop operation
drag	<a href="#">Source node<sup>p797</sup></a>	✓ Cancelable	<a href="#">Protected mode<sup>p789</sup></a>	" <a href="#">none<sup>p791</sup></a> "	Continue the drag-and-drop operation
dragenter	<a href="#">Immediate user selection<sup>p798</sup></a> or the <a href="#">body element<sup>p115</sup></a>	✓ Cancelable	<a href="#">Protected mode<sup>p789</sup></a>	Based on <a href="#">effectAllowed value<sup>p795</sup></a>	Reject <a href="#">immediate user selection<sup>p798</sup></a> as potential <a href="#">target element<sup>p798</sup></a>
dragexit	<a href="#">Previous target element<sup>p798</sup></a>	—	<a href="#">Protected mode<sup>p789</sup></a>	" <a href="#">none<sup>p791</sup></a> "	None
dragleave	<a href="#">Previous target element<sup>p798</sup></a>	—	<a href="#">Protected mode<sup>p789</sup></a>	" <a href="#">none<sup>p791</sup></a> "	None
dragover	<a href="#">Current target element<sup>p798</sup></a>	✓ Cancelable	<a href="#">Protected mode<sup>p789</sup></a>	Based on <a href="#">effectAllowed value<sup>p795</sup></a>	Reset the <a href="#">current drag operation<sup>p799</sup></a> to "none"
drop	<a href="#">Current target element<sup>p798</sup></a>	✓ Cancelable	<a href="#">Read-only mode<sup>p789</sup></a>	<a href="#">Current drag operation<sup>p799</sup></a>	Varies
dragend	<a href="#">Source node<sup>p797</sup></a>	—	<a href="#">Protected mode<sup>p789</sup></a>	<a href="#">Current drag operation<sup>p799</sup></a>	Varies

Not shown in the above table: all these events bubble, are composed, and the [effectAllowed<sup>p791</sup>](#) attribute always has the value it had after the [dragstart<sup>p801</sup>](#) event, defaulting to "[uninitialized<sup>p791</sup>](#)" in the [dragstart<sup>p801</sup>](#) event.

## 6.8.7 The [draggable](#) attribute § <sup>p80</sup><sub>2</sub>

All [HTML elements<sup>p43</sup>](#) may have the [draggable<sup>p802</sup>](#) content attribute set. The [draggable<sup>p802</sup>](#) attribute is an [enumerated attribute<sup>p66</sup>](#). It has three states. The first state is *true* and it has the keyword `true`. The second state is *false* and it has the keyword `false`. The third state is *auto*; it has no keywords but it is the [missing value default<sup>p66</sup>](#) and the [invalid value default<sup>p66</sup>](#).

The *true* state means the element is draggable; the *false* state means that it is not. The *auto* state uses the default behavior of the user agent.

An element with a [draggable<sup>p802</sup>](#) attribute should also have a [title<sup>p136</sup>](#) attribute that names the element for the purpose of non-visual interactions.

### For web developers (non-normative)

#### **`element . draggablep802 [ = value ]`**

Returns true if the element is draggable; otherwise, returns false.

Can be set, to override the default and set the [draggable<sup>p802</sup>](#) content attribute.

The [draggable](#) IDL attribute, whose value depends on the content attribute's in the way described below, controls whether or not the element is draggable. Generally, only text selections are draggable, but elements whose [draggable<sup>p802</sup>](#) IDL attribute is true become draggable as well.

If an element's [draggable<sup>p802</sup>](#) content attribute has the state *true*, the [draggable<sup>p802</sup>](#) IDL attribute must return true.

Otherwise, if the element's [draggable<sup>p802</sup>](#) content attribute has the state *false*, the [draggable<sup>p802</sup>](#) IDL attribute must return false.

Otherwise, the element's [draggable<sup>p802</sup>](#) content attribute has the state *auto*. If the element is an [img<sup>p314</sup>](#) element, an [object<sup>p367</sup>](#) element that [represents<sup>p120</sup>](#) an image, or an [a<sup>p234</sup>](#) element with an [href<sup>p279</sup>](#) content attribute, the [draggable<sup>p802</sup>](#) IDL attribute must return true; otherwise, the [draggable<sup>p802</sup>](#) IDL attribute must return false.

If the [draggable<sup>p802</sup>](#) IDL attribute is set to the value `false`, the [draggable<sup>p802</sup>](#) content attribute must be set to the literal value `"false"`. If the [draggable<sup>p802</sup>](#) IDL attribute is set to the value `true`, the [draggable<sup>p802</sup>](#) content attribute must be set to the literal value `"true"`.

## 6.8.8 Security risks in the drag-and-drop model § <sup>p80</sup><sub>2</sub>

User agents must not make the data added to the [DataTransfer<sup>p789</sup>](#) object during the [dragstart<sup>p801</sup>](#) event available to scripts until the [drop<sup>p801</sup>](#) event, because otherwise, if a user were to drag sensitive information from one document to a second document, crossing a hostile third document in the process, the hostile document could intercept the data.

For the same reason, user agents must consider a drop to be successful only if the user specifically ended the drag operation — if any scripts end the drag operation, it must be considered unsuccessful (canceled) and the [drop<sup>p801</sup>](#) event must not be fired.

User agents should take care to not start drag-and-drop operations in response to script actions. For example, in a mouse-and-window environment, if a script moves a window while the user has their mouse button depressed, the UA would not consider that to start a drag. This is important because otherwise UAs could cause data to be dragged from sensitive sources and dropped into hostile documents without the user's consent.

User agents should filter potentially active (scripted) content (e.g. HTML) when it is dragged and when it is dropped, using a safelist of known-safe features. Similarly, [relative URLs](#) should be turned into absolute URLs to avoid references changing in unexpected ways. This specification does not specify how this is performed.

### Example

Consider a hostile page providing some content and getting the user to select and drag and drop (or indeed, copy and paste) that content to a victim page's [contenteditable<sup>p780</sup>](#) region. If the browser does not ensure that only safe content is dragged, potentially unsafe content such as scripts and event handlers in the selection, once dropped (or pasted) into the victim site, get

the privileges of the victim site. This would thus enable a cross-site scripting attack.

## 7 Loading Web pages §<sup>p80</sup><sub>4</sub>

This section describes features that apply most directly to Web browsers. Having said that, except where specified otherwise, the requirements defined in this section *do* apply to all user agents, whether they are Web browsers or not.

### 7.1 Browsing contexts §<sup>p80</sup><sub>4</sub>

A **browsing context** is an environment in which [Document<sup>p111</sup>](#) objects are presented to the user.

#### Note

A tab or window in a Web browser typically contains a [browsing context<sup>p804</sup>](#), as does an [iframe<sup>p355</sup>](#) or [frame<sup>p1220</sup>](#)s in a [frameset<sup>p1219</sup>](#).

A [browsing context<sup>p804</sup>](#) has a corresponding [WindowProxy<sup>p826</sup>](#) object.

A [browsing context<sup>p804</sup>](#) has an **opener browsing context**, which is null or a [browsing context<sup>p804</sup>](#). It is initially null.

A [browsing context<sup>p804</sup>](#) has a **disowned** boolean. It is initially false.

A [browsing context<sup>p804</sup>](#) has an **is closing** boolean. It is initially false.

A [browsing context<sup>p804</sup>](#) has a [session history<sup>p836</sup>](#), which lists the [Document<sup>p111</sup>](#) objects that the [browsing context<sup>p804</sup>](#) has presented, is presenting, or will present. A [browsing context<sup>p804</sup>](#)'s **active document** is its [WindowProxy<sup>p826</sup>](#) object's [\[\[Window\]\]<sup>p826</sup>](#) internal slot value's [associated Document<sup>p818</sup>](#). A **Document's browsing context** is the [browsing context<sup>p804</sup>](#) whose [session history<sup>p836</sup>](#) contains the [Document<sup>p111</sup>](#), if any such browsing context exists and has not been [discarded<sup>p823</sup>](#), and null otherwise.

#### Note

In general, there is a 1-to-1 mapping from the [Window<sup>p816</sup>](#) object to the [Document<sup>p111</sup>](#) object, as long as the [Document<sup>p111</sup>](#) object has a non-null [browsing context<sup>p804</sup>](#). There is one exception. A [Window<sup>p816</sup>](#) can be reused for the presentation of a second [Document<sup>p111</sup>](#) in the same [browsing context<sup>p804</sup>](#), such that the mapping is then 1-to-2. This occurs when a [browsing context<sup>p804</sup>](#) is [navigated<sup>p852</sup>](#) from the initial [about:blank<sup>p50</sup>](#) [Document<sup>p111</sup>](#) to another, with [replacement enabled<sup>p865</sup>](#).

#### Note

A [Document<sup>p111</sup>](#) does not necessarily have a non-null [browsing context<sup>p804</sup>](#). In particular, data mining tools are likely to never instantiate browsing contexts. A [Document<sup>p111</sup>](#) created using an API such as [createDocument\(\)](#) never has a non-null [browsing context<sup>p804</sup>](#). And the [Document<sup>p111</sup>](#) originally created for an [iframe<sup>p355</sup>](#) element, which has since been [removed from the document<sup>p43</sup>](#), has no associated browsing context, since that browsing context was [discarded<sup>p823</sup>](#).

#### 7.1.1 Creating browsing contexts §<sup>p80</sup><sub>4</sub>

To **set the active document** of a [browsing context<sup>p804</sup>](#) *browsingContext* to a [Document<sup>p111</sup>](#) object *document*, run these steps:

1. Let *window* be *document*'s [relevant global object<sup>p913</sup>](#).

Per this standard *document* can be created before *window*, which does not make much sense. See [issue #2688](#).

2. Set *browsingContext*'s [WindowProxy<sup>p826</sup>](#) object's [\[\[Window\]\]<sup>p826</sup>](#) internal slot value to *window*.
3. Set *window*'s [associated Document<sup>p818</sup>](#) to *document*.
4. Set *window*'s [relevant settings object<sup>p913</sup>](#)'s [execution ready flag<sup>p897</sup>](#).

A [browsing context](#)<sup>p804</sup> has an associated **creator origin** (null or returns an [origin](#)<sup>p829</sup>), **creator URL** (null or returns a [URL](#)), and **creator base URL** (null or returns a [URL](#)). These are all initially null.

To **determine the origin**, given [browsing context](#)<sup>p804</sup> *browsingContext*, [URL](#) *url*, [sandboxing flag set](#)<sup>p833</sup> *sandboxFlags*, and two [origins](#)<sup>p829</sup> *invocationOrigin* and *activeDocumentNavigationOrigin*:

1. If *sandboxFlags* has its [sandboxed origin browsing context flag](#)<sup>p833</sup> set, then return a new [opaque origin](#)<sup>p829</sup>.
2. If *url* is null, then return a new [opaque origin](#)<sup>p829</sup>.
3. If *activeDocumentOrigin* is not null, and *url*'s [scheme](#) is "javascript", then return *activeDocumentNavigationOrigin*.
4. If *invocationOrigin* is non-null and *url* is [about:blank](#)<sup>p50</sup>, then return *invocationOrigin*.

#### Note

The result here is that two documents end up with the same underlying [origin](#)<sup>p829</sup>, meaning that [document.domain](#)<sup>p832</sup> affects both.

5. If *url* is [about:srcdoc](#)<sup>p87</sup>, then return the [origin](#)<sup>p829</sup> of *browsingContext*'s [container document](#)<sup>p806</sup>.
6. Return *url*'s [origin](#).

To **create a new browsing context**, given null or a [Document](#)<sup>p111</sup> object *creator*, [browsing context group](#)<sup>p811</sup> *group*, and an optional *intendedTopLevelOrigin*:

1. Let *browsingContext* be a new [browsing context](#)<sup>p804</sup>.
2. If *creator* is non-null, then set *browsingContext*'s [creator origin](#)<sup>p805</sup> to return *creator*'s [origin](#)<sup>p829</sup>, *browsingContext*'s [creator URL](#)<sup>p805</sup> to return *creator*'s [URL](#), and *browsingContext*'s [creator base URL](#)<sup>p805</sup> to return *creator*'s [base URL](#)<sup>p87</sup>.
3. Let *sandboxFlags* be the result of [determining sandboxing flags](#)<sup>p835</sup> given *browsingContext*.
4. Let *origin* be the result of [determining the origin](#)<sup>p805</sup> given *browsingContext*, [about:blank](#)<sup>p50</sup>, *sandboxFlags*, *browsingContext*'s [creator origin](#)<sup>p805</sup>, and null.
5. Let *featurePolicy* be the result of [creating a feature policy](#) given *browsingContext* and *origin*. [\[FEATUREPOLICY\]](#)<sup>p1266</sup>
6. Let *agent* be the result of [obtaining a similar-origin window agent](#)<sup>p920</sup> given *origin* and *group*.
7. Let *realm execution context* be the result of [creating a new JavaScript realm](#)<sup>p908</sup> given *agent* and the following customizations:
  - For the global object, create a new [Window](#)<sup>p816</sup> object.
  - For the global **this** binding, use *browsingContext*'s [WindowProxy](#)<sup>p826</sup> object.
8. Let *topLevelOrigin* be *intendedTopLevelOrigin*, if present, otherwise let *topLevelOrigin* be *origin*.
9. Let *settingsObject* be the result of [setting up a window environment settings object](#)<sup>p825</sup> given *realm execution context* and *topLevelOrigin*.
10. Let *document* be a new [Document](#)<sup>p111</sup>, marked as an [HTML document](#) in [quirks mode](#), whose [content type](#) is "text/html", [origin](#)<sup>p829</sup> is *origin*, [active sandboxing flag set](#)<sup>p835</sup> is *sandboxFlags*, [feature policy](#)<sup>p112</sup> is *feature policy*, and which is both [ready for post-load tasks](#)<sup>p1145</sup> and [completely loaded](#)<sup>p1145</sup> immediately.
11. Ensure that *document* has a single child [html](#)<sup>p149</sup> node, which itself has two empty child nodes: a [head](#)<sup>p150</sup> element, and a [body](#)<sup>p174</sup> element.
12. [Set the active document](#)<sup>p804</sup> of *browsingContext* to *document*.
13. If *browsingContext*'s [creator URL](#)<sup>p805</sup> is non-null, then set *document*'s [referrer](#)<sup>p111</sup> to the [serialization](#) of it.
14. If *creator* is non-null, then set *document*'s [referrer policy](#)<sup>p112</sup> to *creator*'s [referrer policy](#)<sup>p112</sup>.
15. Add *document* to *browsingContext*'s [session history](#)<sup>p836</sup>.
16. Return *browsingContext*.

To **create a new top-level browsing context**:

1. Let *group* be the result of [creating a new browsing context group](#)<sup>p811</sup>.
2. Return *group*'s [browsing context set](#)<sup>p811</sup>[0].

#### Note

This creates a [top-level browsing context](#)<sup>p807</sup>.

To **create a new auxiliary browsing context**, given a [browsing context](#)<sup>p804</sup> *opener*:

1. Let *group* be *opener*'s [top-level browsing context](#)<sup>p807</sup>'s [group](#)<sup>p807</sup>
2. Assert: *group* is non-null, as [navigating](#)<sup>p852</sup> invokes this directly.
3. Let *browsingContext* be the result of [creating a new browsing context](#)<sup>p805</sup> with *opener*'s [active document](#)<sup>p804</sup> and *group*.
4. [Append](#)<sup>p811</sup> *browsingContext* to *group*.
5. Set *browsingContext*'s [opener browsing context](#)<sup>p804</sup> to *opener*.
6. Assert: *browsingContext*'s [creator origin](#)<sup>p805</sup> is non-null.
7. If *browsingContext*'s [creator origin](#)<sup>p805</sup> is [same origin](#)<sup>p830</sup> with *browsingContext*'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup>, then copy the [sessionStorage](#)<sup>p1041</sup> storage area of *opener* into *browsingContext*'s set of session storage areas. These areas must be considered separate, not affecting each other in any way.
8. Return *browsingContext*.

#### Note

This creates a [top-level browsing context](#)<sup>p807</sup> that is also an [auxiliary browsing context](#)<sup>p807</sup>.

To **create a new nested browsing context**, given an element *element*:

1. Let *topLevelBrowsingContext* be *element*'s [node document](#)'s [browsing context](#)<sup>p804</sup>'s [top-level browsing context](#)<sup>p807</sup>.
2. Let *topLevelOrigin* be *topLevelBrowsingContext*'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup>.
3. Let *browsingContext* be the result of [creating a new browsing context](#)<sup>p805</sup> with *element*'s [node document](#), *topLevelBrowsingContext*'s [group](#)<sup>p807</sup>, and *topLevelOrigin*.
4. Set *element*'s [nested browsing context](#)<sup>p806</sup> to *browsingContext*.
5. If *element* has a `name` attribute, then set *browsingContext*'s [name](#)<sup>p811</sup> to the value of this attribute.

### 7.1.2 Related browsing contexts §<sup>p80</sup><sub>6</sub>

Certain elements (for example, [iframe](#)<sup>p355</sup> elements) can instantiate further [browsing contexts](#)<sup>p804</sup>. These elements are called **browsing context containers**.

Each [browsing context container](#)<sup>p806</sup> has a **nested browsing context**, which is either a [browsing context](#)<sup>p804</sup> or null. It is initially null.

The **container** of a [browsing context](#)<sup>p804</sup> *bc* is the [browsing context container](#)<sup>p806</sup> whose [nested browsing context](#)<sup>p806</sup> is *bc*, or null if there is no such element.

Each [browsing context](#)<sup>p804</sup> *bc* has a **container document**, which is the result of running these steps:

1. If *bc*'s [container](#)<sup>p806</sup> is null, then return null.
2. Return *bc*'s [container](#)<sup>p806</sup>'s [node document](#).

#### Note

This is equal to *bc*'s [container](#)<sup>p806</sup>'s [shadow-including root](#) as *bc*'s [container](#)<sup>p806</sup> has to be [connected](#).

A [browsing context](#)<sup>p804</sup> *child* is said to be a **child browsing context** of another [browsing context](#)<sup>p804</sup> *parent*, if *child*'s [container](#)

[document<sup>p806</sup>](#) is non-null and *child*'s [container document<sup>p806</sup>](#)'s [browsing context<sup>p804</sup>](#) is *parent*.

A [browsing context<sup>p804</sup>](#) *child* is a **document-tree child browsing context** of *parent* if *child* is a [child browsing context<sup>p806</sup>](#) and *child*'s [container<sup>p806</sup>](#) is [in a document tree](#).

A [browsing context<sup>p804</sup>](#) *child* may have a **parent browsing context**. This is the unique [browsing context<sup>p804</sup>](#) that has *child* as a [child browsing context<sup>p806</sup>](#), if any such browsing context exists. Otherwise, the [browsing context<sup>p804</sup>](#) has no [parent browsing context<sup>p807</sup>](#).

A [browsing context<sup>p804</sup>](#) *A* is said to be an **ancestor** of a browsing context *B* if there exists a browsing context *A'* that is a [child browsing context<sup>p806</sup>](#) of *A* and that is itself an [ancestor<sup>p807</sup>](#) of *B*, or if the browsing context *A* is the [parent browsing context<sup>p807</sup>](#) of *B*.

A [browsing context<sup>p804</sup>](#) that has no [parent browsing context<sup>p807</sup>](#) is the **top-level browsing context** for itself and all of the browsing contexts for which it is an [ancestor browsing context<sup>p807</sup>](#).

A [top-level browsing context<sup>p807</sup>](#) has an associated **group** (null or a [browsing context group<sup>p811</sup>](#)). It is initially null.

It is possible to create new browsing contexts that are related to a [top-level browsing context<sup>p807</sup>](#) while their [container<sup>p806</sup>](#) is null. Such browsing contexts are called **auxiliary browsing contexts**. Auxiliary browsing contexts are always [top-level browsing contexts<sup>p807</sup>](#).

The transitive closure of [parent browsing contexts<sup>p807</sup>](#) for a [browsing context<sup>p804</sup>](#) that is a [child browsing context<sup>p806</sup>](#) gives the list of [ancestor browsing contexts<sup>p807</sup>](#).

The **list of the descendant browsing contexts** of a [Document<sup>p111</sup>](#) *d* is the (ordered) list returned by the following algorithm:

1. Let *list* be an empty [list](#).
2. For each [browsing context container<sup>p806</sup>](#) *container*, whose [nested browsing context<sup>p806</sup>](#) is non-null and whose [shadow-including root](#) is *d*, in [shadow-including tree order](#):
  1. Let *nestedBC* be *container*'s [nested browsing context<sup>p806</sup>](#).
  2. [Append](#) *nestedBC* to *list*.
  3. [Extend](#) *list* with the [list of the descendant browsing contexts<sup>p807</sup>](#) of *nestedBC*'s [active document<sup>p804</sup>](#).
3. Return *list*.

A [Document<sup>p111</sup>](#) *d* is said to be **fully active** when *d*'s [browsing context<sup>p804</sup>](#) is non-null, *d*'s [browsing context<sup>p804</sup>](#)'s [active document<sup>p804</sup>](#) is *d*, and either *d*'s [browsing context<sup>p804</sup>](#) is a [top-level browsing context<sup>p807</sup>](#), or *d*'s [container document<sup>p806</sup>](#) is [fully active<sup>p807</sup>](#).

Because they are associated with an element, [child browsing contexts<sup>p806</sup>](#) are always tied to a specific [Document<sup>p111</sup>](#) in their [parent browsing context<sup>p807</sup>](#). User agents must not allow the user to interact with [child browsing contexts<sup>p806</sup>](#) of elements that are in [Document<sup>p111</sup>](#)'s that are not themselves [fully active<sup>p807</sup>](#).

## Example

The following example illustrates the differences between [active<sup>p804</sup>](#) and [fully active<sup>p807</sup>](#) [Document<sup>p111</sup>](#) objects. Here `a.html` is loaded into a browser window, `b-1.html` starts out loaded into an [iframe<sup>p355</sup>](#) as shown, and `b-2.html` and `c.html` are omitted (they can simply be an empty document).

```
<!-- a.html -->
<!DOCTYPE html>
<html lang="en">
<title>Browsing context A</title>

<iframe src="b-1.html"></iframe>
<button onclick="frames[0].location.href = 'b-2.html'">Click me</button>

<!-- b-1.html -->
<!DOCTYPE html>
<html lang="en">
<title>Browsing context B</title>

<iframe src="c.html"></iframe>
```

At this point, the documents given by `a.html`, `b-1.html`, and `c.html` are all the [active documents](#)<sup>p804</sup> of their respective [browsing contexts](#)<sup>p804</sup>. They are also all [fully active](#)<sup>p807</sup>.

After clicking on the [button](#)<sup>p528</sup>, and thus loading a new [Document](#)<sup>p111</sup> from `b-2.html` into browsing context B, we have the following results:

- The `a.html` [Document](#)<sup>p111</sup> remains both the [active document](#)<sup>p804</sup> of browsing context A, and [fully active](#)<sup>p807</sup>.
- The `b-1.html` [Document](#)<sup>p111</sup> is now *not* the [active document](#)<sup>p804</sup> of browsing context B. As such it is also not [fully active](#)<sup>p807</sup>.
- The new `b-2.html` [Document](#)<sup>p111</sup> is now the [active document](#)<sup>p804</sup> of browsing context B, and is also [fully active](#)<sup>p807</sup>.
- The `c.html` [Document](#)<sup>p111</sup> is still the [active document](#)<sup>p804</sup> of browsing context C. However, since C's [container document](#)<sup>p806</sup> is the `b-1.html` [Document](#)<sup>p111</sup>, which is itself not [fully active](#)<sup>p807</sup>, this means the `c.html` [Document](#)<sup>p111</sup> is now not [fully active](#)<sup>p807</sup> (even though it is [active](#)<sup>p804</sup>).

For more explorations of the complexities involved here, especially as it impacts [the session history](#)<sup>p836</sup>, see *A Model of Navigation History*. [[NAVMODEL](#)]<sup>p1268</sup>

A [child browsing context](#)<sup>p806</sup> can be put into a **delaying load events mode**. This is used when it is [navigated](#)<sup>p852</sup>, to [delay the load event](#)<sup>p1145</sup> of its [container](#)<sup>p806</sup> before the new [Document](#)<sup>p111</sup> is created.

The **document family** of a [browsing context](#)<sup>p804</sup> consists of the union of all the [Document](#)<sup>p111</sup> objects in that [browsing context](#)<sup>p804</sup>'s [session history](#)<sup>p836</sup> and the [document families](#)<sup>p808</sup> of all those [Document](#)<sup>p111</sup> objects. The [document family](#)<sup>p808</sup> of a [Document](#)<sup>p111</sup> object consists of the union of all the [document families](#)<sup>p808</sup> of the [browsing contexts](#)<sup>p804</sup> in the [list of the descendant browsing contexts](#)<sup>p807</sup> of the [Document](#)<sup>p111</sup> object.

The **content document** of a [browsing context container](#)<sup>p806</sup> *container* is the result of the following algorithm:

1. If *container's* [nested browsing context](#)<sup>p806</sup> is null, then return null.
2. Let *context* be *container's* [nested browsing context](#)<sup>p806</sup>.
3. Let *document* be *context's* [active document](#)<sup>p804</sup>.
4. If *document's* [origin](#)<sup>p829</sup> and *container's* [node document's](#) [origin](#)<sup>p829</sup> are not [same origin-domain](#)<sup>p830</sup>, then return null.
5. Return *document*.

### 7.1.2.1 Navigating related browsing contexts in the DOM §<sup>p80</sup><sub>B</sub>

For web developers (non-normative)

#### **`window . top`**<sup>p808</sup>

Returns the [WindowProxy](#)<sup>p826</sup> for the [top-level browsing context](#)<sup>p807</sup>.

#### **`window . opener`**<sup>p809</sup> [ = value ]

Returns the [WindowProxy](#)<sup>p826</sup> for the [opener browsing context](#)<sup>p804</sup>.

Returns null if there isn't one or if it has been set to null.

Can be set to null.

#### **`window . parent`**<sup>p809</sup>

Returns the [WindowProxy](#)<sup>p826</sup> for the [parent browsing context](#)<sup>p807</sup>.

#### **`window . frameElement`**<sup>p809</sup>

Returns the [Element](#) for the [browsing context container](#)<sup>p806</sup>.

Returns null if there isn't one, and in cross-origin situations.

The **top** attribute's getter must run these steps:

1. If this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#) is null, then return null.
2. Return this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#)'s [top-level browsing context<sup>p807</sup>](#)'s [WindowProxy<sup>p826</sup>](#) object.

The **opener** attribute's getter must run these steps:

1. Let *current* be this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#).
2. If *current* is null, then return null.
3. If *current*'s [disowned<sup>p804</sup>](#) is true, then return null.
4. If *current*'s [opener browsing context<sup>p804</sup>](#) is null, then return null.
5. Return *current*'s [opener browsing context<sup>p804</sup>](#)'s [WindowProxy<sup>p826</sup>](#) object.

The [opener<sup>p809</sup>](#) attribute's setter must run these steps:

1. If the given value is null and this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#) is non-null, then set this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#)'s [disowned<sup>p804</sup>](#) to true.
2. If the given value is non-null, then return ? [OrdinaryDefineOwnProperty](#)(this [Window<sup>p816</sup>](#) object, "opener", { [[Value]]: the given value, [[Writable]]: true, [[Enumerable]]: true, [[Configurable]]: true }).

#### Note

If a [browsing context<sup>p804</sup>](#)'s [disowned<sup>p804</sup>](#) is true, its [window.opener<sup>p809</sup>](#) attribute is null. That prevents scripts in the [browsing context<sup>p804</sup>](#) from changing any properties of its [opener browsing context<sup>p804</sup>](#)'s [Window<sup>p816</sup>](#) object (i.e., the [Window<sup>p816</sup>](#) object from which the [browsing context<sup>p804</sup>](#) was created).

Otherwise, if a [browsing context<sup>p804</sup>](#)'s [disowned<sup>p804</sup>](#) is false, then scripts in that [browsing context<sup>p804</sup>](#) can use [window.opener<sup>p809</sup>](#) to change properties of its [opener browsing context<sup>p804</sup>](#)'s [Window<sup>p816</sup>](#) object. For example, a script running in the [browsing context<sup>p804</sup>](#) can change the value of `window.opener.location`, causing the [opener browsing context<sup>p804</sup>](#) to navigate to a completely different document.

The **parent** attribute's getter must run these steps:

1. Let *current* be this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#).
2. If *current* is null, then return null.
3. If *current* is a [child browsing context<sup>p806</sup>](#) of another [browsing context<sup>p804</sup>](#) parent, then return parent's [WindowProxy<sup>p826</sup>](#) object.
4. Assert: *current* is a [top-level browsing context<sup>p807</sup>](#).
5. Return *current*'s [WindowProxy<sup>p826</sup>](#) object.

The **frameElement** attribute's getter must run these steps:

1. Let *current* be this [Window<sup>p816</sup>](#) object's [browsing context<sup>p818</sup>](#).
2. If *current* is null, then return null.
3. Let *container* be *current*'s [container<sup>p806</sup>](#).
4. If *container* is null, then return null.
5. If *container*'s [node document](#)'s [origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [current settings object<sup>p913</sup>](#)'s [origin<sup>p897</sup>](#), then return null.
6. Return *container*.

#### Example

An example of when these IDL attributes can return null is as follows:

```
<!DOCTYPE html>
<iframe></iframe>
```

```

<script>
"use strict";
const element = document.querySelector("iframe");
const iframeWindow = element.contentWindow;
element.remove();

console.assert(iframeWindow.top === null);
console.assert(iframeWindow.parent === null);
console.assert(iframeWindow.frameElement === null);
</script>

```

Here the [browsing context](#)<sup>p804</sup> corresponding to `iframeWindow` was [discarded](#)<sup>p823</sup> when `element` was removed from the document.

### 7.1.3 Security <sup>p81</sup><sub>o</sub>

A [browsing context](#)<sup>p804</sup> *A* is **familiar with** a second [browsing context](#)<sup>p804</sup> *B* if one of the following conditions is true:

- Either the [origin](#)<sup>p829</sup> of the [active document](#)<sup>p804</sup> of *A* is the [same](#)<sup>p830</sup> as the [origin](#)<sup>p829</sup> of the [active document](#)<sup>p804</sup> of *B*, or
- The browsing context *A* is a [child browsing context](#)<sup>p806</sup> and its [top-level browsing context](#)<sup>p807</sup> is *B*, or
- The browsing context *B* is an [auxiliary browsing context](#)<sup>p807</sup> and *A* is [familiar with](#)<sup>p810</sup> *B*'s [opener browsing context](#)<sup>p804</sup>, or
- The browsing context *B* is not a [top-level browsing context](#)<sup>p807</sup>, but there exists an [ancestor browsing context](#)<sup>p807</sup> of *B* whose [active document](#)<sup>p804</sup> has the [same](#)<sup>p830</sup> [origin](#)<sup>p829</sup> as the [active document](#)<sup>p804</sup> of *A* (possibly in fact being *A* itself).

A [browsing context](#)<sup>p804</sup> *A* is **allowed to navigate** a second [browsing context](#)<sup>p804</sup> *B* if the following algorithm returns true:

1. If *A* is not the same [browsing context](#)<sup>p804</sup> as *B*, and *A* is not one of the [ancestor browsing contexts](#)<sup>p807</sup> of *B*, and *B* is not a [top-level browsing context](#)<sup>p807</sup>, and *A*'s [active document](#)<sup>p804</sup>'s [active sandboxing flag set](#)<sup>p835</sup> has its [sandboxed navigation browsing context flag](#)<sup>p833</sup> set, then return false.
2. Otherwise, if *B* is a [top-level browsing context](#)<sup>p807</sup>, and is one of the [ancestor browsing contexts](#)<sup>p807</sup> of *A*, then:
  1. If *A*'s [WindowProxy](#)<sup>p826</sup>'s `[[Window]]` value has [transient activation](#)<sup>p760</sup> and *A*'s [active document](#)<sup>p804</sup>'s [active sandboxing flag set](#)<sup>p835</sup> has its [sandboxed top-level navigation with user activation browsing context flag](#)<sup>p833</sup> set, then return false.
  2. Otherwise, if *A*'s [WindowProxy](#)<sup>p826</sup>'s `[[Window]]` value does not have [transient activation](#)<sup>p760</sup> and *A*'s [active document](#)<sup>p804</sup>'s [active sandboxing flag set](#)<sup>p835</sup> has its [sandboxed top-level navigation without user activation browsing context flag](#)<sup>p833</sup> set, then return false.
3. Otherwise, if *B* is a [top-level browsing context](#)<sup>p807</sup>, and is neither *A* nor one of the [ancestor browsing contexts](#)<sup>p807</sup> of *A*, and *A*'s [Document](#)<sup>p111</sup>'s [active sandboxing flag set](#)<sup>p835</sup> has its [sandboxed navigation browsing context flag](#)<sup>p833</sup> set, and *A* is not the [one permitted sandboxed navigator](#)<sup>p833</sup> of *B*, then return false.
4. Return true.

An element has a **browsing context scope origin** if its [Document](#)<sup>p111</sup>'s [browsing context](#)<sup>p804</sup> is a [top-level browsing context](#)<sup>p807</sup> or if all of its [Document](#)<sup>p111</sup>'s [ancestor browsing contexts](#)<sup>p807</sup> all have [active documents](#)<sup>p804</sup> whose [origin](#)<sup>p829</sup> are the [same origin](#)<sup>p830</sup> as the element's [node document](#)'s [origin](#)<sup>p829</sup>. If an element has a [browsing context scope origin](#)<sup>p810</sup>, then its value is the [origin](#)<sup>p829</sup> of the element's [node document](#).

### 7.1.4 Groupings of browsing contexts <sup>§ p81</sup><sub>1</sub>

A user agent holds a **browsing context group set** (a [set](#) of [browsing context groups](#)<sup>p811</sup>).

A **browsing context group** holds a **browsing context set** (a [set](#) of [top-level browsing contexts](#)<sup>p807</sup>).

A [browsing context group](#)<sup>p811</sup> has an associated **agent cluster map** (a weak [map](#) of [agent cluster keys](#)<sup>p920</sup> to [agent clusters](#)). User agents are responsible for collecting agent clusters when it is deemed that nothing can access them anymore.

To **create a new browsing context group**, run these steps:

1. Let *group* be a new [browsing context group](#)<sup>p811</sup>.
2. [Append](#) *group* to the user agent's [browsing context group set](#)<sup>p811</sup>.
3. Let *browsingContext* be the result of [creating a new browsing context](#)<sup>p805</sup> with null and *group*.
4. [Append](#)<sup>p811</sup> *browsingContext* to *group*.
5. Return *group*.

To **append** a [top-level browsing context](#)<sup>p807</sup> *browsingContext* to a [browsing context group](#)<sup>p811</sup> *group*, run these steps:

1. [Append](#) *browsingContext* to *group*'s [browsing context set](#)<sup>p811</sup>.
2. Set *browsingContext*'s [group](#)<sup>p807</sup> to *group*.

To **remove** a [top-level browsing context](#)<sup>p807</sup> *browsingContext*, run these steps:

1. Assert: *browsingContext*'s [group](#)<sup>p807</sup> is non-null, because a [browsing context](#)<sup>p804</sup> only gets [discarded](#)<sup>p823</sup> once.
2. Let *group* be *browsingContext*'s [group](#)<sup>p807</sup>.
3. Set *browsingContext*'s [group](#)<sup>p807</sup> to null.
4. [Remove](#) *browsingContext* from *group*'s [browsing context set](#)<sup>p811</sup>.
5. If *group*'s [browsing context set](#)<sup>p811</sup> is empty, then [remove](#) *group* from the user agent's [browsing context group set](#)<sup>p811</sup>.

#### Note

[Append](#)<sup>p811</sup> and [remove](#)<sup>p811</sup> are primitive operations that help define the lifetime of a [browsing context group](#)<sup>p811</sup>. They are called from [creating a new browsing context group](#)<sup>p811</sup>, [creating a new auxiliary browsing context](#)<sup>p806</sup>, and [discarding a browsing context](#)<sup>p823</sup>.

#### Note

The HTML Standard used to define "unit of related browsing contexts" and "unit of related similar-origin browsing contexts". These have been removed as they were not adequate.

### 7.1.5 Browsing context names <sup>§ p81</sup><sub>1</sub>

Browsing contexts can have a **browsing context name**. Unless stated otherwise, it is the empty string.

A **valid browsing context name** is any string with at least one character that does not start with a U+005F LOW LINE character. (Names starting with an underscore are reserved for special keywords.)

A **valid browsing context name or keyword** is any string that is either a [valid browsing context name](#)<sup>p811</sup> or that is an [ASCII case-insensitive](#) match for one of: `_blank`, `_self`, `_parent`, or `_top`.

These values have different meanings based on whether the page is sandboxed or not, as summarized in the following (non-normative) table. In this table, "current" means the [browsing context](#)<sup>p804</sup> that the link or script is in, "parent" means the [parent browsing context](#)<sup>p807</sup> of the one the link or script is in, "top" means the [top-level browsing context](#)<sup>p807</sup> of the one the link or script is in, "new" means a new [top-level browsing context](#)<sup>p807</sup> or [auxiliary browsing context](#)<sup>p807</sup> is to be created, subject to various user preferences and

user agent policies, "none" means that nothing will happen, and "maybe new" means the same as "new" if the "[allow-popups](#)<sup>p834</sup>" keyword is also specified on the [sandbox](#)<sup>p359</sup> attribute (or if the user overrode the sandboxing), and the same as "none" otherwise.

Keyword	Ordinary effect	Effect in an <a href="#">iframe</a> <sup>p355</sup> with...	
		sandbox=""	sandbox="allow-top-navigation"
none specified, for links and form submissions	current	current	current
empty string	current	current	current
<code>_blank</code>	new	maybe new	maybe new
<code>_self</code>	current	current	current
<code>_parent</code> if there isn't a parent	current	current	current
<code>_parent</code> if parent is also top	parent/top	none	parent/top
<code>_parent</code> if there is one and it's not top	parent	none	none
<code>_top</code> if top is current	current	current	current
<code>_top</code> if top is not current	top	none	top
name that doesn't exist	new	maybe new	maybe new
name that exists and is a descendant	specified descendant	specified descendant	specified descendant
name that exists and is current	current	current	current
name that exists and is an ancestor that is top	specified ancestor	none	specified ancestor/top
name that exists and is an ancestor that is not top	specified ancestor	none	none
other name that exists with common top	specified	none	none
name that exists with different top, if <a href="#">familiar</a> <sup>p810</sup> and <a href="#">one permitted sandboxed navigator</a> <sup>p833</sup>	specified	specified	specified
name that exists with different top, if <a href="#">familiar</a> <sup>p810</sup> but not <a href="#">one permitted sandboxed navigator</a> <sup>p833</sup>	specified	none	none
name that exists with different top, not <a href="#">familiar</a> <sup>p810</sup>	new	maybe new	maybe new

Most of the restrictions on sandboxed browsing contexts are applied by other algorithms, e.g. the [navigation](#)<sup>p852</sup> algorithm, not [the rules for choosing a browsing context](#)<sup>p812</sup> given below.

**The rules for choosing a browsing context**, given a [browsing context name](#)<sup>p811</sup> *name*, a [browsing context](#)<sup>p804</sup> *current*, and a boolean *noopener* are as follows:

- Let *chosen* be null.
- Let *new* be false.
- Let *sandboxingFlagSet* be *current*'s [active document](#)<sup>p804</sup>'s [active sandboxing flag set](#)<sup>p835</sup>.
- If *name* is the empty string or an [ASCII case-insensitive](#) match for "`_self`", then set *chosen* to *current*.
- Otherwise, if *name* is an [ASCII case-insensitive](#) match for "`_parent`", set *chosen* to *current*'s [parent browsing context](#)<sup>p807</sup>, if any, and *current* otherwise.
- Otherwise, if *name* is an [ASCII case-insensitive](#) match for "`_top`", set *chosen* to *current*'s [top-level browsing context](#)<sup>p807</sup>, if any, and *current* otherwise.
- Otherwise, if *name* is not an [ASCII case-insensitive](#) match for "`_blank`", there exists a browsing context whose [name](#)<sup>p811</sup> is the same as *name*, *current* is [familiar with](#)<sup>p810</sup> that browsing context, and the user agent determines that the two browsing contexts are related enough that it is ok if they reach each other, set *chosen* to that browsing context. If there are multiple matching browsing contexts, the user agent should set *chosen* to one in some arbitrary consistent manner, such as the most recently opened, most recently focused, or more closely related.

This will be made more precise in [issue #313](#).

- Otherwise, a new browsing context is being requested, and what happens depends on the user agent's configuration and abilities — it is determined by the rules given for the first applicable option from the following list:
  - ↪ If *current*'s [WindowProxy](#)<sup>p826</sup>'s `[[Window]]` value does not have [transient activation](#)<sup>p760</sup> and the user agent has been configured to not show popups (i.e. the user agent has a "popup blocker" enabled)
    - The user agent may inform the user that a popup has been blocked.

↪ If `sandboxingFlagSet` has the [sandboxed auxiliary navigation browsing context flag](#)<sup>p833</sup> set

The user agent may offer the user one of:

1. Set `chosen` to the result of [creating a new top-level browsing context](#)<sup>p805</sup> and set `new` to true.
2. Set `chosen` to an existing [top-level browsing context](#)<sup>p807</sup>.

**Warning!**

*If this case occurs, it means that an author has explicitly sandboxed the document that is trying to open a link.*

**Note**

*If the user declines or the user agent doesn't offer the above, the variables remain unchanged.*

↪ If the user agent has been configured such that in this instance it will create a new browsing context

1. Set `new` to true.
2. If `noopener` is true, then set `chosen` to the result of [creating a new top-level browsing context](#)<sup>p805</sup>.
3. Otherwise:
  1. Set `chosen` to the result of [creating a new auxiliary browsing context](#)<sup>p806</sup> with `current`.
  2. If `sandboxingFlagSet`'s [sandboxed navigation browsing context flag](#)<sup>p833</sup> is set, then `current` must be set as `chosen`'s [one permitted sandboxed navigator](#)<sup>p833</sup>.
4. If `sandboxingFlagSet`'s [sandbox propagates to auxiliary browsing contexts flag](#)<sup>p834</sup> is set, then all the flags that are set in `sandboxingFlagSet` must be set in `chosen`'s [popup sandboxing flag set](#)<sup>p835</sup>.
5. If `name` is not an [ASCII case-insensitive](#) match for "\_blank", then set `chosen`'s [name](#)<sup>p811</sup> to `name`.

**Note**

*If the newly created [browsing context](#)<sup>p804</sup> is immediately [navigated](#)<sup>p852</sup>, then the navigation will be done with [replacement enabled](#)<sup>p865</sup>.*

↪ If the user agent has been configured such that in this instance it will reuse `current`

Set `chosen` to `current`.

↪ If the user agent has been configured such that in this instance it will not find a browsing context

Do nothing.

**Note**

*User agents are encouraged to provide a way for users to configure the user agent to always reuse `current`.*

9. Return `chosen` and `new`.

## 7.2 Security infrastructure for [Window](#)<sup>p816</sup>, [WindowProxy](#)<sup>p826</sup>, and [Location](#)<sup>p844</sup> objects §<sup>p81</sup><sub>3</sub>

Although typically objects cannot be accessed across [origins](#)<sup>p829</sup>, the web platform would not be true to itself if it did not have some legacy exceptions to that rule that the web depends upon.

### 7.2.1 Integration with IDL §<sup>p81</sup><sub>3</sub>

When [perform a security check](#) is invoked, with a `platformObject`, `identifier`, and `type`, run these steps:

1. If `platformObject` is not a [Window](#)<sup>p816</sup> or [Location](#)<sup>p844</sup> object, then return.

2. For each  $e$  of ! [CrossOriginProperties](#)<sup>p814</sup>( $platformObject$ ):
  1. If [SameValue](#)( $e.[[Property]]$ ,  $identifier$ ) is true, then:
    1. If  $type$  is "method" and  $e$  has neither  $[[NeedsGet]]$  nor  $[[NeedsSet]]$ , then return.
    2. Otherwise, if  $type$  is "getter" and  $e.[[NeedsGet]]$  is true, then return.
    3. Otherwise, if  $type$  is "setter" and  $e.[[NeedsSet]]$  is true, then return.
  3. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>( $platformObject$ ) is false, then throw a "[SecurityError](#)" [DOMException](#).

## 7.2.2 Shared internal slot: [\[\[CrossOriginPropertyDescriptorMap\]\]](#) §<sup>p81</sup><sub>4</sub>

[Window](#)<sup>p816</sup> and [Location](#)<sup>p844</sup> objects both have a [\[\[CrossOriginPropertyDescriptorMap\]\]](#) internal slot, whose value is initially an empty map.

### Note

The [\[\[CrossOriginPropertyDescriptorMap\]\]](#)<sup>p814</sup> internal slot contains a map with entries whose keys are (currentGlobal, objectGlobal, propertyKey)-tuples and values are property descriptors, as a memoization of what is visible to scripts when currentGlobal inspects a [Window](#)<sup>p816</sup> or [Location](#)<sup>p844</sup> object from objectGlobal. It is filled lazily by [CrossOriginGetOwnPropertyHelper](#)<sup>p815</sup>, which consults it on future lookups.

User agents should allow a value held in the map to be garbage collected along with its corresponding key when nothing holds a reference to any part of the value. That is, as long as garbage collection is not observable.

### Example

For example, with `const href = Object.getOwnPropertyDescriptor(crossOriginLocation, "href").set` the value and its corresponding key in the map cannot be garbage collected as that would be observable.

User agents may have an optimization whereby they remove key-value pairs from the map when [document.domain](#)<sup>p832</sup> is set. This is not observable as [document.domain](#)<sup>p832</sup> cannot revisit an earlier value.

### Example

For example, setting [document.domain](#)<sup>p832</sup> to "example.com" on www.example.com means user agents can remove all key-value pairs from the map where part of the key is www.example.com, as that can never be part of the [origin](#)<sup>p829</sup> again and therefore the corresponding value could never be retrieved from the map.

## 7.2.3 Shared abstract operations §<sup>p81</sup><sub>4</sub>

### 7.2.3.1 CrossOriginProperties ( O ) §<sup>p81</sup><sub>4</sub>

1. Assert:  $O$  is a [Location](#)<sup>p844</sup> or [Window](#)<sup>p816</sup> object.
2. If  $O$  is a [Location](#)<sup>p844</sup> object, then return « {  $[[Property]]$ : "href",  $[[NeedsGet]]$ : false,  $[[NeedsSet]]$ : true }, {  $[[Property]]$ : "replace" } ».
3. Return « {  $[[Property]]$ : "window",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "self",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "location",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : true }, {  $[[Property]]$ : "close" }, {  $[[Property]]$ : "closed",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "focus" }, {  $[[Property]]$ : "blur" }, {  $[[Property]]$ : "frames",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "length",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "top",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "opener",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "parent",  $[[NeedsGet]]$ : true,  $[[NeedsSet]]$ : false }, {  $[[Property]]$ : "postMessage" } ».

### Note

Indexed properties do not need to be safelisted as they are handled directly by the [WindowProxy](#)<sup>p826</sup> object.

### 7.2.3.2 CrossOriginPropertyFallback ( P ) § p81<sub>5</sub>

1. If *P* is "then", @@toStringTag<sup>p53</sup>, @@hasInstance<sup>p53</sup>, or @@isConcatSpreadable<sup>p53</sup>, then return `PropertyDescriptor{ [[Value]]: undefined, [[Writable]]: false, [[Enumerable]]: false, [[Configurable]]: true }`.
2. Throw a "SecurityError" `DOMException`.

### 7.2.3.3 IsPlatformObjectSameOrigin ( O ) § p81<sub>5</sub>

1. Return true if the `current settings object`<sup>p913</sup>'s `origin`<sup>p897</sup> is `same origin-domain`<sup>p830</sup> with *O*'s `relevant settings object`<sup>p913</sup>'s `origin`<sup>p897</sup>, and false otherwise.

### 7.2.3.4 CrossOriginGetOwnPropertyHelper ( O, P ) § p81<sub>5</sub>

**Note** *If this abstract operation returns undefined and there is no custom behavior, the caller needs to throw a "SecurityError" DOMException. In practice this is handled by the caller calling CrossOriginPropertyFallback<sup>p815</sup>.*

1. Let `crossOriginKey` be a tuple consisting of the `current settings object`<sup>p913</sup>, *O*'s `relevant settings object`<sup>p913</sup>, and *P*.
2. For each *e* of ! `CrossOriginProperties`<sup>p814</sup>(*O*):
  1. If `SameValue`(*e*.[[Property]], *P*) is true, then:
    1. If the value of the `[[CrossOriginPropertyDescriptorMap]]`<sup>p814</sup> internal slot of *O* contains an entry whose key is `crossOriginKey`, then return that entry's value.
    2. Let `originalDesc` be `OrdinaryGetOwnProperty`(*O*, *P*).
    3. Let `crossOriginDesc` be undefined.
    4. If *e*.[[NeedsGet]] and *e*.[[NeedsSet]] are absent, then:
      1. Let `value` be `originalDesc`.[[Value]].
      2. If ! `IsCallable`(`value`) is true, then set `value` to an anonymous built-in function, created in the `current Realm Record`, that performs the same steps as the IDL operation *P* on object *O*.
      3. Set `crossOriginDesc` to `PropertyDescriptor{ [[Value]]: value, [[Enumerable]]: false, [[Writable]]: false, [[Configurable]]: true }`.
    5. Otherwise:
      1. Let `crossOriginGet` be undefined.
      2. If *e*.[[NeedsGet]] is true, then set `crossOriginGet` to an anonymous built-in function, created in the `current Realm Record`, that performs the same steps as the getter of the IDL attribute *P* on object *O*.
      3. Let `crossOriginSet` be undefined.
      4. If *e*.[[NeedsSet]] is true, then set `crossOriginSet` to an anonymous built-in function, created in the `current Realm Record`, that performs the same steps as the setter of the IDL attribute *P* on object *O*.
      5. Set `crossOriginDesc` to `PropertyDescriptor{ [[Get]]: crossOriginGet, [[Set]]: crossOriginSet, [[Enumerable]]: false, [[Configurable]]: true }`.
    6. Create an entry in the value of the `[[CrossOriginPropertyDescriptorMap]]`<sup>p814</sup> internal slot of *O* with key `crossOriginKey` and value `crossOriginDesc`.
    7. Return `crossOriginDesc`.
  3. Return undefined.

## Note

The reason that the property descriptors produced here are configurable is to preserve the [invariants of the essential internal methods](#) required by the JavaScript specification. In particular, since the value of the property can change as a consequence of navigation, it is required that the property be configurable. (However, see [tc39/ecma262 issue #672](#) and references to it elsewhere in this specification for cases where we are not able to preserve these invariants, for compatibility with existing Web content.) [\[JAVASCRIPT\]<sup>p1267</sup>](#)

## Note

The reason the property descriptors are non-enumerable, despite this mismatching the same-origin behavior, is for compatibility with existing Web content. See [issue #3183](#) for details.

### 7.2.3.5 CrossOriginGet ( O, P, Receiver ) §<sup>p81</sup><sub>6</sub>

1. Let *desc* be ? *O*.[[GetOwnProperty]](*P*).
2. Assert: *desc* is not undefined.
3. If ! [IsDataDescriptor](#)(*desc*) is true, then return *desc*.[[Value]].
4. Assert: [IsAccessorDescriptor](#)(*desc*) is true.
5. Let *getter* be *desc*.[[Get]].
6. If *getter* is undefined, then throw a ["SecurityError" DOMException](#).
7. Return ? [Call](#)(*getter*, *Receiver*).

### 7.2.3.6 CrossOriginSet ( O, P, V, Receiver ) §<sup>p81</sup><sub>6</sub>

1. Let *desc* be ? *O*.[[GetOwnProperty]](*P*).
2. Assert: *desc* is not undefined.
3. If *desc*.[[Set]] is present and its value is not undefined, then:
  1. Perform ? [Call](#)(*setter*, *Receiver*, «*V*»).
  2. Return true.
4. Throw a ["SecurityError" DOMException](#).

### 7.2.3.7 CrossOriginOwnPropertyKeys ( O ) §<sup>p81</sup><sub>6</sub>

1. Let *keys* be a new empty [List](#).
2. For each *e* of ! [CrossOriginProperties](#)<sup>p814</sup>(*O*), [append](#) *e*.[[Property]] to *keys*.
3. Return the concatenation of *keys* and « "then", [@@toStringTag](#)<sup>p53</sup>, [@@hasInstance](#)<sup>p53</sup>, [@@isConcatSpreadable](#)<sup>p53</sup> ».

## 7.3 The [Window](#)<sup>p816</sup> object §<sup>p81</sup><sub>6</sub>

```
IDL
[Global=Window,
 Exposed=Window,
 LegacyUnenumerableNamedProperties]
interface Window : EventTarget {
```

```

// the current browsing context
[LegacyUnforgeable] readonly attribute WindowProxy window;
[Replaceable] readonly attribute WindowProxy self;
[LegacyUnforgeable] readonly attribute Document document;
attribute DOMString name;
[PutForwards=href, LegacyUnforgeable] readonly attribute Location location;
readonly attribute History history;
readonly attribute CustomElementRegistry customElements;
[Replaceable] readonly attribute BarProp locationbar;
[Replaceable] readonly attribute BarProp menubar;
[Replaceable] readonly attribute BarProp personalbar;
[Replaceable] readonly attribute BarProp scrollbar;
[Replaceable] readonly attribute BarProp statusbar;
[Replaceable] readonly attribute BarProp toolbar;
attribute DOMString status;
void close();
readonly attribute boolean closed;
void stop();
void focus();
void blur();

// other browsing contexts
[Replaceable] readonly attribute WindowProxy frames;
[Replaceable] readonly attribute unsigned long length;
[LegacyUnforgeable] readonly attribute WindowProxy? top;
attribute any opener;
[Replaceable] readonly attribute WindowProxy? parent;
readonly attribute Element? frameElement;
WindowProxy? open(optional USVString url = "", optional DOMString target = "_blank", optional
[LegacyNullToEmptyString] DOMString features = "");
getter object (DOMString name);
// Since this is the global object, the IDL named getter adds a NamedPropertiesObject exotic
// object on the prototype chain. Indeed, this does not make the global object an exotic object.
// Indexed access is taken care of by the WindowProxy exotic object.

// the user agent
readonly attribute Navigator navigator;
[SecureContext] readonly attribute ApplicationCache applicationCache;

// user prompts
void alert();
void alert(DOMString message);
boolean confirm(optional DOMString message = "");
DOMString? prompt(optional DOMString message = "", optional DOMString default = "");
void print();

void postMessage(any message, USVString targetOrigin, optional sequence<object> transfer = []);
void postMessage(any message, optional WindowPostMessageOptions options = {});
};
Window includes GlobalEventHandlers;
Window includes WindowEventHandlers;

dictionary WindowPostMessageOptions : PostMessageOptions {
  USVString targetOrigin = "/";
};

```

## Note

**`window . window`**<sup>p818</sup>

**`window . frames`**<sup>p818</sup>

**`window . self`**<sup>p818</sup>

These attributes all return *window*.

**`window . document`**<sup>p818</sup>

Returns the [Document](#)<sup>p111</sup> associated with *window*.

**`document . defaultView`**<sup>p818</sup>

Returns the [Window](#)<sup>p816</sup> object of the [active document](#)<sup>p804</sup>.

The [Window](#)<sup>p816</sup> object has an **associated Document**, which is a [Document](#)<sup>p111</sup> object. It is set when the [Window](#)<sup>p816</sup> object is created, and only ever changed during [navigation](#)<sup>p852</sup> from the initial [about:blank](#)<sup>p50</sup> [Document](#)<sup>p111</sup>.

The [Window](#)<sup>p816</sup> object's **browsing context** is the [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup>'s [browsing context](#)<sup>p804</sup>. *It is either null or a [browsing context](#)<sup>p804</sup>.*

The **`window`**, **`frames`**, and **`self`** attributes' getters must return this [Window](#)<sup>p816</sup> object's [relevant Realm](#)<sup>p913</sup>.[\[\[GlobalEnv\]\]](#)'s [EnvironmentRecord](#)'s [\[\[GlobalThisValue\]\]](#). ✓ MDN

The **`document`** IDL attribute, on getting, must return this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup>. ✓ MDN

## Note

The [Document](#)<sup>p111</sup> object associated with a [Window](#)<sup>p816</sup> object can change in exactly one case: when the [navigate](#)<sup>p852</sup> algorithm creates a new [Document object](#)<sup>p857</sup> for the first page loaded in a [browsing context](#)<sup>p804</sup>. In that specific case, the [Window](#)<sup>p816</sup> object of the original [about:blank](#)<sup>p50</sup> page is reused and gets a new [Document](#)<sup>p111</sup> object.

The **`defaultView`** attribute's getter, when invoked, must run these steps: ✓ MDN

1. If this [Document](#)<sup>p111</sup> object's [browsing context](#)<sup>p804</sup> is null, then return null.
2. Return this [Document](#)<sup>p111</sup> object's [browsing context](#)<sup>p804</sup>'s [WindowProxy](#)<sup>p826</sup> object.

For historical reasons, [Window](#)<sup>p816</sup> objects must also have a writable, configurable, non-enumerable property named **`HTMLDocument`**<sup>p818</sup> whose value is the [Document](#)<sup>p111</sup> interface object. MDN

## 7.3.1 APIs for creating and navigating browsing contexts by name § p818

For web developers (non-normative)

**`window = window . open`**<sup>p819</sup>( [ *url* [, *target* [, *features* ] ] ] )

Opens a window to show *url* (defaults to [about:blank](#)<sup>p50</sup>), and returns it. The *target* argument gives the name of the new window. If a window exists with that name already, it is reused. The *features* argument can be used to influence the rendering of the new window.

**`window . name`**<sup>p821</sup> [ = *value* ]

Returns the name of the window.

Can be set, to change the name.

**`window . close`**<sup>p821</sup>( )

Closes the window.

**`window . closed`**<sup>p821</sup>

Returns true if the window has been closed, false otherwise.

**`window . stop`**<sup>p821</sup>( )

Cancels the document load.

The **window open steps**, given a string *url*, a string *target*, and a string *features*, are as follows:

1. If the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> is nonzero, return null.
2. Let *source browsing context* be the [entry global object](#)<sup>p910</sup>'s [browsing context](#)<sup>p818</sup>.
3. If *target* is the empty string, then set *target* to `"_blank"`.
4. Let *tokenizedFeatures* be the result of [tokenizing](#)<sup>p820</sup> *features*.
5. Let *noopener* and *noreferrer* be false.
6. If *tokenizedFeatures*["noopener"] [exists](#), then:
  1. Set *noopener* to the result of [parsing tokenizedFeatures\["noopener"\] as a boolean feature](#)<sup>p820</sup>.
  2. [Remove](#) *tokenizedFeatures*["noopener"].
7. If *tokenizedFeatures*["noreferrer"] [exists](#), then:
  1. Set *noreferrer* to the result of [parsing tokenizedFeatures\["noreferrer"\] as a boolean feature](#)<sup>p820</sup>.
  2. [Remove](#) *tokenizedFeatures*["noreferrer"].
8. If *noreferrer* is true, then set *noopener* to true.
9. Let *target browsing context* and *new* be the result of applying [the rules for choosing a browsing context](#)<sup>p812</sup> given *target*, *source browsing context*, and *noopener*.

#### Example

If there is a user agent that supports control-clicking a link to open it in a new tab, and the user control-clicks on an element whose [onclick](#)<sup>p941</sup> handler uses the [window.open\(\)](#)<sup>p819</sup> API to open a page in an [iframe](#)<sup>p355</sup> element, the user agent could override the selection of the target browsing context to instead target a new tab.

10. If *target browsing context* is null, then return null.
11. If *new* is true, then [set up browsing context features](#) for *target browsing context* given *tokenizedFeatures*. [\[CSSOMVIEW\]](#)<sup>p1265</sup>
12. Let *urlRecord* be the [URL](#) `"about:blank"`<sup>p59</sup>.
13. If *url* is not the empty string or *new* is true, then:
  1. If *url* is not the empty string, then [parse](#)<sup>p87</sup> *url* relative to the [entry settings object](#)<sup>p910</sup>, and set *urlRecord* to the [resulting URL record](#)<sup>p87</sup>, if any. If the [parse a URL](#)<sup>p87</sup> algorithm failed, then throw a `"SyntaxError" DOMException`.
  2. Let *request* be a new [request](#) whose [URL](#) is *urlRecord*.
  3. If *noreferrer* is true, then set *request*'s [referrer](#) to `"noreferrer"`.
  4. If *urlRecord* is `"about:blank"`<sup>p59</sup> and *new* is true, then [queue a task](#)<sup>p925</sup> to [fire an event](#) named [load](#)<sup>p1261</sup> at *target browsing context*'s [Window](#)<sup>p816</sup> object, with the [legacy target override flag](#) set.
  5. Otherwise, [navigate](#)<sup>p852</sup> *target browsing context* to *request*, with the [exceptions enabled flag](#)<sup>p852</sup> set. If *new* is true, then [replacement must be enabled](#)<sup>p865</sup>. The [source browsing context](#)<sup>p852</sup> is *source browsing context*. Rethrow any exceptions.
14. If *noopener* is true, then return null.
15. Otherwise, if *new* is false, set *target browsing context*'s [opener browsing context](#)<sup>p804</sup> to *source browsing context*.

#### Note

If *new* is true this is done as part of [creating a new auxiliary browsing context](#)<sup>p806</sup>.

16. Return *target browsing context*'s [WindowProxy](#)<sup>p826</sup> object.

The [open\(\*url\*, \*target\*, \*features\*\)](#) method on [Window](#)<sup>p816</sup> objects provides a mechanism for [navigating](#)<sup>p852</sup> an existing [browsing context](#)<sup>p804</sup> or opening and navigating an [auxiliary browsing context](#)<sup>p807</sup>. MIDN

When the method is invoked, the user agent must run the [window open steps](#)<sup>p818</sup> with *url*, *target*, and *features*.

To **tokenize the *features* argument**:

1. Let *tokenizedFeatures* be a new [ordered map](#).
2. Let *position* point at the first code point of *features*.
3. [While](#) *position* is not past the end of *features*:
  1. Let *name* be the empty string.
  2. Let *value* be the empty string.
  3. [Collect a sequence of code points](#) that are [feature separators](#)<sup>p820</sup> from *features* given *position*. This skips past leading separators before the name.
  4. [Collect a sequence of code points](#) that are not [feature separators](#)<sup>p820</sup> from *features* given *position*. Set *name* to the collected characters, [converted to ASCII lowercase](#).
  5. Set *name* to the result of [normalizing the feature name](#)<sup>p820</sup> *name*.
  6. [While](#) *position* is not past the end of *features* and the code point at *position* in *features* is not U+003D (=):
    1. If the code point at *position* in *features* is U+002C (,), or if it is not a [feature separator](#)<sup>p820</sup>, then [break](#).
    2. Advance *position* by 1.

**Note**

*This skips to the first U+003D (=) but does not skip past a U+002C (,) or a non-separator.*

7. If the code point at *position* in *features* is a [feature separator](#)<sup>p820</sup>:
  1. [While](#) *position* is not past the end of *features* and the code point at *position* in *features* is a [feature separator](#)<sup>p820</sup>:
    1. If the code point at *position* in *features* is U+002C (,), then [break](#).
    2. Advance *position* by 1.

**Note**

*This skips to the first non-separator but does not skip past a U+002C (,).*

2. [Collect a sequence of code points](#) that are not [feature separators](#)<sup>p820</sup> code points from *features* given *position*. Set *value* to the collected code points, [converted to ASCII lowercase](#).

8. If *name* is not the empty string, then set *tokenizedFeatures*[*name*] to *value*.

4. Return *tokenizedFeatures*.

A code point is a **feature separator** if it is [ASCII whitespace](#), U+003D (=), or U+002C (,).

For legacy reasons, there are some aliases of some feature names. To **normalize a feature name** *name*, switch on *name*:

- ↪ "screenx"  
Return "left".
- ↪ "screeny"  
Return "top".
- ↪ "innerwidth"  
Return "width".
- ↪ "innerheight"  
Return "height".
- ↪ **Anything else**  
Return *name*.

To **parse a boolean feature** given a string *value*:

1. If *value* is the empty string, then return true.
2. If *value* is a case-sensitive match for *yes*, then return true.
3. Let *parsed* be the result of [parsing value as an integer](#)<sup>p66</sup>.
4. If *parsed* is an error, then set it to 0.
5. Return false if *parsed* is 0, and true otherwise.

The **name** attribute's getter must run these steps:

1. If this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup> is null, then return the empty string.
2. Return this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup>'s [name](#)<sup>p811</sup>.

The [name](#)<sup>p821</sup> attribute's setter must run these steps:

1. If this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup> is null, then return.
2. Set this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup>'s [name](#)<sup>p811</sup> to the given value.

#### Note

The name [gets reset](#)<sup>p866</sup> when the browsing context is [navigated](#)<sup>p852</sup> to another [origin](#)<sup>p829</sup>.

The **close()** method must run these steps:

1. Let *current* be this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup>.
2. If *current* is null or its [is closing](#)<sup>p804</sup> is true, then return.
3. If all the following are true
  - *current* is [script-closable](#)<sup>p821</sup>
  - the [incumbent global object](#)<sup>p911</sup>'s [browsing context](#)<sup>p818</sup> is [familiar with](#)<sup>p810</sup> *current*
  - the [incumbent global object](#)<sup>p911</sup>'s [browsing context](#)<sup>p818</sup> is [allowed to navigate](#)<sup>p810</sup> *current*

then:

1. Set *current*'s [is closing](#)<sup>p804</sup> to true.
2. [Queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> to [close](#)<sup>p823</sup> *current*.

A [browsing context](#)<sup>p804</sup> is **script-closable** if it is an [auxiliary browsing context](#)<sup>p807</sup> that was created by a script (as opposed to by an action of the user), or if it is a [top-level browsing context](#)<sup>p807</sup> whose [session history](#)<sup>p836</sup> contains only one [Document](#)<sup>p111</sup>.

The **closed** attribute's getter must return true if this [Window](#)<sup>p816</sup> object's [browsing context](#)<sup>p818</sup> is null or its [is closing](#)<sup>p804</sup> is true, and false otherwise.

The **stop()** method must [stop document loading](#)<sup>p871</sup> given this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup>.

### 7.3.2 Accessing other browsing contexts §<sup>p82</sup> 1

For web developers (non-normative)

#### **window . length**<sup>p822</sup>

Returns the number of [document-tree child browsing contexts](#)<sup>p807</sup>.

#### **window[index]**

Returns the indicated [document-tree child browsing context](#)<sup>p807</sup>.

The **number of document-tree child browsing contexts** of a [Window](#)<sup>p816</sup> object *W* is the result of running these steps:

1. If *W*'s [browsing context](#)<sup>p818</sup> is null, then return 0.
2. Return the number of [document-tree child browsing contexts](#)<sup>p807</sup> of *W*'s [browsing context](#)<sup>p818</sup>.

The **length** IDL attribute's getter must return the [number of document-tree child browsing contexts](#)<sup>p821</sup> of this [Window](#)<sup>p816</sup> object.

MDN

#### Note

*Indexed access to [document-tree child browsing contexts](#)<sup>p807</sup> is defined through the [\[\[GetOwnProperty\]\]](#)<sup>p827</sup> internal method of the [WindowProxy](#)<sup>p826</sup> object.*

### 7.3.3 Named access on the [Window](#)<sup>p816</sup> object §<sup>p82</sup><sub>2</sub>

For web developers (non-normative)

#### **window[name]**

Returns the indicated element or collection of elements.

As a general rule, relying on this will lead to brittle code. Which IDs end up mapping to this API can vary over time, as new features are added to the Web platform, for example. Instead of this, use `document.getElementById()` or `document.querySelector()`.

The **document-tree child browsing context name property set** of a [Window](#)<sup>p816</sup> object *window* is the return value of running these steps:

1. If *window*'s [browsing context](#)<sup>p818</sup> is null, then return the empty list.
2. Let *childBrowsingContexts* be all [document-tree child browsing contexts](#)<sup>p807</sup> of *window*'s [browsing context](#)<sup>p818</sup> whose [browsing context name](#)<sup>p811</sup> is not the empty string, in order, and including only the first [document-tree child browsing context](#)<sup>p807</sup> with a given [name](#)<sup>p811</sup> if multiple [document-tree child browsing contexts](#)<sup>p807</sup> have the same one.
3. Remove each [browsing context](#)<sup>p804</sup> from *childBrowsingContexts* whose [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup> is not [same origin](#)<sup>p830</sup> with *window*'s [relevant settings object](#)<sup>p913</sup>'s [origin](#)<sup>p897</sup> and whose [browsing context name](#)<sup>p811</sup> does not match the name of its [container](#)<sup>p806</sup>'s name content attribute value.
4. Return the [browsing context names](#)<sup>p811</sup> of *childBrowsingContexts*, in the same order.

#### Example

This means that in the following example, hosted on `https://example.org/`, assuming `https://elsewhere.example/` sets [window.name](#)<sup>p821</sup> to "spices", evaluating `window.spices` after everything has loaded will yield undefined:

```
<iframe src=https://elsewhere.example.com/></iframe>
<iframe name=spices></iframe>
```

The [Window](#)<sup>p816</sup> object [supports named properties](#). The [supported property names](#) of a [Window](#)<sup>p816</sup> object *window* at any moment consist of the following, in [tree order](#) according to the element that contributed them, ignoring later duplicates:

- *window*'s [document-tree child browsing context name property set](#)<sup>p822</sup>;
- the value of the name content attribute for all [embed](#)<sup>p363</sup>, [form](#)<sup>p479</sup>, [img](#)<sup>p314</sup>, and [object](#)<sup>p367</sup> elements that have a non-empty name content attribute and are [in a document tree](#) with *window*'s [associated Document](#)<sup>p818</sup> as their [root](#); and
- the value of the [id](#)<sup>p134</sup> content attribute for all [HTML elements](#)<sup>p43</sup> that have a non-empty [id](#)<sup>p134</sup> content attribute and are [in a document tree](#) with *window*'s [associated Document](#)<sup>p818</sup> as their [root](#).

To [determine the value of a named property](#) *name* in a [Window](#)<sup>p816</sup> object *window*, the user agent must return the value obtained using the following steps:

1. Let *objects* be the list of [named objects](#)<sup>p823</sup> of *window* with the name *name*.

#### Note

*There will be at least one such object, by definition.*

2. If *objects* contains a [browsing context](#)<sup>p804</sup>, then return the [WindowProxy](#)<sup>p826</sup> object of the [nested browsing context](#)<sup>p806</sup> of the first [browsing context container](#)<sup>p806</sup> in [tree order](#) whose [nested browsing context](#)<sup>p806</sup> is in *objects*.
3. Otherwise, if *objects* has only one element, return that element.
4. Otherwise return an [HTMLCollection](#) rooted at *window*'s [associated Document](#)<sup>p818</sup>, whose filter matches only [named objects](#)<sup>p823</sup> of *window* with the name *name*. (By definition, these will all be elements.)

**Named objects** of [Window](#)<sup>p816</sup> object *window* with the name *name*, for the purposes of the above algorithm, consist of the following:

- [document-tree child browsing contexts](#)<sup>p807</sup> of *window*'s [associated Document](#)<sup>p818</sup> whose [name](#)<sup>p811</sup> is *name*;
- [embed](#)<sup>p363</sup>, [form](#)<sup>p479</sup>, [img](#)<sup>p314</sup>, or [object](#)<sup>p367</sup> elements that have a [name](#) content attribute whose value is *name* and are [in a document tree](#) with *window*'s [associated Document](#)<sup>p818</sup> as their [root](#); and
- [HTML elements](#)<sup>p43</sup> that have an [id](#)<sup>p134</sup> content attribute whose value is *name* and are [in a document tree](#) with *window*'s [associated Document](#)<sup>p818</sup> as their [root](#).

### 7.3.4 Discarding browsing contexts §<sup>p82</sup><sub>3</sub>

To **discard** a [Document](#)<sup>p111</sup> *document*:

1. Set *document*'s [salvageable](#)<sup>p869</sup> state to false.
2. Run any [unloading document cleanup steps](#)<sup>p870</sup> for *document* that are defined by this specification and [other applicable specifications](#)<sup>p63</sup>.
3. [Abort](#)<sup>p871</sup> *document*.
4. Remove any [tasks](#)<sup>p925</sup> associated with *document* in any [task source](#)<sup>p925</sup>, without running those tasks.
5. [Discard](#)<sup>p823</sup> all the [child browsing contexts](#)<sup>p806</sup> of *document*.
6. For each [session history entry](#)<sup>p836</sup> *entry* with a [Document](#)<sup>p111</sup> object equal to *document*, remove *entry*'s [Document](#)<sup>p111</sup> object.
7. Set *document*'s [browsing context](#)<sup>p804</sup> to null.
8. [Remove](#) *document* from the [owner set](#)<sup>p1024</sup> of each [WorkerGlobalScope](#)<sup>p1024</sup> object whose set [contains](#) *document*.

To **discard** a [browsing context](#)<sup>p804</sup> *browsingContext*, run these steps:

1. [Discard](#)<sup>p823</sup> all [Document](#)<sup>p111</sup> objects for all the entries in *browsingContext*'s [session history](#)<sup>p836</sup>.
2. If *browsingContext* is a [top-level browsing context](#)<sup>p807</sup>, then [remove](#)<sup>p811</sup> *browsingContext*.

User agents may [discard](#)<sup>p823</sup> [top-level browsing contexts](#)<sup>p807</sup> at any time (typically, in response to user requests, e.g., when a user force-closes a window containing one or more [top-level browsing contexts](#)<sup>p807</sup>). Other [browsing contexts](#)<sup>p804</sup> must be discarded once their [WindowProxy](#)<sup>p826</sup> object is eligible for garbage collection, in addition to the other places where this specification requires them to be discarded.

### 7.3.5 Closing browsing contexts §<sup>p82</sup><sub>3</sub>

To **close a browsing context** *browsingContext*, run these steps:

1. [Prompt to unload](#)<sup>p869</sup> *browsingContext*'s [active document](#)<sup>p804</sup>. If the user [refused to allow the document to be unloaded](#)<sup>p869</sup>, then return.
2. [Unload](#)<sup>p869</sup> *browsingContext*'s [active document](#)<sup>p804</sup>.
3. Remove *browsingContext* from the user interface (e.g., close or hide its tab in a tabbed browser).
4. [Discard](#)<sup>p823</sup> *browsingContext*.

User agents should offer users the ability to arbitrarily [close](#)<sup>p823</sup> any [top-level browsing context](#)<sup>p807</sup>.

## 7.3.6 Browser interface elements § p82 4

To allow Web pages to integrate with Web browsers, certain Web browser interface elements are exposed in a limited way to scripts in Web pages.

Each interface element is represented by a [BarProp](#)<sup>p824</sup> object:

```
IDL [Exposed=Window]
interface BarProp {
  readonly attribute boolean visible;
};
```

### For web developers (non-normative)

#### [window.locationbar](#)<sup>p825</sup> . [visible](#)<sup>p824</sup>

Returns true if the location bar is visible; otherwise, returns false.

#### [window.menubar](#)<sup>p825</sup> . [visible](#)<sup>p824</sup>

Returns true if the menu bar is visible; otherwise, returns false.

#### [window.personalbar](#)<sup>p825</sup> . [visible](#)<sup>p824</sup>

Returns true if the personal bar is visible; otherwise, returns false.

#### [window.scrollbars](#)<sup>p825</sup> . [visible](#)<sup>p824</sup>

Returns true if the scrollbars are visible; otherwise, returns false.

#### [window.statusbar](#)<sup>p825</sup> . [visible](#)<sup>p824</sup>

Returns true if the status bar is visible; otherwise, returns false.

#### [window.toolbar](#)<sup>p825</sup> . [visible](#)<sup>p824</sup>

Returns true if the toolbar is visible; otherwise, returns false.

The **visible** attribute's getter must run these steps:

1. If this [BarProp](#)<sup>p824</sup> object's [relevant global object](#)<sup>p913</sup>'s [browsing context](#)<sup>p818</sup> is null, then return false.
2. If the user agent does not have a user interface element that the object represents, as described below, then return true.
3. Return true or a value determined by the user agent to most accurately represent the visibility state of the user interface element that the object represents, as described below.

The following [BarProp](#)<sup>p824</sup> objects must exist for each [Window](#)<sup>p816</sup> object:

#### **The location bar [BarProp](#) object**

Represents the user interface element that contains a control that displays the [URL](#) of the [active document](#)<sup>p804</sup>, or some similar interface concept.

#### **The menu bar [BarProp](#) object**

Represents the user interface element that contains a list of commands in menu form, or some similar interface concept.

#### **The personal bar [BarProp](#) object**

Represents the user interface element that contains links to the user's favorite pages, or some similar interface concept.

#### **The scrollbar [BarProp](#) object**

Represents the user interface element that contains a scrolling mechanism, or some similar interface concept.

#### **The status bar [BarProp](#) object**

Represents a user interface element found immediately below or after the document, as appropriate for the user's media, which typically provides information about ongoing network activity or information about elements that the user's pointing device is current indicating. If the user agent has no such user interface element, then the object may act as if the corresponding user interface element was absent (i.e. its [visible](#)<sup>p824</sup> attribute may return false).

#### **The toolbar [BarProp](#) object**

Represents the user interface element found immediately above or before the document, as appropriate for the user's media, which typically provides [session history](#)<sup>p836</sup> traversal controls (back and forward buttons, reload buttons, etc). If the user agent has no such user interface element, then the object may act as if the corresponding user interface element was absent (i.e. its [visible](#)<sup>p824</sup> attribute may return false).

attribute may return false).

The **locationbar** attribute must return [the location bar BarProp object](#)<sup>p824</sup>.

The **menubar** attribute must return [the menu bar BarProp object](#)<sup>p824</sup>.

The **personalbar** attribute must return [the personal bar BarProp object](#)<sup>p824</sup>.

The **scrollbars** attribute must return [the scrollbar BarProp object](#)<sup>p824</sup>.

The **statusbar** attribute must return [the status bar BarProp object](#)<sup>p824</sup>.

The **toolbar** attribute must return [the toolbar BarProp object](#)<sup>p824</sup>.

For historical reasons, the **status** attribute on the [Window](#)<sup>p816</sup> object must, on getting, return the last string it was set to, and on setting, must set itself to the new value. When the [Window](#)<sup>p816</sup> object is created, the attribute must be set to the empty string. It does not do anything else.

### 7.3.7 Script settings for [Window](#)<sup>p816</sup> objects §<sup>p82</sup><sub>5</sub>

When the user agent is required to **set up a window environment settings object**, given a [JavaScript execution context](#) *execution context*, a [top-level origin](#)<sup>p897</sup> *top-level origin*, and an optional [environment](#)<sup>p896</sup> *reserved environment*, it must run the following steps:

1. Let *realm* be the value of *execution context*'s Realm component.
2. Let *window* be *realm*'s [global object](#)<sup>p907</sup>.
3. Let *url* be a copy of the URL of *window*'s [associated Document](#)<sup>p818</sup>.
4. Let *settings object* be a new [environment settings object](#)<sup>p897</sup> whose algorithms are defined as follows:

#### The [realm execution context](#)<sup>p897</sup>

Return *execution context*.

#### The [module map](#)<sup>p897</sup>

Return the [module map](#)<sup>p112</sup> of *window*'s [associated Document](#)<sup>p818</sup>.

#### The [responsible document](#)<sup>p897</sup>

Return *window*'s [associated Document](#)<sup>p818</sup>.

#### The [API URL character encoding](#)<sup>p897</sup>

Return the current [character encoding](#) of *window*'s [associated Document](#)<sup>p818</sup>.

#### The [API base URL](#)<sup>p897</sup>

Return the current [base URL](#)<sup>p87</sup> of *window*'s [associated Document](#)<sup>p818</sup>.

#### The [origin](#)<sup>p897</sup>

Return the [origin](#)<sup>p829</sup> of *window*'s [associated Document](#)<sup>p818</sup>.

#### The [top-level origin](#)<sup>p897</sup>

Return *top-level origin*.

#### The [HTTPS state](#)<sup>p897</sup>

Return the [HTTPS state](#)<sup>p112</sup> of *window*'s [associated Document](#)<sup>p818</sup>.

#### The [referrer policy](#)<sup>p897</sup>

1. Let *document* be *window*'s [associated Document](#)<sup>p818</sup>.
2. While *document* is [an iframe srcdoc document](#)<sup>p356</sup> and *document*'s [referrer policy](#)<sup>p112</sup> is the empty string, set *document* to *document*'s [browsing context](#)<sup>p804</sup>'s [container document](#)<sup>p806</sup>.

3. Return *document*'s [referrer policy](#)<sup>p112</sup>.
5. If *reserved environment* is given, then:
  1. Set *settings object*'s [id](#)<sup>p896</sup> to *reserved environment*'s [id](#)<sup>p896</sup>, *settings object*'s [creation URL](#)<sup>p896</sup> to *reserved environment*'s [creation URL](#)<sup>p896</sup>, *settings object*'s [target browsing context](#)<sup>p896</sup> to *reserved environment*'s [target browsing context](#)<sup>p896</sup>, and *settings object*'s [active service worker](#)<sup>p897</sup> to *reserved environment*'s [active service worker](#)<sup>p897</sup>.
  2. Set *reserved environment*'s [id](#)<sup>p896</sup> to the empty string.

#### Note

The identity of the reserved environment is considered to be fully transferred to the created [environment settings object](#)<sup>p897</sup>. The reserved environment is not searchable by the [environment](#)<sup>p896</sup>'s [id](#)<sup>p896</sup> from this point on.

6. Otherwise, set *settings object*'s [id](#)<sup>p896</sup> to a new unique opaque string, *settings object*'s [creation URL](#)<sup>p896</sup> to *url*, *settings object*'s [target browsing context](#)<sup>p896</sup> to null, and *settings object*'s [active service worker](#)<sup>p897</sup> to null.
7. Set *realm*'s `[[HostDefined]]` field to *settings object*.
8. Return *settings object*.

## 7.4 The [WindowProxy](#)<sup>p826</sup> exotic object § p826

A [WindowProxy](#) is an exotic object that wraps a [Window](#)<sup>p816</sup> ordinary object, indirecting most operations through to the wrapped object. Each [browsing context](#)<sup>p804</sup> has an associated [WindowProxy](#)<sup>p826</sup> object. When the [browsing context](#)<sup>p804</sup> is [navigated](#)<sup>p852</sup>, the [Window](#)<sup>p816</sup> object wrapped by the [browsing context](#)<sup>p804</sup>'s associated [WindowProxy](#)<sup>p826</sup> object is changed.

The [WindowProxy](#)<sup>p826</sup> exotic object must use the ordinary internal methods except where it is explicitly specified otherwise below.

There is no [WindowProxy](#)<sup>p826</sup> [interface object](#).

Every [WindowProxy](#)<sup>p826</sup> object has a `[[Window]]` internal slot representing the wrapped [Window](#)<sup>p816</sup> object.

#### Note

Although [WindowProxy](#)<sup>p826</sup> is named as a "proxy", it does not do polymorphic dispatch on its target's internal methods as a real proxy would, due to a desire to reuse machinery between [WindowProxy](#)<sup>p826</sup> and [Location](#)<sup>p844</sup> objects. As long as the [Window](#)<sup>p816</sup> object remains an ordinary object this is unobservable and can be implemented either way.

### 7.4.1 `[[GetPrototypeOf]]` ( ) § p826

1. Let *W* be the value of the `[[Window]]`<sup>p826</sup> internal slot of **this**.
2. If `!IsPlatformObjectSameOrigin`<sup>p815</sup>(*W*) is true, then return `! OrdinaryGetPrototypeOf`(*W*).
3. Return null.

### 7.4.2 `[[SetPrototypeOf]]` ( *V* ) § p826

1. Return `! SetImmutablePrototype`(**this**, *V*).

### 7.4.3 **[[IsExtensible]]** ( ) §<sup>p82</sup><sub>7</sub>

1. Return true.

### 7.4.4 **[[PreventExtensions]]** ( ) §<sup>p82</sup><sub>7</sub>

1. Return false.

### 7.4.5 **[[GetOwnProperty]]** ( *P* ) §<sup>p82</sup><sub>7</sub>

1. Let *W* be the value of the [\[\[Window\]\]](#)<sup>p826</sup> internal slot of **this**.
2. If *P* is an [array index property name](#), then:
  1. Let *index* be ! [ToUint32](#)(*P*).
  2. Let *maxProperties* be the [number of document-tree child browsing contexts](#)<sup>p821</sup> of *W*.
  3. Let *value* be undefined.
  4. If *maxProperties* is greater than 0 and *index* is less than *maxProperties*, then set *value* to the [WindowProxy](#)<sup>p826</sup> object of the *index*th [document-tree child browsing context](#)<sup>p807</sup> of *W*'s [browsing context](#)<sup>p818</sup>, sorted in the order that their [browsing context container](#)<sup>p806</sup> elements were most recently inserted into *W*'s [associated Document](#)<sup>p818</sup>, the [WindowProxy](#)<sup>p826</sup> object of the most recently inserted [browsing context container](#)<sup>p806</sup>'s [nested browsing context](#)<sup>p806</sup> being last.
  5. If *value* is undefined, then:
    1. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>(*W*) is true, then return undefined.
    2. Throw a ["SecurityError" DOMException](#).
  6. Return [PropertyDescriptor](#){ [[Value]]: *value*, [[Writable]]: false, [[Enumerable]]: true, [[Configurable]]: true }.
3. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>(*W*) is true, then return ! [OrdinaryGetOwnProperty](#)(*W*, *P*).

#### Note

This is a [willful violation](#)<sup>p26</sup> of the JavaScript specification's [invariants of the essential internal methods to maintain compatibility with existing Web content](#). See [tc39/ecma262 issue #672](#) for more information. [\[JAVASCRIPT\]](#)<sup>p1267</sup>

4. Let *property* be ! [CrossOriginGetOwnPropertyHelper](#)<sup>p815</sup>(*W*, *P*).
5. If *property* is not undefined, then return *property*.
6. If *property* is undefined and *P* is in *W*'s [document-tree child browsing context name property set](#)<sup>p822</sup>, then:
  1. Let *value* be the [WindowProxy](#)<sup>p826</sup> object of the [named object](#)<sup>p823</sup> of *W* with the name *P*.
  2. Return [PropertyDescriptor](#){ [[Value]]: *value*, [[Enumerable]]: false, [[Writable]]: false, [[Configurable]]: true }.

#### Note

The reason the property descriptors are non-enumerable, despite this mismatching the same-origin behavior, is for compatibility with existing Web content. See [issue #3183](#) for details.

7. Return ? [CrossOriginPropertyFallback](#)<sup>p815</sup>(*P*).

### 7.4.6 **[[DefineOwnProperty]]** ( *P*, *Desc* ) §<sup>p82</sup><sub>7</sub>

1. Let *W* be the value of the [\[\[Window\]\]](#)<sup>p826</sup> internal slot of **this**.

2. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>(*W*) is true, then:
  1. If *P* is an [array index property name](#), return false.
  2. Return ? [OrdinaryDefineOwnProperty](#)(*W*, *P*, *Desc*).

**Note**

This is a [willful violation](#)<sup>p26</sup> of the JavaScript specification's [invariants of the essential internal methods](#) to maintain compatibility with existing Web content. See [tc39/ecma262 issue #672](#) for more information. [\[JAVASCRIPT\]](#)<sup>p1267</sup>

3. Throw a ["SecurityError" DOMException](#).

#### 7.4.7 [\[\[Get\]\]](#) ( *P*, *Receiver* ) §<sup>p82</sup><sub>8</sub>

1. Let *W* be the value of the [\[\[Window\]\]](#)<sup>p826</sup> internal slot of **this**.
2. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>(*W*) is true, then return ? [OrdinaryGet](#)(**this**, *P*, *Receiver*).
3. Return ? [CrossOriginGet](#)<sup>p816</sup>(**this**, *P*, *Receiver*).

**Note**

**this** is passed rather than *W* as [OrdinaryGet](#) and [CrossOriginGet](#)<sup>p816</sup> will invoke the [\[\[GetOwnProperty\]\]](#)<sup>p827</sup> internal method.

#### 7.4.8 [\[\[Set\]\]](#) ( *P*, *V*, *Receiver* ) §<sup>p82</sup><sub>8</sub>

1. Let *W* be the value of the [\[\[Window\]\]](#)<sup>p826</sup> internal slot of **this**.
2. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>(*W*) is true, then return ? [OrdinarySet](#)(**this**, *P*, *V*, *Receiver*).
3. Return ? [CrossOriginSet](#)<sup>p816</sup>(**this**, *P*, *V*, *Receiver*).

**Note**

**this** is passed rather than *W* as [OrdinarySet](#) and [CrossOriginSet](#)<sup>p816</sup> will invoke the [\[\[GetOwnProperty\]\]](#)<sup>p827</sup> internal method. [OrdinarySet](#) will also invoke the [\[\[DefineOwnProperty\]\]](#)<sup>p827</sup> internal method.

#### 7.4.9 [\[\[Delete\]\]](#) ( *P* ) §<sup>p82</sup><sub>8</sub>

1. Let *W* be the value of the [\[\[Window\]\]](#)<sup>p826</sup> internal slot of **this**.
2. If ! [IsPlatformObjectSameOrigin](#)<sup>p815</sup>(*W*) is true, then:
  1. If *P* is an [array index property name](#), then:
    1. Let *desc* be ! **this**.[\[\[GetOwnProperty\]\]](#)(*P*).
    2. If *desc* is undefined, then return true.
    3. Return false.
  2. Return ? [OrdinaryDelete](#)(*W*, *P*).
3. Throw a ["SecurityError" DOMException](#).

#### 7.4.10 `[[OwnPropertyKeys]]` ( ) §<sup>p82</sup><sub>9</sub>

1. Let  $W$  be the value of the `[[Window]]`<sup>p826</sup> internal slot of **this**.
2. Let  $keys$  be a new empty `List`.
3. Let  $maxProperties$  be the `number of document-tree child browsing contexts`<sup>p821</sup> of  $W$ .
4. Let  $index$  be 0.
5. Repeat while  $index < maxProperties$ ,
  1. Add ! `ToString`( $index$ ) as the last element of  $keys$ .
  2. Increment  $index$  by 1.
6. If ! `IsPlatformObjectSameOrigin`<sup>p815</sup>( $W$ ) is true, then return the concatenation of  $keys$  and ! `OrdinaryOwnPropertyKeys`( $W$ ).
7. Return the concatenation of  $keys$  and ! `CrossOriginOwnPropertyKeys`<sup>p816</sup>( $W$ ).

### 7.5 Origin §<sup>p82</sup><sub>9</sub>

Origins are the fundamental currency of the Web's security model. Two actors in the Web platform that share an origin are assumed to trust each other and to have the same authority. Actors with differing origins are considered potentially hostile versus each other, and are isolated from each other to varying degrees.

#### Example

For example, if Example Bank's Web site, hosted at `bank.example.com`, tries to examine the DOM of Example Charity's Web site, hosted at `charity.example.org`, a `"SecurityError" DOMException` will be raised.

An **origin** is one of the following:

#### An opaque origin

An internal value, with no serialization it can be recreated from (it is serialized as `"null"` per `serialization of an origin`<sup>p830</sup>), for which the only meaningful operation is testing for equality.

#### A tuple origin

A `tuple`<sup>p829</sup> consists of:

- A **scheme** (a `scheme`).
- A **host** (a `host`).
- A **port** (a `port`).
- A **domain** (null or a `domain`). Null unless stated otherwise.

#### Note

`Origins`<sup>p829</sup> can be shared, e.g., among multiple `Document`<sup>p111</sup> objects. Furthermore, `origins`<sup>p829</sup> are generally immutable. Only the `domain`<sup>p829</sup> of a `tuple origin`<sup>p829</sup> can be changed, and only through the `document.domain`<sup>p832</sup> API.

The **effective domain** of an `origin`<sup>p829</sup> is computed as follows:

1. If  $origin$  is an `opaque origin`<sup>p829</sup>, then return null.
2. If  $origin$ 's `domain`<sup>p829</sup> is non-null, then return  $origin$ 's `domain`<sup>p829</sup>.
3. Return  $origin$ 's `host`<sup>p829</sup>.

Various specification objects are defined to have an `origin`<sup>p829</sup>. These `origins`<sup>p829</sup> are determined as follows:

#### For `Document`<sup>p111</sup> objects

The `create a new browsing context`<sup>p805</sup> and `navigation`<sup>p852</sup> algorithms assign the `origin`<sup>p829</sup> at construction time. Otherwise, the

default default behavior as defined in *DOM* applies. [DOM]<sup>p1266</sup>

### For images of `img`<sup>p314</sup> elements

- ↪ If the `image data`<sup>p330</sup> is **CORS-cross-origin**<sup>p88</sup>  
A unique `opaque origin`<sup>p829</sup> assigned when the image is created.
- ↪ If the `image data`<sup>p330</sup> is **CORS-same-origin**<sup>p88</sup>  
The `img`<sup>p314</sup> element's `node document`'s `origin`<sup>p829</sup>.

### For `audio`<sup>p377</sup> and `video`<sup>p373</sup> elements

- ↪ If the `media data`<sup>p382</sup> is **CORS-cross-origin**<sup>p88</sup>  
A unique `opaque origin`<sup>p829</sup> assigned when the `media data`<sup>p382</sup> is fetched.
- ↪ If the `media data`<sup>p382</sup> is **CORS-same-origin**<sup>p88</sup>  
The `media element`<sup>p381</sup>'s `node document`'s `origin`<sup>p829</sup>.

Other specifications can override the above definitions by themselves specifying the origin of a particular `Document`<sup>p111</sup> object, image, or `media element`<sup>p381</sup>.

The **serialization of an origin** is the string obtained by applying the following algorithm to the given `origin`<sup>p829</sup> *origin*:

1. If *origin* is an `opaque origin`<sup>p829</sup>, then return "null".
2. Otherwise, let *result* be *origin*'s `scheme`<sup>p829</sup>.
3. Append "://" to *result*.
4. Append *origin*'s `host`<sup>p829</sup>, `serialized`, to *result*.
5. If *origin*'s `port`<sup>p829</sup> is non-null, append a U+003A COLON character (:), and *origin*'s `port`<sup>p829</sup>, `serialized`, to *result*.
6. Return *result*.

#### Example

The `serialization`<sup>p830</sup> of ("https", "xn--maraa-rta.example", null, null) is "https://xn--maraa-rta.example".

#### Note

*There used to also be a Unicode serialization of an origin. However, it was never widely adopted.*

Two `origins`<sup>p829</sup>, *A* and *B*, are said to be **same origin** if the following algorithm returns true:

1. If *A* and *B* are the same `opaque origin`<sup>p829</sup>, then return true.
2. If *A* and *B* are both `tuple origins`<sup>p829</sup> and their `schemes`<sup>p829</sup>, `hosts`<sup>p829</sup>, and `port`<sup>p829</sup> are identical, then return true.
3. Return false.

Two `origins`<sup>p829</sup>, *A* and *B*, are said to be **same origin-domain** if the following algorithm returns true:

1. If *A* and *B* are the same `opaque origin`<sup>p829</sup>, then return true.
2. If *A* and *B* are both `tuple origins`<sup>p829</sup>, run these substeps:
  1. If *A* and *B*'s `schemes`<sup>p829</sup> are identical, and their `domains`<sup>p829</sup> are identical and non-null, then return true.
  2. Otherwise, if *A* and *B* are **same origin**<sup>p830</sup> and their `domains`<sup>p829</sup> are identical and null, then return true.
3. Return false.

#### Example

<i>A</i>	<i>B</i>	<b>same origin</b> <sup>p830</sup>	<b>same origin-domain</b> <sup>p830</sup>
("https", "example.org", null, null)	("https", "example.org", null, null)	✓	✓

("https", "example.org", 314, null)	("https", "example.org", 420, null)	x	x
("https", "example.org", 314, "example.org")	("https", "example.org", 420, "example.org")	x	✓
("https", "example.org", null, null)	("https", "example.org", null, "example.org")	✓	x
("https", "example.org", null, "example.org")	("http", "example.org", null, "example.org")	x	x

### 7.5.1 Sites <sup>p83</sup><sub>1</sub>

A **scheme-and-registrable-domain** is a [tuple](#) of a [scheme](#) and a [domain](#).

A **site** is an [opaque origin](#)<sup>p829</sup>, a [tuple origin](#)<sup>p829</sup> whose [host](#)<sup>p829</sup>'s [registrable domain](#) is null, or a [scheme-and-registrable-domain](#)<sup>p831</sup>.

To **obtain a site**, given an origin *origin*, run these steps:

1. If *origin* is an [opaque origin](#)<sup>p829</sup>, then return *origin*.
2. If *origin*'s [host](#)<sup>p829</sup>'s [registrable domain](#) is null, then return *origin*.
3. Return (*origin*'s [scheme](#)<sup>p829</sup>, *origin*'s [host](#)<sup>p829</sup>'s [registrable domain](#)).

Two [origins](#)<sup>p829</sup>, *A* and *B*, are said to be **schemelessly same site** if the following algorithm returns true:

1. If *A* and *B* are the same [opaque origin](#)<sup>p829</sup>, then return true.
2. If *A* and *B* are both [tuple origins](#)<sup>p829</sup>, then:
  1. Let *hostA* be *A*'s [host](#)<sup>p829</sup>, and let *hostB* be *B*'s [host](#)<sup>p829</sup>.
  2. If *hostA* [equals](#) *hostB* and *hostA*'s [registrable domain](#) is null, then return true.
  3. If *hostA*'s [registrable domain](#) [equals](#) *hostB*'s [registrable domain](#) and is non-null, then return true.
3. Return false.

Two [origins](#)<sup>p829</sup>, *A* and *B*, are said to be **same site** if both of the following statements are true:

- *A* and *B* are [schemelessly same site](#)<sup>p831</sup>
- *A* and *B* are either both [opaque origins](#)<sup>p829</sup>, or both [tuple origins](#)<sup>p829</sup> with the same [scheme](#)<sup>p829</sup>

#### Note

Unlike the [same origin](#)<sup>p830</sup> and [same origin-domain](#)<sup>p830</sup> concepts, for [schemelessly same site](#)<sup>p831</sup> and [same site](#)<sup>p831</sup>, the [port](#)<sup>p829</sup> and [domain](#)<sup>p829</sup> components are ignored.

#### Warning!

For the reasons explained in URL, the [same site](#)<sup>p831</sup> and [schemelessly same site](#)<sup>p831</sup> concepts should be avoided when possible, in favor of [same origin](#)<sup>p830</sup> checks.

#### Example

Given that `wildlife.museum`, `museum`, and `com` are [public suffixes](#) and that `example.com` is not:

A	B	<a href="#">schemelessly same site</a> <sup>p831</sup>	<a href="#">same site</a> <sup>p831</sup>
("https", "example.com")	("https", "sub.example.com")	✓	✓
("https", "example.com")	("https", "sub.other.example.com")	✓	✓
("https", "example.com")	("http", "non-secure.example.com")	✓	x
("https", "r.wildlife.museum")	("https", "sub.r.wildlife.museum")	✓	✓
("https", "r.wildlife.museum")	("https", "sub.other.r.wildlife.museum")	✓	✓
("https", "r.wildlife.museum")	("https", "other.wildlife.museum")	x	x
("https", "r.wildlife.museum")	("https", "wildlife.museum")	x	x

("https", "wildlife.museum")	("https", "wildlife.museum")	x	x
------------------------------	------------------------------	---	---

(Here we have omitted the [port](#)<sup>p829</sup> and [domain](#)<sup>p829</sup> components since they are not considered.)

✓ MDN

## 7.5.2 Relaxing the same-origin restriction <sup>§</sup><sub>2</sub><sup>p83</sup>

For web developers (non-normative)

**`document.domain`<sup>p832</sup> [ = `domain` ]**

Returns the current domain used for security checks.

Can be set to a value that removes subdomains, to change the [origin](#)<sup>p829</sup>'s [domain](#)<sup>p829</sup> to allow pages on other subdomains of the same domain (if they do the same thing) to access each other. (Can't be set in sandboxed [iframe](#)<sup>p355</sup>s.)

To determine if a string `hostSuffixString` is a **registrable domain suffix of or is equal to** a [host](#) `originalHost`, run these steps:

1. If `hostSuffixString` is the empty string, then return false.
2. Let `host` be the result of [parsing](#) `hostSuffixString`.
3. If `host` is failure, then return false.
4. If `host` does not [equal](#) `originalHost`, then:
  1. If `host` or `originalHost` is not a [domain](#), then return false.

### Note

This excludes [hosts](#) that are an [IPv4 address](#) or an [IPv6 address](#).

2. If `host`, prefixed by a U+002E FULL STOP (.), does not exactly match the end of `originalHost`, then return false.
3. If `host` [equals](#) `host`'s [public suffix](#), then return false. [\[URL\]](#)<sup>p1270</sup>
5. Return true.

The `domain` attribute's getter must run these steps:

1. Let `effectiveDomain` be this [Document](#)<sup>p111</sup> object's [origin](#)<sup>p829</sup>'s [effective domain](#)<sup>p829</sup>.
2. If `effectiveDomain` is null, then return the empty string.
3. Return `effectiveDomain`, [serialized](#).

The `domain`<sup>p832</sup> attribute's setter must run these steps:

1. If this [Document](#)<sup>p111</sup> object's [browsing context](#)<sup>p804</sup> is null, then throw a ["SecurityError" DOMException](#).
2. If this [Document](#)<sup>p111</sup> object's [active sandboxing flag set](#)<sup>p835</sup> has its [sandboxed document.domain browsing context flag](#)<sup>p834</sup> set, then throw a ["SecurityError" DOMException](#).
3. If this [Document](#)<sup>p111</sup> object is not [allowed to use](#)<sup>p362</sup> the ["document-domain"](#)<sup>p65</sup> feature, then throw a ["SecurityError" DOMException](#).
4. Let `effectiveDomain` be this [Document](#)<sup>p111</sup> object's [origin](#)<sup>p829</sup>'s [effective domain](#)<sup>p829</sup>.
5. If `effectiveDomain` is null, then throw a ["SecurityError" DOMException](#).
6. If the given value is [not a registrable domain suffix of and is not equal to](#)<sup>p832</sup> `effectiveDomain`, then throw a ["SecurityError" DOMException](#).
7. Set this [Document](#)<sup>p111</sup> object's [origin](#)<sup>p829</sup>'s [domain](#)<sup>p829</sup> to the result of [parsing](#) the given value.

### Note

The `document.domain`<sup>p832</sup> attribute is used to enable pages on different hosts of a domain to access each other's DOMs.

## ⚠Warning!

**Do not use the `document.domain`<sup>p832</sup> attribute when using shared hosting. If an untrusted third party is able to host an HTTP server at the same IP address but on a different port, then the same-origin protection that normally protects two different sites on the same host will fail, as the ports are ignored when comparing origins after the `document.domain`<sup>p832</sup> attribute has been used.**

## 7.6 Sandboxing §<sup>p83</sup><sub>3</sub>

A **sandboxing flag set** is a set of zero or more of the following flags, which are used to restrict the abilities that potentially untrusted resources have:

### The *sandboxed navigation browsing context flag*

This flag [prevents content from navigating browsing contexts other than the sandboxed browsing context itself](#)<sup>p852</sup> (or browsing contexts further nested inside it), [auxiliary browsing contexts](#)<sup>p807</sup> (which are protected by the [sandboxed auxiliary navigation browsing context flag](#)<sup>p833</sup> defined next), and the [top-level browsing context](#)<sup>p807</sup> (which is protected by the [sandboxed top-level navigation without user activation browsing context flag](#)<sup>p833</sup> and [sandboxed top-level navigation with user activation browsing context flag](#)<sup>p833</sup> defined below).

If the [sandboxed auxiliary navigation browsing context flag](#)<sup>p833</sup> is not set, then in certain cases the restrictions nonetheless allow popups (new [top-level browsing contexts](#)<sup>p807</sup>) to be opened. These [browsing contexts](#)<sup>p804</sup> always have **one permitted sandboxed navigator**, set when the browsing context is created, which allows the [browsing context](#)<sup>p804</sup> that created them to actually navigate them. (Otherwise, the [sandboxed navigation browsing context flag](#)<sup>p833</sup> would prevent them from being navigated even if they were opened.)

### The *sandboxed auxiliary navigation browsing context flag*

This flag [prevents content from creating new auxiliary browsing contexts](#)<sup>p813</sup>, e.g. using the [target](#)<sup>p279</sup> attribute or the [window.open\(\)](#)<sup>p819</sup> method.

### The *sandboxed top-level navigation without user activation browsing context flag*

This flag [prevents content from navigating their top-level browsing context](#)<sup>p852</sup> and [prevents content from closing their top-level browsing context](#)<sup>p821</sup>. It is consulted only when the sandboxed browsing context's [WindowProxy](#)<sup>p826</sup>'s `[[Window]]` value does not have [transient activation](#)<sup>p760</sup>.

When the [sandboxed top-level navigation without user activation browsing context flag](#)<sup>p833</sup> is *not* set, content can navigate its [top-level browsing context](#)<sup>p807</sup>, but other [browsing contexts](#)<sup>p804</sup> are still protected by the [sandboxed navigation browsing context flag](#)<sup>p833</sup> and possibly the [sandboxed auxiliary navigation browsing context flag](#)<sup>p833</sup>.

### The *sandboxed top-level navigation with user activation browsing context flag*

This flag [prevents content from navigating their top-level browsing context](#)<sup>p852</sup> and [prevents content from closing their top-level browsing context](#)<sup>p821</sup>. It is consulted only when the sandboxed browsing context's [WindowProxy](#)<sup>p826</sup>'s `[[Window]]` value has [transient activation](#)<sup>p760</sup>.

As with the [sandboxed top-level navigation without user activation browsing context flag](#)<sup>p833</sup>, this flag only affects the [top-level browsing context](#)<sup>p807</sup>; if it is not set, other [browsing contexts](#)<sup>p804</sup> might still be protected by other flags.

### The *sandboxed plugins browsing context flag*

This flag prevents content from instantiating [plugins](#)<sup>p44</sup>, whether using [the embed element](#)<sup>p366</sup>, [the object element](#)<sup>p371</sup>, or through [navigation](#)<sup>p863</sup> of their [nested browsing context](#)<sup>p806</sup>, unless those [plugins](#)<sup>p44</sup> can be [secured](#)<sup>p44</sup>.

### The *sandboxed origin browsing context flag*

This flag [forces content into a unique origin](#)<sup>p805</sup>, thus preventing it from accessing other content from the same [origin](#)<sup>p829</sup>.

This flag also [prevents script from reading from or writing to the `document.cookie` IDL attribute](#)<sup>p113</sup>, and blocks access to [localStorage](#)<sup>p1042</sup>.

### The *sandboxed forms browsing context flag*

This flag [blocks form submission](#)<sup>p589</sup>.

### The **sandboxed pointer lock browsing context flag**

This flag disables the Pointer Lock API. [\[POINTERLOCK\]](#)<sup>p1269</sup>

### The **sandboxed scripts browsing context flag**

This flag [blocks script execution](#)<sup>p895</sup>.

### The **sandboxed automatic features browsing context flag**

This flag blocks features that trigger automatically, such as [automatically playing a video](#)<sup>p401</sup> or [automatically focusing a form control](#)<sup>p775</sup>.

### The **sandboxed document.domain browsing context flag**

This flag prevents content from using the [document.domain](#)<sup>p832</sup> setter.

### The **sandbox propagates to auxiliary browsing contexts flag**

This flag prevents content from escaping the sandbox by ensuring that any [auxiliary browsing context](#)<sup>p807</sup> it creates inherits the content's [active sandboxing flag set](#)<sup>p835</sup>.

### The **sandboxed modals flag**

This flag prevents content from using any of the following features to produce modal dialogs:

- [window.alert\(\)](#)<sup>p957</sup>
- [window.confirm\(\)](#)<sup>p958</sup>
- [window.print\(\)](#)<sup>p958</sup>
- [window.prompt\(\)](#)<sup>p958</sup>
- the [beforeunload](#)<sup>p1260</sup> event

### The **sandboxed orientation lock browsing context flag**

This flag disables the ability to lock the screen orientation. [\[SCREENORIENTATION\]](#)<sup>p1270</sup>

### The **sandboxed presentation browsing context flag**

This flag disables the Presentation API. [\[PRESENTATION\]](#)<sup>p1269</sup>

### The **sandboxed downloads browsing context flag**

This flag prevents content from initiating or instantiating downloads, whether through [downloading hyperlinks](#)<sup>p286</sup> or through [navigation](#)<sup>p855</sup> that gets handled [as a download](#)<sup>p286</sup>.

When the user agent is to **parse a sandboxing directive**, given a string *input*, a [sandboxing flag set](#)<sup>p833</sup> *output*, it must run the following steps:

1. [Split input on ASCII whitespace](#), to obtain *tokens*.
2. Let *output* be empty.
3. Add the following flags to *output*:
  - The [sandboxed navigation browsing context flag](#)<sup>p833</sup>.
  - The [sandboxed auxiliary navigation browsing context flag](#)<sup>p833</sup>, unless *tokens* contains the **allow-popups** keyword.
  - The [sandboxed top-level navigation without user activation browsing context flag](#)<sup>p833</sup>, unless *tokens* contains the **allow-top-navigation** keyword.
  - The [sandboxed top-level navigation with user activation browsing context flag](#)<sup>p833</sup>, unless *tokens* contains either the **allow-top-navigation-by-user-activation** keyword or the [allow-top-navigation](#)<sup>p834</sup> keyword.

#### Note

This means that if the [allow-top-navigation](#)<sup>p834</sup> is present, the [allow-top-navigation-by-user-activation](#)<sup>p834</sup> keyword will have no effect. For this reason, specifying both is a document conformance error.

- The [sandboxed plugins browsing context flag](#)<sup>p833</sup>.
- The [sandboxed origin browsing context flag](#)<sup>p833</sup>, unless the *tokens* contains the **allow-same-origin** keyword.

**Note**

The [allow-same-origin](#)<sup>p834</sup> keyword is intended for two cases.

First, it can be used to allow content from the same site to be sandboxed to disable scripting, while still allowing access to the DOM of the sandboxed content.

Second, it can be used to embed content from a third-party site, sandboxed to prevent that site from opening popups, etc, without preventing the embedded page from communicating back to its originating site, using the database APIs to store data, etc.

- The [sandboxed forms browsing context flag](#)<sup>p833</sup>, unless *tokens* contains the **allow-forms** keyword.
- The [sandboxed pointer lock browsing context flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-pointer-lock** keyword.
- The [sandboxed scripts browsing context flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-scripts** keyword.
- The [sandboxed automatic features browsing context flag](#)<sup>p834</sup>, unless *tokens* contains the [allow-scripts](#)<sup>p835</sup> keyword (defined above).

**Note**

This flag is relaxed by the same keyword as *scripts*, because when *scripts* are enabled these features are trivially possible anyway, and it would be unfortunate to force authors to use *script* to do them when sandboxed rather than allowing them to use the declarative features.

- The [sandboxed document.domain browsing context flag](#)<sup>p834</sup>.
- The [sandbox propagates to auxiliary browsing contexts flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-popups-to-escape-sandbox** keyword.
- The [sandboxed modals flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-modals** keyword.
- The [sandboxed orientation lock browsing context flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-orientation-lock** keyword.
- The [sandboxed presentation browsing context flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-presentation** keyword.
- The [sandboxed downloads browsing context flag](#)<sup>p834</sup>, unless *tokens* contains the **allow-downloads** keyword.

Every [top-level browsing context](#)<sup>p807</sup> has a **popup sandboxing flag set**, which is a [sandboxing flag set](#)<sup>p833</sup>. When a [browsing context](#)<sup>p804</sup> is created, its [popup sandboxing flag set](#)<sup>p835</sup> must be empty. It is populated by [the rules for choosing a browsing context](#)<sup>p812</sup>.

Every [browsing context](#)<sup>p804</sup> that is an [iframe](#)<sup>p355</sup> element's [nested browsing context](#)<sup>p806</sup> has an **iframe sandboxing flag set**, which is a [sandboxing flag set](#)<sup>p833</sup>. Which flags in an [iframe sandboxing flag set](#)<sup>p835</sup> are set at any particular time is determined by the [iframe](#)<sup>p355</sup> element's [sandbox](#)<sup>p359</sup> attribute.

Every [Document](#)<sup>p111</sup> has an **active sandboxing flag set**, which is a [sandboxing flag set](#)<sup>p833</sup>. When the [Document](#)<sup>p111</sup> is created, its [active sandboxing flag set](#)<sup>p835</sup> must be empty. It is populated by the [navigation algorithm](#)<sup>p852</sup>.

Every resource that is obtained by the [navigation algorithm](#)<sup>p852</sup> has a **forced sandboxing flag set**, which is a [sandboxing flag set](#)<sup>p833</sup>. A resource by default has no flags set in its [forced sandboxing flag set](#)<sup>p835</sup>, but other specifications can define that certain flags are set.

**Note**

In particular, the [forced sandboxing flag set](#)<sup>p835</sup> is used by Content Security Policy. [\[CSP\]](#)<sup>p1264</sup>

To **determine sandboxing flags** for a [browsing context](#)<sup>p804</sup> *browsing context*, return the union of the flags that are present in the following [sandboxing flag sets](#)<sup>p833</sup>:

- If *browsing context* is a [top-level browsing context](#)<sup>p807</sup>, then: the flags set on the [popup sandboxing flag set](#)<sup>p835</sup>.
- If *browsing context* is an [iframe](#)<sup>p355</sup> element's [nested browsing context](#)<sup>p806</sup>, then: the flags set on the [iframe sandboxing flag set](#)<sup>p835</sup>.
- If *browsing context* is a [child browsing context](#)<sup>p806</sup>, then: the flags set on *browsing context*'s [container document](#)<sup>p806</sup>'s **active**

## 7.7 Session history and navigation § p83 6

### 7.7.1 The session history of browsing contexts § p83 6

The sequence of [Document](#)<sup>p111</sup>s in a [browsing context](#)<sup>p804</sup> is its **session history**. Each [browsing context](#)<sup>p804</sup>, including [child browsing contexts](#)<sup>p806</sup>, has a distinct session history. A [browsing context](#)<sup>p804</sup>'s session history consists of a flat list of [session history entries](#)<sup>p836</sup>. Each **session history entry** consists, at a minimum, of a [URL](#), and each entry may in addition have [serialized state](#)<sup>p836</sup>, a title, a [Document](#)<sup>p111</sup> object, form data, a [scroll restoration mode](#)<sup>p837</sup>, a scroll position, a [browsing context name](#)<sup>p811</sup>, and other information associated with it.

#### Note

*Each entry, when first created, has a [Document](#)<sup>p111</sup>. However, when a [Document](#)<sup>p111</sup> is not [active](#)<sup>p807</sup>, it's possible for it to be [discarded](#)<sup>p823</sup> to free resources. The [URL](#) and other data in a [session history entry](#)<sup>p836</sup> is then used to bring a new [Document](#)<sup>p111</sup> into being to take the place of the original, in case the user agent finds itself having to reactivate that [Document](#)<sup>p111</sup>.*

#### Note

*Titles associated with [session history entries](#)<sup>p836</sup> need not have any relation with the current [title](#)<sup>p151</sup> of the [Document](#)<sup>p111</sup>. The title of a [session history entry](#)<sup>p836</sup> is intended to explain the state of the document at that point, so that the user can navigate the document's history.*

URLs without associated [serialized state](#)<sup>p836</sup> are added to the session history as the user (or script) navigates from page to page.

Each [Document](#)<sup>p111</sup> object in a [browsing context](#)<sup>p804</sup>'s [session history](#)<sup>p836</sup> is associated with a unique [History](#)<sup>p837</sup> object which must all model the same underlying [session history](#)<sup>p836</sup>.

The **history** attribute of the [Window](#)<sup>p816</sup> interface must return the object implementing the [History](#)<sup>p837</sup> interface for this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup>.

**Serialized state** is a serialization (via [StructuredSerializeForStorage](#)<sup>p105</sup>) of an object representing a user interface state. We sometimes informally refer to "state objects", which are the objects representing user interface state supplied by the author, or alternately the objects created by deserializing (via [StructuredDeserialize](#)<sup>p105</sup>) serialized state.

Pages can [add](#)<sup>p840</sup> [serialized state](#)<sup>p836</sup> to the session history. These are then [deserialized](#)<sup>p105</sup> and [returned to the script](#)<sup>p1261</sup> when the user (or script) goes back in the history, thus enabling authors to use the "navigation" metaphor even in one-page applications.

#### Note

*[Serialized state](#)<sup>p836</sup> is intended to be used for two main purposes: first, storing a prepared description of the state in the [URL](#) so that in the simple case an author doesn't have to do the parsing (though one would still need the parsing for handling [URLs](#) passed around by users, so it's only a minor optimization). Second, so that the author can store state that one wouldn't store in the [URL](#) because it only applies to the current [Document](#)<sup>p111</sup> instance and it would have to be reconstructed if a new [Document](#)<sup>p111</sup> were opened.*

*An example of the latter would be something like keeping track of the precise coordinate from which a popup [div](#)<sup>p233</sup> was made to animate, so that if the user goes back, it can be made to animate to the same location. Or alternatively, it could be used to keep a pointer into a cache of data that would be fetched from the server based on the information in the [URL](#), so that when going back and forward, the information doesn't have to be fetched again.*

At any point, one of the entries in the session history is the **current entry**. This is the entry representing the [active document](#)<sup>p804</sup> of the [browsing context](#)<sup>p804</sup>. Which entry is the [current entry](#)<sup>p836</sup> is changed by the algorithms defined in this specification, e.g. during [session history traversal](#)<sup>p865</sup>.

## Note

The [current entry](#)<sup>p836</sup> is usually an entry for the [URL](#) of the [Document](#)<sup>p111</sup>. However, it can also be one of the entries for [serialized state](#)<sup>p836</sup> added to the history by that document.

An entry with **persisted user state** is one that also has [implementation-defined](#) state. This specification does not specify what kind of state can be stored.

## Example

For example, some user agents might want to persist the scroll position, or the values of form controls.

## Note

User agents that persist the value of form controls are encouraged to also persist their directionality (the value of the element's [dir](#)<sup>p139</sup> attribute). This prevents values from being displayed incorrectly after a history traversal when the user had originally entered the values with an explicit, non-default directionality.

An entry's **scroll restoration mode** indicates whether the user agent should restore the persisted scroll position (if any) when traversing to it. The scroll restoration mode may be one of the following: MDN

### "auto"

The user agent is responsible for restoring the scroll position upon navigation.

### "manual"

The page is responsible for restoring the scroll position and the user agent does not attempt to do so automatically

If unspecified, the [scroll restoration mode](#)<sup>p837</sup> of a new entry must be set to ["auto"](#)<sup>p837</sup>.

Entries that contain [serialized state](#)<sup>p836</sup> share the same [Document](#)<sup>p111</sup> as the entry for the page that was active when they were added.

Contiguous entries that differ just by their [URLs' fragments](#) also share the same [Document](#)<sup>p111</sup>.

## Note

All entries that share the same [Document](#)<sup>p111</sup> (and that are therefore merely different states of one particular document) are contiguous by definition.

Each [Document](#)<sup>p111</sup> in a [browsing context](#)<sup>p804</sup> can also have a **latest entry**. This is the entry for that [Document](#)<sup>p111</sup> to which the [browsing context](#)<sup>p804</sup>'s [session history](#)<sup>p836</sup> was most recently traversed. When a [Document](#)<sup>p111</sup> is created, it initially has no [latest entry](#)<sup>p837</sup>.

User agents may [discard](#)<sup>p823</sup> the [Document](#)<sup>p111</sup> objects of entries other than the [current entry](#)<sup>p836</sup> that are not referenced from any script, reloading the pages afresh when the user or script navigates back to such pages. This specification does not specify when user agents should discard [Document](#)<sup>p111</sup> objects and when they should cache them.

Entries that have had their [Document](#)<sup>p111</sup> objects discarded must, for the purposes of the algorithms given below, act as if they had not. When the user or script navigates back or forwards to a page which has no in-memory DOM objects, any other entries that shared the same [Document](#)<sup>p111</sup> object with it must share the new object as well.

## 7.7.2 The [History](#)<sup>p837</sup> interface §p837

```
IDL enum ScrollRestoration { "auto", "manual" };
```

```
[Exposed=Window]
interface History {
  readonly attribute unsigned long length;
  attribute ScrollRestoration scrollRestoration;
  readonly attribute any state;
  void go(optional long delta = 0);
  void back();
  void forward();
  void pushState(any data, DOMString title, optional USVString? url = null);
```

```
void replaceState(any data, DOMString title, optional USVString? url = null);
};
```

For web developers (non-normative)

**`window.history.length`**<sup>p838</sup>

Returns the number of entries in the [joint session history](#)<sup>p838</sup>.

**`window.history.scrollRestoration`**<sup>p838</sup> [ = value ]

Returns the [scroll restoration mode](#)<sup>p837</sup> of the current entry in the [session history](#)<sup>p836</sup>.

Can be set, to change the [scroll restoration mode](#)<sup>p837</sup> of the current entry in the [session history](#)<sup>p836</sup>.

**`window.history.state`**<sup>p838</sup>

Returns the current [serialized state](#)<sup>p836</sup>, deserialized into an object.

**`window.history.go`**<sup>p839</sup>( [ delta ] )

Goes back or forward the specified number of steps in the [joint session history](#)<sup>p838</sup>.

A zero delta will reload the current page.

If the delta is out of range, does nothing.

**`window.history.back`**<sup>p839</sup>()

Goes back one step in the [joint session history](#)<sup>p838</sup>.

If there is no previous page, does nothing.

**`window.history.forward`**<sup>p839</sup>()

Goes forward one step in the [joint session history](#)<sup>p838</sup>.

If there is no next page, does nothing.

**`window.history.pushState`**<sup>p840</sup>(data, title [, url ] )

Pushes the given data onto the session history, with the given title, and, if provided and not null, the given URL.

**`window.history.replaceState`**<sup>p841</sup>(data, title [, url ] )

Updates the current entry in the session history to have the given data, title, and, if provided and not null, URL.

The **joint session history** of a [top-level browsing context](#)<sup>p807</sup> is the union of all the [session histories](#)<sup>p836</sup> of all [browsing contexts](#)<sup>p804</sup> of all the [fully active](#)<sup>p807</sup> [Document](#)<sup>p111</sup> objects that share that [top-level browsing context](#)<sup>p807</sup>, with all the entries that are [current entries](#)<sup>p836</sup> in their respective [session histories](#)<sup>p836</sup> removed except for the [current entry of the joint session history](#)<sup>p838</sup>.

The **current entry of the joint session history** is the entry that most recently became a [current entry](#)<sup>p836</sup> in its [session history](#)<sup>p836</sup>.

Entries in the [joint session history](#)<sup>p838</sup> are ordered chronologically by the time they were added to their respective [session histories](#)<sup>p836</sup>. Each entry has an index; the earliest entry has index 0, and the subsequent entries are numbered with consecutively increasing integers (1, 2, 3, etc).

#### Note

*Since each [Document](#)<sup>p111</sup> in a [browsing context](#)<sup>p804</sup> might have a different [event loop](#)<sup>p924</sup>, the actual state of the [joint session history](#)<sup>p838</sup> can be somewhat nebulous. For example, two sibling [iframe](#)<sup>p355</sup> elements could both [traverse](#)<sup>p865</sup> from one unique origin to another at the same time, so their precise order might not be well-defined; similarly, since they might only find out about each other later, they might disagree about the length of the [joint session history](#)<sup>p838</sup>.*

The **length** attribute of the [History](#)<sup>p837</sup> interface, on getting, must return the number of entries in the [top-level browsing context](#)<sup>p807</sup>'s [joint session history](#)<sup>p838</sup>. If this [History](#)<sup>p837</sup> object is associated with a [Document](#)<sup>p111</sup> that is not [fully active](#)<sup>p807</sup>, getting must instead throw a ["SecurityError"](#) [DOMException](#).

The actual entries are not accessible from script.

The **scrollRestoration** attribute of the [History](#) interface, on getting, must return the [scroll restoration mode](#)<sup>p837</sup> of the current entry in the [session history](#)<sup>p836</sup>. On setting, the [scroll restoration mode](#)<sup>p837</sup> of the current entry in the [session history](#)<sup>p836</sup> must be set to the new value. If this [History](#)<sup>p837</sup> object is associated with a [Document](#)<sup>p111</sup> that is not [fully active](#)<sup>p807</sup>, both getting and setting must instead throw a ["SecurityError"](#) [DOMException](#).

The **state** attribute of the [History](#)<sup>p837</sup> interface, on getting, must return the last value it was set to by the user agent. If this

[History](#)<sup>p837</sup> object is associated with a [Document](#)<sup>p111</sup> that is not [fully active](#)<sup>p807</sup>, getting must instead throw a ["SecurityError"](#) [DOMException](#). Initially, its value must be null.

When the [go\(delta\)](#) method is invoked:

1. Let *document* be this [History](#)<sup>p837</sup> object's associated [Document](#)<sup>p111</sup>.
2. If *document* is not [fully active](#)<sup>p807</sup>, then throw a ["SecurityError"](#) [DOMException](#).
3. If *delta* is 0, then act as if the [location.reload\(\)](#)<sup>p849</sup> method was called, and return.
4. [Traverse the history by a delta](#)<sup>p839</sup> with *delta* and *document*'s [browsing context](#)<sup>p804</sup>.

When the [back\(\)](#) method is invoked:

1. Let *document* be this [History](#)<sup>p837</sup> object's associated [Document](#)<sup>p111</sup>.
2. If *document* is not [fully active](#)<sup>p807</sup>, then throw a ["SecurityError"](#) [DOMException](#).
3. [Traverse the history by a delta](#)<sup>p839</sup> with  $-1$  and *document*'s [browsing context](#)<sup>p804</sup>.

When the [forward\(\)](#) method is invoked:

1. Let *document* be this [History](#)<sup>p837</sup> object's associated [Document](#)<sup>p111</sup>.
2. If *document* is not [fully active](#)<sup>p807</sup>, then throw a ["SecurityError"](#) [DOMException](#).
3. [Traverse the history by a delta](#)<sup>p839</sup> with  $+1$  and *document*'s [browsing context](#)<sup>p804</sup>.

Each [top-level browsing context](#)<sup>p807</sup> has a **session history traversal queue**, initially empty, to which [tasks](#)<sup>p925</sup> can be added.

Each [top-level browsing context](#)<sup>p807</sup>, when created, must begin running the following algorithm, known as the **session history event loop** for that [top-level browsing context](#)<sup>p807</sup>, [in parallel](#)<sup>p41</sup>:

1. Wait until this [top-level browsing context](#)<sup>p807</sup>'s [session history traversal queue](#)<sup>p839</sup> is not empty.
2. Pull the first [task](#)<sup>p925</sup> from this [top-level browsing context](#)<sup>p807</sup>'s [session history traversal queue](#)<sup>p839</sup>, and execute it.
3. Return to the first step of this algorithm.

The [session history event loop](#)<sup>p839</sup> helps coordinate cross-browsing-context transitions of the [joint session history](#)<sup>p838</sup>: since each [browsing context](#)<sup>p804</sup> might, at any particular time, have a different [event loop](#)<sup>p924</sup> (this can happen if the user navigates from `example.com` to `shop.example`), transitions would otherwise have to involve cross-event-loop synchronization.

To **traverse the history by a delta** given *delta* and [browsing context](#)<sup>p804</sup> *source browsing context*, the user agent must append a [task](#)<sup>p925</sup> to this [top-level browsing context](#)<sup>p807</sup>'s [session history traversal queue](#)<sup>p839</sup>, the [task](#)<sup>p925</sup> consisting of running the following steps:

1. If the index of the [current entry of the joint session history](#)<sup>p838</sup> plus *delta* is less than zero or greater than or equal to the number of items in the [joint session history](#)<sup>p838</sup>, then return.
2. Let *specified entry* be the entry in the [joint session history](#)<sup>p838</sup> whose index is the sum of *delta* and the index of the [current entry of the joint session history](#)<sup>p838</sup>.
3. Let *specified browsing context* be the [browsing context](#)<sup>p804</sup> of the *specified entry*.
4. If *source browsing context* is not [allowed to navigate](#)<sup>p810</sup> *specified browsing context*, then return.
5. If the *specified browsing context*'s [active document](#)<sup>p804</sup>'s [unload a document](#)<sup>p869</sup> algorithm is currently running, return.
6. [Queue a task](#)<sup>p925</sup> that consists of running the following substeps. The relevant [event loop](#)<sup>p924</sup> is that of the *specified browsing context*'s [active document](#)<sup>p804</sup>. The [task source](#)<sup>p925</sup> for the queued task is the [history traversal task source](#)<sup>p932</sup>.
  1. If there is an ongoing attempt to navigate *specified browsing context* that has not yet [matured](#)<sup>p860</sup> (i.e. it has not passed the point of making its [Document](#)<sup>p111</sup> the [active document](#)<sup>p804</sup>), then cancel that attempt to navigate the [browsing context](#)<sup>p804</sup>.

2. If the *specified browsing context's* [active document](#)<sup>p804</sup> is not the same [Document](#)<sup>p111</sup> as the [Document](#)<sup>p111</sup> of the *specified entry*, then run these substeps:
  1. [Prompt to unload](#)<sup>p869</sup> the [active document](#)<sup>p804</sup> of the *specified browsing context*. If the user [refused to allow the document to be unloaded](#)<sup>p869</sup>, then return.
  2. [Unload](#)<sup>p869</sup> the [active document](#)<sup>p804</sup> of the *specified browsing context*.
3. [Traverse the history](#)<sup>p865</sup> of the *specified browsing context* to the *specified entry* with the [history-navigation flag](#)<sup>p865</sup> set.

When the user navigates through a [browsing context](#)<sup>p804</sup>, e.g. using a browser's back and forward buttons, the user agent must [traverse the history by a delta](#)<sup>p839</sup> with a delta equivalent to the action specified by the user and the browsing context being operated on.

The **URL and history update steps**, given a [Document](#)<sup>p111</sup> object *document*, a [URL](#) *newURL*, an optional [serialized state](#)<sup>p836</sup> *serializedData*, and an optional string *title*, optionally with a *state push flag*, are:

1. Let *browsingContext* be *document's* [browsing context](#)<sup>p804</sup>.
2. If the *state push flag* is set, then:
  1. Remove all the entries in *browsingContext's* [session history](#)<sup>p836</sup> after the [current entry](#)<sup>p836</sup>. If the [current entry](#)<sup>p836</sup> is the last entry in the session history, then no entries are removed.

**Note**

*This doesn't necessarily have to affect*<sup>p843</sup> *the user agent's user interface.*

2. Remove any [tasks](#)<sup>p925</sup> queued by the [history traversal task source](#)<sup>p932</sup> that are associated with any [Document](#)<sup>p111</sup> objects in the [top-level browsing context](#)<sup>p807</sup>'s [document family](#)<sup>p808</sup>.
  3. If appropriate, update the [current entry](#)<sup>p836</sup> to reflect any state that the user agent wishes to persist. The entry is then said to be [an entry with persisted user state](#)<sup>p837</sup>.
  4. Add a [session history entry](#)<sup>p836</sup> entry to the session history, after the [current entry](#)<sup>p836</sup>, with
    - *newURL* as the [URL](#);
    - the [scroll restoration mode](#)<sup>p837</sup> of the current entry in the [session history](#)<sup>p836</sup> as the scroll restoration mode;
    - *serializedData* as the [serialized state](#)<sup>p836</sup>, if it is given;
    - *title* as the title, if it is given.
  5. Update the [current entry](#)<sup>p836</sup> to be this newly added entry.
3. Otherwise, update the [current entry](#)<sup>p836</sup> in *browsingContext's* [session history](#)<sup>p836</sup> so that:
    - *newURL* is the entry's new [URL](#);
    - *serializedData* is the entry's new [serialized state](#)<sup>p836</sup>, if it is given; otherwise, the [current entry](#)<sup>p836</sup>'s current [serialized state](#)<sup>p836</sup> is kept;
    - *title* is the entry's new title, if it is given; otherwise, the entry does not have a title;
    - it represents a GET request, if it currently represents a non-GET request (e.g. it was the result of a POST submission).
  4. Set *document's* [URL](#) to *newURL*.

**Note**

*Since this is neither a [navigation](#)<sup>p852</sup> of the [browsing context](#)<sup>p804</sup> nor a [history traversal](#)<sup>p865</sup>, it does not cause a [hashchange](#)<sup>p1260</sup> event to be fired.*

The `pushState(data, title, url)` method adds a state object entry to the history.

The `replaceState(data, title, url)` method updates the state object, title, and optionally the [URL](#) of the [current entry](#)<sup>p836</sup> in the history.

When either of these methods is invoked, the user agent must run the following steps:

1. Let *document* be the unique [Document](#)<sup>p111</sup> object this [History](#)<sup>p837</sup> object is associated with.
2. If *document* is not [fully active](#)<sup>p807</sup>, throw a `"SecurityError"` [DOMException](#).
3. Optionally, return. (For example, the user agent might disallow calls to these methods that are invoked on a timer, or from event listeners that are not triggered in response to a clear user action, or that are invoked in rapid succession.)
4. Let *targetRealm* be this [History](#)<sup>p837</sup> object's [relevant Realm](#)<sup>p913</sup>.
5. Let *serializedData* be [StructuredSerializeForStorage](#)<sup>p105</sup>(*data*). Rethrow any exceptions.
6. Let *newURL* be the [URL](#) of the [current entry](#)<sup>p836</sup> in *browsingContext*'s [session history](#)<sup>p836</sup>.
7. If *url* is not null, then:
  1. [Parse](#)<sup>p87</sup> *url*, relative to the [relevant settings object](#)<sup>p913</sup> of this [History](#)<sup>p837</sup> object.
  2. If that fails, then throw a `"SecurityError"` [DOMException](#).
  3. Set *newURL* to the [resulting URL record](#)<sup>p87</sup>.
  4. Compare *newURL* to *document*'s [URL](#). If any component of these two [URL records](#) differ other than the [path](#), [query](#), and [fragment](#) components, then throw a `"SecurityError"` [DOMException](#).
  5. If the [origin](#) of *newURL* is not [same origin](#)<sup>p830</sup> with the [origin](#)<sup>p829</sup> of *document*, and either the [path](#) or [query](#) components of the two [URL records](#) compared in the previous step differ, throw a `"SecurityError"` [DOMException](#). (This prevents sandboxed content from spoofing other pages on the same origin.)
8. Run the [URL and history update steps](#)<sup>p840</sup> given *document*, *newURL*, *serializedData*, and *title*, with the *state push flag* set if the method invoked was the [pushState\(\)](#)<sup>p840</sup> method.
9. Let *state* be [StructuredDeserialize](#)<sup>p105</sup>(*serializedData*, *targetRealm*). If this throws an exception, catch it, ignore the exception, and set *state* to null.
10. Set [history.state](#)<sup>p838</sup> to *state*.
11. Set the [current entry](#)<sup>p836</sup>'s [Document](#)<sup>p111</sup> object's [latest entry](#)<sup>p837</sup> to the [current entry](#)<sup>p836</sup>.

#### Note

*The title is purely advisory. User agents might use the title in the user interface.*

User agents may limit the number of state objects added to the session history per page. If a page hits the [implementation-defined](#) limit, user agents must remove the entry immediately after the first entry for that [Document](#)<sup>p111</sup> object in the session history after having added the new entry. (Thus the state history acts as a FIFO buffer for eviction, but as a LIFO buffer for navigation.)

#### Example

Consider a game where the user can navigate along a line, such that the user is always at some coordinate, and such that the user can bookmark the page corresponding to a particular coordinate, to return to it later.

A static page implementing the `x=5` position in such a game could look like the following:

```
<!DOCTYPE HTML>
<!-- this is https://example.com/line?x=5 -->
<html lang="en">
<title>Line Game - 5</title>
<p>You are at coordinate 5 on the line.</p>
<p>
  <a href="?x=6">Advance to 6</a> or
  <a href="?x=4">retreat to 4</a>?
</p>
```

The problem with such a system is that each time the user clicks, the whole page has to be reloaded. Here instead is another way of doing it, using script:

```
<!DOCTYPE HTML>
<!-- this starts off as https://example.com/line?x=5 -->
<html lang="en">
<title>Line Game - 5</title>
<p>You are at coordinate <span id="coord">5</span> on the line.</p>
<p>
  <a href="?x=6" onclick="go(1); return false;">Advance to 6</a> or
  <a href="?x=4" onclick="go(-1); return false;">retreat to 4</a>?
</p>
<script>
  var currentPage = 5; // prefilled by server
  function go(d) {
    setupPage(currentPage + d);
    history.pushState(currentPage, document.title, '?x=' + currentPage);
  }
  onpopstate = function(event) {
    setupPage(event.state);
  }
  function setupPage(page) {
    currentPage = page;
    document.title = 'Line Game - ' + currentPage;
    document.getElementById('coord').textContent = currentPage;
    document.links[0].href = '?x=' + (currentPage+1);
    document.links[0].textContent = 'Advance to ' + (currentPage+1);
    document.links[1].href = '?x=' + (currentPage-1);
    document.links[1].textContent = 'retreat to ' + (currentPage-1);
  }
</script>
```

In systems without script, this still works like the previous example. However, users that *do* have script support can now navigate much faster, since there is no network access for the same experience. Furthermore, contrary to the experience the user would have with just a naïve script-based approach, bookmarking and navigating the session history still work.

In the example above, the *data* argument to the `pushState()`<sup>p840</sup> method is the same information as would be sent to the server, but in a more convenient form, so that the script doesn't have to parse the URL each time the user navigates.

### Example

Applications might not use the same title for a [session history entry](#)<sup>p836</sup> as the value of the document's `title`<sup>p151</sup> element at that time. For example, here is a simple page that shows a block in the `title`<sup>p151</sup> element. Clearly, when navigating backwards to a previous state the user does not go back in time, and therefore it would be inappropriate to put the time in the session history title.

```
<!DOCTYPE HTML>
<HTML LANG=EN>
<TITLE>Line</TITLE>
<SCRIPT>
  setInterval(function () { document.title = 'Line - ' + new Date(); }, 1000);
  var i = 1;
  function inc() {
    set(i+1);
    history.pushState(i, 'Line - ' + i);
  }
  function set(newI) {
    i = newI;
    document.forms.F.I.value = newI;
  }
</SCRIPT>
```

```

<BODY ONPOPSTATE="set(event.state)">
<FORM NAME=F>
State: <OUTPUT NAME=I>1</OUTPUT> <INPUT VALUE="Increment" TYPE=BUTTON ONCLICK="inc()">
</FORM>

```

### Example

Most applications want to use the same [scroll restoration mode](#)<sup>p837</sup> value for all of their history entries. To achieve this they can set the [scrollRestoration](#)<sup>p838</sup> attribute as soon as possible (e.g., in the first [script](#)<sup>p607</sup> element in the document's [head](#)<sup>p150</sup> element) to ensure that any entry added to the history session gets the desired scroll restoration mode.

```

<head>
  <script>
    if ('scrollRestoration' in history)
      history.scrollRestoration = 'manual';
  </script>
</head>

```

### 7.7.3 Implementation notes for session history §<sup>p84</sup><sub>3</sub>

*This section is non-normative.*

The [History](#)<sup>p837</sup> interface is not meant to place restrictions on how implementations represent the session history to the user.

For example, session history could be implemented in a tree-like manner, with each page having multiple "forward" pages. This specification doesn't define how the linear list of pages in the [history](#)<sup>p836</sup> object are derived from the actual session history as seen from the user's perspective.

Similarly, a page containing two [iframe](#)<sup>p355</sup>s has a [history](#)<sup>p836</sup> object distinct from the [iframe](#)<sup>p355</sup>'s [history](#)<sup>p836</sup> objects, despite the fact that typical Web browsers present the user with just one "Back" button, with a session history that interleaves the navigation of the two inner frames and the outer page.

**Security:** It is suggested that to avoid letting a page "hijack" the history navigation facilities of a UA by abusing [pushState\(\)](#)<sup>p840</sup>, the UA provide the user with a way to jump back to the previous page (rather than just going back to the previous state). For example, the back button could have a drop down showing just the pages in the session history, and not showing any of the states. Similarly, an aural browser could have two "back" commands, one that goes back to the previous state, and one that jumps straight back to the previous page.

For both [pushState\(\)](#)<sup>p840</sup> and [replaceState\(\)](#)<sup>p841</sup>, user agents are encouraged to prevent abuse of these APIs via too-frequent calls or over-large state objects. As detailed above, the algorithm explicitly allows user agents to ignore any such calls when appropriate.

### 7.7.4 The [Location](#)<sup>p844</sup> interface §<sup>p84</sup><sub>3</sub>

Each [Window](#)<sup>p816</sup> object is associated with a unique instance of a [Location](#)<sup>p844</sup> object, allocated when the [Window](#)<sup>p816</sup> object is created.

#### Warning!

**The [Location](#)<sup>p844</sup> exotic object is defined through a mishmash of IDL, invocation of JavaScript internal methods post-creation, and overridden JavaScript internal methods. Coupled with its scary security policy, please take extra care while implementing this excrescence.**

To create a [Location](#)<sup>p844</sup> object, run these steps:

1. Let *location* be a new [Location](#)<sup>p844</sup> platform object.
2. Let *valueOf* be *location*'s [relevant Realm](#)<sup>p913</sup>.`[[Intrinsics]].[[%ObjProto_valueOf%]]`.

3. Perform ! *location*.[[DefineOwnProperty]]("valueOf", { [[Value]]: *valueOf*, [[Writable]]: false, [[Enumerable]]: false, [[Configurable]]: false }).
4. Perform ! *location*.[[DefineOwnProperty]]("@@toPrimitive"<sup>p53</sup>, { [[Value]]: undefined, [[Writable]]: false, [[Enumerable]]: false, [[Configurable]]: false }).
5. Set the value of the [[DefaultProperties]]<sup>p850</sup> internal slot of *location* to *location*.[[OwnPropertyKeys]]().
6. Return *location*.

#### Note

The addition of *valueOf* and @@toPrimitive<sup>p53</sup> own data properties, as well as the fact that all of *Location*<sup>p844</sup>'s IDL attributes are marked [LegacyUnforgeable], is required by legacy code that consulted the *Location*<sup>p844</sup> interface, or stringified it, to determine the *document URL*, and then used it in a security-sensitive way. In particular, the *valueOf*, @@toPrimitive<sup>p53</sup>, and [LegacyUnforgeable] stringifier mitigations ensure that code such as `foo[location] = bar or location + ""` cannot be misdirected.

#### For web developers (non-normative)

***document* . *location***<sup>p844</sup> [ = value ]

***window* . *location***<sup>p844</sup> [ = value ]

Returns a *Location*<sup>p844</sup> object with the current page's location.

Can be set, to navigate to another page.

The *Document*<sup>p111</sup> object's *location* attribute's getter must return this *Document*<sup>p111</sup> object's *relevant global object*<sup>p913</sup>'s *Location*<sup>p844</sup> object, if this *Document*<sup>p111</sup> object is *fully active*<sup>p807</sup>, and null otherwise.

The *Window*<sup>p816</sup> object's *location* attribute's getter must return this *Window*<sup>p816</sup> object's *Location*<sup>p844</sup> object.

*Location*<sup>p844</sup> objects provide a representation of the *URL* of the *active document*<sup>p804</sup> of their *Document*<sup>p111</sup>'s *browsing context*<sup>p804</sup>, and allow the *current entry*<sup>p836</sup> of the *browsing context*<sup>p804</sup>'s session history to be changed, by adding or replacing entries in the *history*<sup>p836</sup> object.

```
IDL [Exposed=Window]
interface Location { // but see also additional creation steps and overridden internal methods
  [LegacyUnforgeable] stringifier attribute USVString href;
  [LegacyUnforgeable] readonly attribute USVString origin;
  [LegacyUnforgeable] attribute USVString protocol;
  [LegacyUnforgeable] attribute USVString host;
  [LegacyUnforgeable] attribute USVString hostname;
  [LegacyUnforgeable] attribute USVString port;
  [LegacyUnforgeable] attribute USVString pathname;
  [LegacyUnforgeable] attribute USVString search;
  [LegacyUnforgeable] attribute USVString hash;

  [LegacyUnforgeable] void assign(USVString url);
  [LegacyUnforgeable] void replace(USVString url);
  [LegacyUnforgeable] void reload();

  [LegacyUnforgeable, SameObject] readonly attribute DOMStringList ancestorOrigins;
};
```

#### For web developers (non-normative)

***location* . toString()**

***location* . href**<sup>p846</sup>

Returns the *Location*<sup>p844</sup> object's URL.

Can be set, to navigate to the given URL.

***location* . origin**<sup>p846</sup>

Returns the *Location*<sup>p844</sup> object's URL's origin.

### **location . protocol**<sup>p846</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's scheme.

Can be set, to navigate to the same URL with a changed scheme.

### **location . host**<sup>p847</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's host and port (if different from the default port for the scheme).

Can be set, to navigate to the same URL with a changed host and port.

### **location . hostname**<sup>p847</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's host.

Can be set, to navigate to the same URL with a changed host.

### **location . port**<sup>p847</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's port.

Can be set, to navigate to the same URL with a changed port.

### **location . pathname**<sup>p848</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's path.

Can be set, to navigate to the same URL with a changed path.

### **location . search**<sup>p848</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's query (includes leading "?" if non-empty).

Can be set, to navigate to the same URL with a changed query (ignores leading "?").

### **location . hash**<sup>p849</sup>

Returns the [Location](#)<sup>p844</sup> object's URL's fragment (includes leading "#" if non-empty).

Can be set, to navigate to the same URL with a changed fragment (ignores leading "#").

### **location . assign**<sup>p849</sup>(url)

Navigates to the given URL.

### **location . replace**<sup>p849</sup>(url)

Removes the current page from the session history and navigates to the given URL.

### **location . reload**<sup>p849</sup>()

Reloads the current page.

### **location . ancestorOrigins**<sup>p850</sup>

Returns a [DOMStringList](#)<sup>p98</sup> object listing the origins of the ancestor [browsing contexts](#)<sup>p804</sup>, from the [parent browsing context](#)<sup>p807</sup> to the [top-level browsing context](#)<sup>p807</sup>.

A [Location](#)<sup>p844</sup> object has an associated **relevant Document**, which is this [Location](#)<sup>p844</sup> object's [relevant global object](#)<sup>p913</sup>'s [browsing context](#)<sup>p818</sup>'s [active document](#)<sup>p804</sup>, if this [Location](#)<sup>p844</sup> object's [relevant global object](#)<sup>p913</sup>'s [browsing context](#)<sup>p818</sup> is non-null, and null otherwise.

A [Location](#)<sup>p844</sup> object has an associated **url**, which is this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s **URL**, if this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null, and [about:blank](#)<sup>p50</sup> otherwise.

A [Location](#)<sup>p844</sup> object has an associated **ancestor origins list**. When a [Location](#)<sup>p844</sup> object is created, its [ancestor origins list](#)<sup>p845</sup> must be set to a [DOMStringList](#)<sup>p98</sup> object whose associated list is the [list](#) of strings that the following steps would produce:

1. Let *output* be a new [list](#) of strings.
2. Let *current* be the [browsing context](#)<sup>p804</sup> of the [Document](#)<sup>p111</sup> with which this [Location](#)<sup>p844</sup> object is associated.
3. *Loop*: If *current* has no [parent browsing context](#)<sup>p807</sup>, jump to the step labeled *end*.
4. Let *current* be *current*'s [parent browsing context](#)<sup>p807</sup>.
5. **Append** the [serialization](#)<sup>p830</sup> of *current*'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup> to *output*.
6. Return to the step labeled *loop*.

7. *End*: Return output.

A [Location](#)<sup>p844</sup> object has an associated **Location-object-setter navigate** algorithm, which given a *url*, runs these steps:

1. If any of the following conditions are met, let *replacement flag* be unset; otherwise, let it be set:
  - This [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> has [completely loaded](#)<sup>p1145</sup>, or
  - In the [task](#)<sup>p925</sup> in which the algorithm is running, an [activation behavior](#) is currently being processed whose [click](#) event's [isTrusted](#) attribute is true, or
  - In the [task](#)<sup>p925</sup> in which the algorithm is running, the event listener for a [click](#) event, whose [isTrusted](#) attribute is true, is being handled.
2. [Location-object navigate](#)<sup>p846</sup>, given *url* and *replacement flag*.

To **Location-object navigate**, given a *url* and *replacement flag*, run these steps:

1. The [source browsing context](#)<sup>p852</sup> is the [incumbent global object](#)<sup>p911</sup>'s [browsing context](#)<sup>p818</sup>.
2. [Navigate](#)<sup>p852</sup> the [browsing context](#)<sup>p804</sup> to *url*, with the [exceptions enabled flag](#)<sup>p852</sup> set. Rethrow any exceptions.

If the *replacement flag* is set or the [browsing context](#)<sup>p804</sup>'s [session history](#)<sup>p836</sup> contains only one [Document](#)<sup>p111</sup>, and that was the [about:blank](#)<sup>p50</sup> [Document](#)<sup>p111</sup> created when the [browsing context](#)<sup>p804</sup> was created, then the navigation must be done with [replacement enabled](#)<sup>p865</sup>.

The **href** attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a **"SecurityError" DOMException**.
2. Return this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>, *serialized*.

The **href**<sup>p846</sup> attribute's setter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. [Parse](#)<sup>p87</sup> the given value relative to the [entry settings object](#)<sup>p910</sup>. If that failed, throw a **TypeError** exception.
3. [Location-object-setter navigate](#)<sup>p846</sup> to the [resulting URL record](#)<sup>p87</sup>.

#### Note

The **href**<sup>p846</sup> attribute setter intentionally has no security check.

The **origin** attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a **"SecurityError" DOMException**.
2. Return the [serialization](#)<sup>p830</sup> of this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>'s *origin*.

The **protocol** attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a **"SecurityError" DOMException**.
2. Return this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>'s *scheme*, followed by " : ".

The **protocol**<sup>p846</sup> attribute's setter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a **"SecurityError" DOMException**.
3. Let *copyURL* be a copy of this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>.
4. Let *possibleFailure* be the result of [basic URL parsing](#) the given value, followed by " : ", with *copyURL* as *url* and [scheme start state](#) as *state override*.

**Note**

Because the URL parser ignores multiple consecutive colons, providing a value of "https:" (or even "https:::") is the same as providing a value of "https".

5. If *possibleFailure* is failure, then throw a ["SyntaxError" DOMException](#).
6. If *copyURL*'s [scheme](#) is not an [HTTP\(S\) scheme](#), then terminate these steps.
7. [Location-object-setter navigate](#)<sup>p846</sup> to *copyURL*.

The **host** attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a ["SecurityError" DOMException](#).
2. Let *url* be this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>.
3. If *url*'s [host](#) is null, return the empty string.
4. If *url*'s [port](#) is null, return *url*'s [host](#), [serialized](#).
5. Return *url*'s [host](#), [serialized](#), followed by ":" and *url*'s [port](#), [serialized](#).

The [host](#)<sup>p847</sup> attribute's setter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a ["SecurityError" DOMException](#).
3. Let *copyURL* be a copy of this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>.
4. If *copyURL*'s [cannot-be-a-base-URL flag](#) is set, terminate these steps.
5. [Basic URL parse](#) the given value, with *copyURL* as *url* and [host state](#) as *state override*.
6. [Location-object-setter navigate](#)<sup>p846</sup> to *copyURL*.

The **hostname** attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a ["SecurityError" DOMException](#).
2. If this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>'s [host](#) is null, return the empty string.
3. Return this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>'s [host](#), [serialized](#).

The [hostname](#)<sup>p847</sup> attribute's setter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a ["SecurityError" DOMException](#).
3. Let *copyURL* be a copy of this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>.
4. If *copyURL*'s [cannot-be-a-base-URL flag](#) is set, terminate these steps.
5. [Basic URL parse](#) the given value, with *copyURL* as *url* and [hostname state](#) as *state override*.
6. [Location-object-setter navigate](#)<sup>p846</sup> to *copyURL*.

The **port** attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a ["SecurityError" DOMException](#).
2. If this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>'s [port](#) is null, return the empty string.
3. Return this [Location](#)<sup>p844</sup> object's [url](#)<sup>p845</sup>'s [port](#), [serialized](#).

The [port<sup>p847</sup>](#) attribute's setter must run these steps:

1. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#) is null, then return.
2. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#)'s [origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [entry settings object<sup>p910</sup>](#)'s [origin<sup>p897</sup>](#), then throw a ["SecurityError" DOMException](#).
3. Let *copyURL* be a copy of this [Location<sup>p844</sup>](#) object's [url<sup>p845</sup>](#).
4. If *copyURL* [cannot have a username/password/port](#), then return.
5. If the given value is the empty string, then set *copyURL*'s [port](#) to null.
6. Otherwise, [basic URL parse](#) the given value, with *copyURL* as *url* and [port state](#) as *state override*.
7. [Location-object-setter navigate<sup>p846</sup>](#) to *copyURL*.

The [pathname](#) attribute's getter must run these steps:

1. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#) is non-null and its [origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [entry settings object<sup>p910</sup>](#)'s [origin<sup>p897</sup>](#), then throw a ["SecurityError" DOMException](#).
2. Let *url* be this [Location<sup>p844</sup>](#) object's [url<sup>p845</sup>](#).
3. If *url*'s [cannot-be-a-base-URL flag](#) is set, return the first string in *url*'s [path](#).
4. If *url*'s [path](#) is empty, then return the empty string.
5. Return `"/`, followed by the strings in *url*'s [path](#) (including empty strings), separated from each other by `"/`.

The [pathname<sup>p848</sup>](#) attribute's setter must run these steps:

1. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#) is null, then return.
2. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#)'s [origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [entry settings object<sup>p910</sup>](#)'s [origin<sup>p897</sup>](#), then throw a ["SecurityError" DOMException](#).
3. Let *copyURL* be a copy of this [Location<sup>p844</sup>](#) object's [url<sup>p845</sup>](#).
4. If *copyURL*'s [cannot-be-a-base-URL flag](#) is set, terminate these steps.
5. Set *copyURL*'s [path](#) to the empty list.
6. [Basic URL parse](#) the given value, with *copyURL* as *url* and [path start state](#) as *state override*.
7. [Location-object-setter navigate<sup>p846</sup>](#) to *copyURL*.

The [search](#) attribute's getter must run these steps:

1. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#) is non-null and its [origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [entry settings object<sup>p910</sup>](#)'s [origin<sup>p897</sup>](#), then throw a ["SecurityError" DOMException](#).
2. If this [Location<sup>p844</sup>](#) object's [url<sup>p845</sup>](#)'s [query](#) is either null or the empty string, return the empty string.
3. Return `"?"`, followed by this [Location<sup>p844</sup>](#) object's [url<sup>p845</sup>](#)'s [query](#).

The [search<sup>p848</sup>](#) attribute's setter must run these steps:

1. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#) is null, then return.
2. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#)'s [origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [entry settings object<sup>p910</sup>](#)'s [origin<sup>p897</sup>](#), then throw a ["SecurityError" DOMException](#).
3. Let *copyURL* be a copy of this [Location<sup>p844</sup>](#) object's [url<sup>p845</sup>](#).
4. If the given value is the empty string, set *copyURL*'s [query](#) to null.
5. Otherwise, run these substeps:
  1. Let *input* be the given value with a single leading `"?"` removed, if any.

2. Set `copyURL`'s `query` to the empty string.
3. [Basic URL parse input](#), with `copyURL` as `url` and `query state` as `state override`, and the [relevant Document](#)<sup>p845</sup>'s `document's character encoding` as `encoding override`.
6. [Location-object-setter navigate](#)<sup>p846</sup> to `copyURL`.

The `hash` attribute's getter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is non-null and its [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a `"SecurityError" DOMException`.
2. If this [Location](#)<sup>p844</sup> object's `url`<sup>p845</sup>'s `fragment` is either null or the empty string, return the empty string.
3. Return `"#"`, followed by this [Location](#)<sup>p844</sup> object's `url`<sup>p845</sup>'s `fragment`.

The [hash](#)<sup>p849</sup> attribute's setter must run these steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a `"SecurityError" DOMException`.
3. Let `copyURL` be a copy of this [Location](#)<sup>p844</sup> object's `url`<sup>p845</sup>.
4. Let `input` be the given value with a single leading `"#"` removed, if any.
5. Set `copyURL`'s `fragment` to the empty string.
6. [Basic URL parse input](#), with `copyURL` as `url` and `fragment state` as `state override`.
7. [Location-object-setter navigate](#)<sup>p846</sup> to `copyURL`.

#### Note

*Unlike the equivalent API for the [a](#)<sup>p234</sup> and [area](#)<sup>p437</sup> elements, the [hash](#)<sup>p849</sup> attribute's setter does not special case the empty string to remain compatible with deployed scripts.*

When the `assign(url)` method is invoked, the user agent must run the following steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then throw a `"SecurityError" DOMException`.
3. [Parse](#)<sup>p87</sup> `url` relative to the [entry settings object](#)<sup>p910</sup>. If that failed, throw a `"SyntaxError" DOMException`.
4. [Location-object navigate](#)<sup>p846</sup> to the [resulting URL record](#)<sup>p87</sup>.

When the `replace(url)` method is invoked, the user agent must run the following steps:

1. If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null, then return.
2. [Parse](#)<sup>p87</sup> `url` relative to the [entry settings object](#)<sup>p910</sup>. If that failed, throw a `"SyntaxError" DOMException`.
3. [Location-object navigate](#)<sup>p846</sup> to the [resulting URL record](#)<sup>p87</sup> with the `replacement flag` set.

#### Note

*The `replace()`<sup>p849</sup> method intentionally has no security check.*

When the `reload()` method is invoked, the user agent must run the appropriate steps from the following list:

- ↪ **If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup> is null**  
Return.
- ↪ **If this [Location](#)<sup>p844</sup> object's [relevant Document](#)<sup>p845</sup>'s [origin](#)<sup>p829</sup> is not [same origin-domain](#)<sup>p830</sup> with the [entry settings](#)**

## [object<sup>p910</sup>'s origin<sup>p897</sup>](#)

Throw a "[SecurityError](#)" [DOMException](#).

↪ If the currently executing [task<sup>p925</sup>](#) is the dispatch of a [resize](#) event in response to the user resizing the [browsing context<sup>p804</sup>](#)

Repaint the [browsing context<sup>p804</sup>](#) and return.

↪ If the [browsing context<sup>p804</sup>'s active document<sup>p804</sup>](#) is an [iframe srcdoc document<sup>p356</sup>](#)

Reprocess the [iframe attributes<sup>p358</sup>](#) of the [browsing context<sup>p804</sup>'s container<sup>p806</sup>](#).

↪ Otherwise

Navigate<sup>p852</sup> the [browsing context<sup>p804</sup>](#) to this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>'s URL](#) to perform an [entry update<sup>p859</sup>](#) of the [browsing context<sup>p804</sup>'s current entry<sup>p836</sup>](#), with the [exceptions enabled flag<sup>p852</sup>](#) set. The [source browsing context<sup>p852</sup>](#) must be the [browsing context<sup>p804</sup>](#) being navigated. This is a [reload-triggered navigation<sup>p852</sup>](#). Rethrow any exceptions.

When a user requests that the [active document<sup>p804</sup>](#) of a [browsing context<sup>p804</sup>](#) be reloaded through a user interface element, the user agent should [navigate<sup>p852</sup>](#) the [browsing context<sup>p804</sup>](#) to the same resource as that [Document<sup>p111</sup>](#), to perform an [entry update<sup>p859</sup>](#) of the [browsing context<sup>p804</sup>'s current entry<sup>p836</sup>](#). This is a [reload-triggered navigation<sup>p852</sup>](#). In the case of non-idempotent methods (e.g. HTTP POST), the user agent should prompt the user to confirm the operation first, since otherwise transactions (e.g. purchases or database modifications) could be repeated. User agents may allow the user to explicitly override any caches when reloading.

The [ancestorOrigins](#) attribute's getter must run these steps:

MIDN

1. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>](#) is null, then return an empty [list](#).
2. If this [Location<sup>p844</sup>](#) object's [relevant Document<sup>p845</sup>'s origin<sup>p829</sup>](#) is not [same origin-domain<sup>p830</sup>](#) with the [entry settings object<sup>p910</sup>'s origin<sup>p897</sup>](#), then throw a "[SecurityError](#)" [DOMException](#).
3. Otherwise, return this [Location<sup>p844</sup>](#) object's [ancestor origins list<sup>p845</sup>](#).

### ⚠Warning!

*The details of how the [ancestorOrigins<sup>p850</sup>](#) attribute works are still controversial and might change. See [issue #1918](#) for more information.*

As explained earlier, the [Location<sup>p844</sup>](#) exotic object requires additional logic beyond IDL for security purposes. The [Location<sup>p844</sup>](#) object must use the ordinary internal methods except where it is explicitly specified otherwise below.

Also, every [Location<sup>p844</sup>](#) object has a **[[DefaultProperties]]** internal slot representing its own properties at time of its creation.

#### 7.7.4.1 **[[GetPrototypeOf]]** ( ) §<sup>p85</sup><sub>0</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then return ! [OrdinaryGetPrototypeOf](#)(**this**).
2. Return null.

#### 7.7.4.2 **[[SetPrototypeOf]]** ( V ) §<sup>p85</sup><sub>0</sub>

1. Return ! [SetImmutablePrototype](#)(**this**, V).

#### 7.7.4.3 **[[IsExtensible]]** ( ) §<sup>p85</sup><sub>0</sub>

1. Return true.

#### 7.7.4.4 **[[PreventExtensions]]** ( ) §<sup>p85</sup><sub>1</sub>

1. Return false.

#### 7.7.4.5 **[[GetOwnProperty]]** ( *P* ) §<sup>p85</sup><sub>1</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then:
  1. Let *desc* be ! [OrdinaryGetOwnProperty](#)(**this**, *P*).
  2. If the value of the [\[\[DefaultProperties\]\]<sup>p850</sup>](#) internal slot of **this** contains *P*, then set *desc*.[[Configurable]] to true.
  3. Return *desc*.
2. Let *property* be ! [CrossOriginGetOwnPropertyHelper<sup>p815</sup>](#)(**this**, *P*).
3. If *property* is not undefined, then return *property*.
4. Return ? [CrossOriginPropertyFallback<sup>p815</sup>](#)(*P*).

#### 7.7.4.6 **[[DefineOwnProperty]]** ( *P*, *Desc* ) §<sup>p85</sup><sub>1</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then:
  1. If the value of the [\[\[DefaultProperties\]\]<sup>p850</sup>](#) internal slot of **this** contains *P*, then return false.
  2. Return ? [OrdinaryDefineOwnProperty](#)(**this**, *P*, *Desc*).
2. Throw a "[SecurityError](#)" [DOMException](#).

#### 7.7.4.7 **[[Get]]** ( *P*, *Receiver* ) §<sup>p85</sup><sub>1</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then return ? [OrdinaryGet](#)(**this**, *P*, *Receiver*).
2. Return ? [CrossOriginGet<sup>p816</sup>](#)(**this**, *P*, *Receiver*).

#### 7.7.4.8 **[[Set]]** ( *P*, *V*, *Receiver* ) §<sup>p85</sup><sub>1</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then return ? [OrdinarySet](#)(**this**, *P*, *Receiver*).
2. Return ? [CrossOriginSet<sup>p816</sup>](#)(**this**, *P*, *V*, *Receiver*).

#### 7.7.4.9 **[[Delete]]** ( *P* ) §<sup>p85</sup><sub>1</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then return ? [OrdinaryDelete](#)(**this**, *P*).
2. Throw a "[SecurityError](#)" [DOMException](#).

#### 7.7.4.10 **[[OwnPropertyKeys]]** ( ) §<sup>p85</sup><sub>1</sub>

1. If ! [IsPlatformObjectSameOrigin<sup>p815</sup>](#)(**this**) is true, then return ! [OrdinaryOwnPropertyKeys](#)(**this**).
2. Return ! [CrossOriginOwnPropertyKeys<sup>p816</sup>](#)(**this**).

## 7.8 Browsing the Web <sup>§ p85</sup><sub>2</sub>

### 7.8.1 Navigating across documents <sup>§ p85</sup><sub>2</sub>

Certain actions cause the [browsing context](#)<sup>p804</sup> to [navigate](#)<sup>p852</sup> to a new resource. A user agent may provide various ways for the user to explicitly cause a browsing context to navigate, in addition to those defined in this specification.

#### Example

For example, [following a hyperlink](#)<sup>p285</sup>, [form submission](#)<sup>p589</sup>, and the [window.open\(\)](#)<sup>p819</sup> and [location.assign\(\)](#)<sup>p849</sup> methods can all cause a browsing context to navigate.

#### Note

A resource has a URL, but that might not be the only information necessary to identify it. For example, a form submission that uses HTTP POST would also have the HTTP method and payload. Similarly, [an iframe srcdoc document](#)<sup>p356</sup> needs to know the data it is to use.

Navigation always involves **source browsing context**, which is the browsing context which was responsible for starting the navigation.

As explained in [issue #1130](#) the use of a browsing context as source might not be the correct architecture.

To **navigate** a browsing context *browsingContext* to a resource *resource*, optionally with an **exceptions enabled flag**, the user agent must run these steps:

1. If *resource* is a [URL](#), then set *resource* to a new [request](#) whose [url](#) is *resource*.
2. If *resource* is a [request](#) and this is a **reload-triggered navigation**, then set *resource*'s [reload-navigation flag](#).
3. If the [source browsing context](#)<sup>p852</sup> is not [allowed to navigate](#)<sup>p810</sup> *browsingContext*, then:
  1. If the [exceptions enabled flag](#)<sup>p852</sup> is set, then throw a **"SecurityError" DOMException**.
  2. Otherwise, the user agent may instead offer to open *resource* in a new [top-level browsing context](#)<sup>p807</sup> or in the [top-level browsing context](#)<sup>p807</sup> of the [source browsing context](#)<sup>p852</sup>, at the user's option, in which case the user agent must [navigate](#)<sup>p852</sup> that designated [top-level browsing context](#)<sup>p807</sup> to *resource* as if the user had requested it independently.

#### Note

Doing so, however, can be dangerous, as it means that the user is overriding the author's explicit request to sandbox the content.

4. If there is a preexisting attempt to navigate *browsingContext*, and the [source browsing context](#)<sup>p852</sup> is the same as *browsingContext*, and that attempt is currently running the [unload a document](#)<sup>p869</sup> algorithm, then return without affecting the preexisting attempt to navigate *browsingContext*.
5. If the [prompt to unload](#)<sup>p869</sup> algorithm is being run for the [active document](#)<sup>p804</sup> of *browsingContext*, then return without affecting the [prompt to unload](#)<sup>p869</sup> algorithm.
6. If this is not a [reload-triggered navigation](#)<sup>p852</sup>, *resource* is a [request](#), *resource*'s [url equals](#) *browsingContext*'s [active document](#)<sup>p804</sup>'s [URL](#) with [exclude fragments flag](#) set, and *resource*'s [url](#)'s [fragment](#) is non-null, then [navigate to that fragment](#)<sup>p864</sup>, with [replacement enabled](#)<sup>p865</sup> if this was invoked with [replacement enabled](#)<sup>p865</sup>, and return.
7. Let *activeDocumentNavigationOrigin* be the [origin](#)<sup>p829</sup> of the [active document](#)<sup>p804</sup> of *browsingContext*.
8. Let *incumbentNavigationOrigin* be the [origin](#)<sup>p829</sup> of the [incumbent settings object](#)<sup>p911</sup>, or if no [script](#)<sup>p607</sup> was involved, the [origin](#)<sup>p829</sup> of the [node document](#) of the element that initiated the [navigation](#)<sup>p852</sup>.
9. Cancel any preexisting but not yet [mature](#)<sup>p860</sup> attempt to navigate *browsingContext*, including canceling any instances of the [fetch](#) algorithm started by those attempts. If one of those attempts has already [created and initialized a new Document object](#)<sup>p857</sup>, [abort](#)<sup>p871</sup> that [Document](#)<sup>p111</sup> also. (Navigation attempts that have [matured](#)<sup>p860</sup> already have session history entries, and are therefore handled during the [update the session history with the new page](#)<sup>p859</sup> algorithm, later.)
10. [Prompt to unload](#)<sup>p869</sup> the [active document](#)<sup>p804</sup> of *browsingContext*. If the user [refused to allow the document to be](#)

[unloaded](#)<sup>p869</sup>, then return.

If this instance of the [navigation](#)<sup>p852</sup> algorithm gets canceled while this step is running, the [prompt to unload](#)<sup>p869</sup> algorithm must nonetheless be run to completion.

11. [Abort](#)<sup>p871</sup> the [active document](#)<sup>p804</sup> of *browsingContext*.

12. If *browsingContext* is a [child browsing context](#)<sup>p806</sup>, then put it in the [delaying load events mode](#)<sup>p808</sup>.

The user agent must take this [child browsing context](#)<sup>p806</sup> out of the [delaying load events mode](#)<sup>p808</sup> when this [navigation](#)<sup>p852</sup> algorithm later [matures](#)<sup>p860</sup>, or when it terminates (whether due to having run all the steps, or being canceled, or being aborted), whichever happens first.

13. Let *navigationType* be "form-submission" if the [navigation algorithm](#)<sup>p852</sup> was invoked as a result of the [form submission algorithm](#)<sup>p589</sup>, and "other" otherwise.

14. Let *sandboxFlags* be the result of [determining sandboxing flags](#)<sup>p835</sup> given *browsingContext*.

15. Return to whatever algorithm invoked the navigation steps and continue running these steps [in parallel](#)<sup>p41</sup>.

16. This is the step that attempts to obtain *resource*, if necessary. Jump to the first appropriate substep:

**If *resource* is a [response](#)**

Run [process a navigate response](#)<sup>p855</sup> with null, *resource*, *navigationType*, the [source browsing context](#)<sup>p852</sup>, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.

**If *resource* is a [request](#) whose [url's scheme](#) is "[javascript](#)"<sup>p857</sup>**

[Queue a task](#)<sup>p925</sup>, on the [DOM manipulation task source](#)<sup>p932</sup> and associated with the [active document](#)<sup>p804</sup> of *browsingContext*, to run these steps:

1. Let *response* be the result of [executing a javascript: URL request](#)<sup>p857</sup> given *resource*, the [source browsing context](#)<sup>p852</sup>, and *browsingContext*.
2. Run [process a navigate response](#)<sup>p855</sup> with *resource*, *response*, *navigationType*, the [source browsing context](#)<sup>p852</sup>, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.

**Example**

So for example a [javascript: URL](#)<sup>p857</sup> in an [href](#)<sup>p279</sup> attribute of an [a](#)<sup>p234</sup> element would only be evaluated when the link was [followed](#)<sup>p285</sup>, while such a URL in the [src](#)<sup>p356</sup> attribute of an [iframe](#)<sup>p355</sup> element would be evaluated in the context of the [iframe](#)<sup>p355</sup>'s [nested browsing context](#)<sup>p806</sup> when the [iframe](#)<sup>p355</sup> is being set up. Once evaluated, its return value (if it was a string) would replace that [browsing context](#)<sup>p804</sup>'s [active document](#)<sup>p804</sup>, thus also changing the corresponding [Window](#)<sup>p816</sup> object.

**If *resource* is to be fetched using `GET`, and there are [relevant application caches](#)<sup>p875</sup> that are identified by a URL with the [same origin](#)<sup>p830</sup> as the URL in question, and that have this URL as one of their entries, excluding entries marked as [foreign](#)<sup>p874</sup>, and whose [mode](#)<sup>p875</sup> is [fast](#)<sup>p875</sup>, and the user agent is not in a mode where it will avoid using [application caches](#)<sup>p874</sup>**

Fetch *resource* from the [most appropriate application cache](#)<sup>p875</sup> of those that match.

**Example**

For example, imagine an HTML page with an associated application cache displaying an image and a form, where the image is also used by several other application caches. If the user right-clicks on the image and chooses "View Image", then the user agent could decide to show the image from any of those caches, but it is likely that the most useful cache for the user would be the one that was used for the aforementioned HTML page. On the other hand, if the user submits the form, and the form does a POST submission, then the user agent will not use an application cache at all; the submission will be made to the network.

This still needs to be integrated with the Fetch standard. [\[FETCH\]](#)<sup>p1266</sup>

**If *resource* is a [request](#) whose [url's scheme](#) is a [fetch scheme](#)**

Run [process a navigate fetch](#)<sup>p854</sup> given *resource*, the [source browsing context](#)<sup>p852</sup>, *browsingContext*, *navigationType*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.

Otherwise, **resource** is a **request** whose **url**'s **scheme** is neither "**javascript**<sup>p857</sup>" nor a **fetch scheme**

Run **process a navigate URL scheme**<sup>p856</sup> given **resource**'s **url** and **browsingContext**.

To **process a navigate fetch**, given a **request** *request*, two **browsing contexts**<sup>p804</sup> *sourceBrowsingContext* and *browsingContext*, a string *navigationType*, and two **origins**<sup>p829</sup> *incumbentNavigationOrigin* and *activeDocumentNavigationOrigin*, run these steps:

1. Let *response* be null.
2. Set *request*'s **client** to *sourceBrowsingContext*'s **active document**<sup>p804</sup>'s **relevant settings object**<sup>p913</sup>, **destination** to "document", **mode** to "navigate", **credentials mode** to "include", **use-URL-credentials flag**, **redirect mode** to "manual", and **replaces client id** to *browsingContext*'s **active document**<sup>p804</sup>'s **relevant settings object**<sup>p913</sup>'s **id**<sup>p896</sup>.
3. If *browsingContext*'s **container**<sup>p806</sup> is non-null and has a **browsing context scope origin**<sup>p810</sup>, then set *request*'s **origin** to that **browsing context scope origin**<sup>p810</sup>.
4. Let *reservedEnvironment* be null.
5. While true:
  1. Let *currentURL* be *response*'s **location URL**, if *response* is not null, and *request*'s **current URL** otherwise.
  2. If *reservedEnvironment* is not null and *currentURL*'s **origin** is not the **same**<sup>p830</sup> as *reservedEnvironment*'s **creation URL**<sup>p896</sup>'s **origin**, then:
    1. Run the **environment discarding steps**<sup>p897</sup> for *reservedEnvironment*.
    2. Set *reservedEnvironment* to null.
  3. If *reservedEnvironment* is null, then set *reservedEnvironment* to a new **environment**<sup>p896</sup> whose **id**<sup>p896</sup> is a unique opaque string and **target browsing context**<sup>p896</sup> is *browsingContext*.
  4. Set *reservedEnvironment*'s **creation URL**<sup>p896</sup> to *currentURL*.

#### Note

The created environment's **active service worker**<sup>p897</sup> is set in the **Handle Fetch** algorithm during the fetch if the request URL matches a service worker registration. [SW]<sup>p1270</sup>

5. Set *request*'s **reserved client** to *reservedEnvironment*.
6. If the **Should navigation request of type from source in target be blocked by Content Security Policy?** algorithm returns "Blocked" when executed upon *request*, *navigationType*, *sourceBrowsingContext*, and *browsingContext*, then set *response* to a **network error** and **break**. [CSP]<sup>p1264</sup>
7. Otherwise:
  1. If *response* is null, **fetch** *request*.
  2. Otherwise, perform **HTTP-redirect fetch** using *request* and *response*.
  3. Wait for the **task**<sup>p925</sup> on the **networking task source**<sup>p932</sup> to **process response** and set *response* to the result.
  4. If *response* does not have a **location URL** or the **location URL** is not a **URL** whose **scheme** is an **HTTP(S) scheme**, then **break**.

#### Note

**Navigation** handles redirects manually as **navigation** is the only place in the web platform that cares for redirects to **mailto:** URLs and such.

6. If *response* has a **location URL** that is failure, then set *response* to a **network error**.
7. Otherwise, if *response* has a **location URL** that is a **URL** whose **scheme** is "blob", "file", "filesystem", or "javascript", then set *response* to a network error.
8. Otherwise, if *response* has a **location URL** that is a **URL** whose **scheme** is a **fetch scheme**, then run **process a navigate fetch**<sup>p854</sup> with a new **request** whose **url** is *response*'s **location URL**, *sourceBrowsingContext*, *browsingContext*, and *navigationType*, and return.

9. Otherwise, if *response* has a [location URL](#) that is a [URL](#), run the [process a navigate URL scheme](#)<sup>p856</sup> given *response*'s [location URL](#) and *browsingContext*, and return.
10. **Fallback in prefer-online mode:** If *response* was not fetched from an [application cache](#)<sup>p874</sup>, and was to be fetched using ``GET``, and there are [relevant application caches](#)<sup>p875</sup> that are identified by a URL with the [same origin](#)<sup>p830</sup> as the URL in question, and that have this URL as one of their entries, excluding entries marked as [foreign](#)<sup>p874</sup>, and whose [mode](#)<sup>p875</sup> is [prefer-online](#)<sup>p875</sup>, and the user didn't cancel the navigation attempt during the earlier step, and *response* is either a network error or its [status](#) is not an [ok status](#), then:

Let *candidate* be the response identified by the URL in question from the [most appropriate application cache](#)<sup>p875</sup> of those that match.

If *candidate* is not marked as [foreign](#)<sup>p874</sup>, then the user agent must discard the failed load and instead continue along these steps using *candidate* as *response*. The user agent may indicate to the user that the original page load failed, and that the page used was a previously cached response.

11. **Fallback for fallback entries:** If *response* was not fetched from an [application cache](#)<sup>p874</sup>, and was to be fetched using ``GET``, and its URL [matches the fallback namespace](#)<sup>p876</sup> of one or more [relevant application caches](#)<sup>p875</sup>, and the [most appropriate application cache](#)<sup>p875</sup> of those that match does not have an entry in its [online safelist](#)<sup>p875</sup> that has the [same origin](#)<sup>p830</sup> as *response*'s URL and that is a [prefix match](#)<sup>p65</sup> for *response*'s URL, and the user didn't cancel the navigation attempt during the earlier step, and *response* is either a network error or its [status](#) is not an [ok status](#), then:

Let *candidate* be the [fallback response](#)<sup>p874</sup> specified for the [fallback namespace](#)<sup>p875</sup> in question. If multiple application caches match, the user agent must use the fallback of the [most appropriate application cache](#)<sup>p875</sup> of those that match.

If *candidate* is not marked as [foreign](#)<sup>p874</sup>, then the user agent must discard the failed load and instead continue along these steps using *candidate* as *response*. The document's [URL](#), if appropriate, will still be the originally requested URL, not the fallback URL, but the user agent may indicate to the user that the original page load failed, that the page used was a fallback response, and what the URL of the fallback response actually is.

12. Run [process a navigate response](#)<sup>p855</sup> given *request*, *response*, *navigationType*, the [source browsing context](#)<sup>p852</sup>, *browsingContext*, *incumbentNavigationOrigin*, *activeDocumentNavigationOrigin*, and *reservedEnvironment*.

To **process a navigate response**, given null or a [request](#) *request*, a [response](#) *response*, a string *navigationType*, two [browsing contexts](#)<sup>p804</sup> *source* and *browsingContext*, a [sandboxing flag set](#)<sup>p833</sup> *sandboxFlags*, two [origins](#)<sup>p829</sup> *incumbentNavigationOrigin* and *activeDocumentNavigationOrigin*, and an optional [environment](#)<sup>p896</sup> *reservedEnvironment*, run these steps:

1. If any of the following are true, then [display the inline content with an appropriate error shown to the user](#)<sup>p863</sup>, with the newly created [Document](#)<sup>p111</sup> object's [origin](#)<sup>p829</sup> set to a new [opaque origin](#)<sup>p829</sup>, run the [environment discarding steps](#)<sup>p897</sup> for *reservedEnvironment*, and return.
  - *response* is a network error.
  - TODO: Define X-Frame-Options processing here (tracked as [issue #1230](#)).
  - The [Should navigation response to navigation request of type from source in target be blocked by Content Security Policy?](#) algorithm returns "Blocked" when executed upon *request*, *response*, *navigationType*, *source*, and *browsingContext*. [\[CSP\]](#)<sup>p1264</sup>

#### Note

*This is where the network errors defined and propagated by Fetch, such as DNS or TLS errors, end up being displayed to users. [\[FETCH\]](#)<sup>p1266</sup>*

2. If *response*'s [status](#) is 204 or 205, then return.
3. If *response* has an ``Content-Disposition`` header specifying the attachment disposition type, then run the [allowed to download](#)<sup>p286</sup> algorithm with the [source browsing context](#)<sup>p852</sup> of the navigation and the browsing context being [navigated](#)<sup>p852</sup>. If the algorithm returns false, return; otherwise, handle *response* [as a download](#)<sup>p286</sup> and return.
4. Let *type* be the [computed type of response](#).
5. If the user agent has been configured to process resources of the given *type* using some mechanism other than rendering the content in a [browsing context](#)<sup>p804</sup>, then skip this step. Otherwise, if the *type* is one of the following types, jump to the appropriate entry in the following list, and process *response* as described there:

↪ an **HTML MIME type**

Follow the steps given in the [HTML document](#)<sup>p860</sup> section providing *browsingContext*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. Once the steps have completed, return.

↪ an **XML MIME type that is not an explicitly supported XML MIME type**<sup>p856</sup>

Follow the steps given in the [XML document](#)<sup>p861</sup> section providing *browsingContext*, *type*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. Once the steps have completed, return.

↪ a **JavaScript MIME type**

↪ a **JSON MIME type that is not an explicitly supported JSON MIME type**<sup>p856</sup>

↪ "[text/cache-manifest](#)<sup>p1234</sup>"

↪ "[text/css](#)<sup>p1262</sup>"

↪ "[text/plain](#)"

↪ "[text/vtt](#)<sup>p1263</sup>"

Follow the steps given in the [plain text file](#)<sup>p861</sup> section providing *browsingContext*, *type*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. Once the steps have completed, return.

↪ "[multipart/x-mixed-replace](#)<sup>p1232</sup>"

Follow the steps given in the [multipart/x-mixed-replace](#)<sup>p862</sup> section providing *browsingContext*, *type*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. Once the steps have completed, return.

↪ **A supported image, video, or audio type**

Follow the steps given in the [media](#)<sup>p862</sup> section providing *browsingContext*, *type*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. Once the steps have completed, return.

↪ **A type that will use an external application to render the content in *browsingContext***

Follow the steps given in the [plugin](#)<sup>p863</sup> section providing *browsingContext*, *type*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. Once the steps have completed, return.

An **explicitly supported XML MIME type** is an [XML MIME type](#) for which the user agent is configured to use an external application to render the content (either a [plugin](#)<sup>p44</sup> rendering directly in *browsingContext*, or a separate application), or one for which the user agent has dedicated processing rules (e.g. a Web browser with a built-in Atom feed viewer would be said to explicitly support the [application/atom+xml](#)<sup>p1261</sup> MIME type), or one for which the user agent has a dedicated handler.

An **explicitly supported JSON MIME type** is a [JSON MIME type](#) for which the user agent is configured to use an external application to render the content (either a [plugin](#)<sup>p44</sup> rendering directly in *browsingContext*, or a separate application), or one for which the user agent has dedicated processing rules, or one for which the user agent has a dedicated handler.

6. *Non-document content*: If, given *type*, the new resource is to be handled by displaying some sort of inline content, e.g., a native rendering of the content or an error message because the specified type is not supported, then [display the inline content](#)<sup>p863</sup>, and then return.
7. Otherwise, the document's *type* is such that the resource will not affect *browsingContext*, e.g., because the resource is to be handed to an external application or because it is an unknown type that will be processed [as a download](#)<sup>p286</sup>. [Process the resource appropriately](#)<sup>p856</sup>.

To **process a navigate URL scheme**, given a [URL](#) *url* and [browsing context](#)<sup>p804</sup> *browsingContext*, run these steps:

1. If *url* is to be handled using a mechanism that does not affect *browsingContext*, e.g., because *url*'s [scheme](#) is handled externally, then [proceed with that mechanism instead](#)<sup>p856</sup>.
2. Otherwise, *url* is to be handled by displaying some sort of inline content, e.g., an error message because the specified scheme is not one of the supported protocols, or an inline prompt to allow the user to select [a registered handler](#)<sup>p962</sup> for the given scheme. [Display the inline content](#)<sup>p863</sup>.

**Note**

*In the case of a registered handler being used, [navigate](#)<sup>p852</sup> will be invoked with a new URL.*

When a resource is handled by **passing its URL or data to an external software package** separate from the user agent (e.g. handing a [mailto:](#) URL to a mail client, or a Word document to a word processor), user agents should attempt to mitigate the risk that

this is an attempt to exploit the target software, e.g. by prompting the user to confirm that the [source browsing context](#)<sup>p852</sup>'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup> is to be allowed to invoke the specified software. In particular, if the [navigate](#)<sup>p852</sup> algorithm was invoked when [source browsing context](#)<sup>p852</sup>'s [WindowProxy](#)<sup>p826</sup>'s `[[Window]]` value does not have [transient activation](#)<sup>p760</sup>, the user agent should not invoke the external software package without prior user confirmation.

#### Example

For example, there could be a vulnerability in the target software's URL handler which a hostile page would attempt to exploit by tricking a user into clicking a link.

To **execute a javascript: URL request**, given a [request](#) *request* and two [browsing contexts](#)<sup>p804</sup> *source* and *browsingContext*, run these steps:

1. Let *response* be a [response](#) whose [status](#) is 204.
2. If both of the following are true:
  - *source*'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup> is [same origin](#)<sup>p830</sup> with *browsingContext*'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup>.

As explained in [issue #2591](#) this step does not work and presents a security issue.

- The [Should navigation request of type from source in target be blocked by Content Security Policy?](#) algorithm returns "Allowed" when executed upon *request*, "other", *source*, and *browsingContext*. [\[CSP\]](#)<sup>p1264</sup>

then:

1. Let *urlString* be the result of running the [URL serializer](#) on *request*'s [url](#).
2. Let *encodedScriptSource* be the result of removing the leading "javascript:" from *urlString*.
3. Let *scriptSource* be the [UTF-8 decoding](#) of the [string percent decoding](#) of *encodedScriptSource*.
4. [Append](#) *browsingContext*'s [active document](#)<sup>p804</sup>'s [URL](#) to *request*'s [URL list](#).
5. Let *settings* be *browsingContext*'s [active document](#)<sup>p804</sup>'s [relevant settings object](#)<sup>p913</sup>.
6. Let *baseURL* be *settings*'s [API base URL](#)<sup>p897</sup>.
7. Let *script* be the result of [creating a classic script](#)<sup>p904</sup> given *scriptSource*, *settings*, *baseURL*, and the [default classic script fetch options](#)<sup>p898</sup>.
8. Let *evaluationStatus* be the result of [running the classic script](#)<sup>p906</sup> *script*.
9. Let *result* be undefined if *evaluationStatus* is an [abrupt completion](#) or *evaluationStatus*.`[[Value]]` is empty, or *evaluationStatus*.`[[Value]]` otherwise.
10. If [Type](#)(*result*) is String, then set *response* to a [response](#) whose [header list](#) consists of ``Content-Typep88`/`text/htmlp1231`` and ``Referrer-Policy`/`settings`'s referrer policy`, whose [body](#) is *result*, and whose [HTTPS state](#) is *settings*'s [HTTPS state](#)<sup>p897</sup>.

The exact conversion between the string *result* and the bytes that comprise a [response body](#) is not yet specified, pending further investigation into user agent behavior. See [issue #1129](#).

3. Return *response*.

In addition to the specific issues linked above, [javascript:<sup>p857</sup>](#) URLs have a [dedicated label](#) on the issue tracker documenting various problems with their specification.

Some of the sections below, to which the above algorithm defers in certain cases, use the following steps to **create and initialize a Document object**, given a [type](#) *type*, [content type](#) *contentType*, a [request](#) *request*, a [response](#) *response*, a [browsing context](#)<sup>p804</sup> *browsingContext*, a [sandboxing flag set](#)<sup>p833</sup> *sandboxFlags*, two [origins](#)<sup>p829</sup> *incumbentNavigationOrigin*, *activeDocumentNavigationOrigin*, and an optional [environment](#)<sup>p896</sup> *reservedEnvironment*:

1. Let *finalSandboxFlags* be the union of *sandboxFlags* and *response*'s [forced sandboxing flag set](#)<sup>p835</sup>.

- Let *origin* be the result of [determining the origin](#)<sup>p805</sup> given *browsingContext*, *request*'s *url*, *finalSandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.
- Let *featurePolicy* be the result of [creating a feature policy from a response](#) given *browsingContext*, *origin*, and *response*. [\[FEATUREPOLICY\]](#)<sup>p1266</sup>

#### Note

The [creating a feature policy from a response](#) algorithm makes use of *origin*. If [document.domain](#)<sup>p832</sup> has been used for the *browsingContext* [container document](#)<sup>p806</sup>, then its [origin](#)<sup>p829</sup> cannot be [same origin-domain](#)<sup>p830</sup> with *>origin*, because these steps run before the document is created, so it cannot itself yet have used [document.domain](#)<sup>p832</sup>. Note that this means that Feature Policy checks are less permissive compared to doing a [same origin](#)<sup>p830</sup> check instead.

See below for some examples of this in action.

- If *browsingContext*'s only entry in its [session history](#)<sup>p836</sup> is the initial [about:blank](#)<sup>p50</sup> [Document](#)<sup>p111</sup> that was added when *browsingContext* was [created](#)<sup>p805</sup>, and navigation is occurring with [replacement enabled](#)<sup>p865</sup>, and that [Document](#)<sup>p111</sup>'s [origin](#)<sup>p829</sup> is [same origin-domain](#)<sup>p830</sup> with *origin*, then do nothing.
- Otherwise:
  - Let *agent* be the result of [obtaining a similar-origin window agent](#)<sup>p920</sup> given *origin* and *browsingContext*'s [group](#)<sup>p807</sup>.
  - Let *realm execution context* be the result of [creating a new JavaScript realm](#)<sup>p908</sup> given *agent* and the following customizations:
    - For the global object, create a new [Window](#)<sup>p816</sup> object.
    - For the global **this** binding, use *browsingContext*'s [WindowProxy](#)<sup>p826</sup> object.
  - Let *topLevelOrigin* be *origin* if *browsingContext* is [top-level browsing context](#)<sup>p807</sup>, otherwise let *topLevelOrigin* be *browsingContext*'s [top-level browsing context](#)<sup>p807</sup>'s [active document](#)<sup>p804</sup>'s [origin](#)<sup>p829</sup>.
  - [Set up a window environment settings object](#)<sup>p825</sup> with *realm execution context*, *topLevelOrigin*, and *reservedEnvironment*, if present.
- Let *document* be a new [Document](#)<sup>p111</sup>, whose *type* is *type*, *content type* is *contentType*, [origin](#)<sup>p829</sup> is *origin*, [feature policy](#)<sup>p112</sup> is *featurePolicy*, and [active sandboxing flag set](#)<sup>p835</sup> is *finalSandboxFlags*.
- If *request* is non-null, then set *document*'s *URL* to *request*'s [current URL](#).
- Otherwise, set *document*'s *URL* to *response*'s *URL*.
- Set *document*'s [HTTPS state](#)<sup>p112</sup> to the [HTTPS state](#) of *response*.
- Set *document*'s [referrer policy](#)<sup>p112</sup> to the result of [parsing the `Referrer-Policy` header](#) of *response*. [\[REFERRERPOLICY\]](#)<sup>p1269</sup>
- [Initialize a Document's CSP list](#) given *document*, *response*, and *request*. [\[CSP\]](#)<sup>p1264</sup>
- If *request* is non-null, then set *document*'s [referrer](#)<sup>p111</sup> to the [serialization](#) of *request*'s *referrer*, if *request*'s *referrer* is a [URL record](#), and the empty string otherwise.

#### Note

Per Fetch a [request's referrer](#) will be either a [URL record](#) or "no-referrer" at this point.

- If *response* has a [`Refresh`](#)<sup>p1238</sup> header, then:
  - Let *value* be the [isomorphic decoding](#) of the value of the header.
  - Run the [shared declarative refresh steps](#)<sup>p167</sup> with *document* and *value*.

We do not currently have a spec for how to handle multiple [`Refresh`](#)<sup>p1238</sup> headers. This is tracked as [issue #2900](#).

- Return *document*.

#### Example

In this example, the child document is not allowed to use `PaymentRequest`, despite being [same origin-domain](#)<sup>p830</sup> at the time the child document tries to use it. At the time the child document is initialized, only the parent document has set `document.domain`<sup>p832</sup>, and the child document has not.

```
<!-- https://foo.example.com/a.html -->
<!doctype html>
<script>
document.domain = 'example.com';
</script>
<iframe src=b.html></iframe>

<!-- https://bar.example.com/b.html -->
<!doctype html>
<script>
document.domain = 'example.com'; // This happens after the document is initialized
new PaymentRequest(...); // Not allowed to use
</script>
```

### Example

In this example, the child document *is* allowed to use `PaymentRequest`, despite not being [same origin-domain](#)<sup>p830</sup> at the time the child document tries to use it. At the time the child document is initialized, none of the documents have set `document.domain`<sup>p832</sup> yet so [same origin-domain](#)<sup>p830</sup> falls back to a normal [same origin](#)<sup>p830</sup> check.

```
<!-- https://example.com/a.html -->
<!doctype html>
<iframe src=b.html></iframe>
<!-- The child document is now initialized, before the script below is run. -->
<script>
document.domain = 'example.com';
</script>

<!-- https://example.com/b.html -->
<!doctype html>
<script>
new PaymentRequest(...); // Allowed to use
</script>
```

Some of the sections below, to which the above algorithm defers in certain cases, require the user agent to **update the session history with the new page**. When a user agent is required to do this, it must [queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup>, associated with the [Document](#)<sup>p111</sup> object of the [current entry](#)<sup>p836</sup> (not the new one), to run the following steps:

1. [Unload](#)<sup>p869</sup> the [Document](#)<sup>p111</sup> object of the [current entry](#)<sup>p836</sup>.

If this instance of the [navigation](#)<sup>p852</sup> algorithm is canceled while this step is running the [unload a document](#)<sup>p869</sup> algorithm, then the [unload a document](#)<sup>p869</sup> algorithm must be allowed to run to completion, but this instance of the [navigation](#)<sup>p852</sup> algorithm must not run beyond this step. (In particular, for instance, the cancelation of this algorithm does not abort any event dispatch or script execution occurring as part of unloading the document or its descendants.)

2. **If the navigation was initiated for entry update of an entry**

1. Replace the [Document](#)<sup>p111</sup> of the entry being updated, and any other entries that referenced the same document as that entry, with the new [Document](#)<sup>p111</sup>.
2. [Traverse the history](#)<sup>p865</sup> to the new entry.

**If the navigation was initiated with a URL that equals the browsing context**<sup>p804</sup>**'s active document**<sup>p804</sup>**'s URL**

1. Replace the [current entry](#)<sup>p836</sup> with a new entry representing the new resource and its [Document](#)<sup>p111</sup> object, related state, and the default [scroll restoration mode](#)<sup>p837</sup> of "[auto](#)<sup>p837</sup>".
2. [Traverse the history](#)<sup>p865</sup> to the new entry.

## Otherwise

1. Remove all the entries in the [browsing context](#)<sup>p804</sup>'s [session history](#)<sup>p836</sup> after the [current entry](#)<sup>p836</sup>. If the [current entry](#)<sup>p836</sup> is the last entry in the session history, then no entries are removed.

### Note

*This doesn't necessarily have to affect*<sup>p843</sup> *the user agent's user interface.*

2. Append a new entry at the end of the [History](#)<sup>p837</sup> object representing the new resource and its [Document](#)<sup>p111</sup> object, related state, and the default [scroll restoration mode](#)<sup>p837</sup> of "[auto](#)<sup>p837</sup>".
3. [Traverse the history](#)<sup>p865</sup> to the new entry. If the navigation was initiated with [replacement enabled](#)<sup>p865</sup>, then the traversal must itself be initiated with [replacement enabled](#)<sup>p865</sup>.

3. The [navigation algorithm](#)<sup>p852</sup> has now **matured**.

4. [Try to scroll to the fragment](#)<sup>p860</sup> for the [Document](#)<sup>p111</sup>.

To **try to scroll to the fragment** for a [Document](#)<sup>p111</sup> document, perform the following steps [in parallel](#)<sup>p41</sup>:

1. Wait for an [implementation-defined](#) amount of time. (This is intended to allow the user agent to optimize the user experience in the face of performance concerns.)
2. [Queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup> to run these steps:
  1. If document has no parser, or its parser has [stopped parsing](#)<sup>p1145</sup>, or the user agent has reason to believe the user is no longer interested in scrolling to the [fragment](#), then abort these steps.
  2. [Scroll to the fragment](#)<sup>p864</sup> given in document's URL. If this does not find [an indicated part of the document](#)<sup>p864</sup>, then [try to scroll to the fragment](#)<sup>p860</sup> for document.

## 7.8.2 Page load processing model for HTML files §<sup>p86</sup><sub>0</sub>

When **an HTML document is to be loaded** in a [browsing context](#)<sup>p804</sup>, provided *browsingContext*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*, the user agent must [queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup> to:

1. Let *document* be the result of [creating and initializing a Document object](#)<sup>p857</sup> providing "html", "text/html", *request*, *response*, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.
2. Create an [HTML parser](#)<sup>p1059</sup> and associate it with the *document*. Each [task](#)<sup>p925</sup> that the [networking task source](#)<sup>p932</sup> places on the [task queue](#)<sup>p924</sup> while fetching runs must then fill the parser's [input byte stream](#)<sup>p1065</sup> with the fetched bytes and cause the [HTML parser](#)<sup>p1059</sup> to perform the appropriate processing of the input stream.

### Note

*The [input byte stream](#)<sup>p1065</sup> converts bytes into characters for use in the [tokenizer](#)<sup>p1077</sup>. This process relies, in part, on character encoding information found in the real [Content-Type metadata](#)<sup>p88</sup> of the resource; the computed type is not used for this purpose.*

When no more bytes are available, the user agent must [queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup> for the parser to process the implied EOF character, which eventually causes a [load](#)<sup>p1261</sup> event to be fired.

After creating the [Document](#)<sup>p111</sup> object, but before any script execution, certainly before the parser [stops](#)<sup>p1145</sup>, the user agent must [update the session history with the new page](#)<sup>p859</sup>.

### Note

*[Application cache selection](#)<sup>p888</sup> happens in the [HTML parser](#)<sup>p1114</sup>.*

### 7.8.3 Page load processing model for XML files §<sup>p86</sup><sub>1</sub>

When faced with displaying an XML file inline, provided *browsingContext*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*, user agents must follow the requirements defined in *XML and Namespaces in XML*, *XML Media Types*, *DOM*, and other relevant specifications to [create and initialize a Document object](#)<sup>p87</sup> providing "xml", *type*, *request*, *response*, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*. It must also create and a corresponding [XML parser](#)<sup>p1168</sup>. [\[XML\]](#)<sup>p1271</sup> [\[XMLNS\]](#)<sup>p1271</sup> [\[RFC7303\]](#)<sup>p1270</sup> [\[DOM\]](#)<sup>p1266</sup>

#### Note

*At the time of writing, the XML specification community had not actually yet specified how XML and the DOM interact.*

The actual HTTP headers and other metadata, not the headers as mutated or implied by the algorithms given in this specification, are the ones that must be used when determining the character encoding according to the rules given in the above specifications. Once the character encoding is established, the [document's character encoding](#) must be set to that character encoding.

If the [document element](#), as parsed according to XML cited above, is found to be an [html](#)<sup>p149</sup> element with an attribute [manifest](#)<sup>p149</sup> whose value is not the empty string, then, as soon as the element is [inserted into the document](#)<sup>p43</sup>, the user agent must [parse](#)<sup>p87</sup> the value of that attribute relative to that element's [node document](#), and if that is successful, must apply the [URL serializer](#) algorithm to the [resulting URL record](#)<sup>p87</sup> with the *exclude fragment flag* set to obtain *manifest URL*, and then run the [application cache selection algorithm](#)<sup>p88</sup> with *manifest URL* as the manifest URL, passing in the newly-created [Document](#)<sup>p111</sup>. Otherwise, if the attribute is absent, its value is the empty string, or parsing its value fails, then as soon as the [document element](#) is [inserted into the document](#)<sup>p43</sup>, the user agent must run the [application cache selection algorithm](#)<sup>p88</sup> with no manifest, and passing in the [Document](#)<sup>p111</sup>.

#### Note

*Because the processing of the [manifest](#)<sup>p149</sup> attribute happens only once the [document element](#) is parsed, any URLs referenced by processing instructions before the [document element](#) (such as `<?xml-stylesheet?>` PIs) will be fetched from the network and cannot be cached.*

Then, with the newly created [Document](#)<sup>p111</sup>, the user agent must [update the session history with the new page](#)<sup>p89</sup>. User agents may do this before the complete document has been parsed (thus achieving *incremental rendering*), and must do this before any scripts are to be executed.

Error messages from the parse process (e.g., XML namespace well-formedness errors) may be reported inline by mutating the [Document](#)<sup>p111</sup>.

### 7.8.4 Page load processing model for text files §<sup>p86</sup><sub>1</sub>

When a plain text document is to be loaded in a [browsing context](#)<sup>p804</sup>, provided *browsingContext*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*, the user agent must [queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup> to:

1. Let *document* be the result of [creating and initialize a Document object](#)<sup>p857</sup> providing "html", *type*, *request*, *response*, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.
2. Create an [HTML parser](#)<sup>p1059</sup> and associate it with the *document*. Act as if the tokenizer had emitted a start tag token with the tag name "pre" followed by a single U+000A LINE FEED (LF) character, and switch the [HTML parser](#)<sup>p1059</sup>'s tokenizer to the [PLAINTEXT state](#)<sup>p1079</sup>. Each [task](#)<sup>p925</sup> that the [networking task source](#)<sup>p932</sup> places on the [task queue](#)<sup>p924</sup> while fetching runs must then fill the parser's [input byte stream](#)<sup>p1065</sup> with the fetched bytes and cause the [HTML parser](#)<sup>p1059</sup> to perform the appropriate processing of the input stream.

The rules for how to convert the bytes of the plain text document into actual characters, and the rules for actually rendering the text to the user, are defined by the specifications for the [computed MIME type](#) of the resource (*type* in the [navigate](#)<sup>p852</sup> algorithm).

The [document's character encoding](#) must be set to the character encoding used to decode the document.

Upon creation of the [Document](#)<sup>p111</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p88</sup> with no manifest, and passing in the newly-created [Document](#)<sup>p111</sup>.

When no more bytes are available, the user agent must [queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup> for the parser to process the implied EOF character, which eventually causes a [load](#)<sup>p1261</sup> event to be fired.

After creating the [Document<sup>p111</sup>](#) object, but potentially before the page has finished parsing, the user agent must [update the session history with the new page<sup>p859</sup>](#).

User agents may add content to the [head<sup>p150</sup>](#) element of the [Document<sup>p111</sup>](#), e.g., linking to a style sheet, providing script, or giving the document a [title<sup>p151</sup>](#).

#### Note

*In particular, if the user agent supports the `Format=Flowed` feature of RFC 3676 then the user agent would need to apply extra styling to cause the text to wrap correctly and to handle the quoting feature. This could be performed using, e.g., a CSS extension.*

### 7.8.5 Page load processing model for [multipart/x-mixed-replace](#) resources §<sup>p86</sup><sub>2</sub>

When a resource with the type [multipart/x-mixed-replace<sup>p1232</sup>](#) is to be loaded in a [browsing context<sup>p804</sup>](#), the user agent must parse the resource using the rules for multipart types. [\[RFC2046\]<sup>p1269</sup>](#)

For each body part obtained from the resource, the user agent must run [process a navigate response<sup>p855</sup>](#) using the new body part and the same [browsing context<sup>p804</sup>](#), with [replacement enabled<sup>p865</sup>](#) if a previous body part from the same resource resulted in a [creating and initializing a Document object<sup>p857</sup>](#), and otherwise using the same setup as the [navigate<sup>p852</sup>](#) attempt that caused this section to be invoked in the first place.

For the purposes of algorithms processing these body parts as if they were complete stand-alone resources, the user agent must act as if there were no more bytes for those resources whenever the boundary following the body part is reached.

#### Note

*Thus, [load<sup>p1261</sup>](#) events (and for that matter [unload<sup>p1261</sup>](#) events) do fire for each body part loaded.*

### 7.8.6 Page load processing model for media §<sup>p86</sup><sub>2</sub>

When an image, video, or audio resource is to be loaded in a [browsing context<sup>p804</sup>](#), provided *browsingContext*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*, the user agent should:

1. Let *document* be the result of [creating and initialize a Document object<sup>p857</sup>](#) providing "html", *type*, *request*, *response*, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.
2. Append an [html<sup>p149</sup>](#) element to *document*.
3. Append a [head<sup>p150</sup>](#) element to the [html<sup>p149</sup>](#) element.
4. Append a [body<sup>p174</sup>](#) element to the [html<sup>p149</sup>](#) element.
5. Append an element *host element* for the media, as described below, to the [body<sup>p174</sup>](#) element.
6. Set the appropriate attribute of the element *host element*, as described below, to the address of the image, video, or audio resource.

The element *host element* to create for the media is the element given in the table below in the second cell of the row whose first cell describes the media. The appropriate attribute to set is the one given by the third cell in that same row.

Type of media	Element for the media	Appropriate attribute
Image	<a href="#">img<sup>p314</sup></a>	<a href="#">src<sup>p315</sup></a>
Video	<a href="#">video<sup>p373</sup></a>	<a href="#">src<sup>p384</sup></a>
Audio	<a href="#">audio<sup>p377</sup></a>	<a href="#">src<sup>p384</sup></a>

Then, the user agent must act as if it had [stopped parsing<sup>p1145</sup>](#).

Upon creation of the [Document<sup>p111</sup>](#) object, the user agent must run the [application cache selection algorithm<sup>p888</sup>](#) with no manifest, and passing in the newly-created [Document<sup>p111</sup>](#).

After creating the [Document<sup>p111</sup>](#) object, but potentially before the page has finished fully loading, the user agent must [update the](#)

[session history with the new page](#)<sup>p859</sup>.

User agents may add content to the [head](#)<sup>p150</sup> element of the [Document](#)<sup>p111</sup>, or attributes to the element *host element*, e.g., to link to a style sheet, to provide a script, to give the document a [title](#)<sup>p151</sup>, or to make the media [autoplay](#)<sup>p401</sup>.

### 7.8.7 Page load processing model for content that uses plugins §<sup>p86</sup><sub>3</sub>

When a resource that requires an external resource to be rendered is to be loaded in a [browsing context](#)<sup>p804</sup>, provided *browsingContext*, *request*, *response*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*, the user agent should:

1. Let *document* be the result of [creating and initialize a Document object](#)<sup>p857</sup> providing "html", *type*, *request*, *response*, *browsingContext*, *sandboxFlags*, *incumbentNavigationOrigin*, and *activeDocumentNavigationOrigin*.
2. Mark *document* as being a **plugin document**
3. Append an [html](#)<sup>p149</sup> element to *document*.
4. Append a [head](#)<sup>p150</sup> element to the [html](#)<sup>p149</sup> element.
5. Append a [body](#)<sup>p174</sup> element to the [html](#)<sup>p149</sup> element.
6. Append an [embed](#)<sup>p363</sup> to the [body](#)<sup>p174</sup> element
7. Set the [src](#)<sup>p363</sup> attribute of the [embed](#)<sup>p363</sup> element to the address of the resource.

#### Note

The term [plugin document](#)<sup>p863</sup> is used by Content Security Policy as part of the mechanism that ensures [iframe](#)<sup>p355</sup>s can't be used to evade *plugin-types* directives. [\[CSP\]](#)<sup>p1264</sup>

Then, the user agent must act as if it had [stopped parsing](#)<sup>p1145</sup>.

Upon creation of the [Document](#)<sup>p111</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p888</sup> with no manifest, and passing in the newly-created [Document](#)<sup>p111</sup>.

After creating the [Document](#)<sup>p111</sup> object, but potentially before the page has finished fully loading, the user agent must [update the session history with the new page](#)<sup>p859</sup>.

User agents may add content to the [head](#)<sup>p150</sup> element of the [Document](#)<sup>p111</sup>, or attributes to the [embed](#)<sup>p363</sup> element, e.g. to link to a style sheet or to give the document a [title](#)<sup>p151</sup>.

#### Note

If the [Document](#)<sup>p111</sup>'s *active sandboxing flag set*<sup>p835</sup> has its *sandboxed plugins browsing context flag*<sup>p833</sup> set, the synthesized [embed](#)<sup>p363</sup> element will fail to render the content<sup>p366</sup> if the relevant *plugin*<sup>p44</sup> cannot be *secured*<sup>p44</sup>.

### 7.8.8 Page load processing model for inline content that doesn't have a DOM §<sup>p86</sup><sub>3</sub>

When the user agent is to display a user agent page inline in a [browsing context](#)<sup>p804</sup>, the user agent should [create and initialize a Document object](#)<sup>p857</sup> providing "html", "text/html", null, null, *browsingContext*, an empty set, null, and null, and then either associate that [Document](#)<sup>p111</sup> with a custom rendering that is not rendered using the normal [Document](#)<sup>p111</sup> rendering rules, or mutate that [Document](#)<sup>p111</sup> until it represents the content the user agent wants to render.

Once the page has been set up, the user agent must act as if it had [stopped parsing](#)<sup>p1145</sup>.

Upon creation of the [Document](#)<sup>p111</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p888</sup> with no manifest, passing in the newly-created [Document](#)<sup>p111</sup>.

After creating the [Document](#)<sup>p111</sup> object, but potentially before the page has been completely set up, the user agent must [update the session history with the new page](#)<sup>p859</sup>.

## 7.8.9 Navigating to a fragment <sup>§ p86</sup><sub>4</sub>

When a user agent is supposed to navigate to a [fragment](#), optionally with [replacement enabled](#)<sup>p865</sup>, then the user agent must run the following steps:

1. If not with [replacement enabled](#)<sup>p865</sup>, then remove all the entries in the [browsing context](#)<sup>p804</sup>'s [session history](#)<sup>p836</sup> after the [current entry](#)<sup>p836</sup>. If the [current entry](#)<sup>p836</sup> is the last entry in the session history, then no entries are removed.

### Note

*This doesn't necessarily have to affect<sup>p843</sup> the user agent's user interface.*

2. Remove any [tasks](#)<sup>p925</sup> queued by the [history traversal task source](#)<sup>p932</sup> that are associated with any [Document](#)<sup>p111</sup> objects in the [top-level browsing context](#)<sup>p807</sup>'s [document family](#)<sup>p808</sup>.
3. Append a new entry at the end of the [History](#)<sup>p837</sup> object representing the new resource and its [Document](#)<sup>p111</sup> object, related state, and [current entry](#)<sup>p836</sup>'s [scroll restoration mode](#)<sup>p837</sup>. Its [URL](#) must be set to the address to which the user agent was [navigating](#)<sup>p852</sup>. The title must be left unset.
4. [Traverse the history](#)<sup>p865</sup> to the new entry, with [replacement enabled](#)<sup>p865</sup> if this was invoked with [replacement enabled](#)<sup>p865</sup>, and with the [non-blocking events flag](#)<sup>p865</sup> set. This will [scroll to the fragment](#)<sup>p864</sup> given in what is now the document's [URL](#).

### Note

*If the scrolling fails because the relevant [ID](#) has not yet been parsed, then the original [navigation](#)<sup>p852</sup> algorithm will take care of the scrolling instead, as the last few steps of its [update the session history with the new page](#)<sup>p859</sup> algorithm.*

When the user agent is required to **scroll to the fragment** and [the indicated part of the document](#)<sup>p864</sup>, if any, is [being rendered](#)<sup>p1172</sup>, the user agent must either change the scrolling position of the document using the following algorithm, or perform some other action such that [the indicated part of the document](#)<sup>p864</sup> is brought to the user's attention. If there is no indicated part, or if the indicated part is not [being rendered](#)<sup>p1172</sup>, then the user agent must do nothing. The aforementioned algorithm is as follows:

1. If there is no [indicated part of the document](#)<sup>p864</sup>, set the [Document](#)<sup>p111</sup>'s [target element](#)<sup>p864</sup> to null.
2. If the [indicated part of the document](#)<sup>p864</sup> is the top of the document, then:
  1. Set the [Document](#)<sup>p111</sup>'s [target element](#)<sup>p864</sup> to null.
  2. [Scroll to the beginning of the document](#) for the [Document](#)<sup>p111</sup>. [\[CSSOMVIEW\]](#)<sup>p1265</sup>
3. Otherwise:
  1. Let *target* be element that is [the indicated part of the document](#)<sup>p864</sup>.
  2. Set the [Document](#)<sup>p111</sup>'s [target element](#)<sup>p864</sup> to *target*.
  3. [Scroll target into view](#), with *behavior* set to "auto", *block* set to "start", and *inline* set to "nearest". [\[CSSOMVIEW\]](#)<sup>p1265</sup>
  4. Run the [focusing steps](#)<sup>p769</sup> for *target*, with the [Document](#)<sup>p111</sup>'s [viewport](#) as the *fallback target*.
  5. Move the [sequential focus navigation starting point](#)<sup>p772</sup> to *target*.

**The indicated part of the document** is the one that the [fragment](#), if any, identifies. The semantics of the [fragment](#) in terms of mapping it to a node is defined by the specification that defines the [MIME type](#) used by the [Document](#)<sup>p111</sup> (for example, the processing of [fragments](#) for [XML MIME types](#) is the responsibility of RFC7303). [\[RFC7303\]](#)<sup>p1270</sup>

There is also a **target element** for each [Document](#)<sup>p111</sup>, which is used in defining the [:target](#)<sup>p719</sup> pseudo-class and is updated by the above algorithm. It is initially null.

For HTML documents (and [HTML MIME types](#)), the following processing model must be followed to determine what [the indicated part of the document](#)<sup>p864</sup> is.

1. Let *fragment* be the document's [URL](#)'s [fragment](#).
2. If *fragment* is the empty string, then [the indicated part of the document](#)<sup>p864</sup> is the top of the document; return.

3. If [find a potential indicated element](#)<sup>p865</sup> with *fragment* returns non-null, then the return value is [the indicated part of the document](#)<sup>p864</sup>; return.
4. Let *fragmentBytes* be the result of [string percent decoding](#) *fragment*.
5. Let *decodedFragment* be the result of running [UTF-8 decode without BOM](#) on *fragmentBytes*.
6. If [find a potential indicated element](#)<sup>p865</sup> with *decodedFragment* returns non-null, then the return value is [the indicated part of the document](#)<sup>p864</sup>; return.
7. If *decodedFragment* is an [ASCII case-insensitive](#) match for the string *top*, then [the indicated part of the document](#)<sup>p864</sup> is the top of the document; return.
8. There is no [indicated part of the document](#)<sup>p864</sup>.

To **find a potential indicated element** given a string *fragment*, run these steps:

1. If there is an element [in the document tree](#) that has an [ID](#) equal to *fragment*, then return the first such element in [tree order](#).
2. If there is an [a](#)<sup>p234</sup> element [in the document tree](#) that has a [name](#)<sup>p1213</sup> attribute whose value is equal to *fragment*, then return the first such element in [tree order](#).
3. Return null.

The [task source](#)<sup>p925</sup> for the task mentioned in this section must be the [DOM manipulation task source](#)<sup>p932</sup>.

### 7.8.10 History traversal <sup>p86</sup><sub>5</sub>

To **traverse the history** to a [session history entry](#)<sup>p836</sup> *entry*, optionally with **replacement enabled**, optionally with the **non-blocking events flag** set, and optionally with the **history-navigation flag** set:

#### Note

*This algorithm is not just invoked when [explicitly going back or forwards in the session history](#)<sup>p839</sup> — it is also invoked in other situations, for example when [navigating a browsing context](#)<sup>p852</sup>, as part of [updating the session history with the new page](#)<sup>p859</sup>.*

1. If *entry* no longer holds a [Document](#)<sup>p111</sup> object, then:
  1. Let *request* be a new [request](#) whose [url](#) is *entry*'s [URL](#).
  2. If the [history-navigation flag](#)<sup>p865</sup> is set, then set *request*'s [history-navigation flag](#).
  3. [Navigate](#)<sup>p852</sup> the [browsing context](#)<sup>p804</sup> to *request* to perform an [entry update](#)<sup>p859</sup> of *entry*. The navigation must be done using the same [source browsing context](#)<sup>p852</sup> as was used the first time *entry* was created. (This can never happen with [replacement enabled](#)<sup>p865</sup>.)

#### Note

*The "[navigate](#)<sup>p852</sup>" algorithm reinvokes this "traverse" algorithm to complete the traversal, at which point *entry* holds a [Document](#)<sup>p111</sup> object.*

#### Note

*If the resource was obtained using a non-idempotent action, for example a POST form submission, or if the resource is no longer available, for example because the computer is now offline and the page wasn't cached, navigating to it again might not be possible. In this case, the navigation will result in a different page than previously; for example, it might be an error message explaining the problem or offering to resubmit the form.*

4. Return.
2. If the [current entry](#)<sup>p836</sup>'s title was not set by the [pushState\(\)](#)<sup>p840</sup> or [replaceState\(\)](#)<sup>p841</sup> methods, then set its title to the value returned by the [document.title](#)<sup>p114</sup> IDL attribute.
3. If appropriate, update the [current entry](#)<sup>p836</sup> in the [browsing context](#)<sup>p804</sup>'s [Document](#)<sup>p111</sup> object's [History](#)<sup>p837</sup> object to reflect any state that the user agent wishes to persist. The entry is then said to be [an entry with persisted user state](#)<sup>p837</sup>.

4. If *entry* has a different [Document<sup>p111</sup>](#) object than the [current entry<sup>p836</sup>](#), then run the following substeps:
    1. Remove any [tasks<sup>p925</sup>](#) queued by the [history traversal task source<sup>p932</sup>](#) that are associated with any [Document<sup>p111</sup>](#) objects in the [top-level browsing context<sup>p807</sup>](#)'s [document family<sup>p808</sup>](#).
    2. If the [origin<sup>p829</sup>](#) of *entry*'s [Document<sup>p111</sup>](#) object is not the [same<sup>p830</sup>](#) as the [origin<sup>p829</sup>](#) of the [current entry<sup>p836</sup>](#)'s [Document<sup>p111</sup>](#) object, then run the following subsubsteps:
      1. The current [browsing context name<sup>p811</sup>](#) must be stored with all the entries in the history that are associated with [Document<sup>p111</sup>](#) objects with the [same origin<sup>p830</sup>](#) as the [active document<sup>p804</sup>](#) and that are contiguous with the [current entry<sup>p836</sup>](#).
      2. If the browsing context is a [top-level browsing context<sup>p807</sup>](#), but not an [auxiliary browsing context<sup>p807</sup>](#), then set the browsing context's [name<sup>p811</sup>](#) to the empty string.
    3. [Set the active document<sup>p804</sup>](#) of the [browsing context<sup>p804</sup>](#) to *entry*'s [Document<sup>p111</sup>](#) object.
    4. If *entry* has a [browsing context name<sup>p811</sup>](#), then run the following subsubsteps:
      1. Set the browsing context's [browsing context name<sup>p811</sup>](#) to *entry*'s [browsing context name<sup>p811</sup>](#).
      2. Clear any [browsing context names<sup>p811</sup>](#) of all entries in the history that are associated with [Document<sup>p111</sup>](#) objects with the [same origin<sup>p830</sup>](#) as the new [active document<sup>p804</sup>](#) and that are contiguous with *entry*.
    5. If *entry*'s [Document<sup>p111</sup>](#) object has any form controls whose [autofill field name<sup>p571</sup>](#) is "[off<sup>p567</sup>](#)", invoke the [reset algorithm<sup>p597</sup>](#) of each of those elements.
    6. If the [current document readiness<sup>p114</sup>](#) of *entry*'s [Document<sup>p111</sup>](#) object is "complete", then [queue a task<sup>p925</sup>](#) to run the following subsubsteps:
      1. If the [Document<sup>p111</sup>](#)'s [page showing<sup>p869</sup>](#) flag is true, then abort these steps.
      2. Set the [Document<sup>p111</sup>](#)'s [page showing<sup>p869</sup>](#) flag to true.
      3. Run any **session history document visibility change steps** for [Document<sup>p111</sup>](#) that are defined by [other applicable specifications<sup>p63</sup>](#).
- Note**  
 This is specifically intended for use by Page Visibility. [\[PAGEVIS\]<sup>p1268</sup>](#)
4. [Fire an event](#) named [pageshow<sup>p1261</sup>](#) at the [Document<sup>p111</sup>](#) object's [relevant global object<sup>p913</sup>](#), using [PageTransitionEvent<sup>p868</sup>](#), with the [persisted<sup>p868</sup>](#) attribute initialized to true, and *legacy target override flag* set.
  5. Set the document's [URL](#) to *entry*'s [URL](#).
  6. If *entry* has a [URL](#) whose [fragment](#) differs from that of the [current entry<sup>p836</sup>](#)'s when compared in a [case-sensitive<sup>p65</sup>](#) manner, and the two share the same [Document<sup>p111</sup>](#) object, then let *hash changed* be true, and let *old URL* be the [current entry<sup>p836</sup>](#)'s [URL](#) and *new URL* be *entry*'s [URL](#). Otherwise, let *hash changed* be false.
  7. If the traversal was initiated with [replacement enabled<sup>p865</sup>](#), remove the entry immediately before the *specified entry* in the session history.
  8. If *entry* is not [an entry with persisted user state<sup>p837</sup>](#), but its [URL](#)'s [fragment](#) is non-null, then [scroll to the fragment<sup>p864</sup>](#).
  9. Set the [current entry<sup>p836</sup>](#) to *entry*.
  10. Let *targetRealm* be the [current Realm Record](#).
  11. If *entry* has [serialized state<sup>p836</sup>](#), then let *state* be [StructuredDeserialize<sup>p105</sup>](#)(*entry*'s [serialized state<sup>p836</sup>](#), *targetRealm*). If this throws an exception, catch it, ignore the exception, and let *state* be null.
  12. Otherwise, let *state* be null.
  13. Set [history.state<sup>p838</sup>](#) to *state*.
  14. Let *state changed* be true if *entry*'s [Document<sup>p111</sup>](#) object has a [latest entry<sup>p837</sup>](#), and that entry is not *entry*; otherwise let it be false.

15. Set *entry*'s [Document<sup>p111</sup>](#) object's [latest entry<sup>p837</sup>](#) to *entry*.
16. If the [non-blocking events flag<sup>p865</sup>](#) is not set, then run the following substeps [immediately<sup>p41</sup>](#). Otherwise, the [non-blocking events flag<sup>p865</sup>](#) flag is set; [queue a task<sup>p925</sup>](#) to run the following substeps instead.
  1. If *state changed* is true, then [fire an event](#) named [popstate<sup>p1261</sup>](#) at the [Document<sup>p111</sup>](#) object's [relevant global object<sup>p913</sup>](#), using [PopStateEvent<sup>p867</sup>](#), with the [state<sup>p867</sup>](#) attribute initialized to *state*.
  2. If *entry* is [an entry with persisted user state<sup>p837</sup>](#), then the user agent may [restore persisted user state<sup>p867</sup>](#) and update aspects of the document and its rendering.
  3. If *hash changed* is true, then [fire an event](#) named [hashchange<sup>p1260</sup>](#) at the [browsing context<sup>p804</sup>](#)'s [Window<sup>p816</sup>](#) object, using [HashChangeEvent<sup>p868</sup>](#), with the [oldURL<sup>p868</sup>](#) attribute initialized to *old URL* and the [newURL<sup>p868</sup>](#) attribute initialized to *new URL*.

The [task source<sup>p925</sup>](#) for the tasks mentioned above is the [DOM manipulation task source<sup>p932</sup>](#).

### 7.8.10.1 Persisted user state restoration §<sup>p86</sup> 7

When the user agent is to **restore persisted user state** from a history entry, it must run the following steps immediately:

1. If the entry has a [scroll restoration mode<sup>p837</sup>](#), let *scrollRestoration* be that. Otherwise let *scrollRestoration* be ["auto<sup>p837</sup>"](#).
2. If *scrollRestoration* is ["manual<sup>p837</sup>"](#), then the user agent should not restore the scroll position for the [Document<sup>p111</sup>](#) or any of its scrollable regions, with the exception of any [child browsing contexts<sup>p806</sup>](#) of [Document<sup>p111</sup>](#)'s [browsing context<sup>p804</sup>](#) whose scroll restoration is controlled by their own history entry's [scroll restoration mode<sup>p837</sup>](#), otherwise, it may do so.
3. Optionally, update other aspects of the document and its rendering, for instance values of form fields, that the user agent had previously recorded.

#### Note

This can even include updating the [dir<sup>p139</sup>](#) attribute of [textarea<sup>p541</sup>](#) elements or [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attribute is in either the [Text<sup>p492</sup>](#) state or the [Search<sup>p492</sup>](#) state, if the persisted state includes the directionality of user input in such controls.

#### Note

Not restoring the scroll position by user agent does not imply that the scroll position will be left at any particular value (e.g., (0,0)). The actual scroll position depends on the navigation type and the user agent's particular caching strategy. So web applications cannot assume any particular scroll position but rather are urged to set it to what they want it to be.

### 7.8.10.2 The [PopStateEvent<sup>p867</sup>](#) interface §<sup>p86</sup> 7

```
IDL [Exposed=Window,
  Constructor(DOMString type, optional PopStateEventInit eventInitDict = {})]
interface PopStateEvent : Event {
  readonly attribute any state;
};

dictionary PopStateEventInit : EventInit {
  any state = null;
};
```

#### For web developers (non-normative)

##### [event.state<sup>p867</sup>](#)

Returns a copy of the information that was provided to [pushState\(\)<sup>p840</sup>](#) or [replaceState\(\)<sup>p841</sup>](#).

The **state** attribute must return the value it was initialized to. It represents the context information for the event, or null, if the state represented is the initial state of the [Document<sup>p111</sup>](#).

### 7.8.10.3 The `HashChangeEvent`<sup>p868</sup> interface §<sup>p86</sup><sub>8</sub>

MDN

```
IDL [Exposed=Window,
  Constructor(DOMString type, optional HashChangeEventInit eventInitDict = {})]
interface HashChangeEvent : Event {
  readonly attribute USVString oldURL;
  readonly attribute USVString newURL;
};

dictionary HashChangeEventInit : EventInit {
  USVString oldURL = "";
  USVString newURL = "";
};
```

Support:

- Chrome for Android
- Chrome
- iOS Safari
- Safari
- Firefox
- Samsung
- Edge
- UC Browser
- Android
- IE
- Opera
- Opera Mini
- Firefox for Android
- Southern Cross

#### For web developers (non-normative)

##### `event.oldURL`<sup>p868</sup>

Returns the [URL](#) of the [session history entry](#)<sup>p836</sup> that was previously current.

##### `event.newURL`<sup>p868</sup>

Returns the [URL](#) of the [session history entry](#)<sup>p836</sup> that is now current.

The `oldURL` attribute must return the value it was initialized to. It represents context information for the event, specifically the [URL](#) of the [session history entry](#)<sup>p836</sup> that was traversed from.

The `newURL` attribute must return the value it was initialized to. It represents context information for the event, specifically the [URL](#) of the [session history entry](#)<sup>p836</sup> that was traversed to.

### 7.8.10.4 The `PageTransitionEvent`<sup>p868</sup> interface §<sup>p86</sup><sub>8</sub>

MDN

```
IDL [Exposed=Window,
  Constructor(DOMString type, optional PageTransitionEventInit eventInitDict = {})]
interface PageTransitionEvent : Event {
  readonly attribute boolean persisted;
};

dictionary PageTransitionEventInit : EventInit {
  boolean persisted = false;
};
```

#### For web developers (non-normative)

##### `event.persisted`<sup>p868</sup>

For the [pageshow](#)<sup>p1261</sup> event, returns false if the page is newly being loaded (and the [load](#)<sup>p1261</sup> event will fire). Otherwise, returns true.

For the [pagehide](#)<sup>p1261</sup> event, returns false if the page is going away for the last time. Otherwise, returns true, meaning that (if nothing conspires to make the page unsalvageable) the page might be reused if the user navigates back to this page.

Things that can cause the page to be unsalvageable include:

- Listening for [beforeunload](#)<sup>p1260</sup> events
- Listening for [unload](#)<sup>p1261</sup> events
- Having [iframe](#)<sup>p355</sup>s that are not salvageable
- Active [WebSocket](#)<sup>p988</sup> objects
- [Aborting a Document](#)<sup>p871</sup>

The `persisted` attribute must return the value it was initialized to. It represents the context information for the event.

MDN

### 7.8.11 Unloading documents §<sup>p86</sup><sub>9</sub>

A [Document](#)<sup>p111</sup> has a **salvageable** state, which must initially be true, a **fired unload** flag, which must initially be false, and a **page showing** flag, which must initially be false. The [page showing](#)<sup>p869</sup> flag is used to ensure that scripts receive [pageshow](#)<sup>p1261</sup> and [pagehide](#)<sup>p1261</sup> events in a consistent manner (e.g. that they never receive two [pagehide](#)<sup>p1261</sup> events in a row without an intervening [pageshow](#)<sup>p1261</sup>, or vice versa).

[Event loops](#)<sup>p924</sup> have a **termination nesting level** counter, which must initially be 0.

To **prompt to unload**, given a [Document](#)<sup>p111</sup> object *document* and optionally a *recursiveFlag*, run these steps:

1. Increase the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> by 1.
2. Increase the *document*'s [ignore-opens-during-unload counter](#)<sup>p947</sup> by 1.
3. Let *event* be the result of [creating an event](#) using [BeforeUnloadEvent](#)<sup>p870</sup>.
4. Initialize *event*'s **type** attribute to [beforeunload](#)<sup>p1260</sup> and its **cancelable** attribute true.
5. *Dispatch*: [Dispatch](#) event at *document*'s [relevant global object](#)<sup>p913</sup>.
6. Decrease the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> by 1.
7. If any event listeners were triggered by the earlier *dispatch* step, then set *document*'s [salvageable](#)<sup>p869</sup> state to false.
8. If *document*'s [active sandboxing flag set](#)<sup>p835</sup> does not have its [sandboxed modals flag](#)<sup>p834</sup> set, and the [returnValue](#)<sup>p870</sup> attribute of the *event* object is not the empty string, or if the event was canceled, then the user agent may ask the user to confirm that they wish to unload the document.

#### Note

*The message shown to the user is not customizable, but instead determined by the user agent. In particular, the actual value of the [returnValue](#)<sup>p870</sup> attribute is ignored.*

The user agent is encouraged to avoid asking the user for confirmation if it judges that doing so would be annoying, deceptive, or pointless. A simple heuristic might be that if the user has not interacted with the document, the user agent would not ask for confirmation before unloading it.

If the user agent asks the user for confirmation, it must [pause](#)<sup>p931</sup> while waiting for the user's response.

If the user did not confirm the page navigation, then the user agent **refused to allow the document to be unloaded**.

9. If the *recursiveFlag* is not set, then:
  1. Let *descendants* be the [list of the descendant browsing contexts](#)<sup>p807</sup> of *document*.
  2. For each *browsingContext* in *descendants*:
    1. [Prompt to unload](#)<sup>p869</sup> *browsingContext*'s [active document](#)<sup>p804</sup> with the *recursiveFlag* set. If the user [refused to allow the document to be unloaded](#)<sup>p869</sup>, then the user implicitly also [refused to allow document to be unloaded](#)<sup>p869</sup>; **break**.
    2. If the [salvageable](#)<sup>p869</sup> state of *browsingContext*'s [active document](#)<sup>p804</sup> is false, then set the [salvageable](#)<sup>p869</sup> state of *document* to false.
10. Decrease the *document*'s [ignore-opens-during-unload counter](#)<sup>p947</sup> by 1.

To **unload** a [Document](#)<sup>p111</sup> *document*, optionally given a *recursiveFlag*:

1. Increase the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> by one.
2. Increase *document*'s [ignore-opens-during-unload counter](#)<sup>p947</sup> by one.
3. If *document*'s [page showing](#)<sup>p869</sup> flag is false, then jump to the step labeled *unload event* below (i.e. skip firing the [pagehide](#)<sup>p1261</sup> event and don't rerun the [unloading document visibility change steps](#)<sup>p870</sup>).
4. Set *document*'s [page showing](#)<sup>p869</sup> flag to false.
5. [Fire an event](#) named [pagehide](#)<sup>p1261</sup> at *document*'s [relevant global object](#)<sup>p913</sup>, using [PageTransitionEvent](#)<sup>p868</sup>, with the [persisted](#)<sup>p868</sup> attribute initialized to true if *document*'s [salvageable](#)<sup>p869</sup> state is true, and false otherwise, and *legacy target*

override flag set.

- Run any **unloading document visibility change steps** for *document* that are defined by [other applicable specifications](#)<sup>p63</sup>.

**Note**

*This is specifically intended for use by Page Visibility. [PAGEVIS]<sup>p1268</sup>*

- Unload event:** If *document*'s [fired unload](#)<sup>p869</sup> flag is false, then **fire an event** named [unload](#)<sup>p1261</sup> at *document*'s [relevant global object](#)<sup>p913</sup>, with *legacy target override flag* set.
- Decrease the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> by one.
- If any event listeners were triggered by the earlier *unload event* step, then set *document*'s [salvageable](#)<sup>p869</sup> state to false and set *document*'s [fired unload](#)<sup>p869</sup> flag to true.
- Run any [unloading document cleanup steps](#)<sup>p870</sup> for *document* that are defined by this specification and [other applicable specifications](#)<sup>p63</sup>.
- If the *recursiveFlag* is not set, then:
  - Let *descendants* be the [list of the descendant browsing contexts](#)<sup>p807</sup> of *document*.
  - For each *browsingContext* in *descendants*:
    - [Unload](#)<sup>p869</sup> the [active document](#)<sup>p804</sup> of *browsingContext* with the *recursiveFlag* set.
    - If the [salvageable](#)<sup>p869</sup> state of the [active document](#)<sup>p804</sup> of *browsingContext* is false, then set the [salvageable](#)<sup>p869</sup> state of *document* to false also.
    - If *document*'s [salvageable](#)<sup>p869</sup> state is false, then [discard](#)<sup>p823</sup> *document*.
- Decrease *document*'s [ignore-opens-during-unload counter](#)<sup>p947</sup> by one.

This specification defines the following **unloading document cleanup steps**. Other specifications can define more. Given a [Document](#)<sup>p111</sup> *document*:

- Let *window* be *document*'s [relevant global object](#)<sup>p913</sup>.
- For each [WebSocket](#)<sup>p988</sup> object *websocket* whose [relevant global object](#)<sup>p913</sup> is *window*, [make disappear](#)<sup>p995</sup> *websocket*.  
If this affected any [WebSocket](#)<sup>p988</sup> objects, then set *document*'s [salvageable](#)<sup>p869</sup> state to false.
- If *document*'s [salvageable](#)<sup>p869</sup> state is false, then:
  - For each [EventSource](#)<sup>p980</sup> object *eventSource* whose [relevant global object](#)<sup>p913</sup> is equal to *window*, [forcibly close](#)<sup>p987</sup> *eventSource*.
  - Empty *window*'s [list of active timers](#)<sup>p952</sup>.

### 7.8.11.1 The [BeforeUnloadEvent](#)<sup>p870</sup> interface §<sup>p87</sup><sub>0</sub>

```
IDL [Exposed=Window]
interface BeforeUnloadEvent : Event {
  attribute DOMString returnValue;
};
```

**Note**

*There are no [BeforeUnloadEvent](#)<sup>p870</sup>-specific initialization methods.*

The [BeforeUnloadEvent](#)<sup>p870</sup> interface is a legacy interface which allows [prompting to unload](#)<sup>p869</sup> to be controlled not only by canceling the event, but by setting the [returnValue](#)<sup>p870</sup> attribute to a value besides the empty string. Authors should use the [preventDefault\(\)](#) method, or other means of canceling events, instead of using [returnValue](#)<sup>p870</sup>.

The [returnValue](#) attribute controls the process of [prompting to unload](#)<sup>p869</sup>. When the event is created, the attribute must be set to the

empty string. On getting, it must return the last value it was set to. On setting, the attribute must be set to the new value.

#### Note

This attribute is a DOMString only for historical reasons. Any value besides the empty string will be treated as a request to ask the user for confirmation.

### 7.8.12 Aborting a document load § p87

To **abort** a [Document<sup>p111</sup>](#) *document*:

1. [Abort<sup>p871</sup>](#) the [active documents<sup>p804</sup>](#) of every [child browsing context<sup>p806</sup>](#). If this results in any of those [Document<sup>p111</sup>](#) objects having their [salvageable<sup>p869</sup>](#) state set to false, then set *document*'s [salvageable<sup>p869</sup>](#) state to false also.
2. Cancel any instances of the [fetch](#) algorithm in the context of *document*, discarding any [tasks<sup>p925</sup>](#) [queued<sup>p925</sup>](#) for them, and discarding any further data received from the network for them. If this resulted in any instances of the [fetch](#) algorithm being canceled or any [queued<sup>p925</sup>](#) [tasks<sup>p925</sup>](#) or any network data getting discarded, then set *document*'s [salvageable<sup>p869</sup>](#) state to false.
3. If *document* has an [active parser<sup>p114</sup>](#), then:
  1. Set *document*'s [active parser was aborted<sup>p947</sup>](#) to true.
  2. [Abort that parser<sup>p1146</sup>](#).
  3. Set *document*'s [salvageable<sup>p869</sup>](#) state to false.

User agents may allow users to explicitly invoke the [abort a document<sup>p871</sup>](#) algorithm for a [Document<sup>p111</sup>](#). If the user does so, then, if that [Document<sup>p111</sup>](#) is an [active document<sup>p804</sup>](#), the user agent should [queue a task<sup>p925</sup>](#) to [fire an event](#) named [abort<sup>p1260</sup>](#) at that [Document<sup>p111</sup>](#) object's [relevant global object<sup>p913</sup>](#) before invoking the [abort<sup>p871</sup>](#) algorithm.

To **stop document loading** given a [Document<sup>p111</sup>](#) object *document*, run these steps:

1. If *document* is not an [active document<sup>p804</sup>](#), then return.
2. Let *browsingContext* be *document*'s [browsing context<sup>p804</sup>](#).
3. If there is an existing attempt to [navigate<sup>p852</sup>](#) *browsingContext* and that attempt is not currently running the [unload a document<sup>p869</sup>](#) algorithm, then cancel that [navigation<sup>p852</sup>](#).
4. [Abort<sup>p871</sup>](#) *document*.

## 7.9 Offline Web applications § p87

This feature is in the process of being removed from the Web platform. (This is a long process that takes many years.) Using any of the offline Web application features at this time is highly discouraged. Use service workers instead. [\[SW\]<sup>p1270</sup>](#)

### 7.9.1 Introduction § p87

This section is non-normative.

In order to enable users to continue interacting with Web applications and documents even when their network connection is unavailable — for instance, because they are traveling outside of their ISP's coverage area — authors can provide a manifest which lists the files that are needed for the Web application to work offline and which causes the user's browser to keep a copy of the files for use offline.

To illustrate this, consider a simple clock applet consisting of an HTML page "clock1.html", a CSS style sheet "clock.css", and a

JavaScript script "clock.js".

Before adding the manifest, these three files might look like this:

```
<!-- clock1.html -->
<!DOCTYPE HTML>
<html>
  <head>
    <meta charset="utf-8">
    <title>Clock</title>
    <script src="clock.js"></script>
    <link rel="stylesheet" href="clock.css">
  </head>
  <body>
    <p>The time is: <output id="clock"></output></p>
  </body>
</html>
```

```
CSS /* clock.css */
output { font: 2em sans-serif; }

/* clock.js */
setInterval(function () {
  document.getElementById('clock').value = new Date();
}, 1000);
```

If the user tries to open the "clock1.html" page while offline, though, the user agent (unless it happens to have it still in the local cache) will fail with an error.

The author can instead provide a manifest of the three files, say "clock.appcache":

```
CACHE MANIFEST
clock2.html
clock.css
clock.js
```

With a small change to the HTML file, the manifest (served as [text/cache-manifest](#)<sup>P1234</sup>) is linked to the application:

```
<!-- clock2.html -->
<!DOCTYPE HTML>
<html manifest="clock.appcache">
  <head>
    <meta charset="utf-8">
    <title>Clock</title>
    <script src="clock.js"></script>
    <link rel="stylesheet" href="clock.css">
  </head>
  <body>
    <p>The time is: <output id="clock"></output></p>
  </body>
</html>
```

Now, if the user goes to the page, the browser will cache the files and make them available even when the user is offline.

#### Note

*Authors are encouraged to include the main page in the manifest also, but in practice the page that referenced the manifest is automatically cached even if it isn't explicitly mentioned.*

#### Note

*With the exception of "no-store" directive, HTTP cache headers and restrictions on caching pages served over TLS (encrypted, using [https:](#)) are overridden by manifests. Thus, pages will not expire from an application cache before the user agent has*

updated it, and even applications served over TLS can be made to work offline.

[View this example online.](#)

### 7.9.1.1 Supporting offline caching for legacy applications § p87 3

*This section is non-normative.*

The application cache feature works best if the application logic is separate from the application and user data, with the logic (markup, scripts, style sheets, images, etc) listed in the manifest and stored in the application cache, with a finite number of static HTML pages for the application, and with the application and user data stored in Web Storage or a client-side Indexed Database, updated dynamically using Web Sockets, [XMLHttpRequest](#), server-sent events, or some other similar mechanism.

This model results in a fast experience for the user: the application immediately loads, and fresh data is obtained as fast as the network will allow it (possibly while stale data shows).

Legacy applications, however, tend to be designed so that the user data and the logic are mixed together in the HTML, with each operation resulting in a new HTML page from the server.

#### Example

For example, consider a news application. The typical architecture of such an application, when not using the application cache feature, is that the user fetches the main page, and the server returns a dynamically-generated page with the current headlines and the user interface logic mixed together.

A news application designed for the application cache feature, however, would instead have the main page just consist of the logic, and would then have the main page fetch the data separately from the server, e.g. using [XMLHttpRequest](#).

The mixed-content model does not work well with the application cache feature: since the content is cached, it would result in the user always seeing the stale data from the previous time the cache was updated.

While there is no way to make the legacy model work as fast as the separated model, it *can* at least be retrofitted for offline use using the [prefer-online<sup>p875</sup> application cache mode<sup>p875</sup>](#). To do so, list all the static resources used by the HTML page you want to have work offline in an [application cache manifest<sup>p874</sup>](#), use the [manifest<sup>p149</sup>](#) attribute to select that manifest from the HTML file, and then add the following line at the bottom of the manifest:

```
SETTINGS:  
prefer-online  
NETWORK:  
*
```

This causes the [application cache<sup>p874</sup>](#) to only be used for [master entries<sup>p874</sup>](#) when the user is offline, and causes the application cache to be used as an atomic HTTP cache (essentially pinning resources listed in the manifest), while allowing all resources not listed in the manifest to be accessed normally when the user is online.

### 7.9.1.2 Events summary § p87 3

*This section is non-normative.*

When the user visits a page that declares a manifest, the browser will try to update the cache. It does this by fetching a copy of the manifest and, if the manifest has changed since the user agent last saw it, redownloading all the resources it mentions and caching them anew.

As this is going on, a number of events get fired on the [ApplicationCache<sup>p891</sup>](#) object to keep the script updated as to the state of the cache update, so that the user can be notified appropriately. The events are as follows:

Event name	Interface	Fired when...	Next events
<a href="#">checking</a>	<a href="#">Event</a>	The user agent is checking for an update, or attempting to download the manifest for the first time.	<a href="#">nouupdate<sup>p874</sup></a> ,

Event name	Interface	Fired when...	Next events
		<b>This is always the first event in the sequence.</b>	<a href="#">downloading</a> <sup>p874</sup> , <a href="#">obsolete</a> <sup>p874</sup> , <a href="#">error</a> <sup>p874</sup>
<a href="#">nouupdate</a>	<a href="#">Event</a>	The manifest hadn't changed.	Last event in sequence.
<a href="#">downloading</a>	<a href="#">Event</a>	The user agent has found an update and is fetching it, or is downloading the resources listed by the manifest for the first time.	<a href="#">progress</a> <sup>p874</sup> , <a href="#">error</a> <sup>p874</sup> , <a href="#">cached</a> <sup>p874</sup> , <a href="#">updateready</a> <sup>p874</sup>
<a href="#">progress</a>	<a href="#">ProgressEvent</a>	The user agent is downloading resources listed by the manifest. The event object's <a href="#">total</a> attribute returns the total number of files to be downloaded. The event object's <a href="#">loaded</a> attribute returns the number of files processed so far.	<a href="#">progress</a> <sup>p874</sup> , <a href="#">error</a> <sup>p874</sup> , <a href="#">cached</a> <sup>p874</sup> , <a href="#">updateready</a> <sup>p874</sup>
<a href="#">cached</a>	<a href="#">Event</a>	The resources listed in the manifest have been downloaded, and the application is now cached.	Last event in sequence.
<a href="#">updateready</a>	<a href="#">Event</a>	The resources listed in the manifest have been newly redownloaded, and the script can use <a href="#">swapCache()</a> <sup>p893</sup> to switch to the new cache.	Last event in sequence.
<a href="#">obsolete</a>	<a href="#">Event</a>	The manifest was found to have become a 404 or 410 page, so the application cache is being deleted.	Last event in sequence.
<a href="#">error</a>	<a href="#">Event</a>	The manifest was a 404 or 410 page, so the attempt to cache the application has been aborted.	Last event in sequence.
		The manifest hadn't changed, but the page referencing the manifest failed to download properly.	
		A fatal error occurred while fetching the resources listed in the manifest.	
		The manifest changed while the update was being run.	The user agent will try fetching the files again momentarily.

These events are cancelable; their default action is for the user agent to show download progress information. If the page shows its own update UI, canceling the events will prevent the user agent from showing redundant progress information.

## 7.9.2 Application caches <sup>§ p87</sup><sub>4</sub>

An **application cache** is a set of cached resources consisting of:

- One or more resources (including their out-of-band metadata, such as HTTP headers, if any), identified by URLs, each falling into one (or more) of the following categories:

### Master entries

#### Note

These are documents that were added to the cache because a [browsing context](#)<sup>p804</sup> was [navigated](#)<sup>p852</sup> to that document and the document indicated that this was its cache, using the [manifest](#)<sup>p149</sup> attribute.

### The manifest

#### Note

This is the resource corresponding to the URL that was given in a master entry's [html](#)<sup>p149</sup> element's [manifest](#)<sup>p149</sup> attribute. The manifest is fetched and processed during the [application cache download process](#)<sup>p881</sup>. All the [master entries](#)<sup>p874</sup> have the [same origin](#)<sup>p830</sup> as the manifest.

### Explicit entries

#### Note

These are the resources that were listed in the cache's [manifest](#)<sup>p874</sup> in an [explicit section](#)<sup>p878</sup>.

### Fallback entries

#### Note

These are the resources that were listed in the cache's [manifest](#)<sup>p874</sup> in a [fallback section](#)<sup>p878</sup>.

[Explicit entries](#)<sup>p874</sup> and [Fallback entries](#)<sup>p874</sup> can be marked as **foreign**, which means that they have a [manifest](#)<sup>p149</sup> attribute but that it doesn't point at this cache's [manifest](#)<sup>p874</sup>.

**Note**

A URL in the list can be flagged with multiple different types, and thus an entry can end up being categorized as multiple entries. For example, an entry can be a manifest entry and an explicit entry at the same time, if the manifest is listed within the manifest.

- Zero or more **fallback namespaces**, each of which is mapped to a [fallback entry](#)<sup>p874</sup>.

**Note**

These are URLs used as [prefix match patterns](#)<sup>p876</sup> for resources that are to be fetched from the network if possible, or to be replaced by the corresponding [fallback entry](#)<sup>p874</sup> if not. Each namespace URL has the [same origin](#)<sup>p830</sup> as the [manifest](#)<sup>p874</sup>.

- Zero or more URLs that form the **online safelist namespaces**.

**Note**

These are used as prefix match patterns, and declare URLs for which the user agent will ignore the application cache, instead fetching them normally (i.e. from the network or local HTTP cache as appropriate).

- An **online safelist wildcard flag**, which is either *open* or *blocking*.

**Note**

The open state indicates that any URL not listed as cached is to be implicitly treated as being in the [online safelist namespaces](#)<sup>p875</sup>; the blocking state indicates that URLs not listed explicitly in the manifest are to be treated as unavailable.

- A **cache mode flag**, which is either in the **fast** state or the **prefer-online** state.

Each [application cache](#)<sup>p874</sup> has a **completeness flag**, which is either *complete* or *incomplete*.

An **application cache group** is a group of [application caches](#)<sup>p874</sup>, identified by the [absolute URL](#) of a resource [manifest](#)<sup>p874</sup> which is used to populate the caches in the group.

An [application cache](#)<sup>p874</sup> is **newer** than another if it was created after the other (in other words, [application caches](#)<sup>p874</sup> in an [application cache group](#)<sup>p875</sup> have a chronological order).

Only the newest [application cache](#)<sup>p874</sup> in an [application cache group](#)<sup>p875</sup> can have its [completeness flag](#)<sup>p875</sup> set to *incomplete*; the others are always all *complete*.

Each [application cache group](#)<sup>p875</sup> has an **update status**, which is one of the following: *idle*, *checking*, *downloading*.

A **relevant application cache** is an [application cache](#)<sup>p874</sup> that is the [newest](#)<sup>p875</sup> in its [group](#)<sup>p875</sup> to be *complete*.

Each [application cache group](#)<sup>p875</sup> has a **list of pending master entries**. Each entry in this list consists of a resource and a corresponding [Document](#)<sup>p111</sup> object. It is used during the [application cache download process](#)<sup>p881</sup> to ensure that new master entries are cached even if the [application cache download process](#)<sup>p881</sup> was already running for their [application cache group](#)<sup>p875</sup> when they were loaded.

An [application cache group](#)<sup>p875</sup> can be marked as **obsolete**, meaning that it must be ignored when looking at what [application cache groups](#)<sup>p875</sup> exist.

A **cache host** is a [Document](#)<sup>p111</sup> object.

Each [cache host](#)<sup>p875</sup> has an associated [ApplicationCache](#)<sup>p891</sup> object.

Each [cache host](#)<sup>p875</sup> initially is not associated with an [application cache](#)<sup>p874</sup>, but can become associated with one early during the page load process, when steps [in the parser](#)<sup>p1114</sup> and in the [navigation](#)<sup>p852</sup> sections cause [cache selection](#)<sup>p888</sup> to occur.

Multiple [application caches](#)<sup>p874</sup> in different [application cache groups](#)<sup>p875</sup> can contain the same resource, e.g. if the manifests all reference that resource. If the user agent is to **select an application cache** from a list of [relevant application caches](#)<sup>p875</sup> that contain a resource, the user agent must use the application cache that the user most likely wants to see the resource from, taking into account

the following:

- which application cache was most recently updated,
- which application cache was being used to display the resource from which the user decided to look at the new resource, and
- which application cache the user prefers.

A URL **matches a fallback namespace** if there exists a [relevant application cache](#)<sup>p875</sup> whose [manifest](#)<sup>p874</sup>'s URL has the [same origin](#)<sup>p830</sup> as the URL in question, and that has a [fallback namespace](#)<sup>p875</sup> that is a [prefix match](#)<sup>p65</sup> for the URL being examined. If multiple fallback namespaces match the same URL, the longest one is the one that matches. A URL looking for a fallback namespace can match more than one application cache at a time, but only matches one namespace in each cache.

#### Example

If a manifest `https://example.com/app1/manifest` declares that `https://example.com/resources/images` is a fallback namespace, and the user navigates to `https://example.com:80/resources/images/cat.png`, then the user agent will decide that the application cache identified by `https://example.com/app1/manifest` contains a namespace with a match for that URL.

### 7.9.3 The cache manifest syntax § p87 6

#### 7.9.3.1 Some sample manifests § p87 6

*This section is non-normative.*

#### Example

This example manifest requires two images and a style sheet to be cached and safelists a CGI script.

```
CACHE MANIFEST
# the above line is required

# this is a comment
# there can be as many of these anywhere in the file
# they are all ignored
# comments can have spaces before them
# but must be alone on the line

# blank lines are ignored too

# these are files that need to be cached they can either be listed
# first, or a "CACHE:" header could be put before them, as is done
# lower down.
images/sound-icon.png
images/background.png
# note that each file has to be put on its own line

# here is a file for the online safelist -- it isn't cached, and
# references to this file will bypass the cache, always hitting the
# network (or trying to, if the user is offline).
NETWORK:
comm.cgi

# here is another set of files to cache, this time just the CSS file.
CACHE:
style/default.css
```

It could equally well be written as follows:

```
CACHE MANIFEST
NETWORK:
comm.cgi
```

```
CACHE:  
style/default.css  
images/sound-icon.png  
images/background.png
```

#### Example

Offline application cache manifests can use absolute paths or even absolute URLs:

```
CACHE MANIFEST  
  
/main/home  
/main/app.js  
/settings/home  
/settings/app.js  
https://img.example.com/logo.png  
https://img.example.com/check.png  
https://img.example.com/cross.png
```

#### Example

The following manifest defines a catch-all error page that is displayed for any page on the site while the user is offline. It also specifies that the [online safelist wildcard flag](#)<sup>p875</sup> is *open*, meaning that accesses to resources on other sites will not be blocked. (Resources on the same site are already not blocked because of the catch-all fallback namespace.)

So long as all pages on the site reference this manifest, they will get cached locally as they are fetched, so that subsequent hits to the same page will load the page immediately from the cache. Until the manifest is changed, those pages will not be fetched from the server again. When the manifest changes, then all the files will be redownloaded.

Subresources, such as style sheets, images, etc, would only be cached using the regular HTTP caching semantics, however.

```
CACHE MANIFEST  
FALLBACK:  
/ /offline.html  
NETWORK:  
*
```

### 7.9.3.2 Writing cache manifests <sup>§ p87</sup><sub>7</sub>

Manifests must be served using the [text/cache-manifest](#)<sup>p1234</sup> MIME type. All resources served using the [text/cache-manifest](#)<sup>p1234</sup> MIME type must follow the syntax of application cache manifests, as described in this section.

An application cache manifest is a text file, whose text is encoded using UTF-8. Data in application cache manifests is line-based. Newlines must be represented by U+000A LINE FEED (LF) characters, U+000D CARRIAGE RETURN (CR) characters, or U+000D CARRIAGE RETURN (CR) U+000A LINE FEED (LF) pairs. [\[ENCODING\]](#)<sup>p1266</sup>

#### Note

*This is a [willful violation](#)<sup>p26</sup> of RFC 2046, which requires all `text/*` types to only allow CRLF line breaks. This requirement, however, is outdated; the use of CR, LF, and CRLF line breaks is commonly supported and indeed sometimes CRLF is not supported by text editors. [\[RFC2046\]](#)<sup>p1269</sup>*

The first line of an application cache manifest must consist of the string "CACHE", a single U+0020 SPACE character, the string "MANIFEST", and either a U+0020 SPACE character, a U+0009 CHARACTER TABULATION (tab) character, a U+000A LINE FEED (LF) character, or a U+000D CARRIAGE RETURN (CR) character. The first line may optionally be preceded by a U+FEFF BYTE ORDER MARK (BOM) character. If any other text is found on the first line, it is ignored.

Subsequent lines, if any, must all be one of the following:

#### A blank line

Blank lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters only.

## A comment

Comment lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, followed by a single U+0023 NUMBER SIGN character (#), followed by zero or more characters other than U+000A LINE FEED (LF) and U+000D CARRIAGE RETURN (CR) characters.

### Note

*Comments need to be on a line on their own. If they were to be included on a line with a URL, the "#" would be mistaken for part of a [fragment](#).*

## A section header

Section headers change the current section. There are four possible section headers:

### CACHE:

Switches to the **explicit section**.

### FALLBACK:

Switches to the **fallback section**.

### NETWORK:

Switches to the **online safelist section**.

### SETTINGS:

Switches to the **settings section**.

Section header lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, followed by one of the names above (including the U+003A COLON character (:)) followed by zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

Ironically, by default, the current section is the [explicit section](#)<sup>p878</sup>.

## Data for the current section

The format that data lines must take depends on the current section.

When the current section is the [explicit section](#)<sup>p878</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, a [valid URL string](#) identifying a resource other than the manifest itself, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

When the current section is the [fallback section](#)<sup>p878</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, a [valid URL string](#) identifying a resource other than the manifest itself, one or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, another [valid URL string](#) identifying a resource other than the manifest itself, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

When the current section is the [online safelist section](#)<sup>p878</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, either a single U+002A ASTERISK character (\*) or a [valid URL string](#) identifying a resource other than the manifest itself, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

When the current section is the [settings section](#)<sup>p878</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, a [setting](#)<sup>p878</sup>, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

Currently only one **setting** is defined:

### The cache mode setting

This consists of the string "prefer-online". It sets the [cache mode](#)<sup>p875</sup> to [prefer-online](#)<sup>p875</sup>. (The [cache mode](#)<sup>p875</sup> defaults to [fast](#)<sup>p875</sup>.)

Within a [settings section](#)<sup>p878</sup>, each [setting](#)<sup>p878</sup> must occur no more than once.

Manifests may contain sections more than once. Sections may be empty.

URLs that are to be fallback pages associated with [fallback namespaces](#)<sup>p875</sup>, and those namespaces themselves, must be given in [fallback sections](#)<sup>p878</sup>, with the namespace being the first URL of the data line, and the corresponding fallback page being the second URL. All the other pages to be cached must be listed in [explicit sections](#)<sup>p878</sup>.

[Fallback namespaces](#)<sup>p875</sup> and [fallback entries](#)<sup>p874</sup> must have the [same origin](#)<sup>p830</sup> as the manifest itself. [Fallback namespaces](#)<sup>p875</sup> must

also be in the same path as the manifest's URL.

A [fallback namespace](#)<sup>p875</sup> must not be listed more than once.

Namespaces that the user agent is to put into the [online safelist](#)<sup>p875</sup> must all be specified in [online safelist sections](#)<sup>p878</sup>. (This is needed for any URL that the page is intending to use to communicate back to the server.) To specify that all URLs are automatically safelisted in this way, a U+002A ASTERISK character (\*) may be specified as one of the URLs.

Authors should not include namespaces in the [online safelist](#)<sup>p875</sup> for which another namespace in the [online safelist](#)<sup>p875</sup> is a [prefix match](#)<sup>p65</sup>.

[Relative URLs](#) must be given relative to the manifest's own URL. All URLs in the manifest must have the same [scheme](#) as the manifest itself (either explicitly or implicitly, through the use of [relative URLs](#)). [\[URL\]](#)<sup>p1270</sup>

URLs in manifests must not have [fragments](#) (i.e. the U+0023 NUMBER SIGN character isn't allowed in URLs in manifests).

[Fallback namespaces](#)<sup>p875</sup> and namespaces in the [online safelist](#)<sup>p875</sup> are matched by [prefix match](#)<sup>p65</sup>.

### 7.9.3.3 Parsing cache manifests <sup>§<sup>p87</sup><sub>9</sub></sup>

When a user agent is to **parse a manifest**, it means that the user agent must run the following steps:

1. [UTF-8 decode](#) the byte stream corresponding with the manifest to be parsed.

#### Note

The [UTF-8 decode](#) algorithm strips a leading BOM, if any.

2. Let *base URL* be the [absolute URL](#) representing the manifest.
3. Apply the [URL parser](#) to *base URL*, and let *manifest path* be the [path](#) component thus obtained.
4. Remove all the characters in *manifest path* after the last U+002F SOLIDUS character (/), if any. (The first character and the last character in *manifest path* after this step will both be slashes, the URL path separator character.)
5. Apply the [URL parser](#) steps to the *base URL*, so that the components from its [URL record](#) can be used by the subsequent steps of this algorithm.
6. Let *explicit URLs* be an initially empty list of [absolute URLs](#) for [explicit entries](#)<sup>p874</sup>.
7. Let *fallback URLs* be an initially empty mapping of [fallback namespaces](#)<sup>p875</sup> to [absolute URLs](#) for [fallback entries](#)<sup>p874</sup>.
8. Let *online safelist namespaces* be an initially empty list of [absolute URLs](#) for an [online safelist](#)<sup>p875</sup>.
9. Let *online safelist wildcard flag* be *blocking*.
10. Let *cache mode flag* be *fast*.
11. Let *input* be the decoded text of the manifest's byte stream.
12. Let *position* be a pointer into *input*, initially pointing at the first character.
13. If the characters starting from *position* are "CACHE", followed by a U+0020 SPACE character, followed by "MANIFEST", then advance *position* to the next character after those. Otherwise, this isn't a cache manifest; return with a failure while checking for the magic signature.
14. If the character at *position* is neither a U+0020 SPACE character, a U+0009 CHARACTER TABULATION (tab) character, U+000A LINE FEED (LF) character, nor a U+000D CARRIAGE RETURN (CR) character, then this isn't a cache manifest; return with a failure while checking for the magic signature.
15. This is a cache manifest. The algorithm cannot fail beyond this point (though bogus lines can get ignored).
16. [Collect a sequence of code points](#) that are *not* U+000A LINE FEED (LF) or U+000D CARRIAGE RETURN (CR) characters from *input* given *position*, and ignore those characters. (Extra text on the first line, after the signature, is ignored.)
17. Let *mode* be "explicit".
18. *Start of line*: If *position* is past the end of *input*, then jump to the last step. Otherwise, [collect a sequence of code points](#) that

are U+000A LINE FEED (LF), U+000D CARRIAGE RETURN (CR), U+0020 SPACE, or U+0009 CHARACTER TABULATION (tab) characters from *input* given *position*.

19. Now, [collect a sequence of code points](#) that are *not* U+000A LINE FEED (LF) or U+000D CARRIAGE RETURN (CR) characters from *input* given *position*, and let the result be *line*.
20. Drop any trailing U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters at the end of *line*.
21. If *line* is the empty string, then jump back to the step labeled *start of line*.
22. If the first character in *line* is a U+0023 NUMBER SIGN character (#), then jump back to the step labeled *start of line*.
23. If *line* equals "CACHE:" (the word "CACHE" followed by a U+003A COLON character (:)), then set *mode* to "explicit" and jump back to the step labeled *start of line*.
24. If *line* equals "FALLBACK:" (the word "FALLBACK" followed by a U+003A COLON character (:)), then set *mode* to "fallback" and jump back to the step labeled *start of line*.
25. If *line* equals "NETWORK:" (the word "NETWORK" followed by a U+003A COLON character (:)), then set *mode* to "online safelist" and jump back to the step labeled *start of line*.
26. If *line* equals "SETTINGS:" (the word "SETTINGS" followed by a U+003A COLON character (:)), then set *mode* to "settings" and jump back to the step labeled *start of line*.
27. If *line* ends with a U+003A COLON character (:), then set *mode* to "unknown" and jump back to the step labeled *start of line*.
28. This is either a data line or it is syntactically incorrect.
29. Let *position* be a pointer into *line*, initially pointing at the start of the string.
30. Let *tokens* be a list of strings, initially empty.
31. While *position* doesn't point past the end of *line*:
  1. Let *current token* be an empty string.
  2. While *position* doesn't point past the end of *line* and the character at *position* is neither a U+0020 SPACE nor a U+0009 CHARACTER TABULATION (tab) character, add the character at *position* to *current token* and advance *position* to the next character in *input*.
  3. Add *current token* to the *tokens* list.
  4. While *position* doesn't point past the end of *line* and the character at *position* is either a U+0020 SPACE or a U+0009 CHARACTER TABULATION (tab) character, advance *position* to the next character in *input*.
32. Process *tokens* as follows:

↪ **If *mode* is "explicit"**

Let *urlRecord* be the result of [parsing](#) the first item in *tokens* with *base URL*; ignore the rest.

If *urlRecord* is failure, then jump back to the step labeled *start of line*.

If *urlRecord* has a different [scheme](#) component than *base URL* (the manifest's URL), then jump back to the step labeled *start of line*.

Let *new URL* be the result of applying the [URL serializer](#) algorithm to *urlRecord*, with the *exclude fragment flag* set.

Add *new URL* to the *explicit URLs*.

↪ **If *mode* is "fallback"**

Let *part one* be the first token in *tokens*, and let *part two* be the second token in *tokens*.

Let *urlRecordOne* be the result of [parsing](#) *part one* with *base URL*.

Let *urlRecordTwo* be the result of [parsing](#) *part two* with *base URL*.

If either *urlRecordOne* or *urlRecordTwo* are failure, then jump back to the step labeled *start of line*.

If the [origin](#) of either *urlRecordOne* or *urlRecordTwo* is not [same origin](#)<sup>p830</sup> with the manifest's URL [origin](#), then jump back to the step labeled *start of line*.

Let *part one path* be the [path](#) component of *urlRecordOne*.

If *manifest path* is not a [prefix match](#)<sup>p65</sup> for *part one path*, then jump back to the step labeled *start of line*.

Let *part one* be the result of applying the [URL serializer](#) algorithm to *urlRecordOne*, with the *exclude fragment flag* set.

Let *part two* be the result of applying the [URL serializer](#) algorithm to *urlRecordTwo*, with the *exclude fragment flag* set.

If *part one* is already in the *fallback URLs* mapping as a [fallback namespace](#)<sup>p875</sup>, then jump back to the step labeled *start of line*.

Otherwise, add *part one* to the *fallback URLs* mapping as a [fallback namespace](#)<sup>p875</sup>, mapped to *part two* as the [fallback entry](#)<sup>p874</sup>.

↪ **If *mode* is "online safelist"**

If the first item in *tokens* is a U+002A ASTERISK character (\*), then set *online safelist wildcard flag* to *open* and jump back to the step labeled *start of line*.

Otherwise, let *urlRecord* be the result of [parsing](#) the first item in *tokens* with *base URL*.

If *urlRecord* is failure, then jump back to the step labeled *start of line*.

If *urlRecord* has a different [scheme](#) component than *base URL* (the manifest's URL), then jump back to the step labeled *start of line*.

Let *new URL* be the result of applying the [URL serializer](#) algorithm to *urlRecord*, with the *exclude fragment flag* set.

Add *new URL* to the *online safelist namespaces*.

↪ **If *mode* is "settings"**

If *tokens* contains a single token, and that token is a [case-sensitive](#)<sup>p65</sup> match for the string "prefer-online", then set *cache mode flag* to *prefer-online* and jump back to the step labeled *start of line*.

Otherwise, the line is an unsupported setting: do nothing; the line is ignored.

↪ **If *mode* is "unknown"**

Do nothing. The line is ignored.

33. Jump back to the step labeled *start of line*. (That step jumps to the next, and last, step when the end of the file is reached.)

34. Return the *explicit URLs* list, the *fallback URLs* mapping, the *online safelist namespaces*, the *online safelist wildcard flag*, and the *cache mode flag*.

**Note**

The resource that declares the manifest (with the [manifest](#)<sup>p149</sup> attribute) will always get taken from the cache, whether it is listed in the cache or not, even if it is listed in an [online safelist namespace](#)<sup>p875</sup>.

If a resource is listed in the [explicit section](#)<sup>p878</sup> or as a [fallback entry](#)<sup>p874</sup> in the [fallback section](#)<sup>p878</sup>, the resource will always be taken from the cache, regardless of any other matching entries in the [fallback namespaces](#)<sup>p875</sup> or [online safelist namespaces](#)<sup>p875</sup>.

When a [fallback namespace](#)<sup>p875</sup> and an [online safelist namespace](#)<sup>p875</sup> overlap, the [online safelist namespace](#)<sup>p875</sup> has priority.

The [online safelist wildcard flag](#)<sup>p875</sup> is applied last, only for URLs that match neither the [online safelist namespace](#)<sup>p875</sup> nor the [fallback namespace](#)<sup>p875</sup> and that are not listed in the [explicit section](#)<sup>p878</sup>.

## 7.9.4 Downloading or updating an application cache § p88

1

When the user agent is required (by other parts of this specification) to start the **application cache download process** for an [absolute URL](#) purported to identify a [manifest](#)<sup>p874</sup>, or for an [application cache group](#)<sup>p875</sup>, potentially given a particular [cache host](#)<sup>p875</sup>, and potentially given a [master](#)<sup>p874</sup> resource, the user agent must run the steps below. These steps are always run [in parallel](#)<sup>p41</sup> with the [event loop](#)<sup>p924</sup> [tasks](#)<sup>p925</sup>.

Some of these steps have requirements that only apply if the user agent **shows caching progress**. Support for this is optional. Caching progress UI could consist of a progress bar or message panel in the user agent's interface, or an overlay, or something else. Certain events fired during the [application cache download process](#)<sup>p881</sup> allow the script to override the display of such an interface. (Such events are delayed until after the [Load](#)<sup>p1261</sup> event has fired.) The goal of this is to allow Web applications to provide more seamless update mechanisms, hiding from the user the mechanics of the application cache mechanism. User agents may display user interfaces independent of this, but are encouraged to not show prominent update progress notifications for applications that cancel the relevant events.

The [application cache download process](#)<sup>p881</sup> steps are as follows:

1. Optionally, wait until the permission to start the [application cache download process](#)<sup>p881</sup> has been obtained from the user and until the user agent is confident that the network is available. This could include doing nothing until the user explicitly opts-in to caching the site, or could involve prompting the user for permission. The algorithm might never get past this point. (This step is particularly intended to be used by user agents running on severely space-constrained devices or in highly privacy-sensitive environments).

2. Atomically, so as to avoid race conditions, perform the following substeps:

1. Pick the appropriate substeps:

↪ **If these steps were invoked with an [absolute URL](#) purported to identify a [manifest](#)<sup>p874</sup>**

Let *manifest URL* be that [absolute URL](#).

If there is no [application cache group](#)<sup>p875</sup> identified by *manifest URL*, then create a new [application cache group](#)<sup>p875</sup> identified by *manifest URL*. Initially, it has no [application caches](#)<sup>p874</sup>. One will be created later in this algorithm.

↪ **If these steps were invoked with an [application cache group](#)<sup>p875</sup>**

Let *manifest URL* be the [absolute URL](#) of the [manifest](#)<sup>p874</sup> used to identify the [application cache group](#)<sup>p875</sup> to be updated.

If that [application cache group](#)<sup>p875</sup> is [obsolete](#)<sup>p875</sup>, then abort this instance of the [application cache download process](#)<sup>p881</sup>. This can happen if another instance of this algorithm found the manifest to be 404 or 410 while this algorithm was waiting in the first step above.

2. Let *cache group* be the [application cache group](#)<sup>p875</sup> identified by *manifest URL*.
3. If these steps were invoked with a [master](#)<sup>p874</sup> resource, then add the resource, along with the resource's [Document](#)<sup>p111</sup>, to *cache group*'s [list of pending master entries](#)<sup>p875</sup>.
4. If these steps were invoked with a [cache host](#)<sup>p875</sup>, and the [status](#)<sup>p875</sup> of *cache group* is *checking* or *downloading*, then [queue a post-load task](#)<sup>p888</sup> to run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [checking](#)<sup>p873</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of that [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent is checking to see if it can download the application.
5. If these steps were invoked with a [cache host](#)<sup>p875</sup>, and the [status](#)<sup>p875</sup> of *cache group* is *downloading*, then also [queue a post-load task](#)<sup>p888</sup> to run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [downloading](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of that [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user the application is being downloaded.
6. If the [status](#)<sup>p875</sup> of the *cache group* is either *checking* or *downloading*, then abort this instance of the [application cache download process](#)<sup>p881</sup>, as an update is already in progress.
7. Set the [status](#)<sup>p875</sup> of *cache group* to *checking*.
8. For each [cache host](#)<sup>p875</sup> associated with an [application cache](#)<sup>p874</sup> in *cache group*, [queue a post-load task](#)<sup>p888</sup> run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [checking](#)<sup>p873</sup> at the [ApplicationCache](#)<sup>p891</sup>

singleton of the [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.

2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent is checking for the availability of updates.

#### Note

*The remainder of the steps run [in parallel](#)<sup>p41</sup>.*

If *cache group* already has an [application cache](#)<sup>p874</sup> in it, then this is an **upgrade attempt**. Otherwise, this is a **cache attempt**.

3. If this is a [cache attempt](#)<sup>p883</sup>, then this algorithm was invoked with a [cache host](#)<sup>p875</sup>; [queue a post-load task](#)<sup>p888</sup> to run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [checking](#)<sup>p873</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of that [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent is checking for the availability of updates.
4. Let *request* be a new [request](#) whose [url](#) is *manifest URL*, [client](#) is null, [destination](#) is the empty string, [referrer](#) is "no-referrer", [synchronous flag](#) is set, [credentials mode](#) is "include", and whose [use-URL-credentials flag](#) is set.
5. *Fetching the manifest*: Let *manifest* be the result of [fetching](#) *request*. HTTP caching semantics should be honored for this request.

Parse *manifest*'s [body](#) according to the [rules for parsing manifests](#)<sup>p879</sup>, obtaining a list of [explicit entries](#)<sup>p874</sup>, [fallback entries](#)<sup>p874</sup> and the [fallback namespaces](#)<sup>p875</sup> that map to them, entries for the [online safelist](#)<sup>p875</sup>, and values for the [online safelist wildcard flag](#)<sup>p875</sup> and the [cache mode flag](#)<sup>p875</sup>.

#### Note

*The [MIME type](#) of the resource is ignored — it is assumed to be [text/cache-manifest](#)<sup>p1234</sup>. In the future, if new manifest formats are supported, the different types will probably be distinguished on the basis of the file signatures (for the current format, that is the "CACHE MANIFEST" string at the top of the file).*

6. If *fetching the manifest* fails due to a 404 or 410 response status, then run these substeps:
  1. Mark *cache group* as [obsolete](#)<sup>p875</sup>. This *cache group* no longer exists for any purpose other than the processing of [Document](#)<sup>p111</sup> objects already associated with an [application cache](#)<sup>p874</sup> in the *cache group*.
  2. Let *task list* be an empty list of [tasks](#)<sup>p925</sup>.
  3. For each [cache host](#)<sup>p875</sup> associated with an [application cache](#)<sup>p874</sup> in *cache group*, create a [task](#)<sup>p925</sup> to run these steps and append it to *task list*:
    1. Let *showProgress* be the result of [firing an event](#) named [obsolete](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
    2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the application is no longer available for offline use.
  4. For each entry in *cache group*'s [list of pending master entries](#)<sup>p875</sup>, create a [task](#)<sup>p925</sup> to run these steps and append it to *task list*:
    1. Let *showProgress* be the result of [firing an event](#) named [error](#)<sup>p874</sup> (not [obsolete](#)<sup>p874</sup>!) at the [ApplicationCache](#)<sup>p891</sup> singleton of the [Document](#)<sup>p111</sup> for this entry, if there still is one, with the [cancelable](#) attribute initialized to true.
    2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
  5. If *cache group* has an [application cache](#)<sup>p874</sup> whose [completeness flag](#)<sup>p875</sup> is *incomplete*, then discard that [application cache](#)<sup>p874</sup>.
  6. If appropriate, remove any user interface indicating that an update for this cache is in progress.
  7. Let the [status](#)<sup>p875</sup> of *cache group* be *idle*.

8. For each [task<sup>p925</sup>](#) in *task list*, [queue that task as a post-load task<sup>p888</sup>](#).
  9. Abort the [application cache download process<sup>p881</sup>](#).
7. Otherwise, if *fetching the manifest* fails in some other way (e.g. the server returns another 4xx or 5xx response, or there is a DNS error, or the connection times out, or the user cancels the download, or the parser for manifests fails when checking the magic signature), or if the server returned a redirect, then run the [cache failure steps<sup>p887</sup>](#). [\[HTTP\]<sup>p1267</sup>](#)
8. If this is an [upgrade attempt<sup>p883</sup>](#) and the newly downloaded *manifest* is byte-for-byte identical to the manifest found in the [newest<sup>p875</sup> application cache<sup>p874</sup>](#) in *cache group*, or the response status is 304, then run these substeps:

1. Let *cache* be the [newest<sup>p875</sup> application cache<sup>p874</sup>](#) in *cache group*.
2. Let *task list* be an empty list of [tasks<sup>p925</sup>](#).
3. For each entry in *cache group*'s [list of pending master entries<sup>p875</sup>](#), wait for the resource for this entry to have either completely downloaded or failed.

If the download failed (e.g. the server returns a 4xx or 5xx response, or there is a DNS error, the connection times out, or the user cancels the download), or if the resource is labeled with the "no-store" cache directive, then create a [task<sup>p925</sup>](#) to run these steps and append it to *task list*:

1. Let *showProgress* be the result of [firing an event](#) named [error<sup>p874</sup>](#) at the [ApplicationCache<sup>p891</sup>](#) singleton of the [Document<sup>p111</sup>](#) for this entry, if there still is one, with the [cancelable](#) attribute initialized to true.
2. If *showProgress* is true and the user agent [shows caching progress<sup>p882</sup>](#), then display some sort of user interface indicating to the user that the user agent failed to save the application for offline use.

Otherwise, associate the [Document<sup>p111</sup>](#) for this entry with *cache*; store the resource for this entry in *cache*, if it isn't already there, and categorize its entry as a [master entry<sup>p874</sup>](#). If applying the [URL parser](#) algorithm to the resource's [URL](#) results in a [URL record](#) that has a non-null [fragment](#) component, the [URL](#) used for the entry in *cache* must instead be the [absolute URL](#) obtained from applying the [URL serializer](#) algorithm to the [URL record](#) with the [exclude fragment flag](#) set (application caches never include [fragments](#)).

4. For each [cache host<sup>p875</sup>](#) associated with an [application cache<sup>p874</sup>](#) in *cache group*, create a [task<sup>p925</sup>](#) to run these steps and append it to *task list*:
  1. Let *showProgress* be the result of [firing an event](#) named [nouupdate<sup>p874</sup>](#) at the [ApplicationCache<sup>p891</sup>](#) singleton of the [cache host<sup>p875</sup>](#), with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress<sup>p882</sup>](#), then display some sort of user interface indicating to the user that the application is up to date.
5. Empty *cache group*'s [list of pending master entries<sup>p875</sup>](#).
6. If appropriate, remove any user interface indicating that an update for this cache is in progress.
7. Let the [status<sup>p875</sup>](#) of *cache group* be *idle*.
8. For each [task<sup>p925</sup>](#) in *task list*, [queue that task as a post-load task<sup>p888</sup>](#).
9. Abort the [application cache download process<sup>p881</sup>](#).

9. Let *new cache* be a newly created [application cache<sup>p874</sup>](#) in *cache group*. Set its [completeness flag<sup>p875</sup>](#) to *incomplete*.
10. For each entry in *cache group*'s [list of pending master entries<sup>p875</sup>](#), associate the [Document<sup>p111</sup>](#) for this entry with *new cache*.
11. Set the [status<sup>p875</sup>](#) of *cache group* to *downloading*.
12. For each [cache host<sup>p875</sup>](#) associated with an [application cache<sup>p874</sup>](#) in *cache group*, [queue a post-load task<sup>p888</sup>](#) to run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [downloading<sup>p874</sup>](#) at the [ApplicationCache<sup>p891</sup>](#) singleton of the [cache host<sup>p875</sup>](#), with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress<sup>p882</sup>](#), then display some sort of user interface indicating to the user that a new version is being downloaded.
13. Let *file list* be an empty list of URLs with flags.

14. Add all the URLs in the list of [explicit entries](#)<sup>p874</sup> obtained by parsing *manifest* to *file list*, each flagged with "explicit entry".
15. Add all the URLs in the list of [fallback entries](#)<sup>p874</sup> obtained by parsing *manifest* to *file list*, each flagged with "fallback entry".
16. If this is an [upgrade attempt](#)<sup>p883</sup>, then add all the URLs of [master entries](#)<sup>p874</sup> in the [newest](#)<sup>p875</sup> [application cache](#)<sup>p874</sup> in *cache group* whose [completeness flag](#)<sup>p875</sup> is *complete* to *file list*, each flagged with "master entry".
17. If any URL is in *file list* more than once, then merge the entries into one entry for that URL, that entry having all the flags that the original entries had.
18. For each URL in *file list*, run the following steps. These steps may be run in parallel for two or more of the URLs at a time. If, while running these steps, the [ApplicationCache](#)<sup>p891</sup> object's [abort\(\)](#)<sup>p892</sup> method [sends a signal](#)<sup>p892</sup> to this instance of the [application cache download process](#)<sup>p881</sup> algorithm, then run the [cache failure steps](#)<sup>p887</sup> instead.

1. If the resource URL being processed was flagged as neither an "explicit entry" nor or a "fallback entry", then the user agent may skip this URL.

#### Note

*This is intended to allow user agents to expire resources not listed in the manifest from the cache. Generally, implementers are urged to use an approach that expires lesser-used resources first.*

2. For each [cache host](#)<sup>p875</sup> associated with an [application cache](#)<sup>p874</sup> in *cache group*, [queue a progress post-load task](#)<sup>p888</sup> to run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [progress](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [cache host](#)<sup>p875</sup>, using [ProgressEvent](#), with the [cancelable](#) attribute initialized to true, the [lengthComputable](#) attribute initialized to true, the [total](#) attribute initialized to the number of files in *file list*, and the [loaded](#) attribute initialized to the number of files in *file list* that have been either downloaded or skipped so far. [\[XHR\]](#)<sup>p1271</sup>
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that a file is being downloaded in preparation for updating the application.
3. Let *request* be a new [request](#) whose [url](#) is URL, [client](#) is null, [destination](#) is the empty string, [origin](#) is *manifest URL*'s [origin](#)<sup>p829</sup>, [referrer](#) is "no-referrer", [synchronous flag](#) is set, [credentials mode](#) is "include", [use-URL-credentials flag](#) is set, and [redirect mode](#) is "manual".
4. [Fetch request](#). If this is an [upgrade attempt](#)<sup>p883</sup>, then use the [newest](#)<sup>p875</sup> [application cache](#)<sup>p874</sup> in *cache group* as an HTTP cache, and honor HTTP caching semantics (such as expiration, ETags, and so forth) with respect to that cache. User agents may also have other caches in place that are also honored.
5. If the previous step fails (e.g. the server returns a 4xx or 5xx response, or there is a DNS error, or the connection times out, or the user cancels the download), or if the server returned a redirect, or if the resource is labeled with the "no-store" cache directive, then run the first appropriate step from the following list: [\[HTTP\]](#)<sup>p1267</sup>

#### ↪ If the URL being processed was flagged as an "explicit entry" or a "fallback entry"

If these steps are being run in parallel for any other URLs in *file list*, then abort this algorithm for those other URLs. Run the [cache failure steps](#)<sup>p887</sup>.

#### Note

*Redirects are fatal because they are either indicative of a network problem (e.g. a captive portal); or would allow resources to be added to the cache under URLs that differ from any URL that the networking model will allow access to, leaving orphan entries; or would allow resources to be stored under URLs different than their true URLs. All of these situations are bad.*

#### ↪ If the error was a 404 or 410 HTTP response

#### ↪ If the resource was labeled with the "no-store" cache directive

Skip this resource. It is dropped from the cache.

#### ↪ Otherwise

Copy the resource and its metadata from the [newest](#)<sup>p875</sup> [application cache](#)<sup>p874</sup> in *cache group* whose [completeness flag](#)<sup>p875</sup> is *complete*, and act as if that was the fetched resource, ignoring the resource obtained from the network.

User agents may warn the user of these errors as an aid to development.

#### Note

*These rules make errors for resources listed in the manifest fatal, while making it possible for other resources to be removed from caches when they are removed from the server, without errors, and making non-manifest resources survive server-side errors.*

#### Note

*Except for the "no-store" directive, HTTP caching rules that would cause a file to be expired or otherwise not cached are ignored for the purposes of the [application cache download process](#)<sup>p881</sup>.*

6. Otherwise, the fetching succeeded. Store the resource in the *new cache*.

If the user agent is not able to store the resource (e.g. because of quota restrictions), the user agent may prompt the user or try to resolve the problem in some other manner (e.g. automatically pruning content in other caches). If the problem cannot be resolved, the user agent must run the [cache failure steps](#)<sup>p887</sup>.

7. If the URL being processed was flagged as an "explicit entry" in *file list*, then categorize the entry as an [explicit entry](#)<sup>p874</sup>.
  8. If the URL being processed was flagged as a "fallback entry" in *file list*, then categorize the entry as a [fallback entry](#)<sup>p874</sup>.
  9. If the URL being processed was flagged as a "master entry" in *file list*, then categorize the entry as a [master entry](#)<sup>p874</sup>.
  10. As an optimization, if the resource is an HTML or XML file whose [document element](#) is an [html](#)<sup>p149</sup> element with a [manifest](#)<sup>p149</sup> attribute whose value doesn't match the manifest URL of the application cache being processed, then the user agent should mark the entry as being [foreign](#)<sup>p874</sup>.
19. For each [cache host](#)<sup>p875</sup> associated with an [application cache](#)<sup>p874</sup> in *cache group*, [queue a progress post-load task](#)<sup>p888</sup> to run these steps:
    1. Let *showProgress* be the result of [firing an event](#) named [progress](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [cache host](#)<sup>p875</sup>, using [ProgressEvent](#), with the [cancelable](#) attribute initialized to true, the [lengthComputable](#) attribute initialized to true, and the [total](#) and [loaded](#) attributes initialized to the number of files in *file list*.  
[\[XHR\]](#)<sup>p1271</sup>
    2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that all the files have been downloaded.
  20. Store the list of [fallback namespaces](#)<sup>p875</sup>, and the URLs of the [fallback entries](#)<sup>p874</sup> that they map to, in *new cache*.
  21. Store the URLs that form the new [online safelist](#)<sup>p875</sup> in *new cache*.
  22. Store the value of the new [online safelist wildcard flag](#)<sup>p875</sup> in *new cache*.
  23. Store the value of the new [cache mode flag](#)<sup>p875</sup> in *new cache*.
  24. For each entry in *cache group*'s [list of pending master entries](#)<sup>p875</sup>, wait for the resource for this entry to have either completely downloaded or failed.

If the download failed (e.g. the server returns a 4xx or 5xx response, or there is a DNS error, the connection times out, or the user cancels the download), or if the resource is labeled with the "no-store" cache directive, then run these substeps:

1. Unassociate the [Document](#)<sup>p111</sup> for this entry from *new cache*.
2. [Queue a post-load task](#)<sup>p888</sup> to run these steps:
  1. Let *showProgress* be the result of [firing an event](#) named [error](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [Document](#)<sup>p111</sup> for this entry, if there still is one, with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
3. If this is a [cache attempt](#)<sup>p883</sup> and this entry is the last entry in *cache group*'s [list of pending master entries](#)<sup>p875</sup>, then run these further substeps:

1. Discard *cache group* and its only [application cache](#)<sup>p874</sup>, *new cache*.
2. If appropriate, remove any user interface indicating that an update for this cache is in progress.
3. Abort the [application cache download process](#)<sup>p881</sup>.
4. Otherwise, remove this entry from *cache group*'s [list of pending master entries](#)<sup>p875</sup>.

Otherwise, store the resource for this entry in *new cache*, if it isn't already there, and categorize its entry as a [master entry](#)<sup>p874</sup>.

25. Let *request* be a new [request](#) whose [url](#) is *manifest URL*, [client](#) is null, [destination](#) is the empty string, [referrer](#) is "no-referrer", [synchronous flag](#) is set, [credentials mode](#) is "include", and whose [use-URL-credentials flag](#) is set.
26. Let *second manifest* be the result of [fetching request](#). HTTP caching semantics should again be honored for this request.

#### Note

*Since caching can be honored, authors are encouraged to avoid setting the cache headers on the manifest in such a way that the user agent would simply not contact the network for this second request; otherwise, the user agent would not notice if the cache had changed during the cache update process.*

27. If the previous step failed for any reason, or if the fetching attempt involved a redirect, or if *second manifest* and *manifest* are not byte-for-byte identical, then schedule a rerun of the entire algorithm with the same parameters after a short delay, and run the [cache failure steps](#)<sup>p887</sup>.
28. Otherwise, store *manifest* in *new cache*, if it's not there already, and categorize its entry as [the manifest](#)<sup>p874</sup>.
29. Set the [completeness flag](#)<sup>p875</sup> of *new cache* to *complete*.
30. Let *task list* be an empty list of [tasks](#)<sup>p925</sup>.
31. If this is a [cache attempt](#)<sup>p883</sup>, then for each [cache host](#)<sup>p875</sup> associated with an [application cache](#)<sup>p874</sup> in *cache group*, create a [task](#)<sup>p925</sup> to run these steps and append it to *task list*:
  1. Let *showProgress* be the result of [firing an event](#) named [cached](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the application has been cached and that they can now use it offline.

Otherwise, it is an [upgrade attempt](#)<sup>p883</sup>. For each [cache host](#)<sup>p875</sup> associated with an [application cache](#)<sup>p874</sup> in *cache group*, create a [task](#)<sup>p925</sup> to run these steps and append it to *task list*:

1. Let *showProgress* be the result of [firing an event](#) named [updateready](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that a new version is available and that they can activate it by reloading the page.
32. If appropriate, remove any user interface indicating that an update for this cache is in progress.
33. Set the [update status](#)<sup>p875</sup> of *cache group* to *idle*.
34. For each [task](#)<sup>p925</sup> in *task list*, [queue that task as a post-load task](#)<sup>p888</sup>.

The **cache failure steps** are as follows:

1. Let *task list* be an empty list of [tasks](#)<sup>p925</sup>.
2. For each entry in *cache group*'s [list of pending master entries](#)<sup>p875</sup>, run the following further substeps. These steps may be run in parallel for two or more entries at a time.
  1. Wait for the resource for this entry to have either completely downloaded or failed.
  2. Unassociate the [Document](#)<sup>p111</sup> for this entry from its [application cache](#)<sup>p874</sup>, if it has one.
  3. Create a [task](#)<sup>p925</sup> to run these steps and append it to *task list*:
    1. Let *showProgress* be the result of [firing an event](#) named [error](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [Document](#)<sup>p111</sup> for this entry, if there still is one, with the [cancelable](#) attribute initialized to true.

2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
3. For each [cache host](#)<sup>p875</sup> still associated with an [application cache](#)<sup>p874</sup> in *cache group*, create a [task](#)<sup>p925</sup> to run these steps and append it to *task list*:
  1. Let *showProgress* be the result of [firing an event](#) named [error](#)<sup>p874</sup> at the [ApplicationCache](#)<sup>p891</sup> singleton of the [cache host](#)<sup>p875</sup>, with the [cancelable](#) attribute initialized to true.
  2. If *showProgress* is true and the user agent [shows caching progress](#)<sup>p882</sup>, then display some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
4. Empty *cache group*'s [list of pending master entries](#)<sup>p875</sup>.
5. If *cache group* has an [application cache](#)<sup>p874</sup> whose [completeness flag](#)<sup>p875</sup> is *incomplete*, then discard that [application cache](#)<sup>p874</sup>.
6. If appropriate, remove any user interface indicating that an update for this cache is in progress.
7. Let the [status](#)<sup>p875</sup> of *cache group* be *idle*.
8. If this was a [cache attempt](#)<sup>p883</sup>, discard *cache group* altogether.
9. For each [task](#)<sup>p925</sup> in *task list*, [queue that task as a post-load task](#)<sup>p888</sup>.
10. Abort the [application cache download process](#)<sup>p881</sup>.

Attempts to fetch resources as part of the [application cache download process](#)<sup>p881</sup> may be done with cache-defeating semantics, to avoid problems with stale or inconsistent intermediary caches.

User agents may invoke the [application cache download process](#)<sup>p881</sup>, in the background, for any [application cache group](#)<sup>p875</sup>, at any time (with no [cache host](#)<sup>p875</sup>). This allows user agents to keep caches primed and to update caches even before the user visits a site.

Each [Document](#)<sup>p111</sup> has a list of **pending application cache download process tasks** that is used to delay events fired by the algorithm above until the document's [load](#)<sup>p1261</sup> event has fired. When the [Document](#)<sup>p111</sup> is created, the list must be empty.

When the steps above say to **queue a post-load task** *task*, where *task* is a [task](#)<sup>p925</sup> that dispatches an event on a target [ApplicationCache](#)<sup>p891</sup> object *target*, the user agent must run the appropriate steps from the following list:

**If target's node document is ready for post-load tasks**<sup>p1145</sup>

[Queue](#)<sup>p925</sup> the task *task*.

**Otherwise**

Add *task* to *target*'s [node document](#)'s list of [pending application cache download process tasks](#)<sup>p888</sup>.

When the steps above say to **queue a progress post-load task** *task*, where *task* is a [task](#)<sup>p925</sup> that dispatches an event on a target [ApplicationCache](#)<sup>p891</sup> object *target*, the user agent must run the following steps:

1. If there is a *task* in *target*'s [node document](#)'s list of [pending application cache download process tasks](#)<sup>p888</sup> that is labeled as a *progress task*, then remove that task from the list.
2. Label *task* as a *progress task*.
3. [Queue a post-load task](#)<sup>p888</sup> *task*.

The [task source](#)<sup>p925</sup> for these [tasks](#)<sup>p925</sup> is the [networking task source](#)<sup>p932</sup>.

## 7.9.5 The application cache selection algorithm §<sup>p88</sup><sub>8</sub>

When the **application cache selection algorithm** algorithm is invoked with a [Document](#)<sup>p111</sup> *document* and optionally a manifest [URL](#) *manifest URL*, the user agent must run the first applicable set of steps from the following list:

↪ If there is a **manifest URL**, and **document** was loaded from an [application cache](#)<sup>p874</sup>, and the URL of the [manifest](#)<sup>p874</sup> of that cache's [application cache group](#)<sup>p875</sup> is **not the same as manifest URL**

Mark the entry for the resource from which *document* was taken in the [application cache](#)<sup>p874</sup> from which it was loaded as [foreign](#)<sup>p874</sup>.

Restart the current navigation from the top of the [navigation algorithm](#)<sup>p852</sup>, undoing any changes that were made as part of the initial load (changes can be avoided by ensuring that the step to [update the session history with the new page](#)<sup>p859</sup> is only ever completed *after* this [application cache selection algorithm](#)<sup>p888</sup> is run, though this is not required).

#### Note

*The navigation will not result in the same resource being loaded, because "foreign" entries are never picked during navigation.*

User agents may notify the user of the inconsistency between the cache manifest and the document's own metadata, to aid in application development.

↪ If **document** was loaded from an [application cache](#)<sup>p874</sup>, and that [application cache](#)<sup>p874</sup> still exists (it is not now [obsolete](#)<sup>p875</sup>)

Associate *document* with the [application cache](#)<sup>p874</sup> from which it was loaded. Invoke, in the background, the [application cache download process](#)<sup>p881</sup> for that [application cache](#)<sup>p874</sup>'s [application cache group](#)<sup>p875</sup>, with *document* as the [cache host](#)<sup>p875</sup>.

↪ If **document** was loaded using `GET`, and, there is a **manifest URL**, and **manifest URL** has the **same origin**<sup>p830</sup> as **document**

Invoke, in the background, the [application cache download process](#)<sup>p881</sup> for *manifest URL*, with *document* as the [cache host](#)<sup>p875</sup> and with the resource from which *document* was parsed as the [master](#)<sup>p874</sup> resource.

If there are [relevant application caches](#)<sup>p875</sup> that are identified by a URL with the **same origin**<sup>p830</sup> as the URL of *document*, and that have this URL as one of their entries, excluding entries marked as [foreign](#)<sup>p874</sup>, then the user agent should use the [most appropriate application cache](#)<sup>p875</sup> of those that match as an HTTP cache for any subresource loads. User agents may also have other caches in place that are also honored.

↪ **Otherwise**

The [Document](#)<sup>p111</sup> is not associated with any [application cache](#)<sup>p874</sup>.

If there was a *manifest URL*, the user agent may report to the user that it was ignored, to aid in application development.

## 7.9.6 Changes to the networking model §<sup>p88</sup><sub>9</sub>

If "AppCache" is not removed as a feature this section needs to be integrated into the Fetch standard.

When a [cache host](#)<sup>p875</sup> is associated with an [application cache](#)<sup>p874</sup> whose [completeness flag](#)<sup>p875</sup> is *complete*, any and all loads for resources related to that [cache host](#)<sup>p875</sup> other than those for [child browsing contexts](#)<sup>p806</sup> must go through the following steps instead of immediately invoking the mechanisms appropriate to that resource's scheme:

1. If the resource is not to be fetched using the GET method, or if applying the [URL parser](#) algorithm to both its [URL](#) and the [application cache](#)<sup>p874</sup>'s [manifest](#)<sup>p874</sup>'s URL results in two [URL records](#) with different [scheme](#) components, then fetch the resource normally and return.
2. If the resource's URL is [a master entry](#)<sup>p874</sup>, [the manifest](#)<sup>p874</sup>, [an explicit entry](#)<sup>p874</sup>, or [a fallback entry](#)<sup>p874</sup> in the [application cache](#)<sup>p874</sup>, then get the resource from the cache (instead of fetching it), and return.
3. If there is an entry in the [application cache](#)<sup>p874</sup>'s [online safelist](#)<sup>p875</sup> that has the **same origin**<sup>p830</sup> as the resource's URL and that is a [prefix match](#)<sup>p65</sup> for the resource's URL, then fetch the resource normally and return.
4. If the resource's URL has the **same origin**<sup>p830</sup> as the manifest's URL, and there is a [fallback namespace](#)<sup>p875</sup> *f* in the [application cache](#)<sup>p874</sup> that is a [prefix match](#)<sup>p65</sup> for the resource's URL, then:

Fetch the resource normally. If this results in a redirect to a resource with another [origin](#)<sup>p829</sup> (indicative of a captive portal), or a 4xx or 5xx status code, or if there were network errors (but not if the user canceled the download), then instead get, from the cache, the resource of the [fallback entry](#)<sup>p874</sup> corresponding to the [fallback namespace](#)<sup>p875</sup> *f*. Return.

5. If the [application cache](#)<sup>p874</sup>'s [online safelist wildcard flag](#)<sup>p875</sup> is *open*, then fetch the resource normally and return.
6. Fail the resource load as if there had been a generic network error.

#### Note

The above algorithm ensures that so long as the [online safelist wildcard flag](#)<sup>p875</sup> is blocking, resources that are not present in the [manifest](#)<sup>p874</sup> will always fail to load (at least, after the [application cache](#)<sup>p874</sup> has been primed the first time), making the testing of offline applications simpler.

### 7.9.7 Expiring application caches §<sup>p89</sup><sub>0</sub>

As a general rule, user agents should not expire application caches, except on request from the user, or after having been left unused for an extended period of time.

Application caches and cookies have similar implications with respect to privacy (e.g. if the site can identify the user when providing the cache, it can store data in the cache that can be used for cookie resurrection). Implementors are therefore encouraged to expose application caches in a manner related to HTTP cookies, allowing caches to be expunged together with cookies and other origin-specific data.

#### Example

For example, a user agent could have a "delete site-specific data" feature that clears all cookies, application caches, local storage, databases, etc, from an origin all at once.

### 7.9.8 Disk space §<sup>p89</sup><sub>0</sub>

User agents should consider applying constraints on disk usage of [application caches](#)<sup>p874</sup>, and care should be taken to ensure that the restrictions cannot be easily worked around using subdomains.

User agents should allow users to see how much space each domain is using, and may offer the user the ability to delete specific [application caches](#)<sup>p874</sup>.

For predictability, quotas should be based on the uncompressed size of data stored.

#### Note

How quotas are presented to the user is not defined by this specification. User agents are encouraged to provide features such as allowing a user to indicate that certain sites are trusted to use more than the default quota, e.g. by presenting a non-modal user interface while a cache is being updated, or by having an explicit safelist in the user agent's configuration interface.

### 7.9.9 Security concerns with offline applications caches §<sup>p89</sup><sub>0</sub>

This section is non-normative.

The main risk introduced by offline application caches is that an injection attack can be elevated into persistent site-wide page replacement. This attack involves using an injection vulnerability to upload two files to the victim site. The first file is an application cache manifest consisting of just a fallback entry pointing to the second file, which is an HTML page whose manifest is declared as that first file. Once the user has been directed to that second file, all subsequent accesses to any file covered by the given fallback namespace while either the user or the site is offline will instead show that second file. Targeted denial-of-service attacks or cookie bombing attacks (where the client is made to send so many cookies that the server refuses to process the request) can be used to ensure that the site appears offline.

To mitigate this, manifests can only specify fallbacks that are in the same path as the manifest itself. This means that a content injection upload vulnerability in a particular directory on a server can only be escalated to a take-over of that directory and its subdirectories. If there is no way to inject a file into the root directory, the entire site cannot be taken over.

If a site has been attacked in this way, simply removing the offending manifest might eventually clear the problem, since the next time

the manifest is updated, a 404 error will be seen, and the user agent will clear the cache. "Eventually" is the key word here, however; while the attack on the user or server is ongoing, such that connections from an affected user to the affected site are blocked, the user agent will simply assume that the user is offline and will continue to use the hostile manifest. Unfortunately, if a cookie bombing attack has also been used, merely removing the manifest is insufficient; in addition, the server has to be configured to return a 404 or 410 response instead of the 413 "Request Entity Too Large" response.

TLS does not inherently protect a site from this attack, since the attack relies on content being served from the server itself. Not using application caches also does not prevent this attack, since the attack relies on an attacker-provided manifest.

### 7.9.10 Application cache API <sup>p89</sup><sub>1</sub>

```
IDL [SecureContext,
Exposed=Window]
interface ApplicationCache : EventTarget {

  // update_status
  const unsigned short UNCACHED = 0;
  const unsigned short IDLE = 1;
  const unsigned short CHECKING = 2;
  const unsigned short DOWNLOADING = 3;
  const unsigned short UPDATEREADY = 4;
  const unsigned short OBSOLETE = 5;
  readonly attribute unsigned short status;

  // updates
  void update();
  void abort();
  void swapCache();

  // events
  attribute EventHandler onchecking;
  attribute EventHandler onerror;
  attribute EventHandler onnoupdate;
  attribute EventHandler ondownloading;
  attribute EventHandler onprogress;
  attribute EventHandler onupdateready;
  attribute EventHandler oncached;
  attribute EventHandler onobsolete;
};
```

For web developers (non-normative)

**`cache = window . applicationCache`**<sup>p892</sup>

Returns the [ApplicationCache](#)<sup>p891</sup> object that applies to the [active document](#)<sup>p804</sup> of that [Window](#)<sup>p816</sup>.

**`cache . status`**<sup>p892</sup>

Returns the current status of the application cache, as given by the constants defined below.

**`cache . update`**<sup>p892</sup>**`()`**

Invokes the [application cache download process](#)<sup>p881</sup>.

Throws an ["InvalidStateError" DOMException](#) if there is no application cache to update.

Calling this method is not usually necessary, as user agents will generally take care of updating [application caches](#)<sup>p874</sup> automatically.

The method can be useful in situations such as long-lived applications. For example, a Web mail application might stay open in a browser tab for weeks at a time. Such an application could want to test for updates each day.

**`cache . abort`**<sup>p892</sup>**`()`**

Cancels the [application cache download process](#)<sup>p881</sup>.

This method is intended to be used by Web application showing their own caching progress UI, in case the user wants to stop

the update (e.g. because bandwidth is limited).

### **cache . swapCache<sup>p893</sup>()**

Switches to the most recent application cache, if there is a newer one. If there isn't, throws an `"InvalidStateError"` `DOMException`.

This does not cause previously-loaded resources to be reloaded; for example, images do not suddenly get reloaded and style sheets and scripts do not get reparsed or reevaluated. The only change is that subsequent requests for cached resources will obtain the newer copies.

The `updatereadyp874` event will fire before this method can be called. Once it fires, the Web application can, at its leisure, call this method to switch the underlying cache to the one with the more recent updates. To make proper use of this, applications have to be able to bring the new features into play; for example, reloading scripts to enable new features.

An easier alternative to `swapCache()p893` is just to reload the entire page at a time suitable for the user, using `location.reload()p849`.

There is a one-to-one mapping from `cache hostsp875` to `ApplicationCachep891` objects. The `applicationCache` attribute on `Windowp816` objects must return the `ApplicationCachep891` object associated with the `Windowp816` object's `active documentp804`.

### Note

A `Documentp111` has an associated `ApplicationCachep891` object even if that `cache hostp875` has no actual `application cachep874`.

The `status` attribute, on getting, must return the current state of the `application cachep874` that the `ApplicationCachep891` object's `cache hostp875` is associated with, if any. This must be the appropriate value from the following list:

#### **UNCACHED (numeric value 0)**

The `ApplicationCachep891` object's `cache hostp875` is not associated with an `application cachep874` at this time.

#### **IDLE (numeric value 1)**

The `ApplicationCachep891` object's `cache hostp875` is associated with an `application cachep874` whose `application cache groupp875`'s `update statusp875` is *idle*, and that `application cachep874` is the *newest<sup>p875</sup>* cache in its `application cache groupp875`, and the `application cache groupp875` is not marked as *obsolete<sup>p875</sup>*.

#### **CHECKING (numeric value 2)**

The `ApplicationCachep891` object's `cache hostp875` is associated with an `application cachep874` whose `application cache groupp875`'s `update statusp875` is *checking*.

#### **DOWNLOADING (numeric value 3)**

The `ApplicationCachep891` object's `cache hostp875` is associated with an `application cachep874` whose `application cache groupp875`'s `update statusp875` is *downloading*.

#### **UPDATEREADY (numeric value 4)**

The `ApplicationCachep891` object's `cache hostp875` is associated with an `application cachep874` whose `application cache groupp875`'s `update statusp875` is *idle*, and whose `application cache groupp875` is not marked as *obsolete<sup>p875</sup>*, but that `application cachep874` is *not* the *newest<sup>p875</sup>* cache in its group.

#### **OBSOLETE (numeric value 5)**

The `ApplicationCachep891` object's `cache hostp875` is associated with an `application cachep874` whose `application cache groupp875` is marked as *obsolete<sup>p875</sup>*.

If the `update()` method is invoked, the user agent must invoke the `application cache download processp881`, in the background, for the `application cache groupp875` of the `application cachep874` with which the `ApplicationCachep891` object's `cache hostp875` is associated, but without giving that `cache hostp875` to the algorithm. If there is no such `application cachep874`, or if its `application cache groupp875` is marked as *obsolete<sup>p875</sup>*, then the method must throw an `"InvalidStateError"` `DOMException` instead.

If the `abort()` method is invoked, the user agent must **send a signal** to the current `application cache download processp881` for the `application cache groupp875` of the `application cachep874` with which the `ApplicationCachep891` object's `cache hostp875` is associated, if any. If there is no such `application cachep874`, or it does not have a current `application cache download processp881`, then do nothing.

If the `swapCache()` method is invoked, the user agent must run the following steps:

1. Check that `ApplicationCache`<sup>p891</sup> object's `cache host`<sup>p875</sup> is associated with an `application cache`<sup>p874</sup>. If it is not, then throw an `"InvalidStateError" DOMException`.
2. Let `cache` be the `application cache`<sup>p874</sup> with which the `ApplicationCache`<sup>p891</sup> object's `cache host`<sup>p875</sup> is associated. (By definition, this is the same as the one that was found in the previous step.)
3. If `cache`'s `application cache group`<sup>p875</sup> is marked as `obsolete`<sup>p875</sup>, then unassociate the `ApplicationCache`<sup>p891</sup> object's `cache host`<sup>p875</sup> from `cache` and return. (Resources will now load from the network instead of the cache.)
4. Check that there is an application cache in the same `application cache group`<sup>p875</sup> as `cache` whose `completeness flag`<sup>p875</sup> is `complete` and that is `newer`<sup>p875</sup> than `cache`. If there is not, then throw an `"InvalidStateError" DOMException` exception.
5. Let `new cache` be the `newest`<sup>p875</sup> `application cache`<sup>p874</sup> in the same `application cache group`<sup>p875</sup> as `cache` whose `completeness flag`<sup>p875</sup> is `complete`.
6. Unassociate the `ApplicationCache`<sup>p891</sup> object's `cache host`<sup>p875</sup> from `cache` and instead associate it with `new cache`.

The following are the `event handlers`<sup>p934</sup> (and their corresponding `event handler event types`<sup>p937</sup>) that must be supported, as `event handler IDL attributes`<sup>p935</sup>, by all objects implementing the `ApplicationCache`<sup>p891</sup> interface:

Event handler <sup>p934</sup>	Event handler event type <sup>p937</sup>
<code>onchecking</code>	<code>checking</code> <sup>p873</sup>
<code>onerror</code>	<code>error</code> <sup>p874</sup>
<code>onnoupdate</code>	<code>noupdate</code> <sup>p874</sup>
<code>ondownloading</code>	<code>downloading</code> <sup>p874</sup>
<code>onprogress</code>	<code>progress</code> <sup>p874</sup>
<code>onupdateready</code>	<code>updateready</code> <sup>p874</sup>
<code>oncached</code>	<code>cached</code> <sup>p874</sup>
<code>onobsolete</code>	<code>obsolete</code> <sup>p874</sup>

### 7.9.11 Browser state §<sup>p89</sup><sub>3</sub>

```
IDL interface mixin NavigatorOnLine {
  readonly attribute boolean onLine;
};
```

For web developers (non-normative)

`self.navigator`<sup>p959</sup> . `onLine`<sup>p893</sup>

Returns false if the user agent is definitely offline (disconnected from the network). Returns true if the user agent might be online.

The events `online`<sup>p1261</sup> and `offline`<sup>p1261</sup> are fired when the value of this attribute changes.

The `navigator.onLine` attribute must return false if the user agent will not contact the network when the user follows links or when a script requests a remote page (or knows that such an attempt would fail), and must return true otherwise.

When the value that would be returned by the `navigator.onLine`<sup>p893</sup> attribute of a `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> changes from true to false, the user agent must `queue a task`<sup>p925</sup> to `fire an event` named `offline`<sup>p1261</sup> at the `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> object.

On the other hand, when the value that would be returned by the `navigator.onLine`<sup>p893</sup> attribute of a `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> changes from false to true, the user agent must `queue a task`<sup>p925</sup> to `fire an event` named `online`<sup>p1261</sup> at the `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> object.

The `task source`<sup>p925</sup> for these `tasks`<sup>p925</sup> is the `networking task source`<sup>p932</sup>.

MDN

Support:

- Chrome for Android
- Chrome
- iOS Safari
- Safari
- Firefox
- Samsung
- Edge
- UC Browsers
- Android
- IE
- Opera
- Opera Mini
- Firefox for Android
- Southern Cross

## Note

*This attribute is inherently unreliable. A computer can be connected to a network without having Internet access.*

## Example

In this example, an indicator is updated as the browser goes online and offline.

```
<!DOCTYPE HTML>
<html lang="en">
  <head>
    <title>Online status</title>
    <script>
      function updateIndicator() {
        document.getElementById('indicator').textContent = navigator.onLine ? 'online' : 'offline';
      }
    </script>
  </head>
  <body onload="updateIndicator()" ononline="updateIndicator()" onoffline="updateIndicator()">
    <p>The network is: <span id="indicator">(state unknown)</span></p>
  </body>
</html>
```

## 8 Web application APIs § p89

### 8.1 Scripting § p89

#### 8.1.1 Introduction § p89

Various mechanisms can cause author-provided executable code to run in the context of a document. These mechanisms include, but are probably not limited to:

- Processing of [script](#) elements.
- Navigating to [javascript: URLs](#).
- Event handlers, whether registered through the DOM using `addEventListener()`, by explicit [event handler content attributes](#), by [event handler IDL attributes](#), or otherwise.
- Processing of technologies like SVG that have their own scripting features.

#### 8.1.2 Enabling and disabling scripting § p89

**Scripting is enabled** for an [environment settings object](#) *settings* when all of the following conditions are true:

- The user agent supports scripting.
- The user has not disabled scripting for *settings* at this time. (User agents may provide users with the option to disable scripting globally, or in a finer-grained manner, e.g., on a per-origin basis, down to the level of individual [environment settings objects](#).)
- Either *settings*'s [global object](#) is not a [Window](#) object, or *settings*'s [global object](#)'s [associated Document](#)'s [active sandboxing flag set](#) does not have its [sandboxed scripts browsing context flag](#) set.

**Scripting is disabled** for an [environment settings object](#) when scripting is not [enabled](#) for it, i.e., when any of the above conditions are false.

**Scripting is enabled** for a node *node* if *node*'s [node document](#)'s [browsing context](#) is non-null, and [scripting is enabled](#) for *node*'s [relevant settings object](#).

**Scripting is disabled** for a node when scripting is not [enabled](#), i.e., when its [node document](#)'s [browsing context](#) is null or when [scripting is disabled](#) for its [relevant settings object](#).

#### 8.1.3 Processing model § p89

##### 8.1.3.1 Definitions § p89

A **script** is one of two possible [structs](#). All scripts have:

##### **A settings object**

An [environment settings object](#), containing various settings that are shared with other [scripts](#) in the same context.

##### **A record**

Either a [Script Record](#), for [classic scripts](#); a [Source Text Module Record](#), for [module scripts](#); or null. In the former two cases, it represents a parsed script; null represents a failure parsing.

##### **A parse error**

A JavaScript value, which has meaning only if the [record](#) is null, indicating that the corresponding script source text could not be parsed.

#### Note

This value is used for internal tracking of immediate parse errors when [creating scripts](#)<sup>p904</sup>, and is not to be used directly. Instead, consult the [error to rethrow](#)<sup>p896</sup> when determining "what went wrong" for this script.

#### An error to rethrow

A JavaScript value representing an error that will prevent evaluation from succeeding. It will be re-thrown by any attempts to [run](#)<sup>p906</sup> the script.

#### Note

This could be the script's [parse error](#)<sup>p895</sup>, but in the case of a [module script](#)<sup>p896</sup> it could instead be the [parse error](#)<sup>p895</sup> from one of its dependencies, or an error from [resolve a module specifier](#)<sup>p916</sup>.

#### Note

Since this exception value is provided by the JavaScript specification, we know that it is never null, so we use null to signal that no error has occurred.

#### Fetch options

A [script fetch options](#)<sup>p898</sup>, containing various options related to fetching this script or [module scripts](#)<sup>p896</sup> that it imports.

#### A base URL

A base [URL](#) used for [resolving module specifiers](#)<sup>p916</sup>. This will either be the URL from which the script was obtained, for external scripts, or the [document base URL](#)<sup>p87</sup> of the containing document, for inline scripts.

A **classic script** is a type of [script](#)<sup>p895</sup> that has the following additional [item](#):

#### A muted errors boolean

A boolean which, if true, means that error information will not be provided for errors in this script. This is used to mute errors for cross-origin scripts, since that can leak private information.

A **module script** is another type of [script](#)<sup>p895</sup>. It has no additional [items](#).

The **active script** is determined by the following algorithm:

1. Let *record* be [GetActiveScriptOrModule](#)() .
2. If *record* is null, return null.
3. Return *record* .[[HostDefined]] .

#### Note

The [active script](#)<sup>p896</sup> concept is so far only used by the [import\(\)](#) feature, to determine the [base URL](#)<sup>p896</sup> to use for resolving relative module specifiers.

An **environment** is an object that identifies the settings of a current or potential execution environment. An [environment](#)<sup>p896</sup> has the following fields:

#### An id

An opaque string that uniquely identifies the [environment](#)<sup>p896</sup>.

#### A creation URL

A [URL record](#) that represents the location of the resource with which the [environment](#)<sup>p896</sup> is associated.

#### Note

In the case of an [environment settings object](#)<sup>p897</sup>, this URL might be distinct from the [environment settings object](#)<sup>p897</sup>'s [responsible document](#)<sup>p897</sup>'s URL, due to mechanisms such as [history.pushState\(\)](#)<sup>p840</sup>.

#### A target browsing context

Null or a target [browsing context](#)<sup>p804</sup> for a [navigation request](#).

### An active service worker

Null or a [service worker](#) that [controls](#) the [environment](#)<sup>p896</sup>.

### An execution ready flag

A flag that indicates whether the environment setup is done. It is initially unset.

Specifications may define **environment discarding steps** for environments. The steps take an [environment](#)<sup>p896</sup> as input.

### Note

The [environment discarding steps](#)<sup>p897</sup> are run for only a select few environments: the ones that will never become execution ready because, for example, they failed to load.

An **environment settings object** is an [environment](#)<sup>p896</sup> that additionally specifies algorithms for:

### A realm execution context

A [JavaScript execution context](#) shared by all [scripts](#)<sup>p607</sup> that use this settings object, i.e. all scripts in a given [JavaScript realm](#). When we [run a classic script](#)<sup>p906</sup> or [run a module script](#)<sup>p906</sup>, this execution context becomes the top of the [JavaScript execution context stack](#), on top of which another execution context specific to the script in question is pushed. (This setup ensures [ParseScript](#) and [Source Text Module Record](#)'s [Evaluate](#) know which Realm to use.)

### A module map

A [module map](#)<sup>p916</sup> that is used when importing JavaScript modules.

### A responsible document

A [Document](#)<sup>p111</sup> that is assigned responsibility for actions taken by the scripts that use this [environment settings object](#)<sup>p897</sup>.

### Example

For example, the [URL](#) of the [responsible document](#)<sup>p897</sup> is used to set the [URL](#) of the [Document](#)<sup>p111</sup> after it has been reset using [document.open\(\)](#)<sup>p949</sup>.

If the [responsible event loop](#)<sup>p897</sup> is not a [window event loop](#)<sup>p924</sup>, then the [environment settings object](#)<sup>p897</sup> has no [responsible document](#)<sup>p897</sup>.

### An API URL character encoding

A character encoding used to encode URLs by APIs called by scripts that use this [environment settings object](#)<sup>p897</sup>.

### An API base URL

A [URL](#) used by APIs called by scripts that use this [environment settings object](#)<sup>p897</sup> to [parse URLs](#)<sup>p87</sup>.

### An origin

An [origin](#)<sup>p829</sup> used in security checks.

### A top-level origin

The [origin](#)<sup>p829</sup> of the [top-level browsing context](#)<sup>p807</sup> at the time this settings object was set up.

### An HTTPS state

An [HTTPS state value](#) representing the security properties of the network channel used to deliver the resource with which the [environment settings object](#)<sup>p897</sup> is associated.

### A referrer policy

The default [referrer policy](#) for [fetches](#) performed using this [environment settings object](#)<sup>p897</sup> as a [request client](#).  
[\[REFERRERPOLICY\]](#)<sup>p1269</sup>

An [environment settings object](#)<sup>p897</sup> also has an **outstanding rejected promises weak set** and an **about-to-be-notified rejected promises list**, used to track [unhandled promise rejections](#)<sup>p922</sup>. The [outstanding rejected promises weak set](#)<sup>p897</sup> must not create strong references to any of its members, and implementations are free to limit its size, e.g. by removing old entries from it when new ones are added.

An [environment settings object](#)<sup>p897</sup>'s **responsible event loop** is its [global object](#)<sup>p908</sup>'s [relevant agent](#)<sup>p919</sup>'s [event loop](#)<sup>p924</sup>.

### 8.1.3.2 Fetching scripts <sup>p899</sup><sub>8</sub>

This section introduces a number of algorithms for fetching scripts, taking various necessary inputs and resulting in [classic](#)<sup>p896</sup> or [module scripts](#)<sup>p896</sup>.

**Script fetch options** is a [struct](#) with the following [items](#):

#### **cryptographic nonce**

The [cryptographic nonce metadata](#) used for the initial fetch and for fetching any imported modules

#### **integrity metadata**

The [integrity metadata](#) used for the initial fetch

#### **parser metadata**

The [parser metadata](#) used for the initial fetch and for fetching any imported modules

#### **credentials mode**

The [credentials mode](#) used for the initial fetch (for [module scripts](#)<sup>p896</sup>) and for fetching any imported modules (for both [module scripts](#)<sup>p896</sup> and [classic scripts](#)<sup>p896</sup>)

#### **referrer policy**

The [referrer policy](#) used for the initial fetch and for fetching any imported modules

#### Note

Recall that via the [import\(\)](#) feature, [classic scripts](#)<sup>p896</sup> can import [module scripts](#)<sup>p896</sup>.

The **default classic script fetch options** are a [script fetch options](#)<sup>p898</sup> whose [cryptographic nonce](#)<sup>p898</sup> is the empty string, [integrity metadata](#)<sup>p898</sup> is the empty string, [parser metadata](#)<sup>p898</sup> is "not-parser-inserted", [credentials mode](#)<sup>p898</sup> is "same-origin", and [referrer policy](#)<sup>p898</sup> is the empty string.

Given a [request](#) *request* and a [script fetch options](#)<sup>p898</sup> *options*, we define:

#### **set up the classic script request**

Set *request*'s [cryptographic nonce metadata](#) to *options*'s [cryptographic nonce](#)<sup>p898</sup>, its [integrity metadata](#) to *options*'s [integrity metadata](#)<sup>p898</sup>, its [parser metadata](#) to *options*'s [parser metadata](#)<sup>p898</sup>, and its [referrer policy](#) to *options*'s [referrer policy](#)<sup>p898</sup>.

#### **set up the module script request**

Set *request*'s [cryptographic nonce metadata](#) to *options*'s [cryptographic nonce](#)<sup>p898</sup>, its [integrity metadata](#) to *options*'s [integrity metadata](#)<sup>p898</sup>, its [parser metadata](#) to *options*'s [parser metadata](#)<sup>p898</sup>, its [credentials mode](#) to *options*'s [credentials mode](#)<sup>p898</sup>, and its [referrer policy](#) to *options*'s [referrer policy](#)<sup>p898</sup>.

For any given [script fetch options](#)<sup>p898</sup> *options*, the **descendant script fetch options** are a new [script fetch options](#)<sup>p898</sup> whose [items](#) all have the same values, except for the [integrity metadata](#)<sup>p898</sup>, which is instead the empty string.

The algorithms below can be customized by optionally supplying a custom **perform the fetch** hook, which takes a [request](#) and an **is top-level** flag. The algorithm must complete with a [response](#) (which may be a [network error](#)), either synchronously (when using [fetch a classic worker-imported script](#)<sup>p900</sup>) or asynchronously (otherwise). The **is top-level**<sup>p898</sup> flag will be set for all [classic script](#)<sup>p896</sup> fetches, and for the initial fetch when [fetching an external module script graph](#)<sup>p900</sup>, [fetching a module worker script graph](#)<sup>p901</sup>, or [fetching an import\(\) module script graph](#)<sup>p900</sup>, but not for the fetches resulting from `import` statements encountered throughout the graph.

#### Note

By default, not supplying the [perform the fetch](#)<sup>p898</sup> will cause the below algorithms to simply [fetch](#) the given [request](#), with algorithm-specific customizations to the [request](#) and validations of the resulting [response](#).

To layer your own customizations on top of these algorithm-specific ones, supply a [perform the fetch](#)<sup>p898</sup> hook that modifies the given [request](#), [fetches](#) it, and then performs specific validations of the resulting [response](#) (completing with a [network error](#) if the validations fail).

The hook can also be used to perform more subtle customizations, such as keeping a cache of [responses](#) and avoiding performing

a [fetch](#) at all.

#### Note

Service Workers is an example of a specification that runs these algorithms with its own options for the hook. [\[SW\]p1270](#)

Now for the algorithms themselves.

To **fetch a classic script** given a *url*, a *settings object*, some *options*, a *CORS setting*, and a *character encoding*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a new [classic script](#)<sup>p896</sup> (on success).

1. Let *request* be the result of [creating a potential-CORS request](#)<sup>p88</sup> given *url*, "script", and *CORS setting*.
2. Set *request*'s [client](#) to *settings object*.
3. [Set up the classic script request](#)<sup>p898</sup> given *request* and *options*.
4. If the caller specified custom steps to [perform the fetch](#)<sup>p898</sup>, perform them on *request*, with the [is top-level](#)<sup>p898</sup> flag set. Return from this algorithm, and when the custom [perform the fetch](#)<sup>p898</sup> steps complete with [response](#) *response*, run the remaining steps.

Otherwise, [fetch](#) *request*. Return from this algorithm, and run the remaining steps as part of the fetch's [process response](#) for the [response](#) *response*.

#### Note

*response* can be either [CORS-same-origin](#)<sup>p88</sup> or [CORS-cross-origin](#)<sup>p88</sup>. This only affects how error reporting happens.

5. Let *response* be *response*'s [unsafe response](#)<sup>p88</sup>.
6. If *response*'s [type](#) is "error", or *response*'s [status](#) is not an [ok status](#), asynchronously complete this algorithm with null, and abort these steps.
7. If *response*'s [Content Type metadata](#)<sup>p88</sup>, if any, specifies a character encoding, and the user agent supports that encoding, then set *character encoding* to that encoding (ignoring the passed-in value).
8. Let *source text* be the result of [decoding](#) *response*'s [body](#) to Unicode, using *character encoding* as the fallback encoding.

#### Note

The [decode](#) algorithm overrides character encoding if the file contains a BOM.

9. Let *muted errors* be true if *response* was [CORS-cross-origin](#)<sup>p88</sup>, and false otherwise.
10. Let *script* be the result of [creating a classic script](#)<sup>p904</sup> given *source text*, *settings object*, *response*'s [url](#), *options*, and *muted errors*.
11. Asynchronously complete this algorithm with *script*.

To **fetch a classic worker script** given a *url*, a *fetch client settings object*, a *destination*, and a *script settings object*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a new [classic script](#)<sup>p896</sup> (on success).

1. Let *request* be a new [request](#) whose [url](#) is *url*, [client](#) is *fetch client settings object*, [destination](#) is *destination*, [mode](#) is "same-origin", [credentials mode](#) is "same-origin", [parser metadata](#) is "not parser-inserted", and whose [use-URL-credentials flag](#) is set.
2. If the caller specified custom steps to [perform the fetch](#)<sup>p898</sup>, perform them on *request*, with the [is top-level](#)<sup>p898</sup> flag set. Return from this algorithm, and when the custom [perform the fetch](#)<sup>p898</sup> steps complete with [response](#) *response*, run the remaining steps.

Otherwise, [fetch](#) *request*. Return from this algorithm, and run the remaining steps as part of the fetch's [process response](#) for the [response](#) *response*.

3. Let *response* be *response*'s [unsafe response](#)<sup>p88</sup>.
4. If *response*'s [type](#) is "error", or *response*'s [status](#) is not an [ok status](#), asynchronously complete this algorithm with null, and

abort these steps.

5. Let *source text* be the result of [UTF-8 decoding](#) *response*'s *body*.
6. Let *script* be the result of [creating a classic script](#)<sup>p904</sup> using *source text*, *script settings object*, *response*'s *url*, and the [default classic script fetch options](#)<sup>p898</sup>.
7. Asynchronously complete this algorithm with *script*.

To **fetch a classic worker-imported script** given a *url* and a *settings object*, run these steps. The algorithm will synchronously complete with a [classic script](#)<sup>p896</sup> on success, or throw an exception on failure.

1. Let *request* be a new [request](#) whose *url* is *url*, *client* is *settings object*, *destination* is "script", *parser metadata* is "not parser-inserted", *synchronous flag* is set, and whose *use-URL-credentials flag* is set.
2. If the caller specified custom steps to [perform the fetch](#)<sup>p898</sup>, perform them on *request*, with the *is top-level*<sup>p898</sup> flag set. Let *response* be the result.

Otherwise, [fetch](#) *request*, and let *response* be the result.

#### Note

*Unlike other algorithms in this section, the fetching process is synchronous here. Thus any [perform the fetch](#)<sup>p898</sup> steps will also finish their work synchronously.*

3. Let *response* be *response*'s [unsafe response](#)<sup>p88</sup>.
4. If any of the following conditions are met, throw a ["NetworkError" DOMException](#):
  - *response*'s *type* is "error"
  - *response*'s *status* is not an [ok status](#)
  - The result of [extracting a MIME type](#) from *response*'s *header list* is not a [JavaScript MIME type](#)
5. Let *source text* be the result of [UTF-8 decoding](#) *response*'s *body*.
6. Let *muted errors* be true if *response* was [CORS-cross-origin](#)<sup>p88</sup>, and false otherwise.
7. Let *script* be the result of [creating a classic script](#)<sup>p904</sup> given *source text*, *settings object*, *response*'s *url*, the [default classic script fetch options](#)<sup>p898</sup>, and *muted errors*.
8. Return *script*.

To **fetch an external module script graph** given a *url*, a *settings object*, and some *options*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script](#)<sup>p896</sup> (on success).

1. [Fetch a single module script](#)<sup>p903</sup> given *url*, *settings object*, "script", *options*, *settings object*, "client", and with the *top-level module fetch flag* set. If the caller of this algorithm specified custom [perform the fetch](#)<sup>p898</sup> steps, pass those along as well. Wait until the algorithm asynchronously completes with *result*.
2. If *result* is null, asynchronously complete this algorithm with null, and abort these steps.
3. Let *visited set* be « *url* ».
4. [Fetch the descendants of and link](#)<sup>p902</sup> *result* given *settings object*, *destination*, and *visited set*. When this asynchronously completes with *final result*, asynchronously complete this algorithm with *final result*.

To **fetch an import() module script graph** given a *specifier*, a *base URL*, a *settings object*, and some *options*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script](#)<sup>p896</sup> (on success).

1. Let *url* be the result of [resolving a module specifier](#)<sup>p916</sup> given *base URL* and *specifier*.
2. If *url* is failure, then asynchronously complete this algorithm with null, and abort these steps.
3. [Fetch a single module script](#)<sup>p903</sup> given *url*, *settings object*, "script", *options*, *settings object*, "client", and with the *top-level module fetch flag* set. If the caller of this algorithm specified custom [perform the fetch](#)<sup>p898</sup> steps, pass those along as well. Wait until the algorithm asynchronously completes with *result*.
4. If *result* is null, asynchronously complete this algorithm with null, and abort these steps.

5. Let *visited set* be « *url* ».
6. [Fetch the descendants of and link<sup>p902</sup>](#) *result* given *settings object*, *destination*, and *visited set*. When this asynchronously completes with *final result*, asynchronously complete this algorithm with *final result*.

To **fetch a modulepreload module script graph** given a *url*, a *destination*, a *settings object*, and some *options*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script<sup>p896</sup>](#) (on success), although it will perform optional steps even after completing.

1. [Fetch a single module script<sup>p903</sup>](#) given *url*, *settings object*, *destination*, *options*, *settings object*, "client", and with the *top-level module fetch* flag set. Wait until algorithm asynchronously completes with *result*.
2. Asynchronously complete this algorithm with *result*, but do *not* abort these steps.
3. Optionally, perform the following steps:
  1. Let *visited set* be « *url* ».
  2. [Fetch the descendants of and link<sup>p902</sup>](#) *result* given *settings object*, *destination*, and *visited set*.

#### Note

Generally, performing these steps will be beneficial for performance, as it allows pre-loading the modules that will invariably be requested later, via algorithms such as [fetch an external module script graph<sup>p900</sup>](#) that fetch the entire graph. However, user agents might wish to skip them in bandwidth-constrained situations, or situations where the relevant fetches are already in flight.

To **fetch an inline module script graph** given a *source text*, *base URL*, *settings object*, and *options*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script<sup>p896</sup>](#) (on success).

1. Let *script* be the result of [creating a module script<sup>p905</sup>](#) using *source text*, *settings object*, *base URL*, and *options*.
2. If *script* is null, asynchronously complete this algorithm with null, and abort these steps.
3. Let *visited set* be an empty [set](#).
4. [Fetch the descendants of and link<sup>p902</sup>](#) *script*, given *settings object*, the destination "script", and *visited set*. When this asynchronously completes with *final result*, asynchronously complete this algorithm with *final result*.

To **fetch a module worker script graph** given a *url*, a *fetch client settings object*, a *destination*, a *credentials mode*, and a *module map settings object*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script<sup>p896</sup>](#) (on success).

1. Let *options* be a [script fetch options<sup>p898</sup>](#) whose [cryptographic nonce<sup>p898</sup>](#) is the empty string, [integrity metadata<sup>p898</sup>](#) is the empty string, [parser metadata<sup>p898</sup>](#) is "not-parser-inserted", [credentials mode<sup>p898</sup>](#) is *credentials mode*, and [referrer policy<sup>p898</sup>](#) is the empty string.
2. [Fetch a single module script<sup>p903</sup>](#) given *url*, *fetch client settings object*, *destination*, *options*, *module map settings object*, "client", and with the *top-level module fetch flag* set. If the caller of this algorithm specified custom [perform the fetch<sup>p898</sup>](#) steps, pass those along as well. Wait until the algorithm asynchronously completes with *result*.
3. If *result* is null, asynchronously complete this algorithm with null, and abort these steps.
4. Let *visited set* be « *url* ».
5. [Fetch the descendants of and link<sup>p902</sup>](#) *result* given *fetch client settings object*, *destination*, and *visited set*. When this asynchronously completes with *final result*, asynchronously complete this algorithm with *final result*.

The following algorithms are meant for internal use by this specification only as part of [fetching an external module script graph<sup>p900</sup>](#) or other similar concepts above, and should not be used directly by other specifications.

This diagram illustrates how these algorithms relate to the ones above, as well as to each other:

To **fetch the descendants of and link a module script** *module script*, given a *fetch client settings object*, a *destination*, and a *visited set*, run these steps. The algorithm will asynchronously complete with either null (on failure) or with *module script* (on success).

1. [Fetch the descendants of](#)<sup>p902</sup> *module script*, given *fetch client settings object*, *destination*, and *visited set*.
2. Return from this algorithm, and run the following steps when [fetching the descendants of a module script](#)<sup>p902</sup> asynchronously completes with *result*.
3. If *result* is null, then asynchronously complete this algorithm with *result*.

**Note**

*In this case, there was an error fetching one or more of the descendants. We will not attempt to link.*

4. Let *parse error* be the result of [finding the first parse error](#)<sup>p904</sup> given *result*.
5. If *parse error* is null, then:
  1. Let *record* be *result*'s [record](#)<sup>p895</sup>.
  2. Perform *record*.[Link](#)().

**Note**

*This step will recursively call [Link](#) on all of the module's unlinked dependencies.*

If this throws an exception, set *result*'s [error to rethrow](#)<sup>p896</sup> to that exception.

6. Otherwise, set *result*'s [error to rethrow](#)<sup>p896</sup> to *parse error*.
7. Asynchronously complete this algorithm with *result*.

To **fetch the descendants of a module script** *module script*, given a *fetch client settings object*, a *destination*, and a *visited set*, run these steps. The algorithm will asynchronously complete with either null (on failure) or with *module script* (on success).

1. If *module script*'s [record](#)<sup>p895</sup> is null, then asynchronously complete this algorithm with *module script* and abort these steps.
2. Let *record* be *module script*'s [record](#)<sup>p895</sup>.
3. If *record* is not a [Cyclic Module Record](#), or if *record*.[[RequestedModules]] is empty, asynchronously complete this algorithm with *module script*.
4. Let *urls* be a new empty [list](#).
5. [For each](#) string *requested* of *record*.[[RequestedModules]],
  1. Let *url* be the result of [resolving a module specifier](#)<sup>p916</sup> given *module script*'s [base URL](#)<sup>p896</sup> and *requested*.
  2. Assert: *url* is never failure, because [resolving a module specifier](#)<sup>p916</sup> must have been [previously successful](#)<sup>p905</sup> with these same two arguments.
  3. If *visited set* does not [contain](#) *url*, then:
    1. [Append](#) *url* to *urls*.
    2. [Append](#) *url* to *visited set*.
6. Let *options* be the [descendant script fetch options](#)<sup>p898</sup> for *module script*'s [fetch options](#)<sup>p896</sup>.
7. Assert: *options* is not null, as *module script* is a [module script](#)<sup>p896</sup>.

8. For each *url* in *urls*, perform the [internal module script graph fetching procedure](#)<sup>p903</sup> given *url*, *fetch client settings object*, *destination*, *options*, *module script's settings object*<sup>p895</sup>, *visited set*, and *module script's base URL*<sup>p896</sup>. If the caller of this algorithm specified custom [perform the fetch](#)<sup>p898</sup> steps, pass those along while performing the [internal module script graph fetching procedure](#)<sup>p903</sup>.

These invocations of the [internal module script graph fetching procedure](#)<sup>p903</sup> should be performed in parallel to each other.

If any of the invocations of the [internal module script graph fetching procedure](#)<sup>p903</sup> asynchronously complete with null, asynchronously complete this algorithm with null, aborting these steps.

Otherwise, wait until all of the [internal module script graph fetching procedure](#)<sup>p903</sup> invocations have asynchronously completed. Asynchronously complete this algorithm with *module script*.

To perform the **internal module script graph fetching procedure** given a *url*, a *fetch client settings object*, a *destination*, some *options*, a *module map settings object*, a *visited set*, and a *referrer*, perform these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script](#)<sup>p896</sup> (on success).

1. Assert: *visited set* [contains](#) *url*.
2. [Fetch a single module script](#)<sup>p903</sup> given *url*, *fetch client settings object*, *destination*, *options*, *module map settings object*, *referrer*, and with the *top-level module fetch flag* unset. If the caller of this algorithm specified custom [perform the fetch](#)<sup>p898</sup> steps, pass those along while [fetching a single module script](#)<sup>p903</sup>.
3. Return from this algorithm, and run the following steps when [fetching a single module script](#)<sup>p903</sup> asynchronously completes with *result*:
4. If *result* is null, asynchronously complete this algorithm with null, and abort these steps.
5. [Fetch the descendants of](#)<sup>p902</sup> *result* given *fetch client settings object*, *destination*, and *visited set*.
6. When the appropriate algorithm asynchronously completes with *final result*, asynchronously complete this algorithm with *final result*.

To **fetch a single module script**, given a *url*, a *fetch client settings object*, a *destination*, some *options*, a *module map settings object*, a *referrer*, and a *top-level module fetch flag*, run these steps. The algorithm will asynchronously complete with either null (on failure) or a [module script](#)<sup>p896</sup> (on success).

1. Let *moduleMap* be *module map settings object's* [module map](#)<sup>p897</sup>.
2. If *moduleMap[url]* is "fetching", wait [in parallel](#)<sup>p41</sup> until that entry's value changes, then [queue a task](#)<sup>p925</sup> on the [networking task source](#)<sup>p932</sup> to proceed with running the following steps.
3. If *moduleMap[url]* [exists](#), asynchronously complete this algorithm with *moduleMap[url]*, and abort these steps.
4. [Set](#) *moduleMap[url]* to "fetching".
5. Let *request* be a new [request](#) whose [url](#) is *url*, [destination](#) is *destination*, [mode](#) is "cors", [referrer](#) is *referrer*, and [client](#) is *fetch client settings object*.
6. If [destination](#) is "worker" or "sharedworker" and the *top-level module fetch flag* is set, then set *request's mode* to "same-origin".
7. [Set up the module script request](#)<sup>p898</sup> given *request* and *options*.
8. If the caller specified custom steps to [perform the fetch](#)<sup>p898</sup>, perform them on *request*, setting the [is top-level](#)<sup>p898</sup> flag if the *top-level module fetch flag* is set. Return from this algorithm, and when the custom [perform the fetch](#)<sup>p898</sup> steps complete with [response](#) *response*, run the remaining steps.

Otherwise, [fetch](#) *request*. Return from this algorithm, and run the remaining steps as part of the fetch's [process response](#) for the [response](#) *response*.

#### Note

*response* is always [CORS-same-origin](#)<sup>p88</sup>.

9. If any of the following conditions are met, [set](#) *moduleMap[url]* to null, asynchronously complete this algorithm with null, and abort these steps:
  - *response's type* is "error"

- *response*'s [status](#) is not an [ok status](#)
- The result of [extracting a MIME type](#) from *response*'s [header list](#) is not a [JavaScript MIME type](#)

**Note**

For historical reasons, [fetching a classic script](#)<sup>p899</sup> does not include MIME type checking. In contrast, module scripts will fail to load if they are not of a correct MIME type.

- Let *source text* be the result of [UTF-8 decoding](#) *response*'s [body](#).
- Let *module script* be the result of [creating a module script](#)<sup>p905</sup> given *source text*, *module map settings object*, *response*'s [url](#), and *options*.
- [Set](#) *moduleMap*[*url*] to *module script*, and asynchronously complete this algorithm with *module script*.

**Note**

It is intentional that the [module map](#)<sup>p916</sup> is keyed by the [request URL](#), whereas the [base URL](#)<sup>p896</sup> for the [module script](#)<sup>p896</sup> is set to the [response URL](#). The former is used to deduplicate fetches, while the latter is used for URL resolution.

To **find the first parse error** given a root *moduleScript* and an optional *discoveredSet*:

- Let *moduleMap* be *moduleScript*'s [settings object](#)<sup>p895</sup>'s [module map](#)<sup>p897</sup>.
- If *discoveredSet* was not given, let it be an empty [set](#).
- [Append](#) *moduleScript* to *discoveredSet*.
- If *moduleScript*'s [record](#)<sup>p895</sup> is null, then return *moduleScript*'s [parse error](#)<sup>p895</sup>.
- Let *childSpecifiers* be the value of *moduleScript*'s [record](#)<sup>p895</sup>'s [[RequestedModules]] internal slot.
- Let *childURLs* be the [list](#) obtained by calling [resolve a module specifier](#)<sup>p916</sup> once for each item of *childSpecifiers*, given *moduleScript*'s [base URL](#)<sup>p896</sup> and that item. (None of these will ever fail, as otherwise *moduleScript* would have been marked as itself having a parse error.)
- Let *childModules* be the [list](#) obtained by [getting each value](#) in *moduleMap* whose key is given by an item of *childURLs*.
- [For each](#) *childModule* of *childModules*:
  - Assert: *childModule* is a [module script](#)<sup>p896</sup> (i.e., it is not "fetching" or null); by now all [module scripts](#)<sup>p896</sup> in the graph rooted at *moduleScript* will have successfully been fetched.
  - If *discoveredSet* already [contains](#) *childModule*, [continue](#).
  - Let *childParseError* be the result of [finding the first parse error](#)<sup>p904</sup> given *childModule* and *discoveredSet*.
  - If *childParseError* is not null, return *childParseError*.
- Return null.

### 8.1.3.3 Creating scripts § p904

To **create a classic script**, given a [string](#) *source*, an [environment settings object](#)<sup>p897</sup> *settings*, a [URL](#) *baseURL*, some [script fetch options](#)<sup>p898</sup> *options*, and an optional *muted errors* boolean:

- If *muted errors* was not provided, let it be false.
- If [scripting is disabled](#)<sup>p895</sup> for *settings*, then set *source* to the empty string.
- Let *script* be a new [classic script](#)<sup>p896</sup> that this algorithm will subsequently initialize.
- Set *script*'s [settings object](#)<sup>p895</sup> to *settings*.
- Set *script*'s [base URL](#)<sup>p896</sup> to *baseURL*.
- Set *script*'s [fetch options](#)<sup>p896</sup> to *options*.

7. Set *script*'s [muted errors](#)<sup>p896</sup> to *muted errors*.
8. Set *script*'s [parse error](#)<sup>p895</sup> and [error to rethrow](#)<sup>p896</sup> to null.
9. Let *result* be [ParseScript](#)(*source*, *settings*'s [Realm](#)<sup>p908</sup>, *script*).

**Note**

*Passing script as the last parameter here ensures result.[[HostDefined]] will be script.*

10. If *result* is a [list](#) of errors, then:
  1. Set *script*'s [parse error](#)<sup>p895</sup> and its [error to rethrow](#)<sup>p896</sup> to *result*[0].
  2. Return *script*.
11. Set *script*'s [record](#)<sup>p895</sup> to *result*.
12. Return *script*.

To **create a module script**, given a [string](#) *source*, an [environment settings object](#)<sup>p897</sup> *settings*, a [URL](#) *baseURL*, and some [script fetch options](#)<sup>p898</sup> *options*:

1. If [scripting is disabled](#)<sup>p895</sup> for *settings*, then set *source* to the empty string.
2. Let *script* be a new [module script](#)<sup>p896</sup> that this algorithm will subsequently initialize.
3. Set *script*'s [settings object](#)<sup>p895</sup> to *settings*.
4. Set *script*'s [base URL](#)<sup>p896</sup> to *baseURL*.
5. Set *script*'s [fetch options](#)<sup>p896</sup> to *options*.
6. Set *script*'s [parse error](#)<sup>p895</sup> and [error to rethrow](#)<sup>p896</sup> to null.
7. Let *result* be [ParseModule](#)(*source*, *settings*'s [Realm](#)<sup>p908</sup>, *script*).

**Note**

*Passing script as the last parameter here ensures result.[[HostDefined]] will be script.*

8. If *result* is a [list](#) of errors, then:
  1. Set *script*'s [parse error](#)<sup>p895</sup> to *result*[0].
  2. Return *script*.
9. [For each](#) string *requested* of *result*.[[RequestedModules]]:
  1. Let *url* be the result of [resolving a module specifier](#)<sup>p916</sup> given *script*'s [base URL](#)<sup>p896</sup> and *requested*.
  2. If *url* is failure, then:
    1. Let *error* be a new [TypeError](#) exception.
    2. Set *script*'s [parse error](#)<sup>p895</sup> to *error*.
    3. Return *script*.

**Note**

*This step is essentially validating all of the requested module specifiers. We treat a module with unresolvable module specifiers the same as one that cannot be parsed; in both cases, a syntactic issue makes it impossible to ever contemplate linking the module later.*

10. Set *script*'s [record](#)<sup>p895</sup> to *result*.
11. Return *script*.

### 8.1.3.4 Calling scripts §<sup>p90</sup><sub>6</sub>

To **run a classic script** given a [classic script](#)<sup>p896</sup> *script* and an optional *rethrow errors* boolean:

1. If *rethrow errors* is not given, let it be false.
2. Let *settings* be the [settings object](#)<sup>p895</sup> of *script*.
3. [Check if we can run script](#)<sup>p907</sup> with *settings*. If this returns "do not run" then return [NormalCompletion](#)(empty).
4. [Prepare to run script](#)<sup>p907</sup> given *settings*.
5. Let *evaluationStatus* be null.
6. If *script*'s [error to rethrow](#)<sup>p896</sup> is not null, then set *evaluationStatus* to Completion { `[[Type]]: throw`, `[[Value]]: script's error to rethrowp896`, `[[Target]]: empty` }.
7. Otherwise, set *evaluationStatus* to [ScriptEvaluation](#)(*script*'s [record](#)<sup>p895</sup>).  
If [ScriptEvaluation](#) does not complete because the user agent has [aborted the running script](#)<sup>p913</sup>, leave *evaluationStatus* as null.
8. If *evaluationStatus* is an [abrupt completion](#), then:
  1. If *rethrow errors* is true and *script*'s [muted errors](#)<sup>p896</sup> is false, then:
    1. [Clean up after running script](#)<sup>p907</sup> with *settings*.
    2. Rethrow *evaluationStatus*.`[[Value]]`.
  2. If *rethrow errors* is true and *script*'s [muted errors](#)<sup>p896</sup> is true, then:
    1. [Clean up after running script](#)<sup>p907</sup> with *settings*.
    2. Throw a **"NetworkError" DOMException**.
  3. Otherwise, *rethrow errors* is false. Perform the following steps:
    1. [Report the exception](#)<sup>p922</sup> given by *evaluationStatus*.`[[Value]]` for *script*.
    2. [Clean up after running script](#)<sup>p907</sup> with *settings*.
    3. Return *evaluationStatus*.
9. [Clean up after running script](#)<sup>p907</sup> with *settings*.
10. If *evaluationStatus* is a normal completion, then return *evaluationStatus*.
11. If we've reached this point, *evaluationStatus* was left as null because the script was [aborted prematurely](#)<sup>p913</sup> during evaluation. Return Completion { `[[Type]]: throw`, `[[Value]]: a new "QuotaExceededError" DOMException`, `[[Target]]: empty` }.

To **run a module script** given a [module script](#)<sup>p896</sup> *script*, with an optional *rethrow errors* boolean:

1. If *rethrow errors* is not given, let it be false.
2. Let *settings* be the [settings object](#)<sup>p895</sup> of *script*.
3. [Check if we can run script](#)<sup>p907</sup> with *settings*. If this returns "do not run" then return [NormalCompletion](#)(empty).
4. [Prepare to run script](#)<sup>p907</sup> given *settings*.
5. Let *evaluationStatus* be null.
6. If *script*'s [error to rethrow](#)<sup>p896</sup> is not null, then set *evaluationStatus* to Completion { `[[Type]]: throw`, `[[Value]]: script's error to rethrowp896`, `[[Target]]: empty` }.
7. Otherwise:
  1. Let *record* be *script*'s [record](#)<sup>p895</sup>.
  2. Set *evaluationStatus* to *record*.[Evaluate](#)().

**Note**

*This step will recursively evaluate all of the module's dependencies.*

If [Evaluate](#) fails to complete as a result of the user agent [aborting the running script](#)<sup>p913</sup>, then set `evaluationStatus` to Completion { `[[Type]]`: throw, `[[Value]]`: a new `"QuotaExceededError"` `DOMException`, `[[Target]]`: empty }.

8. If `evaluationStatus` is an [abrupt completion](#), then:
  1. If `rethrow errors` is true, rethrow the exception given by `evaluationStatus. [[Value]]`.
  2. Otherwise, [report the exception](#)<sup>p922</sup> given by `evaluationStatus. [[Value]]` for `script`.
9. [Clean up after running script](#)<sup>p907</sup> with `settings`.
10. Return `evaluationStatus`.

The steps to **check if we can run script** with an [environment settings object](#)<sup>p897</sup> `settings` are as follows. They return either "run" or "do not run".

1. If the [global object](#)<sup>p908</sup> specified by `settings` is a [Window](#)<sup>p816</sup> object whose [Document](#)<sup>p111</sup> object is not [fully active](#)<sup>p807</sup>, then return "do not run".
2. If [scripting is disabled](#)<sup>p895</sup> for `settings`, then return "do not run".
3. Return "run".

The steps to **prepare to run script** with an [environment settings object](#)<sup>p897</sup> `settings` are as follows:

1. Push `settings`'s [realm execution context](#)<sup>p897</sup> onto the [JavaScript execution context stack](#); it is now the [running JavaScript execution context](#).
2. Add `settings` to the currently running [task](#)<sup>p925</sup>'s [script evaluation environment settings object set](#)<sup>p925</sup>.

The steps to **clean up after running script** with an [environment settings object](#)<sup>p897</sup> `settings` are as follows:

1. Assert: `settings`'s [realm execution context](#)<sup>p897</sup> is the [running JavaScript execution context](#).
2. Remove `settings`'s [realm execution context](#)<sup>p897</sup> from the [JavaScript execution context stack](#).
3. If the [JavaScript execution context stack](#) is now empty, [perform a microtask checkpoint](#)<sup>p929</sup>. (If this runs scripts, these algorithms will be invoked reentrantly.)

**Note**

*These algorithms are not invoked by one script directly calling another, but they can be invoked reentrantly in an indirect manner, e.g. if a script dispatches an event which has event listeners registered.*

The **running script** is the [script](#)<sup>p895</sup> in the `[[HostDefined]]` field in the `ScriptOrModule` component of the [running JavaScript execution context](#).

### 8.1.3.5 Realms, settings objects, and global objects §<sup>p90</sup><sub>7</sub>

A **global object** is a JavaScript object that is the `[[GlobalObject]]` field of a [JavaScript realm](#).

**Note**

*In this specification, all [JavaScript realms](#) are created<sup>p908</sup> with [global objects](#)<sup>p907</sup> that are either [Window](#)<sup>p816</sup> or [WorkerGlobalScope](#)<sup>p1824</sup> objects.*

There is always a 1-to-1-to-1 mapping between [JavaScript realms](#), [global objects](#)<sup>p907</sup>, and [environment settings objects](#)<sup>p897</sup>:

- A [JavaScript realm](#) has a `[[HostDefined]]` field, which contains **the Realm's settings object**.
- A [JavaScript realm](#) has a `[[GlobalObject]]` field, which contains **the Realm's global object**.
- Each [global object](#)<sup>p907</sup> in this specification is created during the [creation](#)<sup>p908</sup> of a corresponding [JavaScript realm](#), known as

### the global object's Realm.

- Each [global object](#)<sup>p907</sup> in this specification is created alongside a corresponding [environment settings object](#)<sup>p897</sup>, known as its [relevant settings object](#)<sup>p913</sup>.
- An [environment settings object](#)<sup>p897</sup>'s [realm execution context](#)<sup>p897</sup>'s Realm component is **the environment settings object's Realm**.
- An [environment settings object](#)<sup>p897</sup>'s [Realm](#)<sup>p908</sup> then has a `[[GlobalObject]]` field, which contains **the environment settings object's global object**.

To **create a new JavaScript realm** in an [agent](#) *agent*, optionally with instructions to create a global object or a global **this** binding (or both), the following steps are taken:

1. Perform [InitializeHostDefinedRealm\(\)](#) with the provided customizations for creating the global object and the global **this** binding.
2. Let *realm execution context* be the [running JavaScript execution context](#).

#### Note

*This is the [JavaScript execution context](#) created in the previous step.*

3. Remove *realm execution context* from the [JavaScript execution context stack](#).
4. Let *realm* be *realm execution context*'s Realm component.
5. Set *realm*'s agent to *agent*. This pointer is not yet defined in the JavaScript specification; see [tc39/ecma262#1357](#).
6. Return *realm execution context*.

When defining algorithm steps throughout this specification, it is often important to indicate what [JavaScript realm](#) is to be used—or, equivalently, what [global object](#)<sup>p907</sup> or [environment settings object](#)<sup>p897</sup> is to be used. In general, there are at least four possibilities:

#### Entry

This corresponds to the script that initiated the currently running script action: i.e., the function or script that the user agent called into when it called into author code.

#### Incumbent

This corresponds to the most-recently-entered author function or script on the stack, or the author function or script that originally scheduled the currently-running callback.

#### Current

This corresponds to the currently-running function object, including built-in user-agent functions which might not be implemented as JavaScript. (It is derived from the [current JavaScript realm](#).)

#### Relevant

Every [platform object](#) has a [relevant Realm](#)<sup>p913</sup>, which is roughly the [JavaScript realm](#) in which it was created. When writing algorithms, the most prominent [platform object](#) whose [relevant Realm](#)<sup>p913</sup> might be important is the **this** value of the currently-running function object. In some cases, there can be other important [relevant Realms](#)<sup>p913</sup>, such as those of any arguments.

Note how the [entry](#)<sup>p908</sup>, [incumbent](#)<sup>p908</sup>, and [current](#)<sup>p908</sup> concepts are usable without qualification, whereas the [relevant](#)<sup>p908</sup> concept must be applied to a particular [platform object](#).

#### Example

Consider the following pages, with `a.html` being loaded in a browser window, `b.html` being loaded in an [iframe](#)<sup>p355</sup> as shown, and `c.html` and `d.html` omitted (they can simply be empty documents):

```
<!-- a.html -->
<!DOCTYPE html>
<html lang="en">
<title>Entry page</title>

<iframe src="b.html"></iframe>
```

```

<button onclick="frames[0].hello()">Hello</button>

<!-- b.html -->
<!DOCTYPE html>
<html lang="en">
<title>Incumbent page</title>

<iframe src="c.html" id="c"></iframe>
<iframe src="d.html" id="d"></iframe>

<script>
  const c = document.querySelector("#c").contentWindow;
  const d = document.querySelector("#d").contentWindow;

  window.hello = () => {
    c.print.call(d);
  };
</script>

```

Each page has its own [browsing context](#)<sup>p804</sup>, and thus its own [JavaScript realm](#), [global object](#)<sup>p907</sup>, and [environment settings object](#)<sup>p897</sup>.

When the [print\(\)](#)<sup>p958</sup> method is called in response to pressing the button in a.html, then:

- The [entry Realm](#)<sup>p910</sup> is that of a.html.
- The [incumbent Realm](#)<sup>p911</sup> is that of b.html.
- The [current Realm](#) is that of c.html (since it is the [print\(\)](#)<sup>p958</sup> method from c.html whose code is running).
- The [relevant Realm](#)<sup>p913</sup> of the object on which the [print\(\)](#)<sup>p958</sup> method is being called is that of d.html.

### ⚠Warning!

**The [incumbent](#)<sup>p908</sup> and [entry](#)<sup>p908</sup> concepts should not be used by new specifications, as they are excessively complicated and unintuitive to work with. We are working to remove almost all existing uses from the platform: see [issue #1430](#) for [incumbent](#)<sup>p908</sup>, and [issue #1431](#) for [entry](#)<sup>p908</sup>.**

In general, web platform specifications should use the [relevant](#)<sup>p908</sup> concept, applied to the object being operated on (usually the **this** value of the current method). This mismatches the JavaScript specification, where [current](#)<sup>p908</sup> is generally used as the default (e.g. in determining the [JavaScript realm](#) whose `Array` constructor should be used to construct the result in `Array.prototype.map`). But this inconsistency is so embedded in the platform that we have to accept it going forward.

### Example

One reason why the [relevant](#)<sup>p908</sup> concept is generally a better default choice than the [current](#)<sup>p908</sup> concept is that it is more suitable for creating an object that is to be persisted and returned multiple times. For example, the [navigator.getBattery\(\)](#) method creates promises in the [relevant Realm](#)<sup>p913</sup> for the [Navigator](#)<sup>p959</sup> object on which it is invoked. This has the following impact: [\[BATTERY\]](#)<sup>p1264</sup>

```

<!-- outer.html -->
<!DOCTYPE html>
<html lang="en">
<title>Relevant Realm demo: outer page</title>
<script>
  function doTest() {
    const promise = navigator.getBattery.call(frames[0].navigator);

    console.log(promise instanceof Promise);           // logs false
    console.log(promise instanceof frames[0].Promise); // logs true
  }

```

```

    frames[0].hello();
  }
</script>
<iframe src="inner.html" onload="doTest()"></iframe>

<!-- inner.html -->
<!DOCTYPE html>
<html lang="en">
<title>Relevant Realm demo: inner page</title>
<script>
  function hello() {
    const promise = navigator.getBattery();

    console.log(promise instanceof Promise);      // logs true
    console.log(promise instanceof parent.Promise); // logs false
  }
</script>

```

If the algorithm for the [getBattery\(\)](#) method had instead used the [current Realm](#), all the results would be reversed. That is, after the first call to [getBattery\(\)](#) in `outer.html`, the [Navigator](#)<sup>p959</sup> object in `inner.html` would be permanently storing a Promise object created in `outer.html`'s [JavaScript realm](#), and calls like that inside the `hello()` function would thus return a promise from the "wrong" realm. Since this is undesirable, the algorithm instead uses the [relevant Realm](#)<sup>p913</sup>, giving the sensible results indicated in the comments above.

The rest of this section deals with formally defining the [entry](#)<sup>p908</sup>, [incumbent](#)<sup>p908</sup>, [current](#)<sup>p908</sup>, and [relevant](#)<sup>p908</sup> concepts.

#### 8.1.3.5.1 Entry §<sup>p91</sup><sub>0</sub>

The process of [calling scripts](#)<sup>p906</sup> will push or pop [realm execution contexts](#)<sup>p897</sup> onto the [JavaScript execution context stack](#), interspersed with other [execution contexts](#).

With this in hand, we define the **entry execution context** to be the most recently pushed item in the [JavaScript execution context stack](#) that is a [realm execution context](#)<sup>p897</sup>. The **entry Realm** is the [entry execution context](#)<sup>p910</sup>'s Realm component.

Then, the **entry settings object** is the [environment settings object](#)<sup>p907</sup> of the [entry Realm](#)<sup>p910</sup>.

Similarly, the **entry global object** is the [global object](#)<sup>p907</sup> of the [entry Realm](#)<sup>p910</sup>.

#### 8.1.3.5.2 Incumbent §<sup>p91</sup><sub>0</sub>

All [JavaScript execution contexts](#) must contain, as part of their code evaluation state, a **skip-when-determining-incumbent counter** value, which is initially zero. In the process of [preparing to run a callback](#)<sup>p910</sup> and [cleaning up after running a callback](#)<sup>p911</sup>, this value will be incremented and decremented.

Every [event loop](#)<sup>p924</sup> has an associated **backup incumbent settings object stack**, initially empty. Roughly speaking, it is used to determine the [incumbent settings object](#)<sup>p911</sup> when no author code is on the stack, but author code is responsible for the current algorithm having been run in some way. The process of [preparing to run a callback](#)<sup>p910</sup> and [cleaning up after running a callback](#)<sup>p911</sup> manipulate this stack. [\[WEBIDL\]](#)<sup>p1271</sup>

When Web IDL is used to [invoke](#) author code, or when [HostEnqueuePromiseJob](#)<sup>p914</sup> invokes a promise job, they use the following algorithms to track relevant data for determining the [incumbent settings object](#)<sup>p911</sup>:

To **prepare to run a callback** with an [environment settings object](#)<sup>p897</sup> *settings*:

1. Push *settings* onto the [backup incumbent settings object stack](#)<sup>p910</sup>.

- Let *context* be the [topmost script-having execution context](#)<sup>p911</sup>.
- If *context* is not null, increment *context*'s [skip-when-determining-incumbent counter](#)<sup>p910</sup>.

To **clean up after running a callback** with an [environment settings object](#)<sup>p897</sup> settings:

- Let *context* be the [topmost script-having execution context](#)<sup>p911</sup>.

**Note**

*This will be the same as the [topmost script-having execution context](#)<sup>p911</sup> inside the corresponding invocation of [prepare to run a callback](#)<sup>p910</sup>.*

- If *context* is not null, decrement *context*'s [skip-when-determining-incumbent counter](#)<sup>p910</sup>.
- Assert: the topmost entry of the [backup incumbent settings object stack](#)<sup>p910</sup> is *settings*.
- Remove *settings* from the [backup incumbent settings object stack](#)<sup>p910</sup>.

Here, the **topmost script-having execution context** is the topmost entry of the [JavaScript execution context stack](#) that has a non-null `ScriptOrModule` component, or null if there is no such entry in the [JavaScript execution context stack](#).

With all this in place, the **incumbent settings object** is determined as follows:

- Let *context* be the [topmost script-having execution context](#)<sup>p911</sup>.
- If *context* is null, or if *context*'s [skip-when-determining-incumbent counter](#)<sup>p910</sup> is greater than zero, then:
  - Assert: the [backup incumbent settings object stack](#)<sup>p910</sup> is not empty.

**Note**

*This assert would fail if you try to obtain the [incumbent settings object](#)<sup>p911</sup> from inside an algorithm that was triggered neither by [calling scripts](#)<sup>p906</sup> nor by Web IDL [invoking](#) a callback. For example, it would trigger if you tried to obtain the [incumbent settings object](#)<sup>p911</sup> inside an algorithm that ran periodically as part of the [event loop](#)<sup>p924</sup>, with no involvement of author code. In such cases the [incumbent](#)<sup>p908</sup> concept cannot be used.*

- Return the topmost entry of the [backup incumbent settings object stack](#)<sup>p910</sup>.
- Return *context*'s Realm component's [settings object](#)<sup>p907</sup>.

Then, the **incumbent Realm** is the [Realm](#)<sup>p908</sup> of the [incumbent settings object](#)<sup>p911</sup>.

Similarly, the **incumbent global object** is the [global object](#)<sup>p908</sup> of the [incumbent settings object](#)<sup>p911</sup>.

The following series of examples is intended to make it clear how all of the different mechanisms contribute to the definition of the [incumbent](#)<sup>p910</sup> concept:

**Example**

Consider the following very simple example:

```

<!DOCTYPE html>
<iframe></iframe>
<script>
  new frames[0].MessageChannel();
</script>

```

When the [MessageChannel\(\)](#)<sup>p1001</sup> constructor looks up the [incumbent settings object](#)<sup>p911</sup> to use as the [owner](#)<sup>p1002</sup> of the new [MessagePort](#)<sup>p1002</sup> objects, the [topmost script-having execution context](#)<sup>p911</sup> will be that corresponding to the [script](#)<sup>p607</sup> element: it was pushed onto the [JavaScript execution context stack](#) as part of [ScriptEvaluation](#) during the [run a classic script](#)<sup>p906</sup> algorithm. Since there are no Web IDL callback invocations involved, the context's [skip-when-determining-incumbent counter](#)<sup>p910</sup> is zero, so it is used to determine the [incumbent settings object](#)<sup>p911</sup>; the result is the [environment settings object](#)<sup>p897</sup> of window.

(In this example, the [environment settings object](#)<sup>p897</sup> of `frames[0]` is not involved at all. It is the [current settings object](#)<sup>p913</sup>, but the [MessageChannel\(\)](#)<sup>p1001</sup> constructor cares only about the incumbent, not current.)

## Example

Consider the following more complicated example:

```
<!DOCTYPE html>
<iframe></iframe>
<script>
  const bound = frames[0].postMessage.bind(frames[0], "some data", "*");
  window.setTimeout(bound);
</script>
```

There are two interesting [environment settings objects](#)<sup>p897</sup> here: that of `window`, and that of `frames[0]`. Our concern is: what is the [incumbent settings object](#)<sup>p911</sup> at the time that the algorithm for [postMessage\(\)](#)<sup>p998</sup> executes?

It should be that of `window`, to capture the intuitive notion that the author script responsible for causing the algorithm to happen is executing in `window`, not `frames[0]`. Another way of capturing the intuition here is that invoking algorithms asynchronously (in this case via [setTimeout\(\)](#)<sup>p952</sup>) should not change the [incumbent](#)<sup>p908</sup> concept.

Let us now explain how the steps given above give us our intuitively-desired result of `window`'s [relevant settings object](#)<sup>p913</sup>.

When `bound` is [converted](#) to a Web IDL callback type, the [incumbent settings object](#)<sup>p911</sup> is that corresponding to `window` (in the same manner as in our simple example above). Web IDL stores this as the resulting callback value's [callback context](#).

When the [task](#)<sup>p925</sup> posted by [setTimeout\(\)](#)<sup>p952</sup> executes, the algorithm for that task uses Web IDL to [invoke](#) the stored callback value. Web IDL in turn calls the above [prepare to run a callback](#)<sup>p910</sup> algorithm. This pushes the stored [callback context](#) onto the [backup incumbent settings object stack](#)<sup>p910</sup>. At this time (inside the timer task) there is no author code on the stack, so the [topmost script-having execution context](#)<sup>p911</sup> is null, and nothing gets its [skip-when-determining-incumbent counter](#)<sup>p910</sup> incremented.

Invoking the callback then calls `bound`, which in turn calls the [postMessage\(\)](#)<sup>p998</sup> method of `frames[0]`. When the [postMessage\(\)](#)<sup>p998</sup> algorithm looks up the [incumbent settings object](#)<sup>p911</sup>, there is still no author code on the stack, since the bound function just directly calls the built-in method. So the [topmost script-having execution context](#)<sup>p911</sup> will be null: the [JavaScript execution context](#) stack only contains an execution context corresponding to [postMessage\(\)](#)<sup>p998</sup>, with no [ScriptEvaluation](#) context or similar below it.

This is where we fall back to the [backup incumbent settings object stack](#)<sup>p910</sup>. As noted above, it will contain as its topmost entry the [relevant settings object](#)<sup>p913</sup> of `window`. So that is what is used as the [incumbent settings object](#)<sup>p911</sup> while executing the [postMessage\(\)](#)<sup>p998</sup> algorithm.

## Example

Consider this final, even more convoluted example:

```
<!-- a.html -->
<!DOCTYPE html>
<button>click me</button>
<iframe></iframe>
<script>
  const bound = frames[0].location.assign.bind(frames[0].location, "https://example.com/");
  document.querySelector("button").addEventListener("click", bound);
</script>

<!-- b.html -->
<!DOCTYPE html>
<iframe src="a.html"></iframe>
<script>
  const iframe = document.querySelector("iframe");
  iframe.onload = function onLoad() {
    iframe.contentWindow.document.querySelector("button").click();
  };
</script>
```

Again there are two interesting [environment settings objects](#)<sup>p897</sup> in play: that of a.html, and that of b.html. When the [location.assign\(\)](#)<sup>p849</sup> method triggers the [Location-object navigate](#)<sup>p846</sup> algorithm, what will be the [incumbent settings object](#)<sup>p911</sup>? As before, it should intuitively be that of a.html: the [click](#) listener was originally scheduled by a.html, so even if something involving b.html causes the listener to fire, the [incumbent](#)<sup>p908</sup> responsible is that of a.html.

The callback setup is similar to the previous example: when bound is [converted](#) to a Web IDL callback type, the [incumbent settings object](#)<sup>p911</sup> is that corresponding to a.html, which is stored as the callback's [callback context](#).

When the [click\(\)](#)<sup>p762</sup> method is called inside b.html, it [dispatches](#) a [click](#) event on the button that is inside a.html. This time, when the [prepare to run a callback](#)<sup>p910</sup> algorithm executes as part of event dispatch, there is author code on the stack; the [topmost script-having execution context](#)<sup>p911</sup> is that of the onLoad function, whose [skip-when-determining-incumbent counter](#)<sup>p910</sup> gets incremented. Additionally, a.html's [environment settings object](#)<sup>p897</sup> (stored as the [EventHandler](#)<sup>p938</sup>'s [callback context](#)) is pushed onto the [backup incumbent settings object stack](#)<sup>p910</sup>.

Now, when the [Location-object navigate](#)<sup>p846</sup> algorithm looks up the [incumbent settings object](#)<sup>p911</sup>, the [topmost script-having execution context](#)<sup>p911</sup> is still that of the onLoad function (due to the fact we are using a bound function as the callback). Its [skip-when-determining-incumbent counter](#)<sup>p910</sup> value is one, however, so we fall back to the [backup incumbent settings object stack](#)<sup>p910</sup>. This gives us the [environment settings object](#)<sup>p897</sup> of a.html, as expected.

Note that this means that even though it is the [iframe](#)<sup>p355</sup> inside a.html that navigates, it is a.html itself that is used as the [source browsing context](#)<sup>p852</sup>, which determines among other things the [request client](#). This is [perhaps the only justifiable use of the incumbent concept on the web platform](#); in all other cases the consequences of using it are simply confusing and we hope to one day switch them to use [current](#)<sup>p908</sup> or [relevant](#)<sup>p908</sup> as appropriate.

### 8.1.3.5.3 Current §<sup>p91</sup><sub>3</sub>

The JavaScript specification defines the [current Realm Record](#), sometimes abbreviated to the "current Realm". [\[JAVASCRIPT\]](#)<sup>p1267</sup>

Then, the **current settings object** is the [environment settings object](#)<sup>p907</sup> of the [current Realm Record](#).

Similarly, the **current global object** is the [global object](#)<sup>p907</sup> of the [current Realm Record](#).

### 8.1.3.5.4 Relevant §<sup>p91</sup><sub>3</sub>

The **relevant Realm** for a [platform object](#) is the value of its [\[\[Realm\]\] field](#).

Then, the **relevant settings object** for a [platform object](#) o is the [environment settings object](#)<sup>p907</sup> of the [relevant Realm](#)<sup>p913</sup> for o.

Similarly, the **relevant global object** for a [platform object](#) o is the [global object](#)<sup>p907</sup> of the [relevant Realm](#)<sup>p913</sup> for o.

### 8.1.3.6 Killing scripts §<sup>p91</sup><sub>3</sub>

Although the JavaScript specification does not account for this possibility, it's sometimes necessary to **abort a running script**. This causes any [ScriptEvaluation](#) or [Source Text Module Record Evaluate](#) invocations to cease immediately, emptying the [JavaScript execution context stack](#) without triggering any of the normal mechanisms like `finally` blocks. [\[JAVASCRIPT\]](#)<sup>p1267</sup>

User agents may impose resource limitations on scripts, for example CPU quotas, memory limits, total execution time limits, or bandwidth limitations. When a script exceeds a limit, the user agent may either throw a ["QuotaExceededError" DOMException](#), [abort the script](#)<sup>p913</sup> without an exception, prompt the user, or throttle script execution.

#### Example

For example, the following script never terminates. A user agent could, after waiting for a few seconds, prompt the user to either terminate the script or let it continue.

```
<script>
```

```
while (true) { /* loop */ }
</script>
```

User agents are encouraged to allow users to disable scripting whenever the user is prompted either by a script (e.g. using the [window.alert\(\)](#)<sup>p957</sup> API) or because of a script's actions (e.g. because it has exceeded a time limit).

If scripting is disabled while a script is executing, the script should be terminated immediately.

User agents may allow users to specifically disable scripts just for the purposes of closing a [browsing context](#)<sup>p804</sup>.

#### Example

For example, the prompt mentioned in the example above could also offer the user with a mechanism to just close the page entirely, without running any [unload](#)<sup>p1261</sup> event handlers.

### 8.1.3.7 HostEnqueuePromiseJob(job, realm) §<sup>p91</sup><sub>4</sub>

JavaScript contains an [implementation-defined HostEnqueuePromiseJob\(job, realm\)](#) abstract operation to schedule Promise-related operations. HTML schedules these operations in the microtask queue. User agents must use the following implementation: [\[JAVASCRIPT\]](#)<sup>p1267</sup>

1. If *realm* is not null, then let *job settings* be the [settings object](#)<sup>p907</sup> for *realm*. Otherwise, let *job settings* be null.

#### Note

If *realm* is not null, it is the [Realm](#) of the author code that will run. When *job* is returned by [NewPromiseReactionJob](#), it is the realm of the promise's handler function. When *job* is returned by [NewPromiseResolveThenableJob](#), it is the realm of the *then* function.

If *realm* is null, either no author code will run or author code is guaranteed to throw. For the former, the author may not have passed in code to run, such as in `promise.then(null, null)`. For the latter, it is because a revoked Proxy was passed. In both cases, all the steps below that would otherwise use job settings get skipped.

2. Let *incumbent settings* be the [incumbent settings object](#)<sup>p911</sup>.
3. Let *active script* be the [active script](#)<sup>p896</sup>.
4. Let *script execution context* be null.
5. If *active script* is not null, set *script execution context* to a new [JavaScript execution context](#), with its `Function` field set to null, its `Realm` field set to *active script*'s [settings object](#)<sup>p895</sup>'s [Realm](#)<sup>p908</sup>, and its `ScriptOrModule` set to *active script*'s [record](#)<sup>p895</sup>.

#### Note

As seen below, this is used in order to propagate the current [active script](#)<sup>p896</sup> forward to the time when the job is executed.

#### Example

A case where *active script* is non-null, and saving it in this way is useful, is the following:

```
Promise.resolve('import(`./example.mjs`)').then(eval);
```

Without this step (and the steps below that use it), there would be no [active script](#)<sup>p896</sup> when the `import()` expression is evaluated, since `eval()` is a built-in function that does not originate from any particular [script](#)<sup>p895</sup>.

With this step in place, the active script is propagated from the above code into the job, allowing `import()` to use the original script's [base URL](#)<sup>p896</sup> appropriately.

#### Example

*active script* can be null if the user clicks on the following button:

```
<button onclick="Promise.resolve('import(`./example.mjs`')).then(eval)">Click me</button>
```

In this case, the JavaScript function for the [event handler<sup>p934</sup>](#) will be created by the [get the current value of the event handler<sup>p939</sup>](#) algorithm, which creates a function with null `[[ScriptOrModule]]` value. Thus, when the promise machinery calls [HostEnqueuePromiseJob<sup>p914</sup>](#), there will be no [active script<sup>p896</sup>](#) to pass along.

As a consequence, this means that when the `import()` expression is evaluated, there will still be no [active script<sup>p896</sup>](#). Fortunately that is handled by our implementations of [HostResolveImportedModule<sup>p917</sup>](#) and [HostImportModuleDynamically<sup>p918</sup>](#), by falling back to using the [current settings object<sup>p913</sup>](#)'s [API base URL<sup>p897</sup>](#).

6. [Queue a microtask<sup>p926</sup>](#) on the [surrounding agent's event loop<sup>p924</sup>](#) to perform the following steps:
  1. If `job settings` is not null, then [check if we can run script<sup>p907</sup>](#) with `job settings`. If this returns "do not run" then return.
  2. If `job settings` is not null, then [prepare to run script<sup>p907</sup>](#) with `job settings`.

**Note**

*This affects the [entry<sup>p908</sup>](#) concept while the job runs.*

3. [Prepare to run a callback<sup>p910</sup>](#) with `incumbent settings`.

**Note**

*This affects the [incumbent<sup>p908</sup>](#) concept while the job runs.*

4. If `script execution context` is not null, then [push](#) `script execution context` onto the [JavaScript execution context stack](#).

**Note**

*As explained above, this affects the [active script<sup>p896</sup>](#) while the job runs.*

5. Let `result` be `job()`.

**Note**

*`job` is an [abstract closure](#) returned by [NewPromiseReactionJob](#) or [NewPromiseResolveThenableJob](#).*

6. If `script execution context` is not null, then [pop](#) `script execution context` from the [JavaScript execution context stack](#).
7. [Clean up after running a callback<sup>p911</sup>](#) with `incumbent settings`.
8. If `job settings` is not null, then [clean up after running script<sup>p907</sup>](#) with `job settings`.
9. If `result` is an [abrupt completion](#), then [report the exception<sup>p922</sup>](#) given by `result.[[Value]]`.

### 8.1.3.8 Integration with the JavaScript module system §<sup>p91</sup> 5

The JavaScript specification defines a syntax for modules, as well as some host-agnostic parts of their processing model. This specification defines the rest of their processing model: how the module system is bootstrapped, via the [script<sup>p607</sup>](#) element with [type<sup>p608</sup>](#) attribute set to "module", and how modules are fetched, resolved, and executed. [\[JAVASCRIPT\]<sup>p1267</sup>](#)

**Note**

*Although the JavaScript specification speaks in terms of "scripts" versus "modules", in general this specification speaks in terms of [classic scripts<sup>p896</sup>](#) versus [module scripts<sup>p896</sup>](#), since both of them use the [script<sup>p607</sup>](#) element.*

For web developers (non-normative)

**`modulePromise = import(specifier)`**

Returns a promise for the module namespace object for the [module script<sup>p896</sup>](#) identified by `specifier`. This allows dynamic

importing of module scripts at runtime, instead of statically using the `import` statement form. The specifier will be [resolved](#)<sup>p916</sup> relative to the [active script](#)<sup>p896</sup>'s [base URL](#)<sup>p896</sup>.

The returned promise will be rejected if an invalid specifier is given, or if a failure is encountered while [fetching](#)<sup>p900</sup> or [evaluating](#)<sup>p906</sup> the resulting module graph.

This syntax can be used inside both [classic](#)<sup>p896</sup> and [module scripts](#)<sup>p896</sup>. It thus provides a bridge into the module-script world, from the classic-script world.

**`url = import . meta . url`**

Returns the [active module script](#)<sup>p896</sup>'s [base URL](#)<sup>p896</sup>.

This syntax can only be used inside [module scripts](#)<sup>p896</sup>.

A **module map** is a [map](#) of [URL records](#) to values that are either a [module script](#)<sup>p896</sup>, null (used to represent failed fetches), or a placeholder value "fetching". [Module maps](#)<sup>p916</sup> are used to ensure that imported JavaScript modules are only fetched, parsed, and evaluated once per [Document](#)<sup>p111</sup> or [worker](#)<sup>p1008</sup>.

### Example

Since [module maps](#)<sup>p916</sup> are keyed by URL, the following code will create three separate entries in the [module map](#)<sup>p916</sup>, since it results in three different URLs:

```
import "https://example.com/module.mjs";
import "https://example.com/module.mjs#map-buster";
import "https://example.com/module.mjs?debug=true";
```

That is, URL [queries](#) and [fragments](#) can be varied to create distinct entries in the [module map](#)<sup>p916</sup>; they are not ignored. Thus, three separate fetches and three separate module evaluations will be performed.

In contrast, the following code would only create a single entry in the [module map](#)<sup>p916</sup>, since after applying the [URL parser](#) to these inputs, the resulting [URL records](#) are equal:

```
import "https://example.com/module2.mjs";
import "https:example.com/module2.mjs";
import "https://example.com/module2.mjs";
import "https://example.com/foo/./module2.mjs";
```

So in this second example, only one fetch and one module evaluation will occur.

Note that this behavior is the same as how [shared workers](#)<sup>p1033</sup> are keyed by their parsed [constructor url](#)<sup>p1027</sup>.

To **resolve a module specifier** given a [URL base URL](#) and a [string specifier](#), perform the following steps. It will return either a [URL record](#) or failure.

1. Apply the [URL parser](#) to *specifier*. If the result is not failure, return the result.
2. If *specifier* does not start with the character U+002F SOLIDUS (/), the two-character sequence U+002E FULL STOP, U+002F SOLIDUS (./), or the three-character sequence U+002E FULL STOP, U+002E FULL STOP, U+002F SOLIDUS (./), return failure.

### Note

*This restriction is in place so that in the future we can allow custom module loaders to give special meaning to "bare" import specifiers, like `import "jquery"` or `import "web/crypto"`. For now any such imports will fail, instead of being treated as relative URLs.*

3. Return the result of applying the [URL parser](#) to *specifier* with *base URL* as the base URL.

### Example

The following are valid module specifiers according to the above algorithm:

- `https://example.com/apples.mjs`
- `http:example.com\pears.js` (becomes `http://example.com/pears.js` as step 1 parses with no base URL)

- `//example.com/bananas`
- `./strawberries.mjs.cgi`
- `./lychees`
- `/limes.jsx`
- `data:text/javascript,export default 'grapes';`
- `blob:https://whatwg.org/d0360e2f-caee-469f-9a2f-87d5b0456f6f`

The following are valid module specifiers according to the above algorithm, but will invariably cause failures when they are [fetched](#)<sup>p903</sup>:

- `javascript:export default 'artichokes';`
- `data:text/plain,export default 'kale';`
- `about:legumes`
- `wss://example.com/celery`

The following are not valid module specifiers according to the above algorithm:

- `https://eggplant:b/c`
- `pumpkins.js`
- `.tomato`
- `..zucchini.mjs`
- `.\yam.es`

### 8.1.3.8.1 *HostResolveImportedModule(referencingScriptOrModule, specifier)* §<sup>p91</sup><sub>7</sub>

JavaScript contains an [implementation-defined HostResolveImportedModule](#) abstract operation. User agents must use the following implementation: [\[JAVASCRIPT\]](#)<sup>p1267</sup>

1. Let *settings object* be the [current settings object](#)<sup>p913</sup>.
2. Let *base URL* be *settings object*'s [API base URL](#)<sup>p897</sup>.
3. If *referencingScriptOrModule* is not null, then:
  1. Let *referencing script* be *referencingScriptOrModule*.[\[\[HostDefined\]\]](#).
  2. Set *settings object* to *referencing script*'s [settings object](#)<sup>p895</sup>.
  3. Set *base URL* to *referencing script*'s [base URL](#)<sup>p896</sup>.

#### Example

*referencingScriptOrModule* is not usually null, but will be so for event handlers per the [get the current value of the event handler](#)<sup>p939</sup> algorithm. For example, given:

```
<button onclick="import('./foo.mjs')">Click me</button>
```

If a `click` event occurs, then at the time the `import()` expression runs, [GetActiveScriptOrModule](#) will return null, which will be passed to this abstract operation when [HostResolveImportedModule](#) is called by [FinishDynamicImport](#).

4. Let *moduleMap* be *settings object*'s [module map](#)<sup>p897</sup>.
5. Let *url* be the result of [resolving a module specifier](#)<sup>p916</sup> given *base URL* and *specifier*.
6. Assert: *url* is never failure, because [resolving a module specifier](#)<sup>p916</sup> must have been previously successful with these same two arguments (either [while creating the corresponding module script](#)<sup>p905</sup>, or in [HostImportModuleDynamically](#)<sup>p918</sup>).
7. Let *resolved module script* be *moduleMap*[*url*]. (This entry must [exist](#) for us to have gotten to this point.)
8. Assert: *resolved module script* is a [module script](#)<sup>p896</sup> (i.e., is not null or "fetching").
9. Assert: *resolved module script*'s [record](#)<sup>p895</sup> is not null.
10. Return *resolved module script*'s [record](#)<sup>p895</sup>.

### 8.1.3.8.2 *HostImportModuleDynamically*(referencingScriptOrModule, specifier, promiseCapability) §<sup>p91</sup><sub>8</sub>

JavaScript contains an [implementation-defined HostImportModuleDynamically](#) abstract operation. User agents must use the following implementation: [\[JAVASCRIPT\]](#)<sup>p1267</sup>

1. Let *settings object* be the [current settings object](#)<sup>p913</sup>.
2. Let *base URL* be *settings object*'s [API base URL](#)<sup>p897</sup>.
3. Let *fetch options* be the [default classic script fetch options](#)<sup>p898</sup>.
4. If *referencingScriptOrModule* is not null, then:
  1. Let *referencing script* be *referencingScriptOrModule*.[\[\[HostDefined\]\]](#).
  2. Set *settings object* to *referencing script*'s [settings object](#)<sup>p895</sup>.
  3. Set *base URL* to *referencing script*'s [base URL](#)<sup>p896</sup>.
  4. Set *fetch options* to the [descendant script fetch options](#)<sup>p898</sup> for *referencing script*'s [fetch options](#)<sup>p896</sup>.

#### Note

As explained above for [HostResolveImportedModule](#)<sup>p917</sup>, in the common case, *referencingScriptOrModule* is non-null.

5. [Fetch an import\(\) module script graph](#)<sup>p900</sup> given *specifier*, *base URL*, *settings object*, and *fetch options*. Wait until the algorithm asynchronously completes with *result*.
6. If *result* is null, then:
  1. Let *completion* be Completion { [\[\[Type\]\]](#): throw, [\[\[Value\]\]](#): a new [TypeError](#), [\[\[Target\]\]](#): empty }.
  2. Perform [FinishDynamicImport](#)(*referencingScriptOrModule*, *specifier*, *promiseCapability*, *completion*).
  3. Return.
7. [Run the module script](#)<sup>p906</sup> *result*, with the *rethrow errors* boolean set to true.
8. If running the module script throws an exception, then perform [FinishDynamicImport](#)(*referencingScriptOrModule*, *specifier*, *promiseCapability*, the thrown exception completion).
9. Otherwise, perform [FinishDynamicImport](#)(*referencingScriptOrModule*, *specifier*, *promiseCapability*, [NormalCompletion](#)(undefined)).
10. Return undefined.

### 8.1.3.8.3 *HostGetImportMetaProperties*(moduleRecord) §<sup>p91</sup><sub>8</sub>

The *import.meta* proposal contains an [implementation-defined HostGetImportMetaProperties](#) abstract operation. User agents must use the following implementation: [\[JSIMPORTMETA\]](#)<sup>p1267</sup>

1. Let *module script* be *moduleRecord*.[\[\[HostDefined\]\]](#).
2. Let *urlString* be *module script*'s [base URL](#)<sup>p896</sup>, [serialized](#).
3. Return « Record { [\[\[Key\]\]](#): "url", [\[\[Value\]\]](#): *urlString* } ».

### 8.1.3.9 Integration with the JavaScript agent formalism §<sup>p91</sup><sub>8</sub>

JavaScript defines the concept of an [agent](#). This section gives the mapping of that language-level concept on to the web platform.

#### Note

Conceptually, the [agent](#) concept is an architecture-independent, idealized "thread" in which JavaScript code runs. Such code can involve multiple [globals/realms](#)<sup>p908</sup> that can synchronously access each other, and thus needs to run in a single execution thread.

Two [Window<sup>p816</sup>](#) objects having the same [agent](#) does not indicate they can directly access all objects created in each other's realms. They would have to be [same origin-domain<sup>p830</sup>](#); see [IsPlatformObjectSameOrigin<sup>p815</sup>](#).

The following types of agents exist on the web platform:

### Similar-origin window agent

Contains various [Window<sup>p816</sup>](#) objects which can potentially reach each other, either directly or by using [document.domain<sup>p832</sup>](#).

#### Note

Two [Window<sup>p816</sup>](#) objects that are [same origin<sup>p830</sup>](#) can be in different [similar-origin window agents<sup>p919</sup>](#), for instance if they are each in their own [browsing context group<sup>p811</sup>](#).

### Dedicated worker agent

Contains a single [DedicatedWorkerGlobalScope<sup>p1026</sup>](#).

### Shared worker agent

Contains a single [SharedWorkerGlobalScope<sup>p1027</sup>](#).

### Service worker agent

Contains a single [ServiceWorkerGlobalScope](#).

### Worklet agent

Contains a single [WorkletGlobalScope](#) object.

#### Note

Although a given worklet can have multiple realms, each such realm needs its own agent, as each realm can be executing code independently and at the same time as the others.

Only [shared<sup>p919</sup>](#) and [dedicated worker agents<sup>p919</sup>](#) allow the use of JavaScript [Atomics](#) APIs to potentially [block](#).

To **create an agent**, given a boolean *canBlock*:

1. Let *signifier* be a new unique internal value.
2. Let *candidateExecution* be a new [candidate execution](#).
3. Let *agent* be a new [agent](#) whose [\[\[CanBlock\]\]](#) is *canBlock*, [\[\[Signifier\]\]](#) is *signifier*, [\[\[CandidateExecution\]\]](#) is *candidateExecution*, and [\[\[IsLockFree1\]\]](#), [\[\[IsLockFree2\]\]](#), and [\[\[LittleEndian\]\]](#) are set at the implementation's discretion.
4. Set *agent*'s [event loop<sup>p924</sup>](#) to a new [event loop<sup>p924</sup>](#).
5. Return *agent*.

The **relevant agent** for a [platform object](#) *platformObject* is *platformObject*'s [relevant Realm<sup>p913</sup>](#)'s [agent](#). This pointer is not yet defined in the JavaScript specification; see [tc39/ecma262#1357](#).

#### Note

The agent equivalent of the [current Realm Record](#) is the [surrounding agent](#).

### 8.1.3.10 Integration with the JavaScript agent cluster formalism §<sup>p91</sup><sub>9</sub>

JavaScript also defines the concept of an [agent cluster](#), which this standard maps to the web platform by placing agents appropriately when they are created using the [obtain a similar-origin window agent<sup>p920</sup>](#) or [obtain a worker/worklet agent<sup>p920</sup>](#) algorithms.

The [agent cluster](#) concept is crucial for defining the JavaScript memory model, and in particular among which [agents](#) the backing data of [SharedArrayBuffer](#) objects can be shared.

## Note

Conceptually, the [agent cluster](#) concept is an architecture-independent, idealized "process boundary" that groups together multiple "threads" ([agents](#)). The [agent clusters](#) defined by the specification are generally more restrictive than the actual process boundaries implemented in user agents. By enforcing these idealized divisions at the specification level, we ensure that web developers see interoperable behavior with regard to shared memory, even in the face of varying and changing user agent process models.

The following defines the allocation of the [agent clusters](#) of [similar-origin window agents](#)<sup>p919</sup>.

An **agent cluster key** is a [site](#)<sup>p831</sup>.

[whatwg/html #4734](#) is expected to widen [agent cluster key](#)<sup>p920</sup> (but not [site](#)<sup>p831</sup>) to encompass all [tuple origins](#)<sup>p829</sup>.

To **obtain an agent cluster key**, given an origin *origin*, return the result of [obtaining a site](#)<sup>p831</sup> with *origin*.

To **obtain a similar-origin window agent**, given an [origin](#)<sup>p829</sup> *origin* and [browsing context group](#)<sup>p811</sup> *group*, run these steps:

1. Let *clusterKey* be the result of [obtaining an agent cluster key](#)<sup>p920</sup> given *origin*.
2. Let *agentCluster* be the result of [obtaining a browsing context agent cluster](#)<sup>p920</sup> with *group* and *clusterKey*.
3. Return the single [similar-origin window agent](#)<sup>p919</sup> contained in *agentCluster*.

To **obtain a browsing context agent cluster**, given a [browsing context group](#)<sup>p811</sup> *group* and [agent cluster key](#)<sup>p920</sup> *key*, run these steps:

1. If *group*'s [agent cluster map](#)<sup>p811</sup>[*key*] **does not exist, then:**
  1. Let *agentCluster* be a new [agent cluster](#).
  2. Add the result of [creating an agent](#)<sup>p919</sup>, given false, to *agentCluster*.
  3. Set *group*'s [agent cluster map](#)<sup>p811</sup>[*key*] to *agentCluster*.
2. Return *group*'s [agent cluster map](#)<sup>p811</sup>[*key*].

## Note

This means that there is only one [similar-origin window agent](#)<sup>p919</sup> per browsing context agent cluster. (However, [dedicated worker](#)<sup>p919</sup> and [worklet agents](#)<sup>p919</sup> might be in the same cluster.)

The following defines the allocation of the [agent clusters](#) of all other types of agents.

To **obtain a worker/worklet agent**, given an [environment settings object](#)<sup>p897</sup> or null *outside settings*, a boolean *isTopLevel*, and a boolean *canBlock*, run these steps:

1. Let *agentCluster* be null.
2. If *isTopLevel* is true, then set *agentCluster* to a new [agent cluster](#).
3. Otherwise:
  1. Assert: *outside settings* is not null.
  2. Let *ownerAgent* be *outside settings*'s [Realm](#)<sup>p908</sup>'s agent.
  3. Set *agentCluster* to the agent cluster which contains *ownerAgent*.
4. Let *agent* be the result of [creating an agent](#)<sup>p919</sup> given *canBlock*.
5. Add *agent* to *agentCluster*.
6. Return *agent*.

To **obtain a dedicated/shared worker agent**, given an [environment settings object](#)<sup>p897</sup> *outside settings* and a boolean *isShared*,

return the result of [obtaining a worker/worklet agent](#)<sup>p920</sup> given *outside settings*, *isShared*, and *true*.

To **obtain a worklet agent**, given an [environment settings object](#)<sup>p897</sup> *outside settings*, return the result of [obtaining a worker/worklet agent](#)<sup>p920</sup> given *outside settings*, *false*, and *false*.

To **obtain a service worker agent**, return the result of [obtaining a worker/worklet agent](#)<sup>p920</sup> given *null*, *true*, and *false*.

### Example

The following pairs of global objects are each within the same [agent cluster](#), and thus can use [SharedArrayBuffer](#) instances to share memory with each other:

- A [Window](#)<sup>p816</sup> object and a dedicated worker that it created.
- A worker (of any type) and a dedicated worker it created.
- A [Window](#)<sup>p816</sup> object A and the [Window](#)<sup>p816</sup> object of an [iframe](#)<sup>p355</sup> element that A created that could be [same origin-domain](#)<sup>p830</sup> with A.
- A [Window](#)<sup>p816</sup> object and a [same origin-domain](#)<sup>p830</sup> [Window](#)<sup>p816</sup> object that opened it.
- A [Window](#)<sup>p816</sup> object and a worklet that it created.

The following pairs of global objects are *not* within the same [agent cluster](#), and thus cannot share memory:

- A [Window](#)<sup>p816</sup> object and a shared worker it created.
- A worker (of any type) and a shared worker it created.
- A [Window](#)<sup>p816</sup> object and a service worker it created.
- A [Window](#)<sup>p816</sup> object and the [Window](#)<sup>p816</sup> object of an [iframe](#)<sup>p355</sup> element that A created that cannot be [same origin-domain](#)<sup>p830</sup> with A.
- Any two [Window](#)<sup>p816</sup> objects whose [browsing contexts](#)<sup>p804</sup> do not have a non-null [opener](#)<sup>p804</sup> or [ancestor](#)<sup>p807</sup> relationship. This holds even if the two [Window](#)<sup>p816</sup> objects are [same origin](#)<sup>p830</sup>.

### 8.1.3.11 Runtime script errors <sup>p92</sup><sub>1</sub>

When the user agent is required to **report an error** for a particular [script](#)<sup>p895</sup> *script* with a particular position *line:col*, using a particular target *target*, it must run these steps, after which the error is either **handled** or **not handled**:

1. If *target* is [in error reporting mode](#)<sup>p921</sup>, then return; the error is [not handled](#)<sup>p921</sup>.
2. Let *target* be **in error reporting mode**.
3. Let *message* be an [implementation-defined](#) string describing the error in a helpful manner.
4. Let *errorValue* be the value that represents the error: in the case of an uncaught exception, that would be the value that was thrown; in the case of a JavaScript error that would be an **Error** object. If there is no corresponding value, then the null value must be used instead.
5. Let *urlString* be the result of applying the [URL serializer](#) to the [URL record](#) that corresponds to the resource from which *script* was obtained.

#### Note

The resource containing the script will typically be the file from which the [Document](#)<sup>p111</sup> was parsed, e.g. for inline [script](#)<sup>p607</sup> elements or [event handler content attributes](#)<sup>p935</sup>; or the JavaScript file that the script was in, for external scripts. Even for dynamically-generated scripts, user agents are strongly encouraged to attempt to keep track of the original source of a script. For example, if an external script uses the [document.write\(\)](#)<sup>p950</sup> API to insert an inline [script](#)<sup>p607</sup> element during parsing, the URL of the resource containing the script would ideally be reported as being the external script, and the line number might ideally be reported as the line with the [document.write\(\)](#)<sup>p950</sup> call or where the string passed to that call was first constructed. Naturally, implementing this can be somewhat non-trivial.

#### Note

User agents are similarly encouraged to keep careful track of the original line numbers, even in the face of [document.write\(\)](#)<sup>p950</sup> calls mutating the document as it is parsed, or [event handler content attributes](#)<sup>p935</sup> spanning multiple lines.

6. If *script*'s [muted errors](#)<sup>p896</sup> is true, then set *message* to "Script error.", *urlString* to the empty string, *line* and *col* to 0, and *errorValue* to null.
7. Let *notHandled* be the result of [firing an event](#) named [error](#)<sup>p1260</sup> at *target*, using [ErrorEvent](#)<sup>p922</sup>, with the [cancelable](#)

attribute initialized to true, the `message` attribute initialized to `message`, the `filename` attribute initialized to `urlString`, the `lineno` attribute initialized to `line`, the `colno` attribute initialized to `col`, and the `error` attribute initialized to `errorValue`.

- Let `target` no longer be [in error reporting mode](#).
- If `notHandled` is false, then the error is [handled](#). Otherwise, the error is [not handled](#).

#### Note

Returning true in an event handler cancels the event per [the event handler processing algorithm](#).

### 8.1.3.11.1 Runtime script errors in documents

When the user agent is to **report an exception** *E*, the user agent must [report the error](#) for the relevant [script](#), with the problematic position (line number and column number) in the resource containing the script, using the [global object](#) specified by the script's [settings object](#) as the target. If the error is still [not handled](#) after this, then the error may be reported to a developer console.

### 8.1.3.11.2 The `ErrorEvent` interface

```
IDL [Exposed=(Window,Worker)]
interface ErrorEvent : Event {
  constructor(DOMString type, optional ErrorEventInit eventInitDict = {});

  readonly attribute DOMString message;
  readonly attribute USVString filename;
  readonly attribute unsigned long lineno;
  readonly attribute unsigned long colno;
  readonly attribute any error;
};

dictionary ErrorEventInit : EventInit {
  DOMString message = "";
  USVString filename = "";
  unsigned long lineno = 0;
  unsigned long colno = 0;
  any error = null;
};
```

The `message` attribute must return the value it was initialized to. It represents the error message.

The `filename` attribute must return the value it was initialized to. It represents the [URL](#) of the script in which the error originally occurred.

The `lineno` attribute must return the value it was initialized to. It represents the line number where the error occurred in the script.

The `colno` attribute must return the value it was initialized to. It represents the column number where the error occurred in the script.

The `error` attribute must return the value it was initialized to. Where appropriate, it is set to the object representing the error (e.g., the exception object in the case of an uncaught DOM exception).

### 8.1.3.12 Unhandled promise rejections

In addition to synchronous [runtime script errors](#), scripts may experience asynchronous promise rejections, tracked via the [unhandledrejection](#) and [rejectionhandled](#) events.

When the user agent is to **notify about rejected promises** on a given [environment settings object](#) *settings object*, it must run

these steps:

1. Let *list* be a copy of *settings object*'s [about-to-be-notified rejected promises list](#)<sup>p897</sup>.
2. If *list* is empty, return.
3. Clear *settings object*'s [about-to-be-notified rejected promises list](#)<sup>p897</sup>.
4. [Queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> to run the following substep:
  1. For each promise *p* in *list*:
    1. If *p*'s `[[PromisesHandled]]` internal slot is true, continue to the next iteration of the loop.
    2. Let *notHandled* be the result of [firing an event](#) named [unhandledrejection](#)<sup>p1261</sup> at *settings object*'s [global object](#)<sup>p908</sup>, using [PromiseRejectionEvent](#)<sup>p923</sup>, with the [cancelable](#) attribute initialized to true, the [promise](#)<sup>p924</sup> attribute initialized to *p*, and the [reason](#)<sup>p924</sup> attribute initialized to the value of *p*'s `[[PromiseResult]]` internal slot.
    3. If *notHandled* is false, then the promise rejection is [handled](#)<sup>p923</sup>. Otherwise, the promise rejection is [not handled](#)<sup>p923</sup>.
    4. If *p*'s `[[PromisesHandled]]` internal slot is false, add *p* to *settings object*'s [outstanding rejected promises weak set](#)<sup>p897</sup>.

This algorithm results in promise rejections being marked as **handled** or **not handled**. These concepts parallel [handled](#)<sup>p921</sup> and [not handled](#)<sup>p921</sup> script errors. If a rejection is still [not handled](#)<sup>p923</sup> after this, then the rejection may be reported to a developer console.

#### 8.1.3.12.1 [HostPromiseRejectionTracker](#)(*promise*, *operation*) § p92<sub>3</sub>

JavaScript contains an [implementation-defined HostPromiseRejectionTracker](#)(*promise*, *operation*) abstract operation. User agents must use the following implementation: [\[JAVASCRIPT\]](#)<sup>p1267</sup>

1. Let *script* be the [running script](#)<sup>p907</sup>.
2. If *script*'s [muted errors](#)<sup>p896</sup> is true, terminate these steps.
3. Let *settings object* be *script*'s [settings object](#)<sup>p895</sup>.
4. If *operation* is "reject",
  1. Add *promise* to *settings object*'s [about-to-be-notified rejected promises list](#)<sup>p897</sup>.
5. If *operation* is "handle",
  1. If *settings object*'s [about-to-be-notified rejected promises list](#)<sup>p897</sup> contains *promise*, then remove *promise* from that list and return.
  2. If *settings object*'s [outstanding rejected promises weak set](#)<sup>p897</sup> does not contain *promise*, then return.
  3. Remove *promise* from *settings object*'s [outstanding rejected promises weak set](#)<sup>p897</sup>.
  4. [Queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> to [fire an event](#) named [rejectionhandled](#)<sup>p1261</sup> at *settings object*'s [global object](#)<sup>p908</sup>, using [PromiseRejectionEvent](#)<sup>p923</sup>, with the [promise](#)<sup>p924</sup> attribute initialized to *promise*, and the [reason](#)<sup>p924</sup> attribute initialized to the value of *promise*'s `[[PromiseResult]]` internal slot.

#### 8.1.3.12.2 The [PromiseRejectionEvent](#)<sup>p923</sup> interface § p92<sub>3</sub>

MDN

```
IDL [Exposed=(Window,Worker)]
interface PromiseRejectionEvent : Event {
  constructor(DOMString type, PromiseRejectionEventInit eventInitDict);

  readonly attribute Promise<any> promise;
  readonly attribute any reason;
```

MDN

```
};
dictionary PromiseRejectionEventInit : EventInit {
  required Promise<any> promise;
  any reason;
};
```

The **promise** attribute must return the value it was initialized to. It represents the promise which this notification is about. ✓ MDN

The **reason** attribute must return the value it was initialized to. It represents the rejection reason for the promise. ✓ MDN

### 8.1.3.13 HostEnsureCanCompileStrings(*callerRealm*, *calleeRealm*) § p92 4

JavaScript contains an [implementation-defined HostEnsureCanCompileStrings\(\*callerRealm\*, \*calleeRealm\*\)](#) abstract operation. User agents must use the following implementation: [\[JAVASCRIPT\]<sup>p1267</sup>](#)

1. Perform ? [EnsureCSPDoesNotBlockStringCompilation\(\*callerRealm\*, \*calleeRealm\*\)](#). [\[CSP\]<sup>p1264</sup>](#)

## 8.1.4 Event loops § p92 4

### 8.1.4.1 Definitions § p92 4

To coordinate events, user interaction, scripts, rendering, networking, and so forth, user agents must use **event loops** as described in this section. Each [agent](#) has an associated **event loop**, which is unique to that agent.

The [event loop<sup>p924</sup>](#) of a [similar-origin window agent<sup>p919</sup>](#) is known as a **window event loop**. The [event loop<sup>p924</sup>](#) of a [dedicated worker agent<sup>p919</sup>](#), [shared worker agent<sup>p919</sup>](#), or [service worker agent<sup>p919</sup>](#) is known as a **worker event loop**. And the [event loop<sup>p924</sup>](#) of a [worklet agent<sup>p919</sup>](#) is known as a **worklet event loop**.

#### Note

*[Event loops<sup>p924</sup>](#) do not necessarily correspond to implementation threads. For example, multiple [window event loops<sup>p924</sup>](#) could be cooperatively scheduled in a single thread.*

*However, for the various worker [agents](#) that are allocated with `[[CanBlock]]` set to true, the JavaScript specification does place requirements on them regarding [forward progress](#), which effectively amount to requiring dedicated per-agent threads in those cases.*

An [event loop<sup>p924</sup>](#) has one or more **task queues**. A [task queue<sup>p924</sup>](#) is a [set of tasks<sup>p925</sup>](#).

#### Note

*[Task queues<sup>p924</sup>](#) are [sets](#), not [queues](#), because [step one of the event loop processing model<sup>p927</sup>](#) grabs the first [runnable<sup>p925</sup>](#) [task<sup>p925</sup>](#) from the chosen queue, instead of [dequeuing](#) the first task.*

#### Note

*The [microtask queue<sup>p925</sup>](#) is not a [task queue<sup>p924</sup>](#).*

Tasks encapsulate algorithms that are responsible for such work as:

## Events

Dispatching an **Event** object at a particular **EventTarget** object is often done by a dedicated task.

#### Note

*Not all events are dispatched using the [task queue<sup>p924</sup>](#); many are dispatched during other tasks.*

## Parsing

The [HTML parser](#)<sup>p1059</sup> tokenizing one or more bytes, and then processing any resulting tokens, is typically a task.

## Callbacks

Calling a callback is often done by a dedicated task.

## Using a resource

When an algorithm [fetches](#) a resource, if the fetching occurs in a non-blocking fashion then the processing of the resource once some or all of the resource is available is performed by a task.

## Reacting to DOM manipulation

Some elements have tasks that trigger in response to DOM manipulation, e.g. when that element is [inserted into the document](#)<sup>p43</sup>.

Formally, a **task** is a [struct](#) which has:

### Steps

A series of steps specifying the work to be done by the task.

### A source

One of the [task sources](#)<sup>p925</sup>, used to group and serialize related tasks.

### A document

A [Document](#)<sup>p111</sup> associated with the task, or null for tasks that are not in a [window event loop](#)<sup>p924</sup>.

### A script evaluation environment settings object set

A [set](#) of [environment settings objects](#)<sup>p897</sup> used for tracking script evaluation during the task.

A [task](#)<sup>p925</sup> is **runnable** if its [document](#)<sup>p925</sup> is either null or [fully active](#)<sup>p807</sup>.

Per its [source](#)<sup>p925</sup> field, each [task](#)<sup>p925</sup> is defined as coming from a specific **task source**. For each [event loop](#)<sup>p924</sup>, every [task source](#)<sup>p925</sup> must be associated with a specific [task queue](#)<sup>p924</sup>.

## Note

*Essentially, [task sources](#)<sup>p925</sup> are used within standards to separate logically-different types of tasks, which a user agent might wish to distinguish between. [Task queues](#)<sup>p924</sup> are used by user agents to coalesce task sources within a given [event loop](#)<sup>p924</sup>.*

## Example

For example, a user agent could have one [task queue](#)<sup>p924</sup> for mouse and key events (to which the [user interaction task source](#)<sup>p932</sup> is associated), and another to which all other [task sources](#)<sup>p925</sup> are associated. Then, using the freedom granted in the initial step of the [event loop processing model](#)<sup>p927</sup>, it could give keyboard and mouse events preference over other tasks three-quarters of the time, keeping the interface responsive but not starving other task queues. Note that in this setup, the processing model still enforces that the user agent would never process events from any one [task source](#)<sup>p925</sup> out of order.

Each [event loop](#)<sup>p924</sup> has a **currently running task**, which is either a [task](#)<sup>p925</sup> or null. Initially, this is null. It is used to handle reentrancy.

Each [event loop](#)<sup>p924</sup> has a **microtask queue**, which is a [queue](#) of [microtasks](#)<sup>p925</sup>, initially empty. A **microtask** is a colloquial way of referring to a [task](#)<sup>p925</sup> that was created via the [queue a microtask](#)<sup>p926</sup> algorithm.

Each [event loop](#)<sup>p924</sup> has a **performing a microtask checkpoint** boolean, which is initially false. It is used to prevent reentrant invocation of the [perform a microtask checkpoint](#)<sup>p929</sup> algorithm.

### 8.1.4.2 Queuing tasks §<sup>p92</sup><sub>5</sub>

To **queue a task** on a [task source](#)<sup>p925</sup> *source*, which performs a series of steps *steps*, optionally given an event loop *event loop* and a document *document*:

1. If *event loop* was not given, set *event loop* to the [implied event loop](#)<sup>p926</sup>.
2. If *document* was not given, set *document* to the [implied document](#)<sup>p926</sup>.

3. Let *task* be a new [task](#)<sup>p925</sup>.
4. Set *task*'s [steps](#)<sup>p925</sup> to *steps*.
5. Set *task*'s [source](#)<sup>p925</sup> to *source*.
6. Set *task*'s [document](#)<sup>p925</sup> to the *document*.
7. Set *task*'s [script evaluation environment settings object set](#)<sup>p925</sup> to an empty [set](#).
8. Let *queue* be the [task queue](#)<sup>p924</sup> to which *source* is associated on *event loop*.
9. [Append](#) *task* to *queue*.

To **queue an element task** on a [task source](#)<sup>p925</sup> *source*, with an element *element* and a series of steps *steps*:

1. Let *document* be *element*'s [node document](#).
2. Let *event loop* be *document*'s [relevant realm](#)<sup>p913</sup>'s corresponding [agent's event loop](#)<sup>p924</sup>.
3. [Queue a task](#)<sup>p925</sup> given *source*, *event loop*, *document*, and *steps*.

To **queue a microtask** which performs a series of steps *steps*, optionally given an event loop *event loop* and a document *document*:

1. If *event loop* was not given, set *event loop* to the [implied event loop](#)<sup>p926</sup>.
2. If *document* was not given, set *document* to the [implied document](#)<sup>p926</sup>.
3. Let *microtask* be a new [task](#)<sup>p925</sup>.
4. Set *microtask*'s [steps](#)<sup>p925</sup> to *steps*.
5. Set *microtask*'s [source](#)<sup>p925</sup> to the **microtask task source**.
6. Set *microtask*'s [document](#)<sup>p925</sup> to *document*.
7. Set *task*'s [script evaluation environment settings object set](#)<sup>p925</sup> to an empty [set](#).
8. [Enqueue](#) *task* on *event loop*'s [microtask queue](#)<sup>p925</sup>.

#### Note

*It is possible for a [microtask](#)<sup>p925</sup> to be moved to a regular [task queue](#)<sup>p924</sup>, if, during its initial execution, it [spins the event loop](#)<sup>p929</sup>. This is the only case in which the [source](#)<sup>p925</sup>, [document](#)<sup>p925</sup>, and [script evaluation environment settings object set](#)<sup>p925</sup> of the microtask are consulted; they are ignored by the [perform a microtask checkpoint](#)<sup>p929</sup> algorithm.*

The **implied event loop** when queuing a task is the one that can be deduced from the context of the calling algorithm. This is generally unambiguous, as most specification algorithms only ever involve a single [agent](#) (and thus a single [event loop](#)<sup>p924</sup>). The exception is algorithms involving or specifying cross-agent communication (e.g., between a window and a worker); for those cases, the [implied event loop](#)<sup>p926</sup> concept must not be relied upon and specifications must explicitly provide an [event loop](#)<sup>p924</sup> when [queuing a task](#)<sup>p925</sup> or [microtask](#)<sup>p926</sup>.

The **implied document** when queuing a task on an [event loop](#)<sup>p924</sup> *event loop* is determined as follows:

1. If *event loop* is not a [window event loop](#)<sup>p924</sup>, then return null.
2. If the task is being queued in the context of an element, then return the element's [node document](#).
3. If the task is being queued in the context of a [browsing context](#)<sup>p804</sup>, then return the browsing context's [active document](#)<sup>p804</sup>.
4. If the task is being queued by or for a [script](#)<sup>p895</sup>, then return the script's [settings object](#)<sup>p895</sup>'s [responsible document](#)<sup>p897</sup>.
5. Assert: this step is never reached, because one of the previous conditions must be true. Really?

Both [implied event loop](#)<sup>p926</sup> and [implied document](#)<sup>p926</sup> are vaguely-defined and have a lot of action-at-a-distance. Perhaps we can come up with a more explicit architecture, while still avoiding all callers needing to explicitly specify the event loop and document.

### 8.1.4.3 Processing model <sup>§<sup>p92</sup></sup><sub>7</sub>

An [event loop<sup>p924</sup>](#) must continually run through the following steps for as long as it exists:

1. Let *taskQueue* be one of the [event loop<sup>p924</sup>](#)'s [task queues<sup>p924</sup>](#), chosen in an [implementation-defined](#) manner, with the constraint that the chosen task queue must contain at least one [runnable<sup>p925</sup> task<sup>p925</sup>](#). If there is no such task queue, then jump to the *microtasks* step below.

#### Note

Remember that the [microtask queue<sup>p925</sup>](#) is not a [task queue<sup>p924</sup>](#), so it will not be chosen in this step. However, a [task queue<sup>p924</sup>](#) to which the [microtask task source<sup>p926</sup>](#) is associated might be chosen in this step. In that case, the [task<sup>p925</sup>](#) chosen in the next step was originally a [microtask<sup>p925</sup>](#), but it got moved as part of [spinning the event loop<sup>p929</sup>](#).

2. Let *oldestTask* be the first [runnable<sup>p925</sup> task<sup>p925</sup>](#) in *taskQueue*, and [remove](#) it from *taskQueue*.
3. Set the [event loop<sup>p924</sup>](#)'s [currently running task<sup>p925</sup>](#) to *oldestTask*.
4. Let *taskStartTime* be the [current high resolution time](#).
5. Perform *oldestTask*'s [steps<sup>p925</sup>](#).
6. Set the [event loop<sup>p924</sup>](#)'s [currently running task<sup>p925</sup>](#) back to null.
7. *Microtasks*: [Perform a microtask checkpoint<sup>p929</sup>](#).
8. Let *hasARenderingOpportunity* be false.
9. Let *now* be the [current high resolution time](#). [\[HRT\]<sup>p1267</sup>](#)
10. Report the [task<sup>p925</sup>](#)'s duration by performing the following steps:
  1. Let *top-level browsing contexts* be an empty [set](#).
  2. For each [environment settings object<sup>p897</sup>](#) *settings* of *oldestTask*'s [script evaluation environment settings object set<sup>p925</sup>](#), [append](#) *setting*'s [top-level browsing context<sup>p807</sup>](#) to *top-level browsing contexts*.
  3. [Report long tasks](#), passing in *taskStartTime*, *now* (the end time of the task), *top-level browsing contexts*, and *oldestTask*.
11. **Update the rendering**: if this is a [window event loop<sup>p924</sup>](#), then:
  1. Let *docs* be all [Document<sup>p111</sup>](#) objects whose [relevant agent<sup>p919</sup>](#)'s [event loop<sup>p924</sup>](#) is this event loop, sorted arbitrarily except that the following conditions must be met:
    - Any [Document<sup>p111</sup>](#) *B* whose [browsing context<sup>p804</sup>](#)'s [container document<sup>p806</sup>](#) is *A* must be listed after *A* in the list.
    - If there are two documents *A* and *B* whose [browsing contexts<sup>p804</sup>](#) are both [child browsing contexts<sup>p806</sup>](#) whose [container documents<sup>p806</sup>](#) are another [Document<sup>p111</sup>](#) *C*, then the order of *A* and *B* in the list must match the [shadow-including tree order](#) of their respective [browsing context containers<sup>p806</sup>](#) in *C*'s [node tree](#).

In the steps below that iterate over *docs*, each [Document<sup>p111</sup>](#) must be processed in the order it is found in the list.

2. *Rendering opportunities*: Remove from *docs* all [Document<sup>p111</sup>](#) objects whose [browsing context<sup>p804</sup>](#) do not have a [rendering opportunity<sup>p927</sup>](#).

A [browsing context<sup>p804</sup>](#) has a **rendering opportunity** if the user agent is currently able to present the contents of the [browsing context<sup>p804</sup>](#) to the user, accounting for hardware refresh rate constraints and user agent throttling for performance reasons, but considering content presentable even if it's outside the viewport.

[Browsing context<sup>p804</sup> rendering opportunities<sup>p927</sup>](#) are determined based on hardware constraints such as display refresh rates and other factors such as page performance or whether the page is in the background. Rendering opportunities typically occur at regular intervals.

#### Note

This specification does not mandate any particular model for selecting rendering opportunities. But for example, if the browser is attempting to achieve a 60Hz refresh rate, then rendering opportunities occur at a

maximum of every 60th of a second (about 16.7ms). If the browser finds that a [browsing context<sup>p804</sup>](#) is not able to sustain this rate, it might drop to a more sustainable 30 rendering opportunities per second for that [browsing context<sup>p804</sup>](#), rather than occasionally dropping frames. Similarly, if a [browsing context<sup>p804</sup>](#) is not visible, the user agent might decide to drop that page to a much slower 4 rendering opportunities per second, or even less.

3. If *docs* is not empty, then set *hasARenderingOpportunity* to true.
4. *Unnecessary rendering*: Remove from *docs* all [Document<sup>p111</sup>](#) objects which meet both of the following conditions:
  - The user agent believes that updating the rendering of the [Document<sup>p111</sup>](#)'s [browsing context<sup>p804</sup>](#) would have no visible effect, and
  - The [Document<sup>p111</sup>](#)'s [map of animation frame callbacks<sup>p976</sup>](#) is empty.
5. Remove from *docs* all [Document<sup>p111</sup>](#) objects for which the user agent believes that it's preferable to skip updating the rendering for other reasons.

#### Note

*The step labeled Rendering opportunities prevents the user agent from updating the rendering when it is unable to present new content to the user (there's no [rendering opportunity<sup>p927</sup>](#)).*

*The step labeled Unnecessary rendering prevents the user agent from updating the rendering when there's no new content to draw.*

*This step enables the user agent to prevent the steps below from running for other reasons, for example, to ensure certain [tasks<sup>p925</sup>](#) are executed immediately after each other, with only [microtask checkpoints<sup>p929</sup>](#) interleaved (and without, e.g., [animation frame callbacks<sup>p977</sup>](#) interleaved). Concretely, a user agent might wish to coalesce timer callbacks together, with no intermediate rendering updates.*

6. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [flush autofocus candidates<sup>p776</sup>](#) for that [Document<sup>p111</sup>](#) if its [browsing context<sup>p804</sup>](#) is a [top-level browsing context<sup>p807</sup>](#).
  7. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [run the resize steps](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp. [\[CSSOMVIEW\]<sup>p1265</sup>](#)
  8. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [run the scroll steps](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp. [\[CSSOMVIEW\]<sup>p1265</sup>](#)
  9. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [evaluate media queries and report changes](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp. [\[CSSOMVIEW\]<sup>p1265</sup>](#)
  10. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [update animations and send events](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp. [\[WEBANIMATIONS\]<sup>p1271</sup>](#)
  11. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [run the fullscreen steps](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp. [\[FULLSCREEN\]<sup>p1266</sup>](#)
  12. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [run the animation frame callbacks<sup>p977</sup>](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp.
  13. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, [run the update intersection observations steps](#) for that [Document<sup>p111</sup>](#), passing in *now* as the timestamp. [\[INTERSECTIONOBSERVER\]<sup>p1267</sup>](#)
  14. Invoke the [mark paint timing](#) algorithm for each [Document<sup>p111</sup>](#) object in *docs*.
  15. For each [fully active<sup>p807</sup> Document<sup>p111</sup>](#) in *docs*, update the rendering or user interface of that [Document<sup>p111</sup>](#) and its [browsing context<sup>p804</sup>](#) to reflect the current state.
12. If all of the following are true
- this is a [window event loop<sup>p924</sup>](#)
  - there is no [task<sup>p925</sup>](#) in this [event loop<sup>p924</sup>](#)'s [task queues<sup>p924</sup>](#) whose [document<sup>p925</sup>](#) is [fully active<sup>p807</sup>](#)
  - this [event loop<sup>p924</sup>](#)'s [microtask queue<sup>p925</sup>](#) is [empty](#)
  - *hasARenderingOpportunity* is false

then for each [Window<sup>p816</sup>](#) object whose [relevant agent<sup>p919</sup>](#)'s [event loop<sup>p924</sup>](#) is this event loop, run the [start an idle period algorithm](#), passing the [Window<sup>p816</sup>](#). [\[REQUESTIDLECALLBACK\]<sup>p1269</sup>](#)

13. If this is a [worker event loop](#)<sup>p924</sup>, then:

1. If this [event loop](#)<sup>p924</sup>'s [agent](#)'s single [realm](#)'s [global object](#)<sup>p907</sup> is a [supported](#)<sup>p976</sup> [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> and the user agent believes that it would benefit from having its rendering updated at this time, then:
  1. Let *now* be the [current high resolution time](#). [\[HRT\]](#)<sup>p1267</sup>
  2. [Run the animation frame callbacks](#)<sup>p977</sup> for that [DedicatedWorkerGlobalScope](#)<sup>p1026</sup>, passing in *now* as the timestamp.
  3. Update the rendering of that dedicated worker to reflect the current state.

**Note**

*Similar to the notes for [updating the rendering](#)<sup>p927</sup> in a [window event loop](#)<sup>p924</sup>, a user agent can determine the rate of rendering in the dedicated worker.*

2. If there are no [tasks](#)<sup>p925</sup> in the [event loop](#)<sup>p924</sup>'s [task queues](#)<sup>p924</sup> and the [WorkerGlobalScope](#)<sup>p1024</sup> object's [closing](#)<sup>p1027</sup> flag is true, then destroy the [event loop](#)<sup>p924</sup>, aborting these steps, resuming the [run a worker](#)<sup>p1028</sup> steps described in the [Web workers](#)<sup>p1008</sup> section below.

When a user agent is to **perform a microtask checkpoint**:

1. If the [event loop](#)<sup>p924</sup>'s [performing a microtask checkpoint](#)<sup>p925</sup> is true, then return.
2. Set the [event loop](#)<sup>p924</sup>'s [performing a microtask checkpoint](#)<sup>p925</sup> to true.
3. While the [event loop](#)<sup>p924</sup>'s [microtask queue](#)<sup>p925</sup> is not [empty](#):
  1. Let *oldestMicrotask* be the result of [dequeuing](#) from the [event loop](#)<sup>p924</sup>'s [microtask queue](#)<sup>p925</sup>.
  2. Set the [event loop](#)<sup>p924</sup>'s [currently running task](#)<sup>p925</sup> to *oldestMicrotask*.
  3. Run *oldestMicrotask*.

**Note**

*This might involve invoking scripted callbacks, which eventually calls the [clean up after running script](#)<sup>p907</sup> steps, which call this [perform a microtask checkpoint](#)<sup>p929</sup> algorithm again, which is why we use the [performing a microtask checkpoint](#)<sup>p925</sup> flag to avoid reentrancy.*

4. Set the [event loop](#)<sup>p924</sup>'s [currently running task](#)<sup>p925</sup> back to null.
4. For each [environment settings object](#)<sup>p897</sup> whose [responsible event loop](#)<sup>p897</sup> is this [event loop](#)<sup>p924</sup>, [notify about rejected promises](#)<sup>p922</sup> on that [environment settings object](#)<sup>p897</sup>.
5. [Cleanup Indexed Database transactions](#).
6. Set the [event loop](#)<sup>p924</sup>'s [performing a microtask checkpoint](#)<sup>p925</sup> to false.

When an algorithm running [in parallel](#)<sup>p41</sup> is to **await a stable state**, the user agent must [queue a microtask](#)<sup>p926</sup> that runs the following steps, and must then stop executing (execution of the algorithm resumes when the microtask is run, as described in the following steps):

1. Run the algorithm's **synchronous section**.
2. Resumes execution of the algorithm [in parallel](#)<sup>p41</sup>, if appropriate, as described in the algorithm's steps.

**Note**

*Steps in [synchronous sections](#)<sup>p929</sup> are marked with .*

Algorithm steps that say to **spin the event loop** until a condition *goal* is met are equivalent to substituting in the following algorithm steps:

1. Let *task* be the [event loop](#)<sup>p924</sup>'s [currently running task](#)<sup>p925</sup>.

**Note**

task could be a [microtask<sup>p925</sup>](#).

2. Let *task source* be *task*'s [source<sup>p925</sup>](#).
3. Let *old stack* be a copy of the [JavaScript execution context stack](#).
4. Empty the [JavaScript execution context stack](#).
5. [Perform a microtask checkpoint<sup>p929</sup>](#).

**Note**

If *task* is a [microtask<sup>p925</sup>](#) this step will be a no-op due to [performing a microtask checkpoint<sup>p925</sup>](#) being true.

6. [In parallel<sup>p41</sup>](#):
  1. Wait until the condition *goal* is met.
  2. [Queue a task<sup>p925</sup>](#) on *task source* to:
    1. Replace the [JavaScript execution context stack](#) with *old stack*.
    2. Perform any steps that appear after this [spin the event loop<sup>p929</sup>](#) instance in the original algorithm.

**Note**

*This resumes task.*

7. Stop *task*, allowing whatever algorithm that invoked it to resume.

**Note**

This causes the [event loop<sup>p924</sup>](#)'s main set of steps or the [perform a microtask checkpoint<sup>p929</sup>](#) algorithm to continue.

**Note**

Unlike other algorithms in this and other specifications, which behave similar to programming-language function calls, [spin the event loop<sup>p929</sup>](#) is more like a macro, which saves typing and indentation at the usage site by expanding into a series of steps and operations.

**Example**

An algorithm whose steps are:

1. Do something.
2. [Spin the event loop<sup>p929</sup>](#) until awesomeness happens.
3. Do something else.

is a shorthand which, after "macro expansion", becomes

1. Do something.
2. Let *old stack* be a copy of the [JavaScript execution context stack](#).
3. Empty the [JavaScript execution context stack](#).
4. [Perform a microtask checkpoint<sup>p929</sup>](#).
5. [In parallel<sup>p41</sup>](#):
  1. Wait until awesomeness happens.
  2. [Queue a task<sup>p925</sup>](#) on the task source in which "do something" was done to:
    1. Replace the [JavaScript execution context stack](#) with *old stack*.
    2. Do something else.

## Example

Here is a more full example of the substitution, where the event loop is spun from inside a task that is queued from work in parallel. The version using [spin the event loop](#)<sup>p929</sup>:

1. [In parallel](#)<sup>p41</sup>:
  1. Do parallel thing 1.
  2. [Queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> to:
    1. Do task thing 1.
    2. [Spin the event loop](#)<sup>p929</sup> until awesomeness happens.
    3. Do task thing 2.
  3. Do parallel thing 2.

The fully expanded version:

1. [In parallel](#)<sup>p41</sup>:
  1. Do parallel thing 1.
  2. Let *old stack* be null.
  3. [Queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> to:
    1. Do task thing 1.
    2. Set *old stack* to a copy of the [JavaScript execution context stack](#).
    3. Empty the [JavaScript execution context stack](#).
    4. [Perform a microtask checkpoint](#)<sup>p929</sup>.
  4. Wait until awesomeness happens.
  5. [Queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> to:
    1. Replace the [JavaScript execution context stack](#) with *old stack*.
    2. Do task thing 2.
  6. Do parallel thing 2.

Some of the algorithms in this specification, for historical reasons, require the user agent to **pause** while running a [task](#)<sup>p925</sup> until a condition *goal* is met. This means running the following steps:

1. If necessary, update the rendering or user interface of any [Document](#)<sup>p111</sup> or [browsing context](#)<sup>p804</sup> to reflect the current state.
2. Wait until the condition *goal* is met. While a user agent has a paused [task](#)<sup>p925</sup>, the corresponding [event loop](#)<sup>p924</sup> must not run further [tasks](#)<sup>p925</sup>, and any script in the currently running [task](#)<sup>p925</sup> must block. User agents should remain responsive to user input while paused, however, albeit in a reduced capacity since the [event loop](#)<sup>p924</sup> will not be doing anything.

## ⚠Warning!

**[Pausing](#)<sup>p931</sup> is highly detrimental to the user experience, especially in scenarios where a single [event loop](#)<sup>p924</sup> is shared among multiple documents. User agents are encouraged to experiment with alternatives to [pausing](#)<sup>p931</sup>, such as [spinning the event loop](#)<sup>p929</sup> or even simply proceeding without any kind of suspended execution at all, insofar as it is possible to do so while preserving compatibility with existing content. This specification will happily change if a less-drastic alternative is discovered to be web-compatible.**

***In the interim, implementers should be aware that the variety of alternatives that user agents might experiment with can change subtle aspects of [event loop](#)<sup>p924</sup> behavior, including [task](#)<sup>p925</sup> and [microtask](#)<sup>p925</sup> timing. Implementations should continue experimenting even if doing so causes them to violate the exact semantics implied by the [pause](#)<sup>p931</sup> operation.***

#### 8.1.4.4 Generic task sources §<sup>p93</sup><sub>2</sub>

The following [task sources](#)<sup>p925</sup> are used by a number of mostly unrelated features in this and other specifications.

##### The *DOM manipulation task source*

This [task source](#)<sup>p925</sup> is used for features that react to DOM manipulations, such as things that happen in a non-blocking fashion when an element is [inserted into the document](#)<sup>p43</sup>.

##### The *user interaction task source*

This [task source](#)<sup>p925</sup> is used for features that react to user interaction, for example keyboard or mouse input.

Events sent in response to user input (e.g. [click](#) events) must be fired using [tasks](#)<sup>p925</sup> [queued](#)<sup>p925</sup> with the [user interaction task source](#)<sup>p932</sup>. [[UIEVENTS](#)]<sup>p1270</sup>

##### The *networking task source*

This [task source](#)<sup>p925</sup> is used for features that trigger in response to network activity.

##### The *history traversal task source*

This [task source](#)<sup>p925</sup> is used to queue calls to [history.back\(\)](#)<sup>p839</sup> and similar APIs.

#### 8.1.4.5 Dealing with the event loop from other specifications §<sup>p93</sup><sub>2</sub>

Writing specifications that correctly interact with the [event loop](#)<sup>p924</sup> can be tricky. This is compounded by how this specification uses concurrency-model-independent terminology, so we say things like "[event loop](#)<sup>p924</sup>" and "[in parallel](#)<sup>p41</sup>" instead of using more familiar model-specific terms like "main thread" or "on a background thread".

By default, specification text generally runs on the [event loop](#)<sup>p924</sup>. This falls out from the formal [event loop processing model](#)<sup>p927</sup>, in that you can eventually trace most algorithms back to a [task](#)<sup>p925</sup> [queued](#)<sup>p925</sup> there.

#### Example

The algorithm steps for any JavaScript method will be invoked by author code calling that method. And author code can only be run via queued tasks, usually originating somewhere in the [script processing model](#)<sup>p612</sup>.

From this starting point, the overriding guideline is that any work a specification needs to perform that would otherwise block the [event loop](#)<sup>p924</sup> must instead be performed [in parallel](#)<sup>p41</sup> with it. This includes (but is not limited to):

- performing heavy computation;
- displaying a user-facing prompt;
- performing operations which could require involving outside systems (i.e. "going out of process").

The next complication is that, in algorithm sections that are [in parallel](#)<sup>p41</sup>, you must not create or manipulate objects associated to a specific [JavaScript realm](#), [global](#)<sup>p907</sup>, or [environment settings object](#)<sup>p897</sup>. (Stated in more familiar terms, you must not directly access main-thread artifacts from a background thread.) Doing so would create data races observable to JavaScript code, since after all, your algorithm steps are running [in parallel](#)<sup>p41</sup> to the JavaScript code.

You can, however, manipulate specification-level data structures and values from *Infra*, as those are realm-agnostic. They are never directly exposed to JavaScript without a specific conversion taking place (often [via Web IDL](#)). [[INFRA](#)]<sup>p1267</sup> [[WEBIDL](#)]<sup>p1271</sup>

To affect the world of observable JavaScript objects, then, you must [queue a task](#)<sup>p925</sup> to perform any such manipulations. This ensures your steps are properly interleaved with respect to other things happening on the [event loop](#)<sup>p924</sup>. Furthermore, you must choose a [task source](#)<sup>p925</sup> when [queuing a task](#)<sup>p925</sup>; this governs the relative order of your steps versus others. If you are unsure which [task source](#)<sup>p925</sup> to use, pick one of the [generic task sources](#)<sup>p932</sup> that sounds most applicable.

Most invocations of [queue a task](#)<sup>p925</sup> use the [implied event loop](#)<sup>p926</sup>, i.e., the one that is obvious from context. That is because it is very rare for algorithms to be invoked in contexts involving multiple event loops. (Unlike contexts involving multiple global objects, which happen all the time!) So unless you are writing a specification which, e.g., deals with manipulating [workers](#)<sup>p1008</sup>, you can omit this argument when [queuing a task](#)<sup>p925</sup>.

Putting this all together, we can provide a template for a typical algorithm that needs to do work asynchronously:

1. Do any synchronous setup work, while still on the [event loop](#)<sup>p924</sup>. This may include converting [realm](#)-specific JavaScript values into realm-agnostic specification-level values.
2. Perform a set of potentially-expensive steps [in parallel](#)<sup>p41</sup>, operating entirely on realm-agnostic values, and producing a realm-agnostic result.
3. [Queue a task](#)<sup>p925</sup>, on a specified [task source](#)<sup>p925</sup>, to convert the realm-agnostic result back into observable effects on the observable world of JavaScript objects on the [event loop](#)<sup>p924</sup>.

### Example

The following is an algorithm that "encrypts" a passed-in [list](#) of [scalar value strings](#) *input*, after parsing them as URLs:

1. Let *urls* be an empty [list](#).
2. [For each](#) *string* of *input*:
  1. Let *parsed* be the result of [parsing](#)<sup>p87</sup> *string* relative to the [current settings object](#)<sup>p913</sup>.
  2. If *parsed* is failure, return a promise rejected with a `"SyntaxError"` `DOMException`.
  3. Let *serialized* be the result of applying the [URL serializer](#) to *parsed*.
  4. [Append](#) *serialized* to *urls*.
3. Let *realm* be the [current Realm Record](#).
4. Let *p* be a new promise.
5. Run the following steps [in parallel](#)<sup>p41</sup>:
  1. Let *encryptedURLs* be an empty [list](#).
  2. [For each](#) *url* of *urls*:
    1. Wait 100 milliseconds, so that people think we're doing heavy-duty encryption.
    2. Let *encrypted* be a new [string](#) derived from *url*, whose *n*th [code unit](#) is equal to *url*'s *n*th [code unit](#) plus 13.
    3. [Append](#) *encrypted* to *encryptedURLs*.
  3. [Queue a task](#)<sup>p925</sup>, on the [networking task source](#)<sup>p932</sup>, to perform the following steps:
    1. Let *array* be the result of [converting](#) *encryptedURLs* to a JavaScript array, in *realm*.
    2. Resolve *p* with *array*.
6. Return *p*.

Here are several things to notice about this algorithm:

- It does its URL parsing up front, on the [event loop](#)<sup>p924</sup>, before going to the [in parallel](#)<sup>p41</sup> steps. This is necessary, since parsing depends on the [current settings object](#)<sup>p913</sup>, which would no longer be current after going [in parallel](#)<sup>p41</sup>.
- Alternately, it could have saved a reference to the [current settings object](#)<sup>p913</sup>'s [API base URL](#)<sup>p897</sup> and used it during the [in parallel](#)<sup>p41</sup> steps; that would have been equivalent. However, we recommend instead doing as much work as possible up front, as this example does. Attempting to save the correct values can be error prone; for example, if we'd saved just the [current settings object](#)<sup>p913</sup>, instead of its [API base URL](#)<sup>p897</sup>, there would have been a potential race.
- It implicitly passes a [list](#) of [strings](#) from the initial steps to the [in parallel](#)<sup>p41</sup> steps. This is OK, as both [lists](#) and [strings](#) are [realm](#)-agnostic.
- It performs "expensive computation" (waiting for 100 milliseconds per input URL) during the [in parallel](#)<sup>p41</sup> steps, thus not blocking the main [event loop](#)<sup>p924</sup>.
- Promises, as observable JavaScript objects, are never created and manipulated during the [in parallel](#)<sup>p41</sup> steps. *p* is created before entering those steps, and then is manipulated during a [task](#)<sup>p925</sup> that is [queued](#)<sup>p925</sup> specifically for that purpose.

- The creation of a JavaScript array object also happens during the queued task, and is careful to specify which realm it creates the array in since that is no longer obvious from context.

(On these last two points, see also [w3ctag/promises-guide issue #52](#), [heycam/webidl issue #135](#), and [heycam/webidl issue #371](#), where we are still mulling over the subtleties of the above promise-resolution pattern.)

Another thing to note is that, in the event this algorithm was called from a Web IDL-specified operation taking a `sequence<USVString>`, there was an automatic conversion from `realm`-specific JavaScript objects provided by the author as input, into the `realm`-agnostic `sequence<USVString>` Web IDL type, which we then treat as a `list` of `scalar value strings`. So depending on how your specification is structured, there may be other implicit steps happening on the main `event loop` that play a part in this whole process of getting you ready to go `in parallel`.

## 8.1.5 Events §<sup>p93</sup><sub>4</sub>

### 8.1.5.1 Event handlers §<sup>p93</sup><sub>4</sub>

MDN

Many objects can have **event handlers** specified. These act as non-capture `event listeners` for the object on which they are specified. [\[DOM\]](#)<sup>p1266</sup>

An `event handler`<sup>p934</sup> is a `struct` with two `items`:

- a **value**, which is either null, a callback object, or an `internal raw uncompiled handler`<sup>p939</sup>. The `EventHandler`<sup>p938</sup> callback function type describes how this is exposed to scripts. Initially, an `event handler`<sup>p934</sup>'s `value`<sup>p934</sup> must be set to null.
- a **listener**, which is either null or an `event listener` responsible for running [the event handler processing algorithm](#)<sup>p938</sup>. Initially, an `event handler`<sup>p934</sup>'s `listener`<sup>p934</sup> must be set to null.

Event handlers are exposed in two ways.

The first way, common to all event handlers, is as an `event handler IDL attribute`<sup>p935</sup>.

The second way is as an `event handler content attribute`<sup>p935</sup>. Event handlers on [HTML elements](#)<sup>p43</sup> and some of the event handlers on [Window](#)<sup>p816</sup> objects are exposed in this way.

For both of these two ways, the `event handler`<sup>p934</sup> is exposed through a **name**, which is a string that always starts with "on" and is followed by the name of the event for which the handler is intended.

Most of the time, the object that exposes an `event handler`<sup>p934</sup> is the same as the object on which the corresponding `event listener` is added. However, the `body`<sup>p174</sup> and `frameset`<sup>p1219</sup> elements expose several `event handlers`<sup>p934</sup> that act upon the element's [Window](#)<sup>p816</sup> object, if one exists. In either case, we call the object an `event handler`<sup>p934</sup> acts upon the **target** of that `event handler`<sup>p934</sup>.

To **determine the target of an event handler**, given an `EventTarget` object `eventTarget` on which the `event handler`<sup>p934</sup> is exposed, and an `event handler name`<sup>p934</sup> `name`, the following steps are taken:

1. If `eventTarget` is not a `body`<sup>p174</sup> element or a `frameset`<sup>p1219</sup> element, then return `eventTarget`.
2. If `name` is not the name of an attribute member of the `WindowEventHandlers`<sup>p944</sup> interface mixin and the `Window-reflecting body element event handler set`<sup>p942</sup> does not `contain` `name`, then return `eventTarget`.
3. If `eventTarget`'s `node document` is not an `active document`<sup>p804</sup>, then return null.

#### Note

*This could happen if this object is a `body`<sup>p174</sup> element without a corresponding [Window](#)<sup>p816</sup> object, for example.*

#### Note

*This check does not necessarily prevent `body`<sup>p174</sup> and `frameset`<sup>p1219</sup> elements that are not [the body element](#)<sup>p115</sup> of their `node document` from reaching the next step. In particular, a `body`<sup>p174</sup> element created in an `active document`<sup>p804</sup> (perhaps with `document.createElement()`) but not `connected` will also have its corresponding [Window](#)<sup>p816</sup> object as the `target`<sup>p934</sup> of several `event handlers`<sup>p934</sup> exposed through it.*

- Return *eventTarget*'s [node document](#)'s [relevant global object](#)<sup>p913</sup>.

Each **EventTarget** object that has one or more [event handlers](#)<sup>p934</sup> specified has an associated **event handler map**, which is a [map](#) of strings representing [names](#)<sup>p934</sup> of [event handlers](#)<sup>p934</sup> to [event handlers](#)<sup>p934</sup>.

When an **EventTarget** object that has one or more [event handlers](#)<sup>p934</sup> specified is created, its [event handler map](#)<sup>p935</sup> must be initialized such that it contains an [entry](#) for each [event handler](#)<sup>p934</sup> that has that object as [target](#)<sup>p934</sup>, with [items](#) in those [event handlers](#)<sup>p934</sup> set to their initial values.

#### Note

The order of the [entries](#) of [event handler map](#)<sup>p935</sup> could be arbitrary. It is not observable through any algorithms that operate on the map.

#### Note

[Entries](#) are not created in the [event handler map](#)<sup>p935</sup> of an object for [event handlers](#)<sup>p934</sup> that are merely exposed on that object, but have some other object as their [targets](#)<sup>p934</sup>.

An **event handler IDL attribute** is an IDL attribute for a specific [event handler](#)<sup>p934</sup>. The name of the IDL attribute is the same as the [name](#)<sup>p934</sup> of the [event handler](#)<sup>p934</sup>.

The getter of an [event handler IDL attribute](#)<sup>p935</sup> with name *name*, when called, must run these steps:

- Let *eventTarget* be the result of [determining the target of an event handler](#)<sup>p934</sup> given this object and *name*.
- If *eventTarget* is null, then return null.
- Return the result of [getting the current value of the event handler](#)<sup>p939</sup> given *eventTarget* and *name*.

The setter of an [event handler IDL attribute](#)<sup>p935</sup> with name *name*, when called, must run these steps:

- Let *eventTarget* be the result of [determining the target of an event handler](#)<sup>p934</sup> given this object and *name*.
- If *eventTarget* is null, then return.
- If the given value is null, then [deactivate an event handler](#)<sup>p936</sup> given *eventTarget* and *name*.
- Otherwise:
  - Let *handlerMap* be *eventTarget*'s [event handler map](#)<sup>p935</sup>.
  - Let *eventHandler* be *handlerMap*[*name*].
  - Set *eventHandler*'s [value](#)<sup>p934</sup> to the given value.
  - [Activate an event handler](#)<sup>p936</sup> given *eventTarget* and *name*.

#### Note

Certain [event handler IDL attributes](#)<sup>p935</sup> have additional requirements, in particular the [onmessage](#)<sup>p1004</sup> attribute of [MessagePort](#)<sup>p1002</sup> objects.

An **event handler content attribute** is a content attribute for a specific [event handler](#)<sup>p934</sup>. The name of the content attribute is the same as the [name](#)<sup>p934</sup> of the [event handler](#)<sup>p934</sup>.

[Event handler content attributes](#)<sup>p935</sup>, when specified, must contain valid JavaScript code which, when parsed, would match the [FunctionBody](#) production after [automatic semicolon insertion](#).

The following [attribute change steps](#) are used to synchronize between [event handler content attributes](#)<sup>p935</sup> and [event handlers](#)<sup>p934</sup>:  
[\[DOM\]](#)<sup>p1266</sup>

- If *namespace* is not null, or *localName* is not the name of an [event handler content attribute](#)<sup>p935</sup> on *element*, then return.

2. Let *eventTarget* be the result of [determining the target of an event handler](#)<sup>p934</sup> given *element* and *localName*.
3. If *eventTarget* is null, then return.
4. If *value* is null, then [deactivate an event handler](#)<sup>p936</sup> given *eventTarget* and *localName*.
5. Otherwise:
  1. If the [Should element's inline behavior be blocked by Content Security Policy?](#) algorithm returns "Blocked" when executed upon *element*, "script" attribute, and *value*, then return. [\[CSP\]](#)<sup>p1264</sup>
  2. Let *handlerMap* be *eventTarget*'s [event handler map](#)<sup>p935</sup>.
  3. Let *eventHandler* be *handlerMap*[*localName*].
  4. Let *location* be the script location that triggered the execution of these steps.
  5. Set *eventHandler*'s [value](#)<sup>p934</sup> to the [internal raw uncompiled handler](#)<sup>p939</sup> *value/location*.
  6. [Activate an event handler](#)<sup>p936</sup> given *eventTarget* and *localName*.

#### Note

*Per the DOM Standard, these steps are run even if *oldValue* and *value* are identical (setting an attribute to its current value), but not if *oldValue* and *value* are both null (removing an attribute that doesn't currently exist).* [\[DOM\]](#)<sup>p1266</sup>

To **deactivate an event handler** given an [EventTarget](#) object *eventTarget* and a string *name* that is the [name](#)<sup>p934</sup> of an [event handler](#)<sup>p934</sup>, run these steps:

1. Let *handlerMap* be *eventTarget*'s [event handler map](#)<sup>p935</sup>.
2. Let *eventHandler* be *handlerMap*[*name*].
3. Set *eventHandler*'s [value](#)<sup>p934</sup> to null.
4. Let *listener* be *eventHandler*'s [listener](#)<sup>p934</sup>.
5. If *listener* is not null, then [remove an event listener](#) with *eventTarget* and *listener*.
6. Set *eventHandler*'s [listener](#)<sup>p934</sup> to null.

To **erase all event listeners and handlers** given an [EventTarget](#) object *eventTarget*, run these steps:

1. If *eventTarget* has an associated [event handler map](#)<sup>p935</sup>, then for each *name* → *eventHandler* of *eventTarget*'s associated [event handler map](#)<sup>p935</sup>, [deactivate an event handler](#)<sup>p936</sup> given *eventTarget* and *name*.
2. [Remove all event listeners](#) given *eventTarget*.

#### Note

*This algorithm is used to define [document.open\(\)](#)<sup>p949</sup>.*

To **activate an event handler** given an [EventTarget](#) object *eventTarget* and a string *name* that is the [name](#)<sup>p934</sup> of an [event handler](#)<sup>p934</sup>, run these steps:

1. Let *handlerMap* be *eventTarget*'s [event handler map](#)<sup>p935</sup>.
2. Let *eventHandler* be *handlerMap*[*name*].
3. If *eventHandler*'s [listener](#)<sup>p934</sup> is not null, then return.
4. Let *callback* be the result of creating a Web IDL [EventListener](#) instance representing a reference to a function of one argument that executes the steps of [the event handler processing algorithm](#)<sup>p938</sup>, given *eventTarget*, *name*, and its argument.

The [EventListener](#)'s [callback context](#) can be arbitrary; it does not impact the steps of [the event handler processing algorithm](#)<sup>p938</sup>. [\[DOM\]](#)<sup>p1266</sup>

**Note**

The callback is emphatically not the [event handler<sup>p934</sup>](#) itself. Every event handler ends up registering the same callback, the algorithm defined below, which takes care of invoking the right code, and processing the code's return value.

- Let `listener` be a new [event listener](#) whose `type` is the **event handler event type** corresponding to `eventHandler` and `callback` is `callback`.

**Note**

To be clear, an [event listener](#) is different from an [EventListener](#).

- [Add an event listener](#) with `eventTarget` and `listener`.
- Set `eventHandler`'s [listener<sup>p934</sup>](#) to `listener`.

**Note**

The event listener registration happens only if the [event handler<sup>p934</sup>](#)'s [value<sup>p934</sup>](#) is being set to non-null, and the [event handler<sup>p934</sup>](#) is not already activated. Since listeners are called in the order they were registered, assuming no [deactivation<sup>p936</sup>](#) occurred, the order of event listeners for a particular event type will always be:

- the event listeners registered with [addEventListener\(\)](#) before the first time the [event handler<sup>p934</sup>](#)'s [value<sup>p934</sup>](#) was set to non-null
- then the callback to which it is currently set, if any
- and finally the event listeners registered with [addEventListener\(\)](#) after the first time the [event handler<sup>p934</sup>](#)'s [value<sup>p934</sup>](#) was set to non-null.

**Example**

This example demonstrates the order in which event listeners are invoked. If the button in this example is clicked by the user, the page will show four alerts, with the text "ONE", "TWO", "THREE", and "FOUR" respectively.

```
<button id="test">Start Demo</button>
<script>
  var button = document.getElementById('test');
  button.addEventListener('click', function () { alert('ONE') }, false);
  button.setAttribute('onclick', "alert('NOT CALLED')"); // event handler listener is registered
  here
  button.addEventListener('click', function () { alert('THREE') }, false);
  button.onclick = function () { alert('TWO') };
  button.addEventListener('click', function () { alert('FOUR') }, false);
</script>
```

However, in the following example, the event handler is [deactivated<sup>p936</sup>](#) after its initial activation (and its event listener is removed), before being reactivated at a later time. The page will show five alerts with "ONE", "TWO", "THREE", "FOUR", and "FIVE" respectively, in order.

```
<button id="test">Start Demo</button>
<script>
  var button = document.getElementById('test');
  button.addEventListener('click', function () { alert('ONE') }, false);
  button.setAttribute('onclick', "alert('NOT CALLED')"); // event handler is activated here
  button.addEventListener('click', function () { alert('TWO') }, false);
  button.onclick = null; // but deactivated here
  button.addEventListener('click', function () { alert('THREE') }, false);
  button.onclick = function () { alert('FOUR') }; // and re-activated here
  button.addEventListener('click', function () { alert('FIVE') }, false);
</script>
```

**Note**

The interfaces implemented by the event object do not influence whether an [event handler<sup>p934</sup>](#) is triggered or not.

The **event handler processing algorithm** for an [EventTarget](#) object *eventTarget*, a string *name* representing the [name](#)<sup>p934</sup> of an [event handler](#)<sup>p934</sup>, and an [Event](#) object *event* is as follows:

1. Let *callback* be the result of [getting the current value of the event handler](#)<sup>p939</sup> given *eventTarget* and *name*.
2. If *callback* is null, then return.
3. Let *special error event handling* be true if *event* is an [ErrorEvent](#)<sup>p922</sup> object, *event*'s *type* is [error](#)<sup>p1260</sup>, and *event*'s [currentTarget](#) implements the [WindowOrWorkerGlobalScope](#)<sup>p946</sup> mixin. Otherwise, let *special error event handling* be false.
4. Process the [Event](#) object *event* as follows:

↪ **If *special error event handling* is true**

[Invoke](#) *callback* with five arguments, the first one having the value of *event*'s [message](#)<sup>p922</sup> attribute, the second having the value of *event*'s [filename](#)<sup>p922</sup> attribute, the third having the value of *event*'s [lineno](#)<sup>p922</sup> attribute, the fourth having the value of *event*'s [colno](#)<sup>p922</sup> attribute, the fifth having the value of *event*'s [error](#)<sup>p922</sup> attribute, and with the [callback this value](#) set to *event*'s [currentTarget](#). Let *return value* be the callback's return value. [\[WEBIDL\]](#)<sup>p1271</sup>

↪ **Otherwise**

[Invoke](#) *callback* with one argument, the value of which is the [Event](#) object *event*, with the [callback this value](#) set to *event*'s [currentTarget](#). Let *return value* be the callback's return value. [\[WEBIDL\]](#)<sup>p1271</sup>

If an exception gets thrown by the callback, end these steps and allow the exception to propagate. (It will propagate to the [DOM event dispatch logic](#), which will then [report the exception](#)<sup>p922</sup>.)

5. Process *return value* as follows:

↪ **If *event* is a [BeforeUnloadEvent](#)<sup>p870</sup> object and *event*'s *type* is [beforeunload](#)<sup>p1260</sup>**

**Note**

*In this case, the [event handler IDL attribute](#)<sup>p935</sup>'s type will be [OnBeforeUnloadEventHandler](#)<sup>p939</sup>, so return value will have been coerced into either null or a [DOMString](#).*

If *return value* is not null, then:

1. Set *event*'s [canceled flag](#).
2. If *event*'s [returnValue](#)<sup>p870</sup> attribute's value is the empty string, then set *event*'s [returnValue](#)<sup>p870</sup> attribute's value to *return value*.

↪ **If *special error event handling* is true**

If *return value* is true, then set *event*'s [canceled flag](#).

↪ **Otherwise**

If *return value* is false, then set *event*'s [canceled flag](#).

**Note**

*If we've gotten to this "Otherwise" clause because *event*'s *type* is [beforeunload](#)<sup>p1260</sup> but *event* is not a [BeforeUnloadEvent](#)<sup>p870</sup> object, then return value will never be false, since in such cases return value will have been coerced into either null or a [DOMString](#).*

The [EventHandler](#)<sup>p938</sup> callback function type represents a callback used for event handlers. It is represented in Web IDL as follows:

```
IDL [LegacyTreatNonObjectAsNull]
callback EventHandlerNonNull = any (Event event);
typedef EventHandlerNonNull? EventHandler;
```

**Note**

*In JavaScript, any [Function](#) object implements this interface.*

## Example

For example, the following document fragment:

```
<body onload="alert(this)" onclick="alert(this)">
```

...leads to an alert saying "[object Window]" when the document is loaded, and an alert saying "[object HTMLBodyElement]" whenever the user clicks something in the page.

## Note

The return value of the function affects whether the event is canceled or not: as described above, if the return value is false, the event is canceled.

There are two exceptions in the platform, for historical reasons:

- The [onerror](#)<sup>p942</sup> handlers on global objects, where returning true cancels the event
- The [onbeforeunload](#)<sup>p943</sup> handler, where returning any non-null and non-undefined value will cancel the event.

For historical reasons, the [onerror](#)<sup>p942</sup> handler has different arguments:

```
IDL [LegacyTreatNonObjectAsNull]
callback OnErrorEventHandlerNonNull = any ((Event or DOMString) event, optional DOMString source,
optional unsigned long lineno, optional unsigned long colno, optional any error);
typedef OnErrorEventHandlerNonNull? OnErrorEventHandler;
```

## Example

```
window.onerror = (message, source, lineno, colno, error) => { ... };
```

Similarly, the [onbeforeunload](#)<sup>p943</sup> handler has a different return value:

```
IDL [LegacyTreatNonObjectAsNull]
callback OnBeforeUnloadEventHandlerNonNull = DOMString? (Event event);
typedef OnBeforeUnloadEventHandlerNonNull? OnBeforeUnloadEventHandler;
```

An **internal raw uncompiled handler** is a tuple with the following information:

- An uncompiled script body
- A location where the script body originated, in case an error needs to be reported

When the user agent is to **get the current value of the event handler** given an [EventTarget](#) object *eventTarget* and a string *name* that is the [name](#)<sup>p934</sup> of an [event handler](#)<sup>p934</sup>, it must run these steps:

1. Let *handlerMap* be *eventTarget*'s [event handler map](#)<sup>p935</sup>.
2. Let *eventHandler* be *handlerMap*[*name*].
3. If *eventHandler*'s [value](#)<sup>p934</sup> is an [internal raw uncompiled handler](#)<sup>p939</sup>, then:
  1. If *eventTarget* is an element, then let *element* be *eventTarget*, and *document* be *element*'s [node document](#). Otherwise, *eventTarget* is a [Window](#)<sup>p816</sup> object, let *element* be null, and *document* be *eventTarget*'s [associated Document](#)<sup>p818</sup>.
  2. If [scripting is disabled](#)<sup>p895</sup> for *document*, then return null.
  3. Let *body* be the uncompiled script body in *eventHandler*'s [value](#)<sup>p934</sup>.
  4. Let *location* be the location where the script body originated, as given by *eventHandler*'s [value](#)<sup>p934</sup>.
  5. If *element* is not null and *element* has a [form owner](#)<sup>p559</sup>, let *form owner* be that [form owner](#)<sup>p559</sup>. Otherwise, let *form owner* be null.

6. Let *settings object* be the [relevant settings object](#)<sup>p913</sup> of *document*.
7. If *body* is not parsable as [FunctionBody](#) or if parsing detects an [early error](#), then follow these substeps:
  1. Set *eventHandler*'s [value](#)<sup>p934</sup> to null.

**Note**

This does not [deactivate](#)<sup>p936</sup> the event handler, which additionally [removes](#) the event handler's [listener](#)<sup>p934</sup> (if present).

2. [Report the error](#)<sup>p921</sup> for the appropriate [script](#)<sup>p895</sup> and with the appropriate position (line number and column number) given by *location*, using *settings object*'s [global object](#)<sup>p908</sup>. If the error is still [not handled](#)<sup>p921</sup> after this, then the error may be reported to a developer console.
  3. Return null.
8. Push *settings object*'s [realm execution context](#)<sup>p897</sup> onto the [JavaScript execution context stack](#); it is now the [running JavaScript execution context](#).

**Note**

This is necessary so the subsequent invocation of [OrdinaryFunctionCreate](#) takes place in the correct [JavaScript Realm](#).

9. Let *function* be the result of calling [OrdinaryFunctionCreate](#), with arguments:

**functionPrototype**

[%FunctionPrototype%](#)

**sourceText**

- ↪ If *name* is [onerror](#)<sup>p942</sup> and *eventTarget* is a [Window](#)<sup>p816</sup> object

The string formed by concatenating "function ", *name*, "(event, source, lineno, colno, error) {" , U+000A LF, *body*, U+000A LF, and "}".

- ↪ Otherwise

The string formed by concatenating "function ", *name*, "(event) {" , U+000A LF, *body*, U+000A LF, and "}".

**ParameterList**

- ↪ If *name* is [onerror](#)<sup>p942</sup> and *eventTarget* is a [Window](#)<sup>p816</sup> object

Let the function have five arguments, named event, source, lineno, colno, and error.

- ↪ Otherwise

Let the function have a single argument called event.

**Body**

The result of parsing *body* above.

**thisMode**

non-lexical-this

**Scope**

1. Let *realm* be *settings object*'s [Realm](#)<sup>p908</sup>.
  2. Let *scope* be *realm*.[[GlobalEnv]].
  3. If *eventHandler* is an element's [event handler](#)<sup>p934</sup>, then set *scope* to [NewObjectEnvironment](#)(*document*, *scope*).  
(Otherwise, *eventHandler* is a [Window](#)<sup>p816</sup> object's [event handler](#)<sup>p934</sup>.)
  4. If *form owner* is not null, then set *scope* to [NewObjectEnvironment](#)(*form owner*, *scope*).
  5. If *element* is not null, then set *scope* to [NewObjectEnvironment](#)(*element*, *scope*).
  6. Return *scope*.
10. Remove *settings object*'s [realm execution context](#)<sup>p897</sup> from the [JavaScript execution context stack](#).
  11. Set *function*.[[ScriptOrModule]] to null.

**Note**

This is done because the default behavior, of associating the created function with the nearest [script](#)<sup>p895</sup> on the stack, can lead to path-dependent results. For example, an event handler which is first invoked by user interaction would end up with null `[[ScriptOrModule]]` (since then this algorithm would be first invoked when the [active script](#)<sup>p896</sup> is null), whereas one that is first invoked by dispatching an event from script would have its `[[ScriptOrModule]]` set to that script.

Instead, we just always set `[[ScriptOrModule]]` to null. This is more intuitive anyway; the idea that the first script which dispatches an event is somehow responsible for the event handler code is dubious.

In practice, this only affects the resolution of relative URLs via `import()`, which consult the [base URL](#)<sup>p896</sup> of the associated script. Nulling out `[[ScriptOrModule]]` means that [HostResolveImportedModule](#)<sup>p917</sup> and [HostImportModuleDynamically](#)<sup>p918</sup> will fall back to the [current settings object](#)<sup>p913</sup>'s [API base URL](#)<sup>p897</sup>.

12. Set `eventHandler`'s [value](#)<sup>p934</sup> to the result of creating a Web IDL [EventHandler](#)<sup>p938</sup> callback function object whose object reference is `function` and whose [callback context](#) is `settings object`.
4. Return `eventHandler`'s [value](#)<sup>p934</sup>.

### 8.1.5.2 Event handlers on elements, [Document](#)<sup>p111</sup> objects, and [Window](#)<sup>p816</sup> objects § p94 1

The following are the [event handlers](#)<sup>p934</sup> (and their corresponding [event handler event types](#)<sup>p937</sup>) that must be supported by all [HTML elements](#)<sup>p43</sup>, as both [event handler content attributes](#)<sup>p935</sup> and [event handler IDL attributes](#)<sup>p935</sup>; and that must be supported by all [Document](#)<sup>p111</sup> and [Window](#)<sup>p816</sup> objects, as [event handler IDL attributes](#)<sup>p935</sup>:

<a href="#">Event handler</a> <sup>p934</sup>	<a href="#">Event handler event type</a> <sup>p937</sup>

### 8.1.5.3 Event firing § p94

Certain operations and methods are defined as firing events on elements. For example, the [click\(\)](#) p762 method on the [HTMLElement](#) p121 interface is defined as firing a [click](#) event on the element. [\[UIEVENTS\]](#) p1270

**Firing a synthetic mouse event named *e*** at *target*, with an optional *not trusted flag*, means running these steps:

1. Let *event* be the result of [creating an event](#) using [MouseEvent](#).
2. Initialize *event*'s [type](#) attribute to *e*.
3. Initialize *event*'s [bubbles](#) and [cancelable](#) attributes to true.
4. Set *event*'s [composed flag](#).
5. If the *not trusted flag* is set, initialize *event*'s [isTrusted](#) attribute to false.
6. Initialize *event*'s [ctrlKey](#), [shiftKey](#), [altKey](#), and [metaKey](#) attributes according to the current state of the key input device, if any (false for any keys that are not available).
7. Initialize *event*'s [view](#) attribute to *target*'s [node document](#)'s [Window](#) p816 object, if any, and null otherwise.
8. *event*'s [getModifierState\(\)](#) method is to return values appropriately describing the current state of the key input device.
9. Return the result of [dispatching](#) *event* at *target*.

**Firing a [click](#) event** at *target* means [firing a synthetic mouse event named \[click\]\(#\)](#) p945 at *target*.

## 8.2 The [WindowOrWorkerGlobalScope](#) p946 **mixin** § p94

The [WindowOrWorkerGlobalScope](#) p946 mixin is for use of APIs that are to be exposed on [Window](#) p816 and [WorkerGlobalScope](#) p1024 objects.

### Note

Other standards are encouraged to further extend it using partial interface mixin [WindowOrWorkerGlobalScope](#) p946 { ... }; along with an appropriate reference.

```
IDL typedef (DOMString or Function) TimerHandler;
```

```

interface mixin WindowOrWorkerGlobalScope {
  [Replaceable] readonly attribute USVString origin;

  // base64 utility methods
  DOMString btoa(DOMString data);
  ByteString atob(DOMString data);

  // timers
  long setTimeout(TimerHandler handler, optional long timeout = 0, any... arguments);
  void clearTimeout(optional long handle = 0);
  long setInterval(TimerHandler handler, optional long timeout = 0, any... arguments);
  void clearInterval(optional long handle = 0);

  // microtask queuing
  void queueMicrotask(VoidFunction callback);

  // ImageBitmap
  Promise<ImageBitmap> createImageBitmap(ImageBitmapSource image, optional ImageBitmapOptions options = {});
  Promise<ImageBitmap> createImageBitmap(ImageBitmapSource image, long sx, long sy, long sw, long sh, optional ImageBitmapOptions options = {});
};
Window includes WindowOrWorkerGlobalScope;
WorkerGlobalScope includes WindowOrWorkerGlobalScope;

```

For web developers (non-normative)

**origin = self . origin**<sup>p946</sup>

Returns the global object's [origin](#)<sup>p829</sup>, serialized as string.

Example

Developers are strongly encouraged to use `self.origin` over `location.origin`. The former returns the [origin](#)<sup>p829</sup> of the environment, the latter of the URL of the environment. Imagine the following script executing in a document on `https://stargate.example/`:

```

var frame = document.createElement("iframe")
frame.onload = function() {
  var frameWin = frame.contentWindow
  console.log(frameWin.location.origin) // "null"
  console.log(frameWin.origin) // "https://stargate.example"
}
document.body.appendChild(frame)

```

`self.origin` is a more reliable security indicator.

The **origin** attribute's getter must return this object's [relevant settings object](#)<sup>p913</sup>'s [origin](#)<sup>p897</sup>, [serialized](#)<sup>p830</sup>.

MDN

### 8.3 Base64 utility methods

§<sup>p94</sup>  
6

The [atob\(\)](#)<sup>p947</sup> and [btoa\(\)](#)<sup>p947</sup> methods allow developers to transform content to and from the base64 encoding.

Note

*In these APIs, for mnemonic purposes, the "b" can be considered to stand for "binary", and the "a" for "ASCII". In practice, though, for primarily historical reasons, both the input and output of these functions are Unicode strings.*

For web developers (non-normative)

**result = self . btoa<sup>p947</sup>( data )**

Takes the input data, in the form of a Unicode string containing only characters in the range U+0000 to U+00FF, each representing a binary byte with values 0x00 to 0xFF respectively, and converts it to its base64 representation, which it returns.

Throws an ["InvalidCharacterError" DOMException](#) exception if the input string contains any out-of-range characters.

**result = self . atob<sup>p947</sup>( data )**

Takes the input data, in the form of a Unicode string containing base64-encoded binary data, decodes it, and returns a string consisting of characters in the range U+0000 to U+00FF, each representing a binary byte with values 0x00 to 0xFF respectively, corresponding to that binary data.

Throws an ["InvalidCharacterError" DOMException](#) if the input string is not valid base64 data.

The **btoa(data)** method must throw an ["InvalidCharacterError" DOMException](#) if *data* contains any character whose code point is greater than U+00FF. Otherwise, the user agent must convert *data* to a byte sequence whose *n*th byte is the eight-bit representation of the *n*th code point of *data*, and then must apply [forgiving-base64 encode](#) to that byte sequence and return the result.

The **atob(data)** method, when invoked, must run the following steps:

1. Let *decodedData* be the result of running [forgiving-base64 decode](#) on *data*.
2. If *decodedData* is failure, then throw an ["InvalidCharacterError" DOMException](#).
3. Return *decodedData*.

## 8.4 Dynamic markup insertion <sup>§p94</sup><sub>7</sub>

### Note

APIs for dynamically inserting markup into the document interact with the parser, and thus their behavior varies depending on whether they are used with [HTML documents](#) (and the [HTML parser<sup>p1059</sup>](#)) or [XML documents](#) (and the [XML parser<sup>p1168</sup>](#)).

[Document<sup>p111</sup>](#) objects have a **throw-on-dynamic-markup-insertion counter**, which is used in conjunction with the [create an element for the token<sup>p1107</sup>](#) algorithm to prevent [custom element constructors<sup>p696</sup>](#) from being able to use [document.open\(\)<sup>p949</sup>](#), [document.close\(\)<sup>p949</sup>](#), and [document.write\(\)<sup>p950</sup>](#) when they are invoked by the parser. Initially, the counter must be set to zero.

### 8.4.1 Opening the input stream <sup>§p94</sup><sub>7</sub>

#### For web developers (non-normative)

**document = document . open<sup>p949</sup>( )**

Causes the [Document<sup>p111</sup>](#) to be replaced in-place, as if it was a new [Document<sup>p111</sup>](#) object, but reusing the previous object, which is then returned.

The resulting [Document<sup>p111</sup>](#) has an HTML parser associated with it, which can be given data to parse using [document.write\(\)<sup>p950</sup>](#).

The method has no effect if the [Document<sup>p111</sup>](#) is still being parsed.

Throws an ["InvalidStateError" DOMException](#) if the [Document<sup>p111</sup>](#) is an [XML document](#).

Throws an ["InvalidStateError" DOMException](#) if the parser is currently executing a [custom element constructor<sup>p696</sup>](#).

**window = document . open<sup>p949</sup>( url, name, features )**

Works like the [window.open\(\)<sup>p819</sup>](#) method.

[Document<sup>p111</sup>](#) objects have an **ignore-opens-during-unload counter**, which is used to prevent scripts from invoking the [document.open\(\)<sup>p949</sup>](#) method (directly or indirectly) while the document is [being unloaded<sup>p869</sup>](#). Initially, the counter must be set to zero.

[Document<sup>p111</sup>](#) objects have an **active parser was aborted** boolean, which is used to prevent scripts from invoking the

`document.open()`<sup>p949</sup> and `document.write()`<sup>p950</sup> methods (directly or indirectly) after the document's `active parser`<sup>p114</sup> has been aborted. It is initially false.

The **document open steps**, given a *document*, are as follows:

1. If *document* is an [XML document](#), then throw an `"InvalidStateError" DOMException` exception.
2. If *document*'s `throw-on-dynamic-markup-insertion counter`<sup>p947</sup> is greater than 0, then throw an `"InvalidStateError" DOMException`.
3. Let *entryDocument* be the [entry global object](#)<sup>p910</sup>'s [associated Document](#)<sup>p818</sup>.
4. If *document*'s `origin`<sup>p829</sup> is not [same origin](#)<sup>p830</sup> to *entryDocument*'s `origin`<sup>p829</sup>, then throw a `"SecurityError" DOMException`.
5. If *document* has an `active parser`<sup>p114</sup> whose `script nesting level`<sup>p1061</sup> is greater than 0, then return *document*.

**Note**

*This basically causes `document.open()`<sup>p949</sup> to be ignored when it's called in an inline script found during parsing, while still letting it have an effect when called from a non-parser task such as a timer callback or event handler.*

6. Similarly, if *document*'s `ignore-opens-during-unload counter`<sup>p947</sup> is greater than 0, then return *document*.

**Note**

*This basically causes `document.open()`<sup>p949</sup> to be ignored when it's called from a `beforeunload`<sup>p1260</sup>, `pagehide`<sup>p1261</sup>, or `unload`<sup>p1261</sup> event handler while the `Document`<sup>p111</sup> is being unloaded.*

7. If *document*'s `active parser was aborted`<sup>p947</sup> is true, then return *document*.

**Note**

*This notably causes `document.open()`<sup>p949</sup> to be ignored if it is called after a `navigation`<sup>p852</sup> has started, but only during the initial parse. See [issue #4723](#) for more background.*

8. If *document*'s `browsing context`<sup>p804</sup> is non-null and there is an existing attempt to `navigate`<sup>p852</sup> *document*'s `browsing context`<sup>p804</sup>, then `stop document loading`<sup>p871</sup> given *document*.

[Issue #3447](#) looks into the distinction between an ongoing instance of the `navigate`<sup>p852</sup> algorithm versus tasks to `navigate`<sup>p852</sup> that are still queued. For the purpose of implementing this step, both an ongoing instance of the `navigate`<sup>p852</sup> algorithm and tasks queued to `navigate`<sup>p852</sup> should be counted towards "an existing attempt to `navigate`<sup>p852</sup>," at least until that issue is resolved.

9. For each [shadow-including inclusive descendant node](#) of *document*, `erase all event listeners and handlers`<sup>p936</sup> given *node*.
10. If *document* is the [associated Document](#)<sup>p818</sup> of *document*'s [relevant global object](#)<sup>p913</sup>, then `erase all event listeners and handlers`<sup>p936</sup> given *document*'s [relevant global object](#)<sup>p913</sup>.
11. `Replace all` with null within *document*, without firing any mutation events.
12. If *document* is `fully active`<sup>p807</sup>, then:
  1. Let *newURL* be a copy of *entryDocument*'s `URL`.
  2. If *entryDocument* is not *document*, then set *newURL*'s `fragment` to null.
  3. Run the `URL and history update steps`<sup>p840</sup> with *document* and *newURL*.
13. If *document*'s `iframe load in progress`<sup>p359</sup> flag is set, then set *document*'s `mute iframe load`<sup>p359</sup> flag.
14. Set *document* to `no-quirks mode`.
15. Create a new `HTML parser`<sup>p1059</sup> and associate it with *document*. This is a **script-created parser** (meaning that it can be closed by the `document.open()`<sup>p949</sup> and `document.close()`<sup>p949</sup> methods, and that the tokenizer will wait for an explicit call to `document.close()`<sup>p949</sup> before emitting an end-of-file token). The encoding `confidence`<sup>p1066</sup> is *irrelevant*.
16. Set the `current document readiness`<sup>p114</sup> of *document* to "loading".
17. Finally, set the `insertion point`<sup>p1072</sup> to point at just before the end of the `input stream`<sup>p1071</sup> (which at this point will be empty).

18. Return *document*.

#### Note

The [document open steps](#)<sup>p948</sup> do not affect whether a [Document](#)<sup>p111</sup> is [ready for post-load tasks](#)<sup>p1145</sup> or [completely loaded](#)<sup>p1145</sup>.

The `open(unused1, unused2)` method must return the result of running the [document open steps](#)<sup>p948</sup> with this [Document](#)<sup>p111</sup> object.

#### Note

The *unused1* and *unused2* arguments are ignored, but kept in the IDL to allow code that calls the function with one or two arguments to continue working. They are necessary due to Web IDL [overload resolution algorithm](#) rules, which would throw a [TypeError](#) exception for such calls had the arguments not been there. [heycam/webidl issue #581](#) investigates changing the algorithm to allow for their removal. [\[WEBIDL\]](#)<sup>p1271</sup>

The `open(url, name, features)` method must run these steps:

1. If this [Document](#)<sup>p111</sup> object is not an [active document](#)<sup>p804</sup>, then throw an ["InvalidAccessError" DOMException](#) exception.
2. Return the result of running the [window open steps](#)<sup>p818</sup> with *url*, *name*, and *features*.

### 8.4.2 Closing the input stream § p94

For web developers (non-normative)

#### `document.close()`

Closes the input stream that was opened by the [document.open\(\)](#)<sup>p949</sup> method.

Throws an ["InvalidStateError" DOMException](#) if the [Document](#)<sup>p111</sup> is an XML document.

Throws an ["InvalidStateError" DOMException](#) if the parser is currently executing a [custom element constructor](#)<sup>p696</sup>.

The `close()` method must run the following steps:

1. If the [Document](#)<sup>p111</sup> object is an XML document, then throw an ["InvalidStateError" DOMException](#).
2. If the [Document](#)<sup>p111</sup> object's [throw-on-dynamic-markup-insertion counter](#)<sup>p947</sup> is greater than zero, then throw an ["InvalidStateError" DOMException](#).
3. If there is no [script-created parser](#)<sup>p948</sup> associated with the document, then return.
4. Insert an [explicit "EOF" character](#)<sup>p1072</sup> at the end of the parser's [input stream](#)<sup>p1071</sup>.
5. If there is a [pending parsing-blocking script](#)<sup>p616</sup>, then return.
6. Run the tokenizer, processing resulting tokens as they are emitted, and stopping when the tokenizer reaches the [explicit "EOF" character](#)<sup>p1072</sup> or [spins the event loop](#)<sup>p929</sup>.

### 8.4.3 `document.write()` § p950

For web developers (non-normative)

#### `document.write(text...)`

In general, adds the given string(s) to the [Document](#)<sup>p111</sup>'s input stream.

#### ⚠Warning!

**This method has very idiosyncratic behavior. In some cases, this method can affect the state of the HTML parser<sup>p1059</sup> while the parser is running, resulting in a DOM that does not correspond to the source of the document (e.g. if the string written is the string "`<plaintext>`" or "`<!--`"). In other cases, the call can clear the current page first, as if [document.open\(\)](#)<sup>p949</sup> had been called. In yet more cases, the method is simply ignored, or throws an exception. Users agents are explicitly allowed to avoid executing script elements inserted via this method<sup>p1116</sup>. And to make matters even worse, the exact behavior of this method can in some cases be**

**dependent on network latency, which can lead to failures that are very hard to debug. For all these reasons, use of this method is strongly discouraged.**

Throws an `"InvalidStateError"` `DOMException` when invoked on [XML documents](#).

Throws an `"InvalidStateError"` `DOMException` if the parser is currently executing a [custom element constructor](#)<sup>p696</sup>.

`Document`<sup>p111</sup> objects have an **ignore-destructive-writes counter**, which is used in conjunction with the processing of `script`<sup>p607</sup> elements to prevent external scripts from being able to use `document.write()`<sup>p950</sup> to blow away the document by implicitly calling `document.open()`<sup>p949</sup>. Initially, the counter must be set to zero.

The **document write steps**, given a `Document`<sup>p111</sup> object `document` and a string `input`, are as follows:

1. If `document` is an [XML document](#), then throw an `"InvalidStateError"` `DOMException`.
2. If `document`'s [throw-on-dynamic-markup-insertion counter](#)<sup>p947</sup> is greater than 0, then throw an `"InvalidStateError"` `DOMException`.
3. If `document`'s [active parser was aborted](#)<sup>p947</sup> is true, then return.
4. If the [insertion point](#)<sup>p1072</sup> is undefined, then:
  1. If `document`'s [ignore-opens-during-unload counter](#)<sup>p947</sup> is greater than 0 or `document`'s [ignore-destructive-writes counter](#)<sup>p950</sup> is greater than 0, then return.
  2. Run the [document open steps](#)<sup>p948</sup> with `document`.
5. Insert `input` into the [input stream](#)<sup>p1071</sup> just before the [insertion point](#)<sup>p1072</sup>.
6. If there is no [pending parsing-blocking script](#)<sup>p616</sup>, have the [HTML parser](#)<sup>p1059</sup> process `input`, one code point at a time, processing resulting tokens as they are emitted, and stopping when the tokenizer reaches the insertion point or when the processing of the tokenizer is aborted by the tree construction stage (this can happen if a `script`<sup>p607</sup> end tag token is emitted by the tokenizer).

#### Note

If the `document.write()`<sup>p950</sup> method was called from script executing inline (i.e. executing because the parser parsed a set of `script`<sup>p607</sup> tags), then this is a [reentrant invocation of the parser](#)<sup>p1060</sup>. If the [parser pause flag](#)<sup>p1061</sup> is set, the tokenizer will abort immediately and no HTML will be parsed, per the tokenizer's [parser pause flag check](#)<sup>p1077</sup>.

The `document.write(...)` method, when invoked, must run the [document write steps](#)<sup>p950</sup> with this `Document`<sup>p111</sup> object and a string DN that is the concatenation of all arguments passed.

### 8.4.4 `document.writeln()`<sup>p950</sup> §<sup>p95</sup><sub>0</sub>

#### For web developers (non-normative)

##### `document.writeln`<sup>p950</sup>(`text...`)

Adds the given string(s) to the `Document`<sup>p111</sup>'s input stream, followed by a newline character. If necessary, calls the `open()`<sup>p949</sup> method implicitly first.

Throws an `"InvalidStateError"` `DOMException` when invoked on [XML documents](#).

Throws an `"InvalidStateError"` `DOMException` if the parser is currently executing a [custom element constructor](#)<sup>p696</sup>.

The `document.writeln(...)` method, when invoked, must run the [document write steps](#)<sup>p950</sup> with this `Document`<sup>p111</sup> object and a string DN that is the concatenation of all arguments passed and U+000A LINE FEED.

## 8.5 DOM parsing §<sup>p95</sup><sub>1</sub>

The `DOMParserp951` interface allows authors to create new `Documentp111` objects by parsing strings, as either HTML or XML.

For web developers (non-normative)

**`parser = new DOMParserp951()`**

Constructs a new `DOMParserp951` object.

**`document = parser.parseFromStringp951( string, type )`**

Parses `string` using either the HTML or XML parser, according to `type`, and returns the resulting `Documentp111`. `type` can be `"text/htmlp1231"` (which will invoke the HTML parser), or any of `"text/xmlp1263"`, `"application/xmlp1262"`, `"application/xhtml+xmlp1233"`, or `"image/svg+xmlp1262"` (which will invoke the XML parser).

For the XML parser, if `string` can be parsed, then the returned `Documentp111` will contain elements describing the resulting error.

Note that `scriptp607` elements are not evaluated during parsing, and the resulting document's `encoding` will always be `UTF-8`.

Values other than the above for `type` will cause a `TypeError` exception to be thrown.

### Note

The design of `DOMParserp951`, as a class that needs to be constructed and then have its `parseFromString()p951` method called, is an unfortunate historical artifact. If we were designing this functionality today it would be a standalone function.

```
IDL [Exposed=Window]
interface DOMParser {
    constructor();

    [NewObject] Document parseFromString(DOMString string, DOMParserSupportedType type);
};

enum DOMParserSupportedType {
    "text/html",
    "text/xml",
    "application/xml",
    "application/xhtml+xml",
    "image/svg+xml"
};
```

The `DOMParser()` constructor steps are to do nothing.

The `parseFromString(string, type)` method steps are:

1. Let `document` be a new `Documentp111`, whose `content type` is `type` and `url` is this's `relevant global objectp913`'s `associated Documentp818`'s `URL`.

### Note

The document's `encoding` will be left as its default, of `UTF-8`. In particular, any XML declarations or `metap160` elements found while parsing string will have no effect.

2. Switch on type:

↳ `"text/html"`

1. Set `document`'s `type` to `"html"`.
2. Create an `HTML parserp1059` `parser`, associated with `document`.
3. Place `string` into the `input streamp1071` for `parser`. The encoding `confidencep1066` is *irrelevant*.
4. Start `parser` and let it run until it has consumed all the characters just inserted into the input stream.

### Note

This might mutate the document's `mode`.

## Note

Since document does not have a [browsing context](#)<sup>p804</sup>, [scripting is disabled](#)<sup>p895</sup>.

### ↳ Otherwise

1. Create an [XML parser](#)<sup>p1168</sup> *parser*, associated with *document*, and with [XML scripting support disabled](#)<sup>p1169</sup>.
2. Parse *string* using *parser*.
3. If the previous step resulted in an XML well-formedness or XML namespace well-formedness error, then:
  1. Assert: *document* has no child nodes.
  2. Let *root* be the result of [creating an element](#) given *document*, "parsererror", and "http://www.mozilla.org/newlayout/xml/parsererror.xml".
  3. Optionally, add attributes or children to *root* to describe the nature of the parsing error.
  4. [Append](#) *root* to *document*.
3. Return *document*.

## 8.6 Timers §<sup>p95</sup><sub>2</sub>

The [setTimeout\(\)](#)<sup>p952</sup> and [setInterval\(\)](#)<sup>p952</sup> methods allow authors to schedule timer-based callbacks.

### For web developers (non-normative)

**`handle = self . setTimeoutp952( handler [, timeout [, arguments... ] ] )`**

Schedules a timeout to run *handler* after *timeout* milliseconds. Any *arguments* are passed straight through to the *handler*.

**`handle = self . setTimeoutp952( code [, timeout ] )`**

Schedules a timeout to compile and run *code* after *timeout* milliseconds.

**`self . clearTimeoutp953( handle )`**

Cancels the timeout set with [setTimeout\(\)](#)<sup>p952</sup> or [setInterval\(\)](#)<sup>p952</sup> identified by *handle*.

**`handle = self . setIntervalp952( handler [, timeout [, arguments... ] ] )`**

Schedules a timeout to run *handler* every *timeout* milliseconds. Any *arguments* are passed straight through to the *handler*.

**`handle = self . setIntervalp952( code [, timeout ] )`**

Schedules a timeout to compile and run *code* every *timeout* milliseconds.

**`self . clearIntervalp953( handle )`**

Cancels the timeout set with [setInterval\(\)](#)<sup>p952</sup> or [setTimeout\(\)](#)<sup>p952</sup> identified by *handle*.

## Note

Timers can be nested; after five such nested timers, however, the interval is forced to be at least four milliseconds.

## Note

This API does not guarantee that timers will run exactly on schedule. Delays due to CPU load, other tasks, etc, are to be expected.

Objects that implement the [WindowOrWorkerGlobalScope](#)<sup>p946</sup> mixin have a **list of active timers**. Each entry in this lists is identified by a number, which must be unique within the list for the lifetime of the object that implements the [WindowOrWorkerGlobalScope](#)<sup>p946</sup> mixin.

The [setTimeout\(\)](#) method must return the value returned by the [timer initialization steps](#)<sup>p953</sup>, passing them the method's arguments, the object on which the method for which the algorithm is running is implemented (a [Window](#)<sup>p816</sup> or [WorkerGlobalScope](#)<sup>p1024</sup> object) as the *method context*, and the *repeat* flag set to false.

The [setInterval\(\)](#) method must return the value returned by the [timer initialization steps](#)<sup>p953</sup>, passing them the method's arguments,

the object on which the method for which the algorithm is running is implemented (a [Window](#)<sup>p816</sup> or [WorkerGlobalScope](#)<sup>p1024</sup> object) as the *method context*, and the *repeat* flag set to true.

The [clearTimeout\(\)](#) and [clearInterval\(\)](#) methods must clear the entry identified as *handle* from the [list of active timers](#)<sup>p952</sup> of the [WindowOrWorkerGlobalScope](#)<sup>p946</sup> object on which the method was invoked, if any, where *handle* is the argument passed to the method. (If *handle* does not identify an entry in the [list of active timers](#)<sup>p952</sup> of the [WindowOrWorkerGlobalScope](#)<sup>p946</sup> object on which the method was invoked, the method does nothing.)

#### Note

Because [clearTimeout\(\)](#)<sup>p953</sup> and [clearInterval\(\)](#)<sup>p953</sup> clear entries from the same list, either method can be used to clear timers created by [setTimeout\(\)](#)<sup>p952</sup> or [setInterval\(\)](#)<sup>p952</sup>.

The **timer initialization steps**, which are invoked with some method arguments, a *method context*, a *repeat* flag which can be true or false, and optionally (and only if the *repeat* flag is true) a *previous handle*, are as follows:

1. Let *method context proxy* be *method context* if that is a [WorkerGlobalScope](#)<sup>p1024</sup> object, or else the [WindowProxy](#)<sup>p826</sup> that corresponds to *method context*.
2. If *previous handle* was provided, let *handle* be *previous handle*; otherwise, let *handle* be an [implementation-defined](#) integer that is greater than zero that will identify the timeout to be set by this call in the [list of active timers](#)<sup>p952</sup>.
3. If *previous handle* was not provided, add an entry to the [list of active timers](#)<sup>p952</sup> for *handle*.
4. Let *callerRealm* be the [current Realm Record](#), and *calleeRealm* be *method context*'s [JavaScript realm](#).
5. Let *initiating script* be the [active script](#)<sup>p896</sup>.
6. Assert: *initiating script* is not null, since this algorithm is always called from some script.
7. Let *task* be a [task](#)<sup>p925</sup> that runs the following substeps:

1. If the entry for *handle* in the [list of active timers](#)<sup>p952</sup> has been cleared, then abort these steps.
2. Run the appropriate set of steps from the following list:

↪ **If the first method argument is a Function**

[Invoke](#) the [Function](#). Use the third and subsequent method arguments (if any) as the arguments for invoking the [Function](#). Use *method context proxy* as the [callback this value](#).

↪ **Otherwise**

1. Perform [HostEnsureCanCompileStrings](#)<sup>p924</sup>(*callerRealm*, *calleeRealm*). If this throws an exception, catch it, [report the exception](#)<sup>p922</sup>, and abort these steps.
2. Let *script source* be the first method argument.
3. Let *settings object* be *method context*'s [environment settings object](#)<sup>p897</sup>.
4. Let *base URL* be *initiating script*'s [base URL](#)<sup>p896</sup>.
5. Let *fetch options* be a [script fetch options](#)<sup>p898</sup> whose [cryptographic nonce](#)<sup>p898</sup> is *initiating script*'s [fetch options](#)<sup>p896</sup>'s [cryptographic nonce](#)<sup>p898</sup>, [integrity metadata](#)<sup>p898</sup> is the empty string, [parser metadata](#)<sup>p898</sup> is "not-parser-inserted", [credentials mode](#)<sup>p898</sup> is *initiating script*'s [fetch options](#)<sup>p896</sup>'s [credentials mode](#)<sup>p898</sup>, and [referrer policy](#)<sup>p898</sup> is *initiating script*'s [fetch options](#)<sup>p896</sup>'s [referrer policy](#)<sup>p898</sup>.

#### Note

The effect of these options ensures that the string compilation done by [setTimeout\(\)](#)<sup>p952</sup> and [setInterval\(\)](#)<sup>p952</sup> behaves equivalently to that done by [eval\(\)](#). That is, [module script](#)<sup>p896</sup> fetches via [import\(\)](#) will behave the same in both contexts.

6. Let *script* be the result of [creating a classic script](#)<sup>p904</sup> given *script source*, *settings object*, *base URL*, and *fetch options*.
7. [Run the classic script](#)<sup>p906</sup> *script*.

3. If the *repeat* flag is true, then call [timer initialization steps](#)<sup>p953</sup> again, passing them the same method arguments, the same *method context*, with the *repeat* flag still set to true, and with the *previous handle* set to *handler*.
8. Let *timeout* be the second method argument.
9. If the currently running [task](#)<sup>p925</sup> is a task that was created by this algorithm, then let *nesting level* be the [task](#)<sup>p925</sup>'s [timer nesting level](#)<sup>p954</sup>. Otherwise, let *nesting level* be zero.

#### Note

The task's [timer nesting level](#)<sup>p954</sup> is used both for nested calls to [setTimeout\(\)](#)<sup>p952</sup>, and for the repeating timers created by [setInterval\(\)](#)<sup>p952</sup>. (Or, indeed, for any combination of the two.) In other words, it represents nested invocations of this algorithm, not of a particular method.

10. If *timeout* is less than 0, then set *timeout* to 0.
11. If *nesting level* is greater than 5, and *timeout* is less than 4, then set *timeout* to 4.
12. Increment *nesting level* by one.
13. Let task's **timer nesting level** be *nesting level*.
14. Return *handle*, and then continue running this algorithm [in parallel](#)<sup>p41</sup>.
15. If *method context* is a [Window](#)<sup>p816</sup> object, wait until the [Document](#)<sup>p111</sup> associated with *method context* has been [fully active](#)<sup>p807</sup> for a further *timeout* milliseconds (not necessarily consecutively).  
Otherwise, *method context* is a [WorkerGlobalScope](#)<sup>p1024</sup> object; wait until *timeout* milliseconds have passed with the worker not suspended (not necessarily consecutively).
16. Wait until any invocations of this algorithm that had the same *method context*, that started before this one, and whose *timeout* is equal to or less than this one's, have completed.

#### Note

Argument conversion as defined by Web IDL (for example, invoking [toString\(\)](#) methods on objects passed as the first argument) happens in the algorithms defined in Web IDL, before this algorithm is invoked.

#### Example

So for example, the following rather silly code will result in the log containing "ONE TWO ":

```
var log = '';
function logger(s) { log += s + ' '; }

setTimeout({ toString: function () {
  setTimeout("logger('ONE')", 100);
  return "logger('TWO')";
} }, 100);
```

17. Optionally, wait a further [implementation-defined](#) length of time.

#### Note

This is intended to allow user agents to pad timeouts as needed to optimize the power usage of the device. For example, some processors have a low-power mode where the granularity of timers is reduced; on such platforms, user agents can slow timers down to fit this schedule instead of requiring the processor to use the more accurate mode with its associated higher power usage.

18. [Queue](#)<sup>p925</sup> the [task](#)<sup>p925</sup> task.

#### Note

Once the task has been processed, if the *repeat* flag is false, it is safe to remove the entry for *handle* from the [list of active timers](#)<sup>p952</sup> (there is no way for the entry's existence to be detected past this point, so it does not technically matter one way or the other).

The [task source](#)<sup>p925</sup> for these [tasks](#)<sup>p925</sup> is the **timer task source**.

## Example

To run tasks of several milliseconds back to back without any delay, while still yielding back to the browser to avoid starving the user interface (and to avoid the browser killing the script for hogging the CPU), simply queue the next timer before performing work:

```
function doExpensiveWork() {
  var done = false;
  // ...
  // this part of the function takes up to five milliseconds
  // set done to true if we're done
  // ...
  return done;
}

function rescheduleWork() {
  var handle = setTimeout(rescheduleWork, 0); // preschedule next iteration
  if (doExpensiveWork())
    clearTimeout(handle); // clear the timeout if we don't need it
}

function scheduleWork() {
  setTimeout(rescheduleWork, 0);
}

scheduleWork(); // queues a task to do lots of work
```

## 8.7 Microtask queuing §<sup>p95</sup><sub>5</sub>

✓ MDN

For web developers (non-normative)

**`self.queueMicrotask`**<sup>p955</sup>(*callback*)

[Queues](#)<sup>p926</sup> a [microtask](#)<sup>p925</sup> to run the given *callback*.

The `queueMicrotask(callback)` method must [queue a microtask](#)<sup>p926</sup> to [invoke](#) *callback*, and if *callback* throws an exception, [report the exception](#)<sup>p922</sup>.

The `queueMicrotask()`<sup>p955</sup> method allows authors to schedule a callback on the [microtask queue](#)<sup>p925</sup>. This allows their code to run after the currently-executing [task](#)<sup>p925</sup> has run to completion and the [JavaScript execution context stack](#) is empty, but without yielding control back to the [event loop](#)<sup>p924</sup>, as would be the case when using, for example, `setTimeout(f, 0)`<sup>p952</sup>.

Authors ought to be aware that scheduling a lot of microtasks has the same performance downsides as running a lot of synchronous code. Both will prevent the browser from doing its own work, such as rendering or scrolling. In many cases, [requestAnimationFrame\(\)](#)<sup>p976</sup> or [requestIdleCallback\(\)](#) is a better choice. In particular, if the goal is to run code before the next rendering cycle, that is the purpose of [requestAnimationFrame\(\)](#)<sup>p976</sup>.

As can be seen from the following examples, the best way of thinking about `queueMicrotask()`<sup>p955</sup> is as a mechanism for rearranging synchronous code, effectively placing the queued code immediately after the current task's worth of non-queued JavaScript.

## Example

The most common reason for using `queueMicrotask()`<sup>p955</sup> is to create consistent ordering, even in the cases where information is available synchronously, without introducing undue delay.

For example, consider a custom element firing a `load` event, that also maintains an internal cache of previously-loaded data. A naïve implementation might look like:

```
MyElement.prototype.loadData = function (url) {
  if (this._cache[url]) {
    this._setData(this._cache[url]);
  }
}
```

```

    this.dispatchEvent(new Event("load"));
  } else {
    fetch(url).then(res => res.arrayBuffer()).then(data => {
      this._cache[url] = data;
      this._setData(data);
      this.dispatchEvent(new Event("load"));
    });
  }
};

```

This naïve implementation is problematic, however, in that it causes its users to experience inconsistent behavior. For example, code such as

```

element.addEventListener("load", () => console.log("loaded"));
console.log("1");
element.loadData();
console.log("2");

```

will sometimes log "1, 2, loaded" (if the data needs to be fetched), and sometimes log "1, loaded, 2" (if the data is already cached). Similarly, after the call to `loadData()`, it will be inconsistent whether or not the data is set on the element.

To get a consistent ordering, [`queueMicrotask\(\)`](#)<sup>p955</sup> can be used:

```

MyElement.prototype.loadData = function (url) {
  if (this._cache[url]) {
    queueMicrotask(() => {
      this._setData(this._cache[url]);
      this.dispatchEvent(new Event("load"));
    });
  } else {
    fetch(url).then(res => res.arrayBuffer()).then(data => {
      this._cache[url] = data;
      this._setData(data);
      this.dispatchEvent(new Event("load"));
    });
  }
};

```

By essentially rearranging the queued code to be after the currently-executing task, this ensures a consistent ordering and update of the element's state.

### Example

Another interesting use of [`queueMicrotask\(\)`](#)<sup>p955</sup> is to allow uncoordinated "batching" of work by multiple callers. For example, consider a library function that wants to send data somewhere as soon as possible, but doesn't want to make multiple network requests if doing so is easily avoidable. One way to balance this would be like so:

```

const queuedToSend = [];

function sendData(data) {
  queuedToSend.push(data);

  if (queuedToSend.length === 1) {
    queueMicrotask(() => {
      const stringToSend = JSON.stringify(queuedToSend);
      queuedToSend.length = 0;

      fetch("/endpoint", stringToSend);
    });
  }
}

```

```
}  
}
```

With this architecture, multiple subsequent calls to `sendData()` within the same turn of the event loop will be batched together into one `fetch()` call, but with no intervening event loop tasks preempting the fetch (as would have happened with similar code that instead used `setTimeout()`<sup>p952</sup>).

## 8.8 User prompts <sup>§ p95</sup>

7

### 8.8.1 Simple dialogs <sup>§ p95</sup>

7

For web developers (non-normative)

#### **`window . alert`**<sup>p957</sup>(**`message`**)

Displays a modal alert with the given message, and waits for the user to dismiss it.

#### **`result = window . confirm`**<sup>p958</sup>(**`message`**)

Displays a modal OK/Cancel prompt with the given message, waits for the user to dismiss it, and returns true if the user clicks OK and false if the user clicks Cancel.

#### **`result = window . prompt`**<sup>p958</sup>(**`message`** [, **`default`**] )

Displays a modal text control prompt with the given message, waits for the user to dismiss it, and returns the value that the user entered. If the user cancels the prompt, then returns null instead. If the second argument is present, then the given value is used as a default.

#### Note

Logic that depends on [tasks](#)<sup>p925</sup> or [microtasks](#)<sup>p925</sup>, such as [media elements](#)<sup>p381</sup> loading their [media data](#)<sup>p382</sup>, are stalled when these methods are invoked.

To **optionally truncate a simple dialog string** `s`, return either `s` itself or some string derived from `s` that is shorter. User agents should not provide UI for displaying the elided portion of `s`, as this makes it too easy for abusers to create dialogs of the form "Important security alert! Click 'Show More' for full details!".

#### Note

For example, a user agent might want to only display the first 100 characters of a message. Or, a user agent might replace the middle of the string with "...". These types of modifications can be useful in limiting the abuse potential of unnaturally large, trustworthy-looking system dialogs.

The **`alert(message)`** method, when invoked, must run the following steps:

1. If the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> is nonzero, optionally return.
2. If the [active sandboxing flag set](#)<sup>p835</sup> of this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup> has the [sandboxed modals flag](#)<sup>p834</sup> set, then return.
3. Optionally, return. (For example, the user agent might give the user the option to ignore all alerts, and would thus abort at this step whenever the method was invoked.)
4. If the method was invoked with no arguments, then let `message` be the empty string; otherwise, let `message` be the method's first argument.
5. Set `message` to the result of [normalizing newlines](#) given `message`.
6. Set `message` to the result of [optionally truncating](#)<sup>p957</sup> `message`.
7. Show `message` to the user, treating U+000A LF as a line break.
8. Optionally, [pause](#)<sup>p931</sup> while waiting for the user to acknowledge the message.

The `confirm(message)` method, when invoked, must run the following steps:

1. If the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> is nonzero, optionally return false.
2. If the [active sandboxing flag set](#)<sup>p835</sup> of this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup> has the [sandboxed modals flag](#)<sup>p834</sup> set, then return.
3. Optionally, return false. (For example, the user agent might give the user the option to ignore all prompts, and would thus abort at this step whenever the method was invoked.)
4. Set *message* to the result of [normalizing newlines](#) given *message*.
5. Set *message* to the result of [optionally truncating](#)<sup>p957</sup> *message*.
6. Show *message* to the user, treating U+000A LF as a line break, and ask the user to respond with a positive or negative response.
7. [Pause](#)<sup>p931</sup> until the user responds either positively or negatively.
8. If the user responded positively, return true; otherwise, the user responded negatively: return false.

The `prompt(message, default)` method, when invoked, must run the following steps:

1. If the [event loop](#)<sup>p924</sup>'s [termination nesting level](#)<sup>p869</sup> is nonzero, optionally return null.
2. If the [active sandboxing flag set](#)<sup>p835</sup> of this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup> has the [sandboxed modals flag](#)<sup>p834</sup> set, then return.
3. Optionally, return null. (For example, the user agent might give the user the option to ignore all prompts, and would thus abort at this step whenever the method was invoked.)
4. Set *message* to the result of [optionally truncating](#)<sup>p957</sup> *message*.
5. Set *message* to the result of [normalizing newlines](#) given *message*.
6. Set *default* to the result of [optionally truncating](#)<sup>p957</sup> *default*.
7. Show *message* to the user, treating U+000A LF as a line break, and ask the user to either respond with a string value or abort. The response must be defaulted to the value given by *default*.
8. [Pause](#)<sup>p931</sup> while waiting for the user's response.
9. If the user aborts, then return null; otherwise, return the string that the user responded with.

## 8.8.2 Printing <sup>p95</sup>

For web developers (non-normative)

**`window.print()`**<sup>p958</sup>

Prompts the user to print the page.

When the `print()` method is invoked, if the [Document](#)<sup>p111</sup> is [ready for post-load tasks](#)<sup>p1145</sup>, then the user agent must run the [printing steps](#)<sup>p958</sup>. Otherwise, the user agent must only set the **print when loaded** flag on the [Document](#)<sup>p111</sup>.

User agents should also run the [printing steps](#)<sup>p958</sup> whenever the user asks for the opportunity to [obtain a physical form](#)<sup>p1209</sup> (e.g. printed copy), or the representation of a physical form (e.g. PDF copy), of a document.

The **printing steps** are as follows:

1. The user agent may display a message to the user or return (or both).

### Example

For instance, a kiosk browser could silently ignore any invocations of the [print\(\)](#)<sup>p958</sup> method.

### Example

For instance, a browser on a mobile device could detect that there are no printers in the vicinity and display a message saying so before continuing to offer a "save to PDF" option.

2. If the [active sandboxing flag set](#)<sup>p835</sup> of this [Window](#)<sup>p816</sup> object's [associated Document](#)<sup>p818</sup> has the [sandboxed modals flag](#)<sup>p834</sup> set, then return.

### Note

*If the printing dialog is blocked by a [Document](#)<sup>p111</sup>'s sandbox, then neither the [beforeprint](#)<sup>p1260</sup> nor [afterprint](#)<sup>p1260</sup> events will be fired.*

3. The user agent must [fire an event](#) named [beforeprint](#)<sup>p1260</sup> at the [relevant global object](#)<sup>p913</sup> of the [Document](#)<sup>p111</sup> that is being printed, as well as any [child browsing contexts](#)<sup>p806</sup> in it.

### Example

The [beforeprint](#)<sup>p1260</sup> event can be used to annotate the printed copy, for instance adding the time at which the document was printed.

4. The user agent should offer the user the opportunity to [obtain a physical form](#)<sup>p1209</sup> (or the representation of a physical form) of the document. The user agent may wait for the user to either accept or decline before returning; if so, the user agent must [pause](#)<sup>p931</sup> while the method is waiting. Even if the user agent doesn't wait at this point, the user agent must use the state of the relevant documents as they are at this point in the algorithm if and when it eventually creates the alternate form.
5. The user agent must [fire an event](#) named [afterprint](#)<sup>p1260</sup> at the [relevant global object](#)<sup>p913</sup> of the [Document](#)<sup>p111</sup> that is being printed, as well as any [child browsing contexts](#)<sup>p806</sup> in it.

### Example

The [afterprint](#)<sup>p1260</sup> event can be used to revert annotations added in the earlier event, as well as showing post-printing UI. For instance, if a page is walking the user through the steps of applying for a home loan, the script could automatically advance to the next step after having printed a form or other.

## 8.9 System state and capabilities <sup>p95</sup>

### 8.9.1 The [Navigator](#)<sup>p959</sup> object <sup>p95</sup>

✓ MDN

The [navigator](#) attribute of the [Window](#)<sup>p816</sup> interface must return an instance of the [Navigator](#)<sup>p959</sup> interface, which represents the identity and state of the user agent (the client), and allows Web pages to register themselves as potential protocol handlers:

MDN

```
IDL [Exposed=Window]
interface Navigator {
    // objects implementing this interface also implement the interfaces given below
};
Navigator includes NavigatorID;
Navigator includes NavigatorLanguage;
Navigator includes NavigatorOnLine;
Navigator includes NavigatorContentUtils;
Navigator includes NavigatorCookies;
Navigator includes NavigatorPlugins;
Navigator includes NavigatorConcurrentHardware;
```

These interface mixins are defined separately so that [WorkerNavigator](#)<sup>p1036</sup> can re-use parts of the [Navigator](#)<sup>p959</sup> interface.

#### 8.9.1.1 Client identification <sup>p95</sup>

```
IDL interface mixin NavigatorID {
    readonly attribute DOMString appCodeName; // constant "Mozilla"
```

✓ MDN

```

readonly attribute DOMString appName; // constant "Netscape"
readonly attribute DOMString appVersion;
readonly attribute DOMString platform;
readonly attribute DOMString product; // constant "Gecko"
[Exposed=Window] readonly attribute DOMString productSub;
readonly attribute DOMString userAgent;
[Exposed=Window] readonly attribute DOMString vendor;
[Exposed=Window] readonly attribute DOMString vendorSub; // constant ""
};

```

In certain cases, despite the best efforts of the entire industry, Web browsers have bugs and limitations that Web authors are forced to work around.

This section defines a collection of attributes that can be used to determine, from script, the kind of user agent in use, in order to work around these issues.

The user agent has a **navigator compatibility mode**, which is either *Chrome*, *Gecko*, or *WebKit*.

#### Note

The [navigator compatibility mode](#)<sup>p960</sup> constrains the [NavigatorID](#)<sup>p959</sup> interface to the combinations of attribute values and presence of [taintEnabled\(\)](#)<sup>p961</sup> and [oscpu](#)<sup>p961</sup> that are known to be compatible with existing Web content.

Client detection should always be limited to detecting known current versions; future versions and unknown versions should always be assumed to be fully compliant.

#### For web developers (non-normative)

**[self . navigator](#)<sup>p959</sup> . [appCodeName](#)<sup>p960</sup>**

Returns the string "Mozilla".

**[self . navigator](#)<sup>p959</sup> . [appName](#)<sup>p960</sup>**

Returns the string "Netscape".

**[self . navigator](#)<sup>p959</sup> . [appVersion](#)<sup>p960</sup>**

Returns the version of the browser.

**[self . navigator](#)<sup>p959</sup> . [platform](#)<sup>p961</sup>**

Returns the name of the platform.

**[self . navigator](#)<sup>p959</sup> . [product](#)<sup>p961</sup>**

Returns the string "Gecko".

**[window . navigator](#)<sup>p959</sup> . [productSub](#)<sup>p961</sup>**

Returns either the string "20030107", or the string "20100101".

**[self . navigator](#)<sup>p959</sup> . [userAgent](#)<sup>p961</sup>**

Returns the complete `User-Agent` header.

**[window . navigator](#)<sup>p959</sup> . [vendor](#)<sup>p961</sup>**

Returns either the empty string, the string "Apple Computer, Inc.", or the string "Google Inc.".

**[window . navigator](#)<sup>p959</sup> . [vendorSub](#)<sup>p961</sup>**

Returns the empty string.

#### **appCodeName**

Must return the string "Mozilla".

#### **appName**

Must return the string "Netscape".

#### **appVersion**

Must return either the string "4.0" or a string representing the version of the browser in detail, e.g. "1.0 (VMS; en-US) Mellblomenator/9000".

### platform

Must return either the empty string or a string representing the platform on which the browser is executing, e.g. "MacIntel", "Win32", "FreeBSD i386", "WebTV OS".

### product

Must return the string "Gecko".

### productSub

Must return the appropriate string from the following list:

- ↪ If the [navigator compatibility mode](#)<sup>p960</sup> is **Chrome** or **WebKit**  
The string "20030107".
- ↪ If the [navigator compatibility mode](#)<sup>p960</sup> is **Gecko**  
The string "20100101".

### userAgent

Must return the [default `User-Agent` value](#).

### vendor

Must return the appropriate string from the following list:

- ↪ If the [navigator compatibility mode](#)<sup>p960</sup> is **Chrome**  
The string "Google Inc.".
- ↪ If the [navigator compatibility mode](#)<sup>p960</sup> is **Gecko**  
The empty string.
- ↪ If the [navigator compatibility mode](#)<sup>p960</sup> is **WebKit**  
The string "Apple Computer, Inc.".

### vendorSub

Must return the empty string.

If the [navigator compatibility mode](#)<sup>p960</sup> is **Gecko**, then the user agent must also support the following partial interface:

```
IDL partial interface mixin NavigatorID {  
  [Exposed=Window] boolean taintEnabled(); // constant false  
  [Exposed=Window] readonly attribute DOMString oscpu;  
};
```

The `taintEnabled()` method must return false.

The `oscpu` attribute's getter must return either the empty string or a string representing the platform on which the browser is executing, e.g. "Windows NT 10.0; Win64; x64", "Linux x86\_64".

### ⚠Warning!

**Any information in this API that varies from user to user can be used to profile the user. In fact, if enough such information is available, a user can actually be uniquely identified. For this reason, user agent implementers are strongly urged to include as little information in this API as possible.**

## 8.9.1.2 Language preferences <sup>§ p96</sup>

1

```
IDL interface mixin NavigatorLanguage {  
  readonly attribute DOMString language;  
  readonly attribute FrozenArray<DOMString> languages;  
};
```

For web developers (non-normative)

**`self.navigator`<sup>p959</sup> . `language`<sup>p962</sup>**

Returns a language tag representing the user's preferred language.

**`self.navigator`<sup>p959</sup> . `languages`<sup>p962</sup>**

Returns an array of language tags representing the user's preferred languages, with the most preferred language first.

The most preferred language is the one returned by `navigator.language`<sup>p962</sup>.

#### Note

A `Languagechange`<sup>p1260</sup> event is fired at the `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> object when the user agent's understanding of what the user's preferred languages are changes.

#### Language

Must return a valid BCP 47 language tag representing either a [plausible language](#)<sup>p962</sup> or the user's most preferred language. [\[BCP47\]](#)<sup>p1264</sup>

#### Languages

Must return a [frozen array](#) of valid BCP 47 language tags representing either one or more [plausible languages](#)<sup>p962</sup>, or the user's preferred languages, ordered by preference with the most preferred language first. The same object must be returned until the user agent needs to return different values, or values in a different order. [\[BCP47\]](#)<sup>p1264</sup>

Whenever the user agent needs to make the `navigator.languages`<sup>p962</sup> attribute of a `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> object return a new set of language tags, the user agent must [queue a task](#)<sup>p925</sup> to [fire an event](#) named `Languagechange`<sup>p1260</sup> at the `Window`<sup>p816</sup> or `WorkerGlobalScope`<sup>p1024</sup> object and wait until that task begins to be executed before actually returning a new value.

The [task source](#)<sup>p925</sup> for this [task](#)<sup>p925</sup> is the [DOM manipulation task source](#)<sup>p932</sup>.

To determine a **plausible language**, the user agent should bear in mind the following:

- Any information in this API that varies from user to user can be used to profile or identify the user.
- If the user is not using a service that obfuscates the user's point of origin (e.g. the Tor anonymity network), then the value that is least likely to distinguish the user from other users with similar origins (e.g. from the same IP address block) is the language used by the majority of such users. [\[TOR\]](#)<sup>p1270</sup>
- If the user is using an anonymizing service, then the value "en-US" is suggested; if all users of the service use that same value, that reduces the possibility of distinguishing the users from each other.

To avoid introducing any more fingerprinting vectors, user agents should use the same list for the APIs defined in this function as for the HTTP `Accept-Language` header.

#### 8.9.1.3 Custom scheme handlers: the `registerProtocolHandler()`<sup>p962</sup> method §<sup>p96</sup><sub>2</sub>

```
IDL interface mixin NavigatorContentUtils {
  [SecureContext] void registerProtocolHandler(DOMString scheme, USVString url);
  [SecureContext] void unregisterProtocolHandler(DOMString scheme, USVString url);
};
```

The `registerProtocolHandler()` method allows Web sites to register themselves as possible handlers for particular schemes. For example, an online telephone messaging service could register itself as a handler of the `sms:` scheme, so that if the user clicks on such a link, they are given the opportunity to use that web site. [\[SMS\]](#)<sup>p1270</sup>

#### For web developers (non-normative)

**`window.navigator`<sup>p959</sup> . `registerProtocolHandler`<sup>p962</sup>(*scheme*, *url*)**

Registers a handler for the given scheme, at the given URL.

The string "%s" in the URL is used as a placeholder for where to put the URL of the content to be handled.

Throws a `"SecurityError"` `DOMException` if the user agent blocks the registration (this might happen if trying to register as a handler for "http", for instance).

Support: registerproto

- Chrome
- Edge
- Firefox
- Opera
- Safari
- Android
- iOS
- Windows

Throws a ["SyntaxError" DOMException](#) if the "%s" string is missing in the URL.

User agents may, within the constraints described in this section, do whatever they like when the method is called. A UA could, for instance, prompt the user and offer the user the opportunity to add the site to a shortlist of handlers, or make the handlers their default, or cancel the request. UAs could provide such a UI through modal UI or through a non-modal transient notification interface. UAs could also simply silently collect the information, providing it only when relevant to the user.

User agents should keep track of which sites have registered handlers (even if the user has declined such registrations) so that the user is not repeatedly prompted with the same request.

The arguments to the method have the following meanings and corresponding implementation requirements. The requirements that involve throwing exceptions must be processed in the order given below, stopping at the first exception thrown. (So the exceptions for the first argument take precedence over the exceptions for the second argument.)

### **scheme**

A scheme, such as "mailto" or "web+auth". The scheme must be compared in an [ASCII case-insensitive](#) manner by user agents for the purposes of comparing with the scheme part of URLs that they consider against the list of registered handlers.

The *scheme* value, if it contains a colon (as in "mailto:"), will never match anything, since schemes don't contain colons.

If the [registerProtocolHandler\(\)](#)<sup>p962</sup> method is invoked with a scheme that is neither a [safelisted scheme](#)<sup>p963</sup> nor a scheme whose value starts with the substring "web+" and otherwise contains only [ASCII lower alphas](#), and whose length is at least five characters (including the "web+" prefix), the user agent must throw a ["SecurityError" DOMException](#).

The following schemes are the **safelisted schemes**:

- bitcoin
- geo
- im
- irc
- ircs
- magnet
- mailto
- mms
- news
- nntp
- openpgp4fpr
- sip
- sms
- smsto
- ssh
- tel
- urn
- webcal
- wtai
- xmpp

### **Note**

*This list can be changed. If there are schemes that ought to be added, please send feedback.*

### **Note**

*This list excludes any schemes that could reasonably be expected to be supported inline, e.g. in an [iframe](#)<sup>p355</sup>, such as *http* or (more theoretically) *gopher*. If those were supported, they could potentially be used in man-in-the-middle attacks, by replacing pages that have frames with such content with content under the control of the protocol handler. If the user agent has native support for the schemes, this could further be used for cookie-theft attacks.*

### **url**

A string used to build the [URL](#) of the page that will handle the requests.

User agents must throw a ["SyntaxError" DOMException](#) if the *url* argument passed to one of these methods does not contain the exact literal string "%s".

User agents must throw a ["SyntaxError" DOMException](#) if [parsing](#)<sup>p87</sup> the *url* argument relative to the [relevant settings object](#)<sup>p913</sup> of this [NavigatorContentUtils](#)<sup>p962</sup> object is not successful.

## Note

The [resulting URL string](#)<sup>p87</sup> would by definition not be a [valid URL string](#) as it would include the string "%s" which is not a valid component in a URL.

User agents must throw a ["SecurityError" DOMException](#) if the [resulting URL record](#)<sup>p87</sup> has an [origin](#) that differs from the [origin](#)<sup>p897</sup> specified by the [relevant settings object](#)<sup>p913</sup> of this [NavigatorContentUtils](#)<sup>p962</sup> object.

## Note

This is forcibly the case if the %s placeholder is in the scheme, host, or port parts of the URL.

The [resulting URL string](#)<sup>p87</sup> is the **proto-URL**. It identifies the handler for the purposes of the methods described below.

When the user agent uses this handler, it must replace the first occurrence of the exact literal string "%s" in the *url* argument with an escaped version of the [absolute URL](#) of the content in question (as defined below), then [parse](#)<sup>p87</sup> the resulting URL, relative to the [relevant settings object](#)<sup>p913</sup> of the [NavigatorContentUtils](#)<sup>p962</sup> object on which the [registerProtocolHandler\(\)](#)<sup>p962</sup> method was invoked, and then [navigate](#)<sup>p852</sup> an appropriate [browsing context](#)<sup>p804</sup> to the resulting URL.

To get the escaped version of the [absolute URL](#) of the content in question, the user agent must replace every character in that [absolute URL](#) that is not a character in the URL [default encode set](#) with the result of [UTF-8 percent encoding](#) that character.

## Example

If the user had visited a site at `https://example.com/` that made the following call:

```
navigator.registerProtocolHandler('web+soup', 'soup?url=%s', 'SoupWeb™')
```

...and then, much later, while visiting `https://www.example.net/`, clicked on a link such as:

```
<a href="web+soup:chicken-kīwi">Download our Chicken Kīwi soup!</a>
```

...then the UA might navigate to the following URL:

```
https://example.com/soup?url=web+soup:chicken-k%3AFwi
```

This site could then do whatever it is that it does with soup (synthesize it and ship it to the user, or whatever).

This section does not define how the pages registered by this method are used, beyond the requirements on how to process the *url* value (see above). To some extent, the [processing model for navigating across documents](#)<sup>p852</sup> defines some cases where these methods are relevant, but in general UAs may use this information wherever they would otherwise consider handing content to native plugins or helper applications.

In addition to the registration method, there is also a method for unregistering handlers.

## For web developers (non-normative)

**`window.navigator`<sup>p959</sup> . `unregisterProtocolHandler`<sup>p964</sup>(*scheme*, *url*)**

Unregisters the handler given by the arguments.

The `unregisterProtocolHandler()` method must unregister the handler described by the two arguments to the method, where the first argument gives the scheme and the second gives the string used to build the [URL](#) of the page that will handle the requests.

The first argument must be compared to the schemes for which custom protocol handlers are registered in an [ASCII case-insensitive](#) manner to find the relevant handlers.

The second argument must be preprocessed as described below, and if that is successful, must then be matched against the [proto-URLs](#)<sup>p964</sup> of the relevant handlers to find the described handler.

The second argument must be preprocessed as follows:

1. If the string does not contain the substring "%s", then return. There's no matching handler.
2. [Parse](#)<sup>p87</sup> the string relative to the [relevant settings object](#)<sup>p913</sup> of this [NavigatorContentUtils](#)<sup>p962</sup> object. If this fails, then throw a ["SyntaxError" DOMException](#).

3. If the [resulting URL record](#)<sup>p87</sup>'s [origin](#) is not the [same origin](#)<sup>p830</sup> as the [origin](#)<sup>p897</sup> of the [relevant settings object](#)<sup>p913</sup> of this [NavigatorContentUtils](#)<sup>p962</sup> object, then throw a `"SecurityError"` [DOMException](#).
4. Return the [resulting URL string](#)<sup>p87</sup> as the result of preprocessing the argument.

### 8.9.1.3.1 Security and privacy §<sup>p96</sup><sub>5</sub>

Custom scheme handlers can introduce a number of concerns, in particular privacy concerns.

**Hijacking all Web usage.** User agents should not allow schemes that are key to its normal operation, such as an [HTTP\(S\) scheme](#), to be rerouted through third-party sites. This would allow a user's activities to be trivially tracked, and would allow user information, even in secure connections, to be collected.

**Hijacking defaults.** User agents are strongly urged to not automatically change any defaults, as this could lead the user to send data to remote hosts that the user is not expecting. New handlers registering themselves should never automatically cause those sites to be used.

**Registration spamming.** User agents should consider the possibility that a site will attempt to register a large number of handlers, possibly from multiple domains (e.g., by redirecting through a series of pages each on a different domain, and each registering a handler for `web+spam`: — analogous practices abusing other web browser features have been used by pornography Web sites for many years). User agents should gracefully handle such hostile attempts, protecting the user.

**Hostile handler metadata.** User agents should protect against typical attacks against strings embedded in their interface, for example ensuring that markup or escape characters in such strings are not executed, that null bytes are properly handled, that over-long strings do not cause crashes or buffer overruns, and so forth.

**Leaking private data.** Web page authors may reference a custom scheme handler using URL data considered private. They might do so with the expectation that the user's choice of handler points to a page inside the organization, ensuring that sensitive data will not be exposed to third parties. However, a user may have registered a handler pointing to an external site, resulting in a data leak to that third party. Implementors might wish to consider allowing administrators to disable custom handlers on certain subdomains, content types, or schemes.

**Leaking credentials.** User agents must never send username or password information in the URLs that are escaped and included sent to the handler sites. User agents may even avoid attempting to pass to Web-based handlers the URLs of resources that are known to require authentication to access, as such sites would be unable to access the resources in question without prompting the user for credentials themselves (a practice that would require the user to know whether to trust the third-party handler, a decision many users are unable to make or even understand).

**Interface interference.** User agents should be prepared to handle intentionally long arguments to the methods. For example, if the user interface exposed consists of an "accept" button and a "deny" button, with the "accept" binding containing the name of the handler, it's important that a long name not cause the "deny" button to be pushed off the screen.

### 8.9.1.4 Cookies §<sup>p96</sup><sub>5</sub>

```
IDL interface mixin NavigatorCookies {
  readonly attribute boolean cookieEnabled;
};
```

For web developers (non-normative)

`window.navigator`<sup>p959</sup> . `cookieEnabled`<sup>p965</sup>

Returns false if setting a cookie will be ignored, and true otherwise.

The `cookieEnabled` attribute must return true if the user agent attempts to handle cookies according to *HTTP State Management Mechanism*, and false if it ignores cookie change requests. [\[COOKIES\]](#)<sup>p1264</sup>

```
IDL interface mixin NavigatorPlugins {
  [SameObject] readonly attribute PluginArray plugins;
  [SameObject] readonly attribute MimeTypeArray mimeTypes;
  boolean javaEnabled();
};

[Exposed=Window,
 LegacyUnenumerableNamedProperties]
interface PluginArray {
  void refresh(optional boolean reload = false);
  readonly attribute unsigned long length;
  getter Plugin? item(unsigned long index);
  getter Plugin? namedItem(DOMString name);
};

[Exposed=Window,
 LegacyUnenumerableNamedProperties]
interface MimeTypeArray {
  readonly attribute unsigned long length;
  getter MimeType? item(unsigned long index);
  getter MimeType? namedItem(DOMString name);
};

[Exposed=Window,
 LegacyUnenumerableNamedProperties]
interface Plugin {
  readonly attribute DOMString name;
  readonly attribute DOMString description;
  readonly attribute DOMString filename;
  readonly attribute unsigned long length;
  getter MimeType? item(unsigned long index);
  getter MimeType? namedItem(DOMString name);
};

[Exposed=Window]
interface MimeType {
  readonly attribute DOMString type;
  readonly attribute DOMString description;
  readonly attribute DOMString suffixes; // comma-separated
  readonly attribute Plugin enabledPlugin;
};
```

## For web developers (non-normative)

**`window.navigatorp959.pluginsp967.refreshp968( [ refresh ] )`**

Updates the lists of supported plugins and MIME types for this page, and reloads the page if the lists have changed.

**`window.navigatorp959.pluginsp967.lengthp968`**

Returns the number of plugins, represented by `Pluginp966` objects, that the user agent reports.

**`plugin = window.navigatorp959.pluginsp967.itemp968(index)`**

**`window.navigatorp959.pluginsp967[index]`**

Returns the specified `Pluginp966` object.

**`plugin = window.navigatorp959.pluginsp967.itemp968(name)`**

**`window.navigatorp959.pluginsp967[name]`**

Returns the `Pluginp966` object for the plugin with the given name.

**`window.navigatorp959.mimeTypesp967.lengthp968`**

Returns the number of MIME types, represented by `MimeTypep966` objects, supported by the plugins that the user agent reports.

**`mimeType = window.navigatorp959.mimeTypesp967.itemp968(index)`**

**`window.navigatorp959.mimeTypesp967[index]`**

Returns the specified [MimeType<sup>p966</sup>](#) object.

**`mimeType = window.navigatorp959.mimeTypesp967.itemp968(name)`**

**`window.navigatorp959.mimeTypesp967[name]`**

Returns the [MimeType<sup>p966</sup>](#) object for the given MIME type.

**`plugin.namep969`**

Returns the plugin's name.

**`plugin.descriptionp969`**

Returns the plugin's description.

**`plugin.filenamep969`**

Returns the plugin library's filename, if applicable on the current platform.

**`plugin.lengthp969`**

Returns the number of MIME types, represented by [MimeType<sup>p966</sup>](#) objects, supported by the plugin.

**`mimeType = plugin.itemp969(index)`**

**`plugin[index]`**

Returns the specified [MimeType<sup>p966</sup>](#) object.

**`mimeType = plugin.itemp969(name)`**

**`plugin[name]`**

Returns the [MimeType<sup>p966</sup>](#) object for the given MIME type.

**`mimeType.typep970`**

Returns the MIME type.

**`mimeType.descriptionp970`**

Returns the MIME type's description.

**`mimeType.suffixesp970`**

Returns the MIME type's typical file extensions, in a comma-separated list.

**`mimeType.enabledPluginp970`**

Returns the [Plugin<sup>p966</sup>](#) object that implements this MIME type.

**`window.navigatorp959.javaEnabled()p970`**

Returns true if there's a plugin that supports the MIME type "application/x-java-vm".

The [navigator.plugins](#) attribute must return a [PluginArray<sup>p966</sup>](#) object.

 MDN

The [navigator.mimeTypes](#) attribute must return a [MimeTypeArray<sup>p966</sup>](#) object.

 MDN

A [PluginArray<sup>p966</sup>](#) object represents none, some, or all of the [plugins<sup>p44</sup>](#) supported by the user agent, each of which is represented by a [Plugin<sup>p966</sup>](#) object. Each of these [Plugin<sup>p966</sup>](#) objects may be **hidden plugins**. A [hidden plugin<sup>p967</sup>](#) can't be enumerated, but can still be inspected by using its name.

#### Note

The fewer [plugins<sup>p44</sup>](#) are represented by the [PluginArray<sup>p966</sup>](#) object, and of those, the more that are [hidden<sup>p967</sup>](#), the more the user's privacy will be protected. Each exposed plugin increases the number of bits that can be derived for fingerprinting. Hiding a plugin helps, but unless it is an extremely rare plugin, it is likely that a site attempting to derive the list of plugins can still determine whether the plugin is supported or not by probing for it by name (the names of popular plugins are widely known). Therefore not exposing a plugin at all is preferred. Unfortunately, many legacy sites use this feature to determine, for example, which plugin to use to play video. Not exposing any plugins at all might therefore not be entirely plausible.

The [PluginArray<sup>p966</sup>](#) objects created by a user agent must not be [live<sup>p44</sup>](#). The set of plugins represented by the objects must not change once an object is created, except when it is updated by the [refresh\(\)<sup>p968</sup>](#) method.

Each [plugin<sup>p44</sup>](#) represented by a [PluginArray<sup>p966</sup>](#) can support a number of [MIME types](#). For each such [plugin<sup>p44</sup>](#), the user agent must pick one or more of these [MIME types](#) to be those that are **explicitly supported**.

#### Note

The [explicitly supported<sup>p968</sup> MIME types](#) of a [plugin<sup>p44</sup>](#) are those that are exposed through the [Plugin<sup>p966</sup>](#) and [MimeTypeArray<sup>p966</sup>](#) interfaces. As with [plugins<sup>p44</sup>](#) themselves, any variation between users regarding what is exposed allows sites to fingerprint users. User agents are therefore encouraged to expose the same [MIME types](#) for all users of a [plugin<sup>p44</sup>](#), regardless of the actual types supported... at least, within the constraints imposed by compatibility with legacy content.

The [supported property indices](#) of a [PluginArray<sup>p966</sup>](#) object are the numbers from zero to the number of non-[hidden<sup>p967</sup> plugins<sup>p44</sup>](#) represented by the object, if any.

The **length** attribute must return the number of non-[hidden<sup>p967</sup> plugins<sup>p44</sup>](#) represented by the object.

The [item\(\)](#) method of a [PluginArray<sup>p966</sup>](#) object must return null if the argument is not one of the object's [supported property indices](#), and otherwise must return the result of running the following steps, using the method's argument as *index*:

1. Let *list* be the [Plugin<sup>p966</sup>](#) objects representing the non-[hidden<sup>p967</sup> plugins<sup>p44</sup>](#) represented by the [PluginArray<sup>p966</sup>](#) object.
2. Sort *list* alphabetically by the [name<sup>p969</sup>](#) of each [Plugin<sup>p966</sup>](#).
3. Return the *index*th entry in *list*.

#### Note

It is important for privacy that the order of plugins not leak additional information, e.g., the order in which plugins were installed.

The [supported property names](#) of a [PluginArray<sup>p966</sup>](#) object are the values of the [name<sup>p969</sup>](#) attributes of all the [Plugin<sup>p966</sup>](#) objects represented by the [PluginArray<sup>p966</sup>](#) object.

The [namedItem\(\)](#) method of a [PluginArray<sup>p966</sup>](#) object must return null if the argument is not one of the object's [supported property names](#), and otherwise must return the [Plugin<sup>p966</sup>](#) object, of those represented by the [PluginArray<sup>p966</sup>](#) object, that has a [name<sup>p969</sup>](#) equal to the method's argument.

The [refresh\(\)](#) method of the [PluginArray<sup>p966</sup>](#) object of a [Navigator<sup>p959</sup>](#) object, when invoked, must check to see if any [plugins<sup>p44</sup>](#) have been installed or reconfigured since the user agent created the [PluginArray<sup>p966</sup>](#) object. If so, and the method's argument is true, then the user agent must act as if the [location.reload\(\)<sup>p849</sup>](#) method was called instead. Otherwise, the user agent must update the [PluginArray<sup>p966</sup>](#) object and [MimeTypeArray<sup>p966</sup>](#) object created for attributes of that [Navigator<sup>p959</sup>](#) object, and the [Plugin<sup>p966</sup>](#) and [MimeType<sup>p966</sup>](#) objects created for those [PluginArray<sup>p966</sup>](#) and [MimeTypeArray<sup>p966</sup>](#) objects, using the same [Plugin<sup>p966</sup>](#) objects for cases where the [name<sup>p969</sup>](#) is the same, and the same [MimeType<sup>p966</sup>](#) objects for cases where the [type<sup>p970</sup>](#) is the same, and creating new objects for cases where there were no matching objects immediately prior to the [refresh\(\)<sup>p968</sup>](#) call. Old [Plugin<sup>p966</sup>](#) and [MimeType<sup>p966</sup>](#) objects must continue to return the same values that they had prior to the update, though naturally now the data is stale and may appear inconsistent (for example, an old [MimeType<sup>p966</sup>](#) entry might list as its [enabledPlugin<sup>p970</sup>](#) a [Plugin<sup>p966</sup>](#) object that no longer lists that [MimeType<sup>p966</sup>](#) as a supported [MimeType<sup>p966</sup>](#)).

A [MimeTypeArray<sup>p966</sup>](#) object represents the [MIME types explicitly supported<sup>p968</sup>](#) by [plugins<sup>p44</sup>](#) supported by the user agent, each of which is represented by a [MimeType<sup>p966</sup>](#) object.

The [MimeTypeArray<sup>p966</sup>](#) objects created by a user agent must not be [live<sup>p44</sup>](#). The set of MIME types represented by the objects must not change once an object is created, except when it is updated by the [PluginArray<sup>p966</sup>](#) object's [refresh\(\)<sup>p968</sup>](#) method.

The [supported property indices](#) of a [MimeTypeArray<sup>p966</sup>](#) object are the numbers from zero to the number of [MIME types explicitly supported<sup>p968</sup>](#) by non-[hidden<sup>p967</sup> plugins<sup>p44</sup>](#) represented by the corresponding [PluginArray<sup>p966</sup>](#) object, if any.

The **length** attribute must return the number of [MIME types explicitly supported<sup>p968</sup>](#) by non-[hidden<sup>p967</sup> plugins<sup>p44</sup>](#) represented by the corresponding [PluginArray<sup>p966</sup>](#) object, if any.

The [item\(\)](#) method of a [MimeTypeArray<sup>p966</sup>](#) object must return null if the argument is not one of the object's [supported property indices](#), and otherwise must return the result of running the following steps, using the method's argument as *index*:

1. Let *list* be the [MimeType<sup>p966</sup>](#) objects representing the [MIME types explicitly supported<sup>p968</sup>](#) by non-hidden [plugins<sup>p44</sup>](#) represented by the corresponding [PluginArray<sup>p966</sup>](#) object, if any.
2. Sort *list* alphabetically by the [type<sup>p970</sup>](#) of each [MimeType<sup>p966</sup>](#).
3. Return the *indexth* entry in *list*.

#### Note

*It is important for privacy that the order of MIME types not leak additional information, e.g., the order in which plugins were installed.*

The [supported property names](#) of a [MimeTypeArray<sup>p966</sup>](#) object are the values of the [type<sup>p970</sup>](#) attributes of all the [MimeType<sup>p966</sup>](#) objects represented by the [MimeTypeArray<sup>p966</sup>](#) object.

The [namedItem\(\)](#) method of a [MimeTypeArray<sup>p966</sup>](#) object must return null if the argument is not one of the object's [supported property names](#), and otherwise must return the [MimeType<sup>p966</sup>](#) object that has a [type<sup>p970</sup>](#) equal to the method's argument.

A [Plugin<sup>p966</sup>](#) object represents a [plugin<sup>p44</sup>](#). It has several attributes to provide details about the plugin, and can be enumerated to obtain the list of [MIME types](#) that it [explicitly supports<sup>p968</sup>](#).

The [Plugin<sup>p966</sup>](#) objects created by a user agent must not be [live<sup>p44</sup>](#). The set of MIME types represented by the objects, and the values of the objects' attributes, must not change once an object is created, except when updated by the [PluginArray<sup>p966</sup>](#) object's [refresh\(\)<sup>p968</sup>](#) method.

The **reported MIME types** for a [Plugin<sup>p966</sup>](#) object are the [MIME types explicitly supported<sup>p968</sup>](#) by the corresponding [plugin<sup>p44</sup>](#) when this object was last created or updated by [refresh\(\)<sup>p968</sup>](#), whichever happened most recently.

The [supported property indices](#) of a [Plugin<sup>p966</sup>](#) object are the numbers from zero to the number of [reported MIME types<sup>p969</sup>](#).

The **length** attribute must return the number of [reported MIME types<sup>p969</sup>](#).

The [item\(\)](#) method of a [Plugin<sup>p966</sup>](#) object must return null if the argument is not one of the object's [supported property indices](#), and otherwise must return the result of running the following steps, using the method's argument as *index*:

1. Let *list* be the [MimeType<sup>p966</sup>](#) objects representing the [reported MIME types<sup>p969</sup>](#).
2. Sort *list* alphabetically by the [type<sup>p970</sup>](#) of each [MimeType<sup>p966</sup>](#).
3. Return the *indexth* entry in *list*.

#### Note

*It is important for privacy that the order of MIME types not leak additional information, e.g., the order in which plugins were installed.*

The [supported property names](#) of a [Plugin<sup>p966</sup>](#) object are the values of the [type<sup>p970</sup>](#) attributes of the [MimeType<sup>p966</sup>](#) objects representing the [reported MIME types<sup>p969</sup>](#).

The [namedItem\(\)](#) method of a [Plugin<sup>p966</sup>](#) object must return null if the argument is not one of the object's [supported property names](#), and otherwise must return the [MimeType<sup>p966</sup>](#) object that has a [type<sup>p970</sup>](#) equal to the method's argument.

The **name** attribute must return the [plugin<sup>p44</sup>](#)'s name.

The **description** and **filename** attributes must return [implementation-defined](#) (in all likelihood, [plugin<sup>p44</sup>](#)-defined) strings. In each case, the same string must be returned each time, except that the strings returned may change when the [refresh\(\)<sup>p968</sup>](#) method updates the object.

**△Warning!**

*If the values returned by the [description](#)<sup>p969</sup> or [filename](#)<sup>p969</sup> attributes vary between versions of a [plugin](#)<sup>p44</sup>, they can be used both as a fingerprinting vector and, even more importantly, as a trivial way to determine what security vulnerabilities a [plugin](#)<sup>p44</sup> (and thus a browser) may have. It is thus highly recommended that the [description](#)<sup>p969</sup> attribute just return the same value as the [name](#)<sup>p969</sup> attribute, and that the [filename](#)<sup>p969</sup> attribute return the empty string.*

A [MimeType](#)<sup>p966</sup> object represents a [MIME type](#) that is, or was, [explicitly supported](#)<sup>p968</sup> by a [plugin](#)<sup>p44</sup>.

The [MimeType](#)<sup>p966</sup> objects created by a user agent must not be [live](#)<sup>p44</sup>. The values of the objects' attributes must not change once an object is created, except when updated by the [PluginArray](#)<sup>p966</sup> object's [refresh\(\)](#)<sup>p968</sup> method.

The [type](#) attribute must return the [valid MIME type string with no parameters](#) describing the [MIME type](#).

The [description](#) and [suffixes](#) attributes must return [implementation-defined](#) (in all likelihood, [plugin](#)<sup>p44</sup>-defined) strings. In each case, the same string must be returned each time, except that the strings returned may change when the [refresh\(\)](#)<sup>p968</sup> method updates the object.

**△Warning!**

*If the values returned by the [description](#)<sup>p970</sup> or [suffixes](#)<sup>p970</sup> attributes vary between versions of a [plugin](#)<sup>p44</sup>, they can be used both as a fingerprinting vector and, even more importantly, as a trivial way to determine what security vulnerabilities a [plugin](#)<sup>p44</sup> (and thus a browser) may have. It is thus highly recommended that the [description](#)<sup>p970</sup> attribute just return the same value as the [type](#)<sup>p970</sup> attribute, and that the [suffixes](#)<sup>p970</sup> attribute return the empty string.*

**Note**

Commas in the [suffixes](#)<sup>p970</sup> attribute are interpreted as separating subsequent filename extensions, as in "htm,html".

The [enabledPlugin](#) attribute must return the [Plugin](#)<sup>p966</sup> object that represents the [plugin](#)<sup>p44</sup> that [explicitly supported](#)<sup>p968</sup> the [MIME type](#) that this [MimeType](#)<sup>p966</sup> object represents when this object was last created or updated by [refresh\(\)](#)<sup>p968</sup>, whichever happened most recently.

The [navigator.javaEnabled\(\)](#) method must return true if the user agent supports a [plugin](#)<sup>p44</sup> that supports the [MIME type](#) "application/x-java-vm"; otherwise it must return false.

## 8.10 Images <sup>s<sub>0</sub><sup>p97</sup></sup>

```

IDL [Exposed=(Window,Worker), Serializable, Transferable]
interface ImageBitmap {
  readonly attribute unsigned long width;
  readonly attribute unsigned long height;
  void close();
};

typedef (CanvasImageSource or
  Blob or
  ImageData) ImageBitmapSource;

enum ImageOrientation { "none", "flipY" };
enum PremultiplyAlpha { "none", "premultiply", "default" };
enum ColorSpaceConversion { "none", "default" };
enum ResizeQuality { "pixelated", "low", "medium", "high" };

dictionary ImageBitmapOptions {
  ImageOrientation imageOrientation = "none";
}

```

```

PremultiplyAlpha premultiplyAlpha = "default";
ColorSpaceConversion colorSpaceConversion = "default";
[EnforceRange] unsigned long resizeWidth;
[EnforceRange] unsigned long resizeHeight;
ResizeQuality resizeQuality = "low";
};

```

An [ImageBitmap](#)<sup>p970</sup> object represents a bitmap image that can be painted to a canvas without undue latency.

#### Note

The exact judgement of what is undue latency of this is left up to the implementer, but in general if making use of the bitmap requires network I/O, or even local disk I/O, then the latency is probably undue; whereas if it only requires a blocking read from a GPU or system RAM, the latency is probably acceptable.

#### For web developers (non-normative)

**promise = self . createImageBitmap**<sup>p972</sup>(*image* [, *options* ])

**promise = self . createImageBitmap**<sup>p972</sup>(*image*, *sx*, *sy*, *sw*, *sh* [, *options* ])

Takes *image*, which can be an [img](#)<sup>p314</sup> element, an [SVG image](#) element, a [video](#)<sup>p373</sup> element, a [canvas](#)<sup>p627</sup> element, a [Blob](#) object, an [ImageData](#)<sup>p635</sup> object, or another [ImageBitmap](#)<sup>p970</sup> object, and returns a promise that is resolved when a new [ImageBitmap](#)<sup>p970</sup> is created.

If no [ImageBitmap](#)<sup>p970</sup> object can be constructed, for example because the provided *image* data is not actually an image, then the promise is rejected instead.

If *sx*, *sy*, *sw*, and *sh* arguments are provided, the source image is cropped to the given pixels, with any pixels missing in the original replaced by [transparent black](#). These coordinates are in the source image's pixel coordinate space, *not* in [CSS pixels](#).

If *options* is provided, the [ImageBitmap](#)<sup>p970</sup> object's bitmap data is modified according to *options*. For example, if the [premultiplyAlpha](#)<sup>p974</sup> option is set to "[premultiply](#)<sup>p974</sup>", the [bitmap data](#)<sup>p971</sup>'s color channels are premultiplied by its alpha channel.

Rejects the promise with an ["InvalidStateError" DOMException](#) if the source image is not in a valid state (e.g., an [img](#)<sup>p314</sup> element that hasn't loaded successfully, an [ImageBitmap](#)<sup>p970</sup> object whose [\[\[Detached\]\]](#)<sup>p101</sup> internal slot value is true, an [ImageData](#)<sup>p635</sup> object whose [data](#)<sup>p669</sup> attribute value's [\[\[ViewedArrayBuffer\]\]](#) internal slot is detached, or a [Blob](#) whose data cannot be interpreted as a bitmap image).

Rejects the promise with a ["SecurityError" DOMException](#) if the script is not allowed to access the image data of the source image (e.g. a [video](#)<sup>p373</sup> that is [CORS-cross-origin](#)<sup>p88</sup>, or a [canvas](#)<sup>p627</sup> being drawn on by a script in a worker from another [origin](#)<sup>p829</sup>).

**imageBitmap . close**<sup>p975</sup>( )

Releases *imageBitmap*'s underlying [bitmap data](#)<sup>p971</sup>.

**imageBitmap . width**<sup>p975</sup>

Returns the [intrinsic width](#) of the image, in [CSS pixels](#).

**imageBitmap . height**<sup>p975</sup>

Returns the [intrinsic height](#) of the image, in [CSS pixels](#).

An [ImageBitmap](#)<sup>p970</sup> object whose [\[\[Detached\]\]](#)<sup>p101</sup> internal slot value is false always has associated **bitmap data**, with a width and a height. However, it is possible for this data to be corrupted. If an [ImageBitmap](#)<sup>p970</sup> object's media data can be decoded without errors, it is said to be **fully decodable**.

An [ImageBitmap](#)<sup>p970</sup> object's bitmap has an [origin-clean](#)<sup>p629</sup> flag, which indicates whether the bitmap is tainted by content from a different [origin](#)<sup>p829</sup>. The flag is initially set to true and may be changed to false by the steps of [createImageBitmap\(\)](#)<sup>p972</sup>.

[ImageBitmap](#)<sup>p970</sup> objects are [serializable objects](#)<sup>p99</sup> and [transferable objects](#)<sup>p100</sup>.

Their [serialization steps](#)<sup>p99</sup>, given *value* and *serialized*, are:

1. If *value*'s [origin-clean](#)<sup>p629</sup> flag is not set, then throw a ["DataCloneError" DOMException](#).
2. Set *serialized*.[\[\[BitmapData\]\]](#) to a copy of *value*'s [bitmap data](#)<sup>p971</sup>.

Their [deserialization steps](#)<sup>p100</sup>, given *serialized* and *value*, are:

1. Set *value*'s [bitmap data](#)<sup>p971</sup> to *serialized*.[[BitmapData]].

Their [transfer steps](#)<sup>p101</sup>, given *value* and *dataHolder*, are:

1. If *value*'s [origin-clean](#)<sup>p629</sup> flag is not set, then throw a ["DataCloneError" DOMException](#).
2. Set *dataHolder*.[[BitmapData]] to *value*'s [bitmap data](#)<sup>p971</sup>.
3. Unset *value*'s [bitmap data](#)<sup>p971</sup>.

Their [transfer-receiving steps](#)<sup>p101</sup>, given *dataHolder* and *value*, are:

1. Set *value*'s [bitmap data](#)<sup>p971</sup> to *dataHolder*.[[BitmapData]].

The [createImageBitmap\(\*image\*, \*options\*\)](#) and `createImageBitmap(image sx, sy, sw, sh, options)` methods, when invoked, must run these steps:

1. Let *p* be a new promise.
2. If either *sw* or *sh* is given and is 0, then return *p* rejected with a [RangeError](#).
3. If either *options*'s [resizeWidth](#) or *options*'s [resizeHeight](#) is present and is 0, then return *p* rejected with an ["InvalidStateError" DOMException](#).
4. [Check the usability of the \*image\* argument](#)<sup>p655</sup>. If this throws an exception or returns *bad*, then return *p* rejected with an ["InvalidStateError" DOMException](#).
5. Let *imageBitmap* be a new [ImageBitmap](#)<sup>p970</sup> object.
6. Switch on *image*:
  - ↪ [img](#)<sup>p314</sup>
  - ↪ [SVG image](#)
    1. If *image*'s media data has no [intrinsic dimensions](#) (e.g., it's a vector graphic with no specified content size) and either *options*'s [resizeWidth](#)<sup>p972</sup> or *options*'s [resizeHeight](#)<sup>p972</sup> is not present, then return *p* rejected with an ["InvalidStateError" DOMException](#).
    2. If *image*'s media data has no [intrinsic dimensions](#) (e.g., it's a vector graphics with no specified content size), it should be rendered to a bitmap of the size specified by the [resizeWidth](#)<sup>p972</sup> and the [resizeHeight](#)<sup>p972</sup> options.
    3. Set *imageBitmap*'s [bitmap data](#)<sup>p971</sup> to a copy of *image*'s media data, [cropped to the source rectangle with formatting](#)<sup>p973</sup>. If this is an animated image, *imageBitmap*'s [bitmap data](#)<sup>p971</sup> must only be taken from the default image of the animation (the one that the format defines is to be used when animation is not supported or is disabled), or, if there is no such image, the first frame of the animation.
    4. If the [origin](#)<sup>p829</sup> of *image*'s image is not [same origin](#)<sup>p830</sup> with [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then set the [origin-clean](#)<sup>p629</sup> flag of *imageBitmap*'s bitmap to false.
    5. Run this step [in parallel](#)<sup>p41</sup>:
      1. Resolve *p* with *imageBitmap*.
  - ↪ [video](#)<sup>p373</sup>
    1. If *image*'s [networkState](#)<sup>p386</sup> attribute is [NETWORK\\_EMPTY](#)<sup>p386</sup>, then return *p* rejected with an ["InvalidStateError" DOMException](#).
    2. Set *imageBitmap*'s [bitmap data](#)<sup>p971</sup> to a copy of the frame at the [current playback position](#)<sup>p397</sup>, at the [media resource](#)<sup>p382</sup>'s [intrinsic width](#)<sup>p376</sup> and [intrinsic height](#)<sup>p376</sup> (i.e., after any aspect-ratio correction has been applied), [cropped to the source rectangle with formatting](#)<sup>p973</sup>.
    3. If the [origin](#)<sup>p829</sup> of *image*'s video is not [same origin](#)<sup>p830</sup> with [entry settings object](#)<sup>p910</sup>'s [origin](#)<sup>p897</sup>, then set the [origin-clean](#)<sup>p629</sup> flag of *imageBitmap*'s bitmap to false.

4. Run this step [in parallel](#)<sup>p41</sup>:
  1. Resolve *p* with *imageBitmap*.

↪ [canvas](#)<sup>p627</sup>

1. Set *imageBitmap*'s [bitmap data](#)<sup>p971</sup> to a copy of *image*'s [bitmap data](#)<sup>p971</sup>, [cropped to the source rectangle with formatting](#)<sup>p973</sup>.
2. Set the [origin-clean](#)<sup>p629</sup> flag of the *imageBitmap*'s bitmap to the same value as the [origin-clean](#)<sup>p629</sup> flag of *image*'s bitmap.
3. Run this step [in parallel](#)<sup>p41</sup>:
  1. Resolve *p* with *imageBitmap*.

↪ [Blob](#)

Run these step [in parallel](#)<sup>p41</sup>:

1. Let *imageData* be the result of reading *image*'s data. If an [error occurs during reading of the object](#)<sup>p56</sup>, then reject *p* with an ["InvalidStateError" DOMException](#) and abort these steps.
2. Apply the [image sniffing rules](#) to determine the file format of *imageData*, with MIME type of *image* (as given by *image*'s [type](#) attribute) giving the official type.
3. If *imageData* is not in a supported image file format (e.g., it's not an image at all), or if *imageData* is corrupted in some fatal way such that the image dimensions cannot be obtained (e.g., a vector graphic with no intrinsic size), then reject *p* with an ["InvalidStateError" DOMException](#) and abort these steps.
4. Set *imageBitmap*'s [bitmap data](#)<sup>p971</sup> to *imageData*, [cropped to the source rectangle with formatting](#)<sup>p973</sup>. If this is an animated image, *imageBitmap*'s [bitmap data](#)<sup>p971</sup> must only be taken from the default image of the animation (the one that the format defines is to be used when animation is not supported or is disabled), or, if there is no such image, the first frame of the animation.
5. Resolve *p* with *imageBitmap*.

↪ [ImageData](#)<sup>p635</sup>

1. Let *buffer* be *image*'s [data](#)<sup>p669</sup> attribute value's `[[ViewedArrayBuffer]]` internal slot.
2. If `IsDetachedBuffer(buffer)` is true, then return *p* rejected with an ["InvalidStateError" DOMException](#).
3. Set *imageBitmap*'s [bitmap data](#)<sup>p971</sup> to *image*'s image data, [cropped to the source rectangle with formatting](#)<sup>p973</sup>.
4. Run this step [in parallel](#)<sup>p41</sup>:
  1. Resolve *p* with *imageBitmap*.

↪ [ImageBitmap](#)<sup>p970</sup>

1. Set *imageBitmap*'s [bitmap data](#)<sup>p971</sup> to a copy of *image*'s [bitmap data](#)<sup>p971</sup>, [cropped to the source rectangle with formatting](#)<sup>p973</sup>.
2. Set the [origin-clean](#)<sup>p629</sup> flag of *imageBitmap*'s bitmap to the same value as the [origin-clean](#)<sup>p629</sup> flag of *image*'s bitmap.
3. Run this step [in parallel](#)<sup>p41</sup>:
  1. Resolve *p* with *imageBitmap*.

7. Return *p*.

When the steps above require that the user agent **crop bitmap data to the source rectangle with formatting**, the user agent must run the following steps:

1. Let *input* be the [bitmap data](#)<sup>p971</sup> being transformed.
2. If *sx*, *sy*, *sw* and *sh* are specified, let *sourceRectangle* be a rectangle whose corners are the four points (*sx*, *sy*), (*sx*+*sw*, *sy*), (*sx*+*sw*, *sy*+*sh*), (*sx*,*sy*+*sh*). Otherwise let *sourceRectangle* be a rectangle whose corners are the four points (0,0), (*width*, 0), (*width*, *height*), (0,*height*).

of *input*, 0), (width of *input*, height of *input*), (0, height of *input*).

#### Note

If either *sw* or *sh* are negative, then the top-left corner of this rectangle will be to the left or above the (*sx*, *sy*) point.

3. Clip *sourceRectangle* to the dimensions of *input*.
4. Let *outputWidth* be determined as follows:
  - ↪ If the **`resizeWidth`**<sup>p972</sup> member of *options* is specified  
the value of the **`resizeWidth`**<sup>p972</sup> member of *options*
  - ↪ If the **`resizeWidth`**<sup>p972</sup> member of *options* is not specified, but the **`resizeHeight`**<sup>p972</sup> member is specified  
the width of *sourceRectangle*, times the value of the **`resizeHeight`**<sup>p972</sup> member of *options*, divided by the height of *sourceRectangle*, rounded up to the nearest integer
  - ↪ If neither **`resizeWidth`**<sup>p972</sup> nor **`resizeHeight`**<sup>p972</sup> are specified  
the width of *sourceRectangle*
5. Let *outputHeight* be determined as follows:
  - ↪ If the **`resizeHeight`**<sup>p972</sup> member of *options* is specified  
the value of the **`resizeHeight`**<sup>p972</sup> member of *options*
  - ↪ If the **`resizeHeight`**<sup>p972</sup> member of *options* is not specified, but the **`resizeWidth`**<sup>p972</sup> member is specified  
the height of *sourceRectangle*, times the value of the **`resizeWidth`**<sup>p972</sup> member of *options*, divided by the width of *sourceRectangle*, rounded up to the nearest integer
  - ↪ If neither **`resizeWidth`**<sup>p972</sup> nor **`resizeHeight`**<sup>p972</sup> are specified  
the height of *sourceRectangle*
6. Place *input* on an infinite **transparent black** grid plane, positioned so that its top left corner is at the origin of the plane, with the *x*-coordinate increasing to the right, and the *y*-coordinate increasing down, and with each pixel in the *input* image data occupying a cell on the plane's grid.
7. Let *output* be the rectangle on the plane denoted by *sourceRectangle*.
8. Scale *output* to the size specified by *outputWidth* and *outputHeight*. The user agent should use the value of the **`resizeQuality`** option to guide the choice of scaling algorithm.
9. If the value of the **`imageOrientation`** member of *options* is **"flipY"**, *output* must be flipped vertically, disregarding any image orientation metadata of the source (such as EXIF metadata), if any. [\[EXIF\]](#)<sup>p1266</sup>

#### Note

If the value is **"none"**, no extra step is required.

10. If *image* is an **`img`**<sup>p314</sup> element or a **Blob** object, let *val* be the value of the **`colorSpaceConversion`** member of *options*, and then run these substeps:
  1. If *val* is **"default"**, the color space conversion behavior is implementation-specific, and should be chosen according to the color space that the implementation uses for drawing images onto the canvas.
  2. If *val* is **"none"**, *output* must be decoded without performing any color space conversions. This means that the image decoding algorithm must ignore color profile metadata embedded in the source data as well as the display device color profile.

#### Note

The native color space of canvas is currently unspecified, but this is expected to change in the future.

11. Let *val* be the value of **`premultiplyAlpha`** member of *options*, and then run these substeps:
  1. If *val* is **"default"**, the alpha premultiplication behavior is implementation-specific, and should be chosen according to implementation deems optimal for drawing images onto the canvas.
  2. If *val* is **"premultiply"**, the *output* that is not premultiplied by alpha must have its color components multiplied by alpha and that is premultiplied by alpha must be left untouched.

3. If *val* is "none", the *output* that is not pre-multiplied by alpha must be left untouched and that is pre-multiplied by alpha must have its color components divided by alpha.

12. Return *output*.

When the `close()` method is called, the user agent must run these steps:

MDN

1. Set this `ImageBitmap`<sup>p970</sup> object's `[[Detached]]`<sup>p101</sup> internal slot value to true.
2. Unset this `ImageBitmap`<sup>p970</sup> object's `bitmap_data`<sup>p971</sup>.

The `width` attribute's getter must run these steps:

MDN

1. If this `ImageBitmap`<sup>p970</sup> object's `[[Detached]]`<sup>p101</sup> internal slot's value is true, then return 0.
2. Return this `ImageBitmap`<sup>p970</sup> object's width, in [CSS pixels](#).

The `height` attribute's getter must run these steps:

MDN

1. If this `ImageBitmap`<sup>p970</sup> object's `[[Detached]]`<sup>p101</sup> internal slot's value is true, then return 0.
2. Return this `ImageBitmap`<sup>p970</sup> object's height, in [CSS pixels](#).

The `ResizeQuality`<sup>p970</sup> enumeration is used to express a preference for the interpolation quality to use when scaling images.

The "pixelated" value indicates a preference to scale the image that maximizes the appearance. Scaling algorithms that "smooth" colors are acceptable, such as bilinear interpolation.

The "low" value indicates a preference for a low level of image interpolation quality. Low-quality image interpolation may be more computationally efficient than higher settings.

The "medium" value indicates a preference for a medium level of image interpolation quality.

The "high" value indicates a preference for a high level of image interpolation quality. High-quality image interpolation may be more computationally expensive than lower settings.

**Note**  
*Bilinear scaling is an example of a relatively fast, lower-quality image-smoothing algorithm. Bicubic or Lanczos scaling are examples of image-scaling algorithms that produce higher-quality output. This specification does not mandate that specific interpolation algorithms be used unless the value is "pixelated"<sup>p975</sup>.*

**Example**  
Using this API, a sprite sheet can be pre-cut and prepared:

```
var sprites = {};  
function loadMySprites() {  
  var image = new Image();  
  image.src = 'mysprites.png';  
  var resolver;  
  var promise = new Promise(function (arg) { resolver = arg });  
  image.onload = function () {  
    resolver(Promise.all([  
      createImageBitmap(image, 0, 0, 40, 40).then(function (image) { sprites.person = image }),  
      createImageBitmap(image, 40, 0, 40, 40).then(function (image) { sprites.grass = image }),  
      createImageBitmap(image, 80, 0, 40, 40).then(function (image) { sprites.tree = image }),  
      createImageBitmap(image, 0, 40, 40, 40).then(function (image) { sprites.hut = image }),  
      createImageBitmap(image, 40, 40, 40, 40).then(function (image) { sprites.apple = image }),  
      createImageBitmap(image, 80, 40, 40, 40).then(function (image) { sprites.snake = image })  
    ]));  
  };  
  return promise;  
}
```

```
function runDemo() {
  var canvas = document.querySelector('canvas#demo');
  var context = canvas.getContext('2d');
  context.drawImage(sprites.tree, 30, 10);
  context.drawImage(sprites.snake, 70, 10);
}

loadMySprites().then(runDemo);
```

## 8.11 Animation frames §<sup>p97</sup><sub>6</sub>

Some objects include the [AnimationFrameProvider<sup>p976</sup>](#) interface mixin.

```
IDL callback FrameRequestCallback = void (DOMHighResTimeStamp time);

interface mixin AnimationFrameProvider {
  unsigned long requestAnimationFrame(FrameRequestCallback callback);
  void cancelAnimationFrame(unsigned long handle);
};
Window includes AnimationFrameProvider;
DedicatedWorkerGlobalScope includes AnimationFrameProvider;
```

Each [AnimationFrameProvider<sup>p976</sup>](#) object also has a **target object** that stores the provider's internal state. It is defined as follows:

If the [AnimationFrameProvider<sup>p976</sup>](#) is a [Window<sup>p816</sup>](#)

The [Window<sup>p816</sup>](#)'s [associated Document<sup>p818</sup>](#)

If the [AnimationFrameProvider<sup>p976</sup>](#) is a [DedicatedWorkerGlobalScope<sup>p1026</sup>](#)

The [DedicatedWorkerGlobalScope<sup>p1026</sup>](#)

Each [target object<sup>p976</sup>](#) has a **map of animation frame callbacks**, which is an [ordered map](#) that must be initially empty, and an **animation frame callback identifier**, which is a number that must initially be zero.

An [AnimationFrameProvider<sup>p976</sup>](#) *provider* is considered **supported** if any of the following hold:

- *provider* is a [Window<sup>p816</sup>](#).
- *provider*'s [owner set<sup>p1024</sup>](#) contains a [Document<sup>p111</sup>](#) object.
- Any of the [DedicatedWorkerGlobalScope<sup>p1026</sup>](#) objects in *provider*'s [owner set<sup>p1024</sup>](#) are [supported<sup>p976</sup>](#).

The [requestAnimationFrame\(\*callback\*\)](#) method must run the following steps:

1. If this [AnimationFrameProvider<sup>p976</sup>](#) is not [supported<sup>p976</sup>](#), then throw a ["NotSupportedError" DOMException](#).
2. Let *target* be this [AnimationFrameProvider<sup>p976</sup>](#)'s [target object<sup>p976</sup>](#).
3. Increment *target*'s [animation frame callback identifier<sup>p976</sup>](#) by one, and let *handle* be the result.
4. Let *callbacks* be *target*'s [map of animation frame callbacks<sup>p976</sup>](#).
5. Set *callbacks*[*handle*] to *callback*.
6. Return *handle*.

The [cancelAnimationFrame\(\*handle\*\)](#) method must run the following steps:

1. If this [AnimationFrameProvider<sup>p976</sup>](#) is not [supported<sup>p976</sup>](#), then throw a ["NotSupportedError" DOMException](#).
2. Let *callbacks* be this [AnimationFrameProvider<sup>p976</sup>](#)'s [target object<sup>p976</sup>](#)'s [map of animation frame callbacks<sup>p976</sup>](#).

3. [Remove](#) `callbacks[handle]`.

To **run the animation frame callbacks** for a [target object](#)<sup>p976</sup> `target` with a timestamp `now`:

1. Let `callbacks` be `target`'s [map of animation frame callbacks](#)<sup>p976</sup>.
2. Let `callbackHandles` be the result of [getting the keys](#) of `callbacks`.
3. [For each](#) `handle` in `callbackHandles`, if `handle` [exists](#) in `callbacks`:
  1. Let `callback` be `callbacks[handle]`.
  2. [Remove](#) `callbacks[handle]`.
  3. [Invoke](#) `callback`, passing `now` as the only argument, and if an exception is thrown, [report the exception](#)<sup>p922</sup>.

#### Example

Inside workers, [requestAnimationFrame\(\)](#)<sup>p976</sup> can be used together with an [OffscreenCanvas](#)<sup>p682</sup> transferred from a [canvas](#)<sup>p627</sup> element. First, in the document, transfer control to the worker:

```
const offscreenCanvas = document.getElementById("c").transferControlToOffscreen();
worker.postMessage(offscreenCanvas, [offscreenCanvas]);
```

Then, in the worker, the following code will draw a rectangle moving from left to right:

```
let ctx, pos = 0;
function draw(dt) {
  ctx.clearRect(0, 0, 100, 100);
  ctx.fillRect(pos, 0, 10, 10);
  pos += 10 * dt;
  requestAnimationFrame(draw);
}

self.onmessage = function(ev) {
  const transferredCanvas = ev.data;
  ctx = transferredCanvas.getContext("2d");
  draw();
};
```

## 9 Communication § p97

### 9.1 The `MessageEvent` interface § p97

Messages in [server-sent events](#)<sup>p979</sup>, [Web sockets](#)<sup>p988</sup>, [cross-document messaging](#)<sup>p996</sup>, [channel messaging](#)<sup>p998</sup>, and [broadcast channels](#)<sup>p1005</sup> use the `MessageEvent`<sup>p978</sup> interface for their `message`<sup>p1261</sup> events:

```
IDL [Exposed=(Window,Worker,AudioWorklet)]
interface MessageEvent : Event {
    constructor(DOMString type, optional MessageEventInit eventInitDict = {});

    readonly attribute any data;
    readonly attribute USVString origin;
    readonly attribute DOMString lastEventId;
    readonly attribute MessageEventSource? source;
    readonly attribute FrozenArray<MessagePort> ports;

    void initMessageEvent(DOMString type, optional boolean bubbles = false, optional boolean cancelable =
false, optional any data = null, optional USVString origin = "", optional DOMString lastEventId = "",
optional MessageEventSource? source = null, optional sequence<MessagePort> ports = []);
};

dictionary MessageEventInit : EventInit {
    any data = null;
    USVString origin = "";
    DOMString lastEventId = "";
    MessageEventSource? source = null;
    sequence<MessagePort> ports = [];
};

typedef (WindowProxy or MessagePort or ServiceWorker) MessageEventSource;
```

For web developers (non-normative)

#### `event.data`<sup>p978</sup>

Returns the data of the message.

#### `event.origin`<sup>p978</sup>

Returns the origin of the message, for [server-sent events](#)<sup>p979</sup> and [cross-document messaging](#)<sup>p996</sup>.

#### `event.lastEventId`<sup>p978</sup>

Returns the [last event ID string](#)<sup>p980</sup>, for [server-sent events](#)<sup>p979</sup>.

#### `event.source`<sup>p978</sup>

Returns the [WindowProxy](#)<sup>p826</sup> of the source window, for [cross-document messaging](#)<sup>p996</sup>, and the [MessagePort](#)<sup>p1002</sup> being attached, in the [connect](#)<sup>p1260</sup> event fired at [SharedWorkerGlobalScope](#)<sup>p1027</sup> objects.

#### `event.ports`<sup>p979</sup>

Returns the [MessagePort](#)<sup>p1002</sup> array sent with the message, for [cross-document messaging](#)<sup>p996</sup> and [channel messaging](#)<sup>p998</sup>.

The `data` attribute must return the value it was initialized to. It represents the message being sent.

The `origin` attribute must return the value it was initialized to. It represents, in [server-sent events](#)<sup>p979</sup> and [cross-document messaging](#)<sup>p996</sup>, the [origin](#)<sup>p829</sup> of the document that sent the message (typically the scheme, hostname, and port of the document, but not its path or [fragment](#)).

The `lastEventId` attribute must return the value it was initialized to. It represents, in [server-sent events](#)<sup>p979</sup>, the [last event ID string](#)<sup>p980</sup> of the event source.

The `source` attribute must return the value it was initialized to. It represents, in [cross-document messaging](#)<sup>p996</sup>, the [WindowProxy](#)<sup>p826</sup> of

the [browsing context](#)<sup>p804</sup> of the [Window](#)<sup>p816</sup> object from which the message came; and in the [connect](#)<sup>p1260</sup> events used by [shared workers](#)<sup>p1027</sup>, the newly connecting [MessagePort](#)<sup>p1002</sup>.

The [ports](#) attribute must return the value it was initialized to. It represents, in [cross-document messaging](#)<sup>p996</sup> and [channel messaging](#)<sup>p998</sup>, the [MessagePort](#)<sup>p1002</sup> array being sent.

The [initMessageEvent\(\)](#) method must initialize the event in a manner analogous to the similarly-named [initEvent\(\)](#) method. [\[DOM\]](#)<sup>p1266</sup>

#### Note

Various APIs (e.g., [WebSocket](#)<sup>p988</sup>, [EventSource](#)<sup>p980</sup>) use the [MessageEvent](#)<sup>p978</sup> interface for their [message](#)<sup>p1261</sup> event without using the [MessagePort](#)<sup>p1002</sup> API.

## 9.2 Server-sent events §<sup>p97</sup><sub>9</sub>

### 9.2.1 Introduction §<sup>p97</sup><sub>9</sub>

*This section is non-normative.*

To enable servers to push data to Web pages over HTTP or using dedicated server-push protocols, this specification introduces the [EventSource](#)<sup>p980</sup> interface.

Using this API consists of creating an [EventSource](#)<sup>p980</sup> object and registering an event listener.

```
var source = new EventSource('updates.cgi');
source.onmessage = function (event) {
  alert(event.data);
};
```

On the server-side, the script ("updates.cgi" in this case) sends messages in the following form, with the [text/event-stream](#)<sup>p1237</sup> MIME type:

```
data: This is the first message.
```

```
data: This is the second message, it
data: has two lines.
```

```
data: This is the third message.
```

Authors can separate events by using different event types. Here is a stream that has two event types, "add" and "remove":

```
event: add
data: 73857293
```

```
event: remove
data: 2153
```

```
event: add
data: 113411
```

The script to handle such a stream would look like this (where `addHandler` and `removeHandler` are functions that take one argument, the event):

```
var source = new EventSource('updates.cgi');
source.addEventListener('add', addHandler, false);
source.addEventListener('remove', removeHandler, false);
```

The default event type is "message".

Event streams are always decoded as UTF-8. There is no way to specify another character encoding.

Event stream requests can be redirected using HTTP 301 and 307 redirects as with normal HTTP requests. Clients will reconnect if the connection is closed; a client can be told to stop reconnecting using the HTTP 204 No Content response code.

Using this API rather than emulating it using [XMLHttpRequest](#) or an [iframe](#)<sup>p355</sup> allows the user agent to make better use of network resources in cases where the user agent implementer and the network operator are able to coordinate in advance. Amongst other benefits, this can result in significant savings in battery life on portable devices. This is discussed further in the section below on [connectionless push](#)<sup>p986</sup>.

## 9.2.2 The [EventSource](#)<sup>p980</sup> interface §<sup>p98</sup><sub>0</sub>

```
IDL [Exposed=(Window,Worker)]
interface EventSource : EventTarget {
  constructor(USVString url, optional EventSourceInit eventSourceInitDict = {});

  readonly attribute USVString url;
  readonly attribute boolean withCredentials;

  // ready state
  const unsigned short CONNECTING = 0;
  const unsigned short OPEN = 1;
  const unsigned short CLOSED = 2;
  readonly attribute unsigned short readyState;

  // networking
  attribute EventHandler onopen;
  attribute EventHandler onmessage;
  attribute EventHandler onerror;
  void close();
};

dictionary EventSourceInit {
  boolean withCredentials = false;
};
```

Each [EventSource](#)<sup>p980</sup> object has the following associated with it:

- A **url** (a [URL record](#)). Set during construction.
- A **request**. This must initially be null.
- A **reconnection time**, in milliseconds. This must initially be an [implementation-defined](#) value, probably in the region of a few seconds.
- A **last event ID string**. This must initially be the empty string.

Apart from [url](#)<sup>p980</sup> these are not currently exposed on the [EventSource](#)<sup>p980</sup> object.

### For web developers (non-normative)

```
source = new EventSourcep981( url [, { withCredentialsp980: true } ] )
```

Creates a new [EventSource](#)<sup>p980</sup> object.

*url* is a string giving the [URL](#) that will provide the event stream.

Setting [withCredentials](#)<sup>p980</sup> to true will set the [credentials mode](#) for connection requests to *url* to "include".

```
source . closep981( )
```

Aborts any instances of the [fetch](#) algorithm started for this [EventSource](#)<sup>p980</sup> object, and sets the [readyState](#)<sup>p981</sup> attribute to

**CLOSED**<sup>p981</sup>.

**source . url**<sup>p981</sup>

Returns the [URL providing the event stream](#)<sup>p980</sup>.

**source . withCredentials**<sup>p981</sup>

Returns true if the [credentials mode](#) for connection requests to the [URL providing the event stream](#)<sup>p980</sup> is set to "include", and false otherwise.

**source . readyState**<sup>p981</sup>

Returns the state of this [EventSource](#)<sup>p980</sup> object's connection. It can have the values described below.

The [EventSource\(url, eventSourceInitDict\)](#) constructor, when invoked, must run these steps:

1. Let *ev* be a new [EventSource](#)<sup>p980</sup> object.
2. Let *settings* be *ev*'s [relevant settings object](#)<sup>p913</sup>.
3. Let *urlRecord* be the result of [parsing url](#) with *settings*'s [API base URL](#)<sup>p897</sup> and *settings*'s [API URL character encoding](#)<sup>p897</sup>.
4. If *urlRecord* is failure, then throw a ["SyntaxError" DOMException](#).
5. Set *ev*'s [url](#)<sup>p980</sup> to *urlRecord*.
6. Let *corsAttributeState* be [Anonymous](#)<sup>p89</sup>.
7. If the value of *eventSourceInitDict*'s [withCredentials](#)<sup>p980</sup> member is true, then set *corsAttributeState* to [Use Credentials](#)<sup>p89</sup> and set *ev*'s [withCredentials](#)<sup>p981</sup> attribute to true.
8. Let *request* be the result of [creating a potential-CORS request](#)<sup>p88</sup> given *urlRecord*, the empty string, and *corsAttributeState*.
9. Set *request*'s [client](#) to *settings*.
10. User agents may set `set `Accept`/`text/event-stream``<sup>p1237</sup> in *request*'s [header list](#).
11. Set *request*'s [cache mode](#) to "no-store".
12. Set *ev*'s [request](#)<sup>p980</sup> to *request*.
13. Run this step [in parallel](#)<sup>p41</sup>:
  1. [Fetch request](#).
14. Return *ev*.

The [url](#) attribute's getter must return the [serialization](#) of this [EventSource](#)<sup>p980</sup> object's [url](#)<sup>p980</sup>.

The [withCredentials](#) attribute must return the value to which it was last initialized. When the object is created, it must be initialized to false.

The [readyState](#) attribute represents the state of the connection. It can have the following values:

#### **CONNECTING (numeric value 0)**

The connection has not yet been established, or it was closed and the user agent is reconnecting.

#### **OPEN (numeric value 1)**

The user agent has an open connection and is dispatching events as it receives them.

#### **CLOSED (numeric value 2)**

The connection is not open, and the user agent is not trying to reconnect. Either there was a fatal error or the [close\(\)](#)<sup>p981</sup> method was invoked.

When the object is created its [readyState](#)<sup>p981</sup> must be set to [CONNECTING](#)<sup>p981</sup> (0). The rules given below for handling the connection define when the value changes.

The [close\(\)](#) method must abort any instances of the [fetch](#) algorithm started for this [EventSource](#)<sup>p980</sup> object, and must set the

[readyState<sup>p981</sup>](#) attribute to [CLOSED<sup>p981</sup>](#).

The following are the [event handlers<sup>p934</sup>](#) (and their corresponding [event handler event types<sup>p937</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p935</sup>](#), by all objects implementing the [EventSource<sup>p980</sup>](#) interface:

<a href="#">Event handler<sup>p934</sup></a>	<a href="#">Event handler event type<sup>p937</sup></a>
<a href="#">onopen</a>	<a href="#">open<sup>p1261</sup></a>
<a href="#">onmessage</a>	<a href="#">message<sup>p1261</sup></a>
<a href="#">onerror</a>	<a href="#">error<sup>p1260</sup></a>

### 9.2.3 Processing model §<sup>p98</sup> 2

The resource indicated in the argument to the [EventSource<sup>p981</sup>](#) constructor is fetched when the constructor is run.

As data is received, the [tasks<sup>p925</sup>](#) queued by the [networking task source<sup>p932</sup>](#) to handle the data must act as follows.

HTTP 200 OK responses with a `Content-Typep88` header specifying the type `text/event-streamp1237`, ignoring any [MIME type](#) parameters, must be processed line by line [as described below<sup>p983</sup>](#).

When a successful response with a supported [MIME type](#) is received, such that the user agent begins parsing the contents of the stream, the user agent must [announce the connection<sup>p982</sup>](#).

The [task<sup>p925</sup>](#) that the [networking task source<sup>p932</sup>](#) places on the [task queue<sup>p924</sup>](#) once fetching for such a resource (with the correct [MIME type](#)) has completed must cause the user agent to [reestablish the connection<sup>p982</sup> in parallel<sup>p41</sup>](#). This applies whether the connection is closed gracefully or unexpectedly (but does not apply when fetching is canceled by the user agent, e.g., in response to [window.stop\(\)<sup>p821</sup>](#), since in those cases the final [task<sup>p925</sup>](#) is actually discarded). It doesn't apply for the error conditions listed below except where explicitly specified.

HTTP 200 OK responses that have a `Content-Typep88` specifying an unsupported type, or that have no `Content-Typep88` at all, must cause the user agent to [fail the connection<sup>p983</sup>](#).

Network errors that prevents the connection from being established in the first place (e.g. DNS errors), should cause the user agent to [reestablish the connection<sup>p982</sup> in parallel<sup>p41</sup>](#), unless the user agent knows that to be futile, in which case the user agent may [fail the connection<sup>p983</sup>](#).

Any other HTTP response code not listed here, as well as the cancelation of the fetch algorithm by the user agent (e.g. in response to [window.stop\(\)<sup>p821</sup>](#) or the user canceling the network connection manually) must cause the user agent to [fail the connection<sup>p983</sup>](#).

When a user agent is to **announce the connection**, the user agent must [queue a task<sup>p925</sup>](#) which, if the [readyState<sup>p981</sup>](#) attribute is set to a value other than [CLOSED<sup>p981</sup>](#), sets the [readyState<sup>p981</sup>](#) attribute to [OPEN<sup>p981</sup>](#) and [fires an event](#) named [open<sup>p1261</sup>](#) at the [EventSource<sup>p980</sup>](#) object.

When a user agent is to **reestablish the connection**, the user agent must run the following steps. These steps are run [in parallel<sup>p41</sup>](#), not as part of a [task<sup>p925</sup>](#). (The tasks that it queues, of course, are run like normal tasks and not themselves [in parallel<sup>p41</sup>](#).)

1. [Queue a task<sup>p925</sup>](#) to run the following steps:
  1. If the [readyState<sup>p981</sup>](#) attribute is set to [CLOSED<sup>p981</sup>](#), abort the task.
  2. Set the [readyState<sup>p981</sup>](#) attribute to [CONNECTING<sup>p981</sup>](#).
  3. [Fire an event](#) named [error<sup>p1260</sup>](#) at the [EventSource<sup>p980</sup>](#) object.
2. Wait a delay equal to the reconnection time of the event source.
3. Optionally, wait some more. In particular, if the previous attempt failed, then user agents might introduce an exponential backoff delay to avoid overloading a potentially already overloaded server. Alternatively, if the operating system has reported that there is no network connectivity, user agents might wait for the operating system to announce that the network connection has returned before retrying.
4. Wait until the aforementioned task has run, if it has not yet run.

5. [Queue a task](#)<sup>p925</sup> to run the following steps:
  1. If the [EventSource](#)<sup>p980</sup> object's [readyState](#)<sup>p981</sup> attribute is not set to [CONNECTING](#)<sup>p981</sup>, return.
  2. Let *request* be the [EventSource](#)<sup>p980</sup> object's [request](#)<sup>p980</sup>.
  3. If the [EventSource](#)<sup>p980</sup> object's [last event ID string](#)<sup>p980</sup> is not the empty string, [set](#) ``Last-Event-ID`p1239`/last event ID stringp980, encoded as UTF-8, in request's header list.`
  4. [Fetch](#) *request* and process the response obtained in this fashion, if any, as described earlier in this section.

When a user agent is to **fail the connection**, the user agent must [queue a task](#)<sup>p925</sup> which, if the [readyState](#)<sup>p981</sup> attribute is set to a value other than [CLOSED](#)<sup>p981</sup>, sets the [readyState](#)<sup>p981</sup> attribute to [CLOSED](#)<sup>p981</sup> and [fires an event](#) named [error](#)<sup>p1260</sup> at the [EventSource](#)<sup>p980</sup> object. **Once the user agent has [failed the connection](#)<sup>p983</sup>, it does *not* attempt to reconnect!**

The [task source](#)<sup>p925</sup> for any [tasks](#)<sup>p925</sup> that are [queued](#)<sup>p925</sup> by [EventSource](#)<sup>p980</sup> objects is the **remote event task source**.

### 9.2.4 Parsing an event stream §<sup>p98</sup><sub>3</sub>

This event stream format's [MIME type](#) is [text/event-stream](#)<sup>p1237</sup>.

The event stream format is as described by the `stream` production of the following ABNF, the character set for which is Unicode. [\[ABNF\]](#)<sup>p1264</sup>

```

stream      = [ bom ] *event
event       = *( comment / field ) end-of-line
comment     = colon *any-char end-of-line
field       = 1*name-char [ colon [ space ] *any-char ] end-of-line
end-of-line = ( cr lf / cr / lf )

; characters
lf          = %x000A ; U+000A LINE FEED (LF)
cr          = %x000D ; U+000D CARRIAGE RETURN (CR)
space       = %x0020 ; U+0020 SPACE
colon       = %x003A ; U+003A COLON (:)
bom         = %xFEFF ; U+FEFF BYTE ORDER MARK
name-char   = %x0000-0009 / %x000B-000C / %x000E-0039 / %x003B-10FFFF
             ; a scalar value other than U+000A LINE FEED (LF), U+000D CARRIAGE RETURN (CR), or
             U+003A COLON (:)
any-char    = %x0000-0009 / %x000B-000C / %x000E-10FFFF
             ; a scalar value other than U+000A LINE FEED (LF) or U+000D CARRIAGE RETURN (CR)

```

Event streams in this format must always be encoded as UTF-8. [\[ENCODING\]](#)<sup>p1266</sup>

Lines must be separated by either a U+000D CARRIAGE RETURN U+000A LINE FEED (CRLF) character pair, a single U+000A LINE FEED (LF) character, or a single U+000D CARRIAGE RETURN (CR) character.

Since connections established to remote servers for such resources are expected to be long-lived, UAs should ensure that appropriate buffering is used. In particular, while line buffering with lines are defined to end with a single U+000A LINE FEED (LF) character is safe, block buffering or line buffering with different expected line endings can cause delays in event dispatch.

### 9.2.5 Interpreting an event stream §<sup>p98</sup><sub>3</sub>

Streams must be decoded using the [UTF-8 decode](#) algorithm.

#### Note

The [UTF-8 decode](#) algorithm strips one leading UTF-8 Byte Order Mark (BOM), if any.

The stream must then be parsed by reading everything line by line, with a U+000D CARRIAGE RETURN U+000A LINE FEED (CRLF) character pair, a single U+000A LINE FEED (LF) character not preceded by a U+000D CARRIAGE RETURN (CR) character, and a single U+000D CARRIAGE RETURN (CR) character not followed by a U+000A LINE FEED (LF) character being the ways in which a line can end.

When a stream is parsed, a *data* buffer, an *event type* buffer, and a *last event ID* buffer must be associated with it. They must be initialized to the empty string

Lines must be processed, in the order they are received, as follows:

↪ **If the line is empty (a blank line)**

[Dispatch the event<sup>p984</sup>](#), as defined below.

↪ **If the line starts with a U+003A COLON character (:)**

Ignore the line.

↪ **If the line contains a U+003A COLON character (:)**

Collect the characters on the line before the first U+003A COLON character (:), and let *field* be that string.

Collect the characters on the line after the first U+003A COLON character (:), and let *value* be that string. If *value* starts with a U+0020 SPACE character, remove it from *value*.

[Process the field<sup>p984</sup>](#) using the steps described below, using *field* as the field name and *value* as the field value.

↪ **Otherwise, the string is not empty but does not contain a U+003A COLON character (:)**

[Process the field<sup>p984</sup>](#) using the steps described below, using the whole line as the field name, and the empty string as the field value.

Once the end of the file is reached, any pending data must be discarded. (If the file ends in the middle of an event, before the final empty line, the incomplete event is not dispatched.)

The steps to **process the field** given a field name and a field value depend on the field name, as given in the following list. Field names must be compared literally, with no case folding performed.

↪ **If the field name is "event"**

Set the *event type* buffer to field value.

↪ **If the field name is "data"**

Append the field value to the *data* buffer, then append a single U+000A LINE FEED (LF) character to the *data* buffer.

↪ **If the field name is "id"**

If the field value does not contain U+0000 NULL, then set the *last event ID* buffer to the field value. Otherwise, ignore the field.

↪ **If the field name is "retry"**

If the field value consists of only [ASCII digits](#), then interpret the field value as an integer in base ten, and set the event stream's [reconnection time<sup>p980</sup>](#) to that integer. Otherwise, ignore the field.

↪ **Otherwise**

The field is ignored.

When the user agent is required to **dispatch the event**, the user agent must process the *data* buffer, the *event type* buffer, and the *last event ID* buffer using steps appropriate for the user agent.

For Web browsers, the appropriate steps to [dispatch the event<sup>p984</sup>](#) are as follows:

1. Set the [last event ID string<sup>p980</sup>](#) of the event source to the value of the *last event ID* buffer. The buffer does not get reset, so the [last event ID string<sup>p980</sup>](#) of the event source remains set to this value until the next time it is set by the server.
2. If the *data* buffer is an empty string, set the *data* buffer and the *event type* buffer to the empty string and return.
3. If the *data* buffer's last character is a U+000A LINE FEED (LF) character, then remove the last character from the *data* buffer.
4. Let *event* be the result of [creating an event](#) using [MessageEvent<sup>p978</sup>](#), in the [relevant Realm<sup>p913</sup>](#) of the [EventSource<sup>p980</sup>](#) object.
5. Initialize *event*'s [type](#) attribute to [message<sup>p1261</sup>](#), its [data<sup>p978</sup>](#) attribute to *data*, its [origin<sup>p978</sup>](#) attribute to the [serialization<sup>p830</sup>](#) of

the [origin](#) of the event stream's final URL (i.e., the URL after redirects), and its [lastEventId<sup>p978</sup>](#) attribute to the [last event ID string<sup>p980</sup>](#) of the event source.

6. If the *event type* buffer has a value other than the empty string, change the [type](#) of the newly created event to equal the value of the *event type* buffer.
7. Set the *data* buffer and the *event type* buffer to the empty string.
8. [Queue a task<sup>p925</sup>](#) which, if the [readyState<sup>p981</sup>](#) attribute is set to a value other than [CLOSED<sup>p981</sup>](#), [dispatches](#) the newly created event at the [EventSource<sup>p980</sup>](#) object.

**Note**  
*If an event doesn't have an "id" field, but an earlier event did set the event source's [last event ID string<sup>p980</sup>](#), then the event's [lastEventId<sup>p978</sup>](#) field will be set to the value of whatever the last seen "id" field was.*

For other user agents, the appropriate steps to [dispatch the event<sup>p984</sup>](#) are implementation dependent, but at a minimum they must set the *data* and *event type* buffers to the empty string before returning.

**Example**  
The following event stream, once followed by a blank line:

```
data: YH00
data: +2
data: 10
```

...would cause an event [message<sup>p1261</sup>](#) with the interface [MessageEvent<sup>p978</sup>](#) to be dispatched on the [EventSource<sup>p980</sup>](#) object. The event's [data<sup>p978</sup>](#) attribute would contain the string "YH00\n+2\n10" (where "\n" represents a newline).

This could be used as follows:

```
var stocks = new EventSource("https://stocks.example.com/ticker.php");
stocks.onmessage = function (event) {
  var data = event.data.split('\n');
  updateStocks(data[0], data[1], data[2]);
};
```

...where `updateStocks()` is a function defined as:

```
function updateStocks(symbol, delta, value) { ... }
```

...or some such.

**Example**  
The following stream contains four blocks. The first block has just a comment, and will fire nothing. The second block has two fields with names "data" and "id" respectively; an event will be fired for this block, with the data "first event", and will then set the last event ID to "1" so that if the connection died between this block and the next, the server would be sent a [`Last-Event-ID<sup>p1239`</sup>](#) header with the value "1". The third block fires an event with data "second event", and also has an "id" field, this time with no value, which resets the last event ID to the empty string (meaning no [`Last-Event-ID<sup>p1239`</sup>](#) header will now be sent in the event of a reconnection being attempted). Finally, the last block just fires an event with the data " third event" (with a single leading space character). Note that the last still has to end with a blank line, the end of the stream is not enough to trigger the dispatch of the last event.

```
: test stream

data: first event
id: 1

data:second event
id

data:  third event
```

### Example

The following stream fires two events:

```
data
```

```
data  
data
```

```
data:
```

The first block fires events with the data set to the empty string, as would the last block if it was followed by a blank line. The middle block fires an event with the data set to a single newline character. The last block is discarded because it is not followed by a blank line.

### Example

The following stream fires two identical events:

```
data: test
```

```
data: test
```

This is because the space after the colon is ignored if present.

## 9.2.6 Authoring notes § p98 6

Legacy proxy servers are known to, in certain cases, drop HTTP connections after a short timeout. To protect against such proxy servers, authors can include a comment line (one starting with a ':' character) every 15 seconds or so.

Authors wishing to relate event source connections to each other or to specific documents previously served might find that relying on IP addresses doesn't work, as individual clients can have multiple IP addresses (due to having multiple proxy servers) and individual IP addresses can have multiple clients (due to sharing a proxy server). It is better to include a unique identifier in the document when it is served and then pass that identifier as part of the URL when the connection is established.

Authors are also cautioned that HTTP chunking can have unexpected negative effects on the reliability of this protocol, in particular if the chunking is done by a different layer unaware of the timing requirements. If this is a problem, chunking can be disabled for serving event streams.

Clients that support HTTP's per-server connection limitation might run into trouble when opening multiple pages from a site if each page has an [EventSource](#)<sup>p980</sup> to the same domain. Authors can avoid this using the relatively complex mechanism of using unique domain names per connection, or by allowing the user to enable or disable the [EventSource](#)<sup>p980</sup> functionality on a per-page basis, or by sharing a single [EventSource](#)<sup>p980</sup> object using a [shared worker](#)<sup>p1027</sup>.

## 9.2.7 Connectionless push and other features § p98 6

User agents running in controlled environments, e.g. browsers on mobile handsets tied to specific carriers, may offload the management of the connection to a proxy on the network. In such a situation, the user agent for the purposes of conformance is considered to include both the handset software and the network proxy.

### Example

For example, a browser on a mobile device, after having established a connection, might detect that it is on a supporting network and request that a proxy server on the network take over the management of the connection. The timeline for such a situation might be as follows:

1. Browser connects to a remote HTTP server and requests the resource specified by the author in the [EventSource](#)<sup>p981</sup> constructor.
2. The server sends occasional messages.

3. In between two messages, the browser detects that it is idle except for the network activity involved in keeping the TCP connection alive, and decides to switch to sleep mode to save power.
4. The browser disconnects from the server.
5. The browser contacts a service on the network, and requests that the service, a "push proxy", maintain the connection instead.
6. The "push proxy" service contacts the remote HTTP server and requests the resource specified by the author in the [EventSource<sup>p981</sup>](#) constructor (possibly including a ``Last-Event-IDp1239`` HTTP header, etc).
7. The browser allows the mobile device to go to sleep.
8. The server sends another message.
9. The "push proxy" service uses a technology such as OMA push to convey the event to the mobile device, which wakes only enough to process the event and then returns to sleep.

This can reduce the total data usage, and can therefore result in considerable power savings.

As well as implementing the existing API and [text/event-stream<sup>p1237</sup>](#) wire format as defined by this specification and in more distributed ways as described above, formats of event framing defined by [other applicable specifications<sup>p63</sup>](#) may be supported. This specification does not define how they are to be parsed or processed.

## 9.2.8 Garbage collection §<sup>p98</sup> 7

While an [EventSource<sup>p980</sup>](#) object's [readyState<sup>p981</sup>](#) is [CONNECTING<sup>p981</sup>](#), and the object has one or more event listeners registered for [open<sup>p1261</sup>](#), [message<sup>p1261</sup>](#) or [error<sup>p1260</sup>](#) events, there must be a strong reference from the [Window<sup>p816</sup>](#) or [WorkerGlobalScope<sup>p1024</sup>](#) object that the [EventSource<sup>p980</sup>](#) object's constructor was invoked from to the [EventSource<sup>p980</sup>](#) object itself.

While an [EventSource<sup>p980</sup>](#) object's [readyState<sup>p981</sup>](#) is [OPEN<sup>p981</sup>](#), and the object has one or more event listeners registered for [message<sup>p1261</sup>](#) or [error<sup>p1260</sup>](#) events, there must be a strong reference from the [Window<sup>p816</sup>](#) or [WorkerGlobalScope<sup>p1024</sup>](#) object that the [EventSource<sup>p980</sup>](#) object's constructor was invoked from to the [EventSource<sup>p980</sup>](#) object itself.

While there is a task queued by an [EventSource<sup>p980</sup>](#) object on the [remote event task source<sup>p983</sup>](#), there must be a strong reference from the [Window<sup>p816</sup>](#) or [WorkerGlobalScope<sup>p1024</sup>](#) object that the [EventSource<sup>p980</sup>](#) object's constructor was invoked from to that [EventSource<sup>p980</sup>](#) object.

If a user agent is to **forcibly close** an [EventSource<sup>p980</sup>](#) object (this happens when a [Document<sup>p111</sup>](#) object goes away permanently), the user agent must abort any instances of the [fetch](#) algorithm started for this [EventSource<sup>p980</sup>](#) object, and must set the [readyState<sup>p981</sup>](#) attribute to [CLOSED<sup>p981</sup>](#).

If an [EventSource<sup>p980</sup>](#) object is garbage collected while its connection is still open, the user agent must abort any instance of the [fetch](#) algorithm opened by this [EventSource<sup>p980</sup>](#).

## 9.2.9 Implementation advice §<sup>p98</sup> 7

*This section is non-normative.*

User agents are strongly urged to provide detailed diagnostic information about [EventSource<sup>p980</sup>](#) objects and their related network connections in their development consoles, to aid authors in debugging code using this API.

For example, a user agent could have a panel displaying all the [EventSource<sup>p980</sup>](#) objects a page has created, each listing the constructor's arguments, whether there was a network error, what the CORS status of the connection is and what headers were sent by the client and received from the server to lead to that status, the messages that were received and how they were parsed, and so forth.

Implementations are especially encouraged to report detailed information to their development consoles whenever an [error<sup>p1260</sup>](#) event

is fired, since little to no information can be made available in the events themselves.

## 9.3 Web sockets § p98

### 9.3.1 Introduction § p98

*This section is non-normative.*

To enable Web applications to maintain bidirectional communications with server-side processes, this specification introduces the [WebSocket](#)<sup>p98</sup> interface.

#### Note

*This interface does not allow for raw access to the underlying network. For example, this interface could not be used to implement an IRC client without proxying messages through a custom server.*

### 9.3.2 The [WebSocket](#)<sup>p98</sup> interface § p98

MDN

```
IDL enum BinaryType { "blob", "arraybuffer" };
[Exposed=(Window,Worker)]
interface WebSocket : EventTarget {
  constructor(USVString url, optional (DOMString or sequence<DOMString>) protocols = []);

  readonly attribute USVString url;

  // ready state
  const unsigned short CONNECTING = 0;
  const unsigned short OPEN = 1;
  const unsigned short CLOSING = 2;
  const unsigned short CLOSED = 3;
  readonly attribute unsigned short readyState;
  readonly attribute unsigned long long bufferedAmount;

  // networking
  attribute EventHandler onopen;
  attribute EventHandler onerror;
  attribute EventHandler onclose;
  readonly attribute DOMString extensions;
  readonly attribute DOMString protocol;
  void close(optional [Clamp] unsigned short code, optional USVString reason);

  // messaging
  attribute EventHandler onmessage;
  attribute BinaryType binaryType;
  void send(USVString data);
  void send(Blob data);
  void send(ArrayBuffer data);
  void send(ArrayBufferView data);
};
```

Each [WebSocket](#)<sup>p98</sup> object has an associated **url** (a [URL record](#)).

For web developers (non-normative)

**socket = new [WebSocket](#)<sup>p98</sup>(url [, protocols ] )**

Creates a new [WebSocket](#)<sup>p98</sup> object, immediately establishing the associated WebSocket connection.

url is a string giving the [URL](#) over which the connection is established. Only "ws" or "wss" schemes are allowed; others will cause

a ["SyntaxError" DOMException](#). URLs with [fragments](#) will also cause such an exception.

*protocols* is either a string or an array of strings. If it is a string, it is equivalent to an array consisting of just that string; if it is omitted, it is equivalent to the empty array. Each string in the array is a subprotocol name. The connection will only be established if the server reports that it has selected one of these subprotocols. The subprotocol names have to match the requirements for elements that comprise the value of [Sec-WebSocket-Protocol](#)<sup>p61</sup> fields as defined by *The WebSocket protocol*. [\[WSP\]](#)<sup>p1271</sup>

#### **`socket . send`**<sup>p992</sup>( *data* )

Transmits *data* using the WebSocket connection. *data* can be a string, a [Blob](#), an [ArrayBuffer](#), or an [ArrayBufferView](#).

#### **`socket . close`**<sup>p990</sup>( [ *code* ] [, *reason* ] )

Closes the WebSocket connection, optionally using *code* as the [the WebSocket connection close code](#)<sup>p61</sup> and *reason* as the [the WebSocket connection close reason](#)<sup>p61</sup>.

#### **`socket . url`**<sup>p990</sup>

Returns the [URL that was used](#)<sup>p988</sup> to establish the WebSocket connection.

#### **`socket . readyState`**<sup>p990</sup>

Returns the state of the [WebSocket](#)<sup>p988</sup> object's connection. It can have the values described below.

#### **`socket . bufferedAmount`**<sup>p991</sup>

Returns the number of bytes of application data (UTF-8 text and binary data) that have been queued using [send\(\)](#)<sup>p992</sup> but not yet been transmitted to the network.

If the WebSocket connection is closed, this attribute's value will only increase with each call to the [send\(\)](#)<sup>p992</sup> method. (The number does not reset to zero once the connection closes.)

#### **`socket . extensions`**<sup>p990</sup>

Returns the extensions selected by the server, if any.

#### **`socket . protocol`**<sup>p990</sup>

Returns the subprotocol selected by the server, if any. It can be used in conjunction with the array form of the constructor's second argument to perform subprotocol negotiation.

#### **`socket . binaryType`**<sup>p991</sup> [ = *value* ]

Returns a string that indicates how binary data from the [WebSocket](#)<sup>p988</sup> object is exposed to scripts:

**"blob"**<sup>p993</sup>

Binary data is returned in [Blob](#) form.

**"arraybuffer"**<sup>p993</sup>

Binary data is returned in [ArrayBuffer](#) form.

Can be set, to change how binary data is returned. The default is **"blob"**<sup>p993</sup>.

The [WebSocket\(url, protocols\)](#) constructor, when invoked, must run these steps:

MDN

1. Let *urlRecord* be the result of applying the [URL parser](#) to *url*.
2. If *urlRecord* is failure, then throw a ["SyntaxError" DOMException](#).
3. If *urlRecord*'s [scheme](#) is not "ws" or "wss", then throw a ["SyntaxError" DOMException](#).
4. If *urlRecord*'s [fragment](#) is non-null, then throw a ["SyntaxError" DOMException](#).
5. If *protocols* is a string, set *protocols* to a sequence consisting of just that string.
6. If any of the values in *protocols* occur more than once or otherwise fail to match the requirements for elements that comprise the value of [Sec-WebSocket-Protocol](#)<sup>p61</sup> fields as defined by *The WebSocket protocol*, then throw a ["SyntaxError" DOMException](#). [\[WSP\]](#)<sup>p1271</sup>
7. Run this step [in parallel](#)<sup>p41</sup>:
  1. [Establish a WebSocket connection](#) given *urlRecord*, *protocols*, and the [entry settings object](#)<sup>p910</sup>. [\[FETCH\]](#)<sup>p1266</sup>

#### Note

If the [establish a WebSocket connection algorithm](#) fails, it triggers the [fail the WebSocket connection](#)<sup>p61</sup>

algorithm, which then invokes the [close the WebSocket connection<sup>p61</sup>](#) algorithm, which then establishes that the [WebSocket connection is closed<sup>p61</sup>](#), which fires the [close<sup>p1260</sup>](#) event [as described below<sup>p993</sup>](#).

8. Return a new [WebSocket<sup>p988</sup>](#) object whose [url<sup>p988</sup>](#) is *urlRecord*.

The **url** attribute's getter must return this [WebSocket<sup>p988</sup>](#) object's [url<sup>p988</sup>](#), [serialized](#).

The **readyState** attribute represents the state of the connection. It can have the following values:

#### **CONNECTING (numeric value 0)**

The connection has not yet been established.

#### **OPEN (numeric value 1)**

[The WebSocket connection is established<sup>p61</sup>](#) and communication is possible.

#### **CLOSING (numeric value 2)**

The connection is going through the closing handshake, or the [close\(\)<sup>p990</sup>](#) method has been invoked.

#### **CLOSED (numeric value 3)**

The connection has been closed or could not be opened.

When the object is created its [readyState<sup>p990</sup>](#) must be set to [CONNECTING<sup>p990</sup>](#) (0).

The **extensions** attribute must initially return the empty string. After [the WebSocket connection is established<sup>p61</sup>](#), its value might change, as defined below.

The **protocol** attribute must initially return the empty string. After [the WebSocket connection is established<sup>p61</sup>](#), its value might change, as defined below.

The [close\(\*code\*, \*reason\*\)](#) method, when invoked, must run these steps:

1. If *code* is present, but is neither an integer equal to 1000 nor an integer in the range 3000 to 4999, inclusive, throw an ["InvalidAccessError" DOMException](#).
2. If *reason* is present, then run these substeps:
  1. Let *reasonBytes* be the result of [encoding](#) *reason*.
  2. If *reasonBytes* is longer than 123 bytes, then throw a ["SyntaxError" DOMException](#).
3. Run the first matching steps from the following list:

- ↪ If the [readyState<sup>p990</sup>](#) attribute is in the [CLOSING<sup>p990</sup>](#) (2) or [CLOSED<sup>p990</sup>](#) (3) state  
Do nothing.

#### Note

*The connection is already closing or is already closed. If it has not already, a [close<sup>p1260</sup>](#) event will eventually fire [as described below<sup>p993</sup>](#).*

- ↪ If the [WebSocket connection is not yet established<sup>p61</sup>](#) [\[WSP\]<sup>p1271</sup>](#)  
[Fail the WebSocket connection<sup>p61</sup>](#) and set the [readyState<sup>p990</sup>](#) attribute's value to [CLOSING<sup>p990</sup>](#) (2). [\[WSP\]<sup>p1271</sup>](#)

#### Note

*The [fail the WebSocket connection<sup>p61</sup>](#) algorithm invokes the [close the WebSocket connection<sup>p61</sup>](#) algorithm, which then establishes that [the WebSocket connection is closed<sup>p61</sup>](#), which fires the [close<sup>p1260</sup>](#) event [as described below<sup>p993</sup>](#).*

- ↪ If the [WebSocket closing handshake has not yet been started<sup>p61</sup>](#) [\[WSP\]<sup>p1271</sup>](#)  
[Start the WebSocket closing handshake<sup>p61</sup>](#) and set the [readyState<sup>p990</sup>](#) attribute's value to [CLOSING<sup>p990</sup>](#) (2). [\[WSP\]<sup>p1271</sup>](#)

If neither *code* nor *reason* is present, the WebSocket Close message must not have a body.

#### Note

WebSocket Protocol *erroneously states that the status code is required for the [start the WebSocket closing handshake](#)<sup>p61</sup> algorithm.*

If *code* is present, then the status code to use in the WebSocket Close message must be the integer given by *close*. [\[WSP\]](#)<sup>p1271</sup>

If *reason* is also present, then *reasonBytes* must be provided in the Close message after the status code. [\[WSP\]](#)<sup>p1271</sup>

#### Note

*The [start the WebSocket closing handshake](#)<sup>p61</sup> algorithm eventually invokes the [close the WebSocket connection](#)<sup>p61</sup> algorithm, which then establishes that [the WebSocket connection is closed](#)<sup>p61</sup>, which fires the [close](#)<sup>p1260</sup> event [as described below](#)<sup>p993</sup>.*

#### ↪ Otherwise

Set the [readyState](#)<sup>p990</sup> attribute's value to [CLOSING](#)<sup>p990</sup> (2).

#### Note

*The [WebSocket closing handshake is started](#)<sup>p61</sup>, and will eventually invoke the [close the WebSocket connection](#)<sup>p61</sup> algorithm, which will establish that [the WebSocket connection is closed](#)<sup>p61</sup>, and thus the [close](#)<sup>p1260</sup> event will fire, [as described below](#)<sup>p993</sup>.*

#### Note

*The [close\(\)](#)<sup>p990</sup> method does not discard previously sent messages before starting the WebSocket closing handshake — even if, in practice, the user agent is still busy sending those messages, the handshake will only start after the messages are sent.*

The [bufferedAmount](#) attribute must return the number of bytes of application data (UTF-8 text and binary data) that have been queued using [send\(\)](#)<sup>p992</sup> but that, as of the last time the [event loop](#)<sup>p924</sup> reached [step 1](#)<sup>p927</sup>, had not yet been transmitted to the network. (This thus includes any text sent during the execution of the current task, regardless of whether the user agent is able to transmit text in the background [in parallel](#)<sup>p41</sup> with script execution.) This does not include framing overhead incurred by the protocol, or buffering done by the operating system or network hardware. MDN

#### Example

In this simple example, the [bufferedAmount](#)<sup>p991</sup> attribute is used to ensure that updates are sent either at the rate of one update every 50ms, if the network can handle that rate, or at whatever rate the network *can* handle, if that is too fast.

```
var socket = new WebSocket('ws://game.example.com:12010/updates');
socket.onopen = function () {
  setInterval(function () {
    if (socket.bufferedAmount == 0)
      socket.send(getUpdateData());
  }, 50);
};
```

The [bufferedAmount](#)<sup>p991</sup> attribute can also be used to saturate the network without sending the data at a higher rate than the network can handle, though this requires more careful monitoring of the value of the attribute over time.

When a [WebSocket](#)<sup>p988</sup> object is created, its [binaryType](#) IDL attribute must be set to the string "[blob](#)<sup>p993</sup>". On getting, it must return the last value it was set to. On setting, the user agent must set the IDL attribute to the new value.

#### Note

*User agents can use the [binaryType](#)<sup>p991</sup> attribute as a hint for how to handle incoming binary data: if the attribute is set to "[blob](#)<sup>p993</sup>", it is safe to spool it to disk, and if it is set to "[arraybuffer](#)<sup>p993</sup>", it is likely more efficient to keep the data in memory. Naturally, user agents are encouraged to use more subtle heuristics to decide whether to keep incoming data in memory or not, e.g. based on how big the data is or how common it is for a script to change the attribute at the last minute. This latter aspect is important in particular because it is quite possible for the attribute to be changed after the user agent has received the data but*

before the user agent has fired the event for it.

The `send(data)` method transmits data using the connection. If the `readyState`<sup>p990</sup> attribute is `CONNECTING`<sup>p990</sup>, it must throw an `"InvalidStateError"` `DOMException`. Otherwise, the user agent must run the appropriate set of steps from the following list:

MDN

#### If the argument is a string

If [the WebSocket connection is established](#)<sup>p61</sup> and [the WebSocket closing handshake has not yet started](#)<sup>p61</sup>, then the user agent must [send a WebSocket Message](#)<sup>p61</sup> comprised of the `data` argument using a text frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p993</sup> and then [close the WebSocket connection](#)<sup>p61</sup>. Any invocation of this method with a string argument that does not throw an exception must increase the `bufferedAmount`<sup>p991</sup> attribute by the number of bytes needed to express the argument as UTF-8. [\[UNICODE\]](#)<sup>p1270</sup> [\[ENCODING\]](#)<sup>p1266</sup> [\[WSP\]](#)<sup>p1271</sup>

#### If the argument is a Blob object

If [the WebSocket connection is established](#)<sup>p61</sup>, and [the WebSocket closing handshake has not yet started](#)<sup>p61</sup>, then the user agent must [send a WebSocket Message](#)<sup>p61</sup> comprised of `data` using a binary frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p993</sup> and then [close the WebSocket connection](#)<sup>p61</sup>. The data to be sent is the raw data represented by the `Blob` object. Any invocation of this method with a `Blob` argument that does not throw an exception must increase the `bufferedAmount`<sup>p991</sup> attribute by the size of the `Blob` object's raw data, in bytes. [\[WSP\]](#)<sup>p1271</sup> [\[FILEAPI\]](#)<sup>p1266</sup>

#### If the argument is an ArrayBuffer object

If [the WebSocket connection is established](#)<sup>p61</sup>, and [the WebSocket closing handshake has not yet started](#)<sup>p61</sup>, then the user agent must [send a WebSocket Message](#)<sup>p61</sup> comprised of `data` using a binary frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p993</sup> and then [close the WebSocket connection](#)<sup>p61</sup>. The data to be sent is the data stored in the buffer described by the `ArrayBuffer` object. Any invocation of this method with an `ArrayBuffer` argument that does not throw an exception must increase the `bufferedAmount`<sup>p991</sup> attribute by the length of the `ArrayBuffer` in bytes. [\[WSP\]](#)<sup>p1271</sup>

#### If the argument is an object that matches the ArrayBufferView type definition

If [the WebSocket connection is established](#)<sup>p61</sup>, and [the WebSocket closing handshake has not yet started](#)<sup>p61</sup>, then the user agent must [send a WebSocket Message](#)<sup>p61</sup> comprised of `data` using a binary frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p993</sup> and then [close the WebSocket connection](#)<sup>p61</sup>. The data to be sent is the data stored in the section of the buffer described by the `ArrayBuffer` object that `data` references. Any invocation of this method with this kind of argument that does not throw an exception must increase the `bufferedAmount`<sup>p991</sup> attribute by the length of `data`'s buffer in bytes. [\[WSP\]](#)<sup>p1271</sup>

The following are the [event handlers](#)<sup>p934</sup> (and their corresponding [event handler event types](#)<sup>p937</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p935</sup>, by all objects implementing the `WebSocket`<sup>p988</sup> interface:

Event handler <sup>p934</sup>	Event handler event type <sup>p937</sup>
<code>onopen</code>	<code>open</code> <sup>p1261</sup>
<code>onmessage</code>	<code>message</code> <sup>p1261</sup>
<code>onerror</code>	<code>error</code> <sup>p1260</sup>
<code>onclose</code>	<code>close</code> <sup>p1260</sup>

### 9.3.3 Feedback from the protocol §<sup>p99</sup> 2

When [the WebSocket connection is established](#)<sup>p61</sup>, the user agent must [queue a task](#)<sup>p925</sup> to run these steps:

1. Change the `readyState`<sup>p990</sup> attribute's value to `OPEN`<sup>p990</sup> (1).
2. Change the `extensions`<sup>p990</sup> attribute's value to the [extensions in use](#)<sup>p61</sup>, if it is not the null value. [\[WSP\]](#)<sup>p1271</sup>
3. Change the `protocol`<sup>p990</sup> attribute's value to the [subprotocol in use](#)<sup>p61</sup>, if it is not the null value. [\[WSP\]](#)<sup>p1271</sup>
4. [Fire an event](#) named `open`<sup>p1261</sup> at the `WebSocket`<sup>p988</sup> object.

## Note

Since the algorithm above is [queued as a task](#)<sup>p925</sup>, there is no race condition between [the WebSocket connection being established](#)<sup>p61</sup> and the script setting up an event listener for the [open](#)<sup>p1261</sup> event.

When [a WebSocket message has been received](#)<sup>p61</sup> with type `type` and data `data`, the user agent must [queue a task](#)<sup>p925</sup> to follow these steps: [\[WSP\]](#)<sup>p1271</sup>

1. If the [readyState](#)<sup>p990</sup> attribute's value is not [OPEN](#)<sup>p990</sup> (1), then return.
2. Let `dataForEvent` be determined by switching on `type` and [binaryType](#)<sup>p991</sup>:
  - ↪ **type indicates that the data is Text**  
a new [DOMString](#) containing `data`
  - ↪ **type indicates that the data is Binary and [binaryType](#)<sup>p991</sup> is "blob"**  
a new [Blob](#) object, created in the [relevant Realm](#)<sup>p913</sup> of the [WebSocket](#)<sup>p988</sup> object, that represents `data` as its raw data [\[FILEAPI\]](#)<sup>p1266</sup>
  - ↪ **type indicates that the data is Binary and [binaryType](#)<sup>p991</sup> is "arraybuffer"**  
a new [ArrayBuffer](#) object, created in the [relevant Realm](#)<sup>p913</sup> of the [WebSocket](#)<sup>p988</sup> object, whose contents are `data`
3. [Fire an event](#) named [message](#)<sup>p1261</sup> at the [WebSocket](#)<sup>p988</sup> object, using [MessageEvent](#)<sup>p978</sup>, with the [origin](#)<sup>p978</sup> attribute initialized to the [serialization](#)<sup>p830</sup> of the [WebSocket](#)<sup>p988</sup> object's [url](#)<sup>p988</sup>'s [origin](#), and the [data](#)<sup>p978</sup> attribute initialized to `dataForEvent`.

## Note

User agents are encouraged to check if they can perform the above steps efficiently before they run the task, picking tasks from other [task queues](#)<sup>p924</sup> while they prepare the buffers if not. For example, if the [binaryType](#)<sup>p991</sup> attribute was set to `"blob"`<sup>p993</sup> when the data arrived, and the user agent spooled all the data to disk, but just before running the above [task](#)<sup>p925</sup> for this particular message the script switched [binaryType](#)<sup>p991</sup> to `"arraybuffer"`<sup>p993</sup>, the user agent would want to page the data back to RAM before running this [task](#)<sup>p925</sup> so as to avoid stalling the main thread while it created the [ArrayBuffer](#) object.

## Example

Here is an example of how to define a handler for the [message](#)<sup>p1261</sup> event in the case of text frames:

```
mysocket.onmessage = function (event) {
  if (event.data == 'on') {
    turnLampOn();
  } else if (event.data == 'off') {
    turnLampOff();
  }
};
```

The protocol here is a trivial one, with the server just sending "on" or "off" messages.

When [the WebSocket closing handshake is started](#)<sup>p61</sup>, the user agent must [queue a task](#)<sup>p925</sup> to change the [readyState](#)<sup>p990</sup> attribute's value to [CLOSING](#)<sup>p990</sup> (2). (If the [close\(\)](#)<sup>p990</sup> method was called, the [readyState](#)<sup>p990</sup> attribute's value will already be set to [CLOSING](#)<sup>p990</sup> (2) when this task runs.) [\[WSP\]](#)<sup>p1271</sup>

When [the WebSocket connection is closed](#)<sup>p61</sup>, possibly *cleanly*, the user agent must [queue a task](#)<sup>p925</sup> to run the following substeps:

1. Change the [readyState](#)<sup>p990</sup> attribute's value to [CLOSED](#)<sup>p990</sup> (3).
2. If the user agent was required to [fail the WebSocket connection](#)<sup>p61</sup>, or if the [the WebSocket connection was closed](#)<sup>p61</sup> after being **flagged as full**, [fire an event](#) named `error` at the [WebSocket](#)<sup>p988</sup> object. [\[WSP\]](#)<sup>p1271</sup>
3. [Fire an event](#) named [close](#)<sup>p1260</sup> at the [WebSocket](#)<sup>p988</sup> object, using [CloseEvent](#)<sup>p994</sup>, with the [wasClean](#)<sup>p995</sup> attribute initialized to true if the connection closed *cleanly* and false otherwise, the [code](#)<sup>p995</sup> attribute initialized to [the WebSocket connection close code](#)<sup>p61</sup>, and the [reason](#)<sup>p995</sup> attribute initialized to the result of applying [UTF-8 decode without BOM](#) to [the WebSocket](#)

**Warning!**

User agents must not convey any failure information to scripts in a way that would allow a script to distinguish the following situations:

- A server whose host name could not be resolved.
- A server to which packets could not successfully be routed.
- A server that refused the connection on the specified port.
- A server that failed to correctly perform a TLS handshake (e.g., the server certificate can't be verified).
- A server that did not complete the opening handshake (e.g. because it was not a WebSocket server).
- A WebSocket server that sent a correct opening handshake, but that specified options that caused the client to drop the connection (e.g. the server specified a subprotocol that the client did not offer).
- A WebSocket server that abruptly closed the connection after successfully completing the opening handshake.

In all of these cases, the [the WebSocket connection close code](#)<sup>p61</sup> would be 1006, as required by WebSocket Protocol. [\[WSP\]](#)<sup>p1271</sup>

Allowing a script to distinguish these cases would allow a script to probe the user's local network in preparation for an attack.

**Note**

In particular, this means the code 1015 is not used by the user agent (unless the server erroneously uses it in its close frame, of course).

The [task source](#)<sup>p925</sup> for all [tasks](#)<sup>p925</sup> [queued](#)<sup>p925</sup> in this section is the **WebSocket task source**.

### 9.3.4 Ping and Pong frames §<sup>p99</sup><sub>4</sub>

The *WebSocket protocol* defines Ping and Pong frames that can be used for keep-alive, heart-beats, network status probing, latency instrumentation, and so forth. These are not currently exposed in the API.

User agents may send ping and unsolicited pong frames as desired, for example in an attempt to maintain local network NAT mappings, to detect failed connections, or to display latency metrics to the user. User agents must not use pings or unsolicited pongs to aid the server; it is assumed that servers will solicit pongs whenever appropriate for the server's needs.

### 9.3.5 The [CloseEvent](#)<sup>p994</sup> interface §<sup>p99</sup><sub>4</sub>

[WebSocket](#)<sup>p988</sup> objects use the [CloseEvent](#)<sup>p994</sup> interface for their [close](#)<sup>p1260</sup> events:

```
IDL [Exposed=(Window,Worker)]
interface CloseEvent : Event {
  constructor(DOMString type, optional CloseEventInit eventInitDict = {});

  readonly attribute boolean wasClean;
  readonly attribute unsigned short code;
  readonly attribute USVString reason;
};

dictionary CloseEventInit : EventInit {
```

```
boolean wasClean = false;
unsigned short code = 0;
USVString reason = "";
};
```

For web developers (non-normative)

**event . wasClean**<sup>p995</sup>

Returns true if the connection closed cleanly; false otherwise.

**event . code**<sup>p995</sup>

Returns the WebSocket connection close code provided by the server.

**event . reason**<sup>p995</sup>

Returns the WebSocket connection close reason provided by the server.

The **wasClean** attribute must return the value it was initialized to. It represents whether the connection closed cleanly or not.

The **code** attribute must return the value it was initialized to. It represents the WebSocket connection close code provided by the server.

The **reason** attribute must return the value it was initialized to. It represents the WebSocket connection close reason provided by the server.

### 9.3.6 Garbage collection § p99

A **WebSocket**<sup>p988</sup> object whose **readyState**<sup>p990</sup> attribute's value was set to **CONNECTING**<sup>p990</sup> (0) as of the last time the **event loop**<sup>p924</sup> reached **step 1**<sup>p927</sup> must not be garbage collected if there are any event listeners registered for **open**<sup>p1261</sup> events, **message**<sup>p1261</sup> events, **error**<sup>p1260</sup> events, or **close**<sup>p1260</sup> events.

A **WebSocket**<sup>p988</sup> object whose **readyState**<sup>p990</sup> attribute's value was set to **OPEN**<sup>p990</sup> (1) as of the last time the **event loop**<sup>p924</sup> reached **step 1**<sup>p927</sup> must not be garbage collected if there are any event listeners registered for **message**<sup>p1261</sup> events, **error**<sup>p1260</sup>, or **close**<sup>p1260</sup> events.

A **WebSocket**<sup>p988</sup> object whose **readyState**<sup>p990</sup> attribute's value was set to **CLOSING**<sup>p990</sup> (2) as of the last time the **event loop**<sup>p924</sup> reached **step 1**<sup>p927</sup> must not be garbage collected if there are any event listeners registered for **error**<sup>p1260</sup> or **close**<sup>p1260</sup> events.

A **WebSocket**<sup>p988</sup> object with **an established connection**<sup>p61</sup> that has data queued to be transmitted to the network must not be garbage collected. [\[WSP\]](#)<sup>p1271</sup>

If a **WebSocket**<sup>p988</sup> object is garbage collected while its connection is still open, the user agent must **start the WebSocket closing handshake**<sup>p61</sup>, with no status code for the Close message. [\[WSP\]](#)<sup>p1271</sup>

If a user agent is to **make disappear** a **WebSocket**<sup>p988</sup> object (this happens when a **Document**<sup>p111</sup> object goes away), the user agent must follow the first appropriate set of steps from the following list:

↪ **If the WebSocket connection is not yet **established****<sup>p61</sup> [\[WSP\]](#)<sup>p1271</sup>

[Fail the WebSocket connection](#)<sup>p61</sup>. [\[WSP\]](#)<sup>p1271</sup>

↪ **If the WebSocket closing handshake has not yet been **started****<sup>p61</sup> [\[WSP\]](#)<sup>p1271</sup>

[Start the WebSocket closing handshake](#)<sup>p61</sup>, with the status code to use in the WebSocket Close message being 1001. [\[WSP\]](#)<sup>p1271</sup>

↪ **Otherwise**

Do nothing.

## 9.4 Cross-document messaging § p99

Web browsers, for security and privacy reasons, prevent documents in different domains from affecting each other; that is, cross-site scripting is disallowed.

While this is an important security feature, it prevents pages from different domains from communicating even when those pages are not hostile. This section introduces a messaging system that allows documents to communicate with each other regardless of their source domain, in a way designed to not enable cross-site scripting attacks.

### Note

The `postMessage()` API can be used as a [tracking vector](#).

### 9.4.1 Introduction § p99

This section is non-normative.

#### Example

For example, if document A contains an `iframe` element that contains document B, and script in document A calls `postMessage()` on the `Window` object of document B, then a message event will be fired on that object, marked as originating from the `Window` of document A. The script in document A might look like:

```
var o = document.getElementsByTagName('iframe')[0];
o.contentWindow.postMessage('Hello world', 'https://b.example.org/');
```

To register an event handler for incoming events, the script would use `addEventListener()` (or similar mechanisms). For example, the script in document B might look like:

```
window.addEventListener('message', receiver, false);
function receiver(e) {
  if (e.origin == 'https://example.com') {
    if (e.data == 'Hello world') {
      e.source.postMessage('Hello', e.origin);
    } else {
      alert(e.data);
    }
  }
}
```

This script first checks the domain is the expected domain, and then looks at the message, which it either displays to the user, or responds to by sending a message back to the document which sent the message in the first place.

### 9.4.2 Security § p99

#### 9.4.2.1 Authors § p99

#### ⚠Warning!

**Use of this API requires extra care to protect users from hostile entities abusing a site for their own purposes.**

Authors should check the `origin` attribute to ensure that messages are only accepted from domains that they expect to receive messages from. Otherwise, bugs in the author's message handling code could be exploited by hostile sites.

Furthermore, even after checking the `origin` attribute, authors should also check that the data in question is of the expected format. Otherwise, if the source of the event has been attacked using a cross-site scripting flaw, further unchecked processing of information sent using the `postMessage()` method could result in the attack being propagated into the receiver.

Authors should not use the wildcard keyword (\*) in the `targetOrigin` argument in messages that contain any confidential information, as

otherwise there is no way to guarantee that the message is only delivered to the recipient to which it was intended.

Authors who accept messages from any origin are encouraged to consider the risks of a denial-of-service attack. An attacker could send a high volume of messages; if the receiving page performs expensive computation or causes network traffic to be sent for each such message, the attacker's message could be multiplied into a denial-of-service attack. Authors are encouraged to employ rate limiting (only accepting a certain number of messages per minute) to make such attacks impractical.

#### 9.4.2.2 User agents §<sup>p99</sup><sub>7</sub>

The integrity of this API is based on the inability for scripts of one [origin<sup>p829</sup>](#) to post arbitrary events (using `dispatchEvent()` or otherwise) to objects in other origins (those that are not the [same<sup>p830</sup>](#)).

#### Note

*Implementors are urged to take extra care in the implementation of this feature. It allows authors to transmit information from one domain to another domain, which is normally disallowed for security reasons. It also requires that UAs be careful to allow access to certain properties but not others.*

User agents are also encouraged to consider rate-limiting message traffic between different [origins<sup>p829</sup>](#), to protect naïve sites from denial-of-service attacks.

#### 9.4.3 Posting messages §<sup>p99</sup><sub>7</sub>

##### For web developers (non-normative)

##### **`window . postMessagep998(message [, options ] )`**

Posts a message to the given window. Messages can be structured objects, e.g. nested objects and arrays, can contain JavaScript values (strings, numbers, [Date](#) objects, etc), and can contain certain data objects such as [File Blob](#), [FileList](#), and [ArrayBuffer](#) objects.

Objects listed in the `transfer` member of `options` are transferred, not just cloned, meaning that they are no longer usable on the sending side.

A target origin can be specified using the `targetOrigin` member of `options`. If not provided, it defaults to `"/"`. This default restricts the message to same-origin targets only.

If the origin of the target window doesn't match the given target origin, the message is discarded, to avoid information leakage. To send the message to the target regardless of origin, set the target origin to `"*"`.

Throws a ["DataCloneError" DOMException](#) if `transfer` array contains duplicate objects or if `message` could not be cloned.

##### **`window . postMessagep998(message, targetOrigin [, transfer ] )`**

This is an alternate version of [postMessage\(\)<sup>p998</sup>](#) where the target origin is specified as a parameter. Calling `window.postMessage(message, target, transfer)` is equivalent to `window.postMessage(message, {targetOrigin, transfer})`.

#### Note

*When posting a message to a [Window<sup>p816</sup>](#) of a [browsing context<sup>p804</sup>](#) that has just been navigated to a new [Document<sup>p111</sup>](#) is likely to result in the message not receiving its intended recipient: the scripts in the target [browsing context<sup>p804</sup>](#) have to have had time to set up listeners for the messages. Thus, for instance, in situations where a message is to be sent to the [Window<sup>p816</sup>](#) of newly created child [iframe<sup>p355</sup>](#), authors are advised to have the child [Document<sup>p111</sup>](#) post a message to their parent announcing their readiness to receive messages, and for the parent to wait for this message before beginning posting messages.*

The **window post message steps**, given a `targetWindow`, `message`, and `options`, are as follows:

1. Let `targetRealm` be `targetWindow`'s [Realm<sup>p908</sup>](#).
2. Let `incumbentSettings` be the [incumbent settings object<sup>p911</sup>](#).
3. Let `targetOrigin` be `options["targetOrigin"]`.

4. If *targetOrigin* is a single U+002F SOLIDUS character (/), then set *targetOrigin* to *incumbentSettings*'s [origin](#)<sup>p897</sup>.
5. Otherwise, if *targetOrigin* is not a single U+002A ASTERISK character (\*), then:
  1. Let *parsedURL* be the result of running the [URL parser](#) on *targetOrigin*.
  2. If *parsedURL* is failure, then throw a ["SyntaxError" DOMException](#).
  3. Set *targetOrigin* to *parsedURL*'s [origin](#).
6. Let *transfer* be *options*["transfer"].
7. Let *serializeWithTransferResult* be [StructuredSerializeWithTransfer](#)<sup>p107</sup>(*message*, *transfer*). Rethrow any exceptions.
8. [Queue a task](#)<sup>p925</sup> on the **posted message task source** of *targetWindow*'s [relevant agent](#)<sup>p919</sup>'s [event loop](#)<sup>p924</sup> to run the following steps:
  1. If the *targetOrigin* argument is not a single literal U+002A ASTERISK character (\*) and *targetWindow*'s [associated Document](#)<sup>p818</sup>'s [origin](#)<sup>p829</sup> is not [same origin](#)<sup>p830</sup> with *targetOrigin*, then return.
  2. Let *origin* be the [serialization](#)<sup>p830</sup> of *incumbentSettings*'s [origin](#)<sup>p897</sup>.
  3. Let *source* be the [WindowProxy](#)<sup>p826</sup> object corresponding to *incumbentSettings*'s [global object](#)<sup>p908</sup> (a [Window](#)<sup>p816</sup> object).
  4. Let *deserializeRecord* be [StructuredDeserializeWithTransfer](#)<sup>p108</sup>(*serializeWithTransferResult*, *targetRealm*).  
If this throws an exception, catch it, [fire an event](#) named [messageerror](#)<sup>p1261</sup> at *targetWindow*, using [MessageEvent](#)<sup>p978</sup>, with the [origin](#)<sup>p978</sup> attribute initialized to *origin* and the [source](#)<sup>p978</sup> attribute initialized to *source*, and then return.
  5. Let *messageClone* be *deserializeRecord*.[[Deserialized]].
  6. Let *newPorts* be a new [frozen array](#) consisting of all [MessagePort](#)<sup>p1002</sup> objects in *deserializeRecord*.[[TransferredValues]], if any, maintaining their relative order.
  7. [Fire an event](#) named [message](#)<sup>p1261</sup> at *targetWindow*, using [MessageEvent](#)<sup>p978</sup>, with the [origin](#)<sup>p978</sup> attribute initialized to *origin*, the [source](#)<sup>p978</sup> attribute initialized to *source*, the [data](#)<sup>p978</sup> attribute initialized to *messageClone*, and the [ports](#)<sup>p979</sup> attribute initialized to *newPorts*.

The [postMessage\(message, options\)](#) method, when invoked on a [Window](#)<sup>p816</sup> object, must run the following steps:

1. Let *targetWindow* be this [Window](#)<sup>p816</sup> object.
2. Run the [window post message steps](#)<sup>p997</sup> providing *targetWindow*, *message*, and *options*.

The [postMessage\(message, targetOrigin, transfer\)](#) method, when invoked on a [Window](#)<sup>p816</sup> object, must run the following steps:

1. Let *targetWindow* be this [Window](#)<sup>p816</sup> object.
2. Let *options* be «[ "targetOrigin" → *targetOrigin*, "transfer" → *transfer* ]».
3. Run the [window post message steps](#)<sup>p997</sup> providing *targetWindow*, *message*, and *options*.

## 9.5 Channel messaging <sup>p99</sup><sub>8</sub>

### 9.5.1 Introduction <sup>p99</sup><sub>8</sub>

*This section is non-normative.*

To enable independent pieces of code (e.g. running in different [browsing contexts](#)<sup>p804</sup>) to communicate directly, authors can use [channel messaging](#)<sup>p998</sup>.

Communication channels in this mechanism are implemented as two-ways pipes, with a port at each end. Messages sent in one port

are delivered at the other port, and vice-versa. Messages are delivered as DOM events, without interrupting or blocking running [tasks](#)<sup>p925</sup>.

To create a connection (two "entangled" ports), the `MessageChannel()` constructor is called:

```
var channel = new MessageChannel();
```

One of the ports is kept as the local port, and the other port is sent to the remote code, e.g. using [postMessage\(\)](#)<sup>p998</sup>:

```
otherWindow.postMessage('hello', 'https://example.com', [channel.port2]);
```

To send messages, the [postMessage\(\)](#)<sup>p1004</sup> method on the port is used:

```
channel.port1.postMessage('hello');
```

To receive messages, one listens to [message](#)<sup>p1261</sup> events:

```
channel.port1.onmessage = handleMessage;
function handleMessage(event) {
  // message is in event.data
  // ...
}
```

Data sent on a port can be structured data; for example here an array of strings is passed on a [MessagePort](#)<sup>p1002</sup>:

```
port1.postMessage(['hello', 'world']);
```

### 9.5.1.1 Examples <sup>p99</sup><sub>9</sub>

*This section is non-normative.*

#### Example

In this example, two JavaScript libraries are connected to each other using [MessagePort](#)<sup>p1002</sup>s. This allows the libraries to later be hosted in different frames, or in [Worker](#)<sup>p1032</sup> objects, without any change to the APIs.

```
<script src="contacts.js"></script> <!-- exposes a contacts object -->
<script src="compose-mail.js"></script> <!-- exposes a composer object -->
<script>
  var channel = new MessageChannel();
  composer.addContactsProvider(channel.port1);
  contacts.registerConsumer(channel.port2);
</script>
```

Here's what the "addContactsProvider()" function's implementation could look like:

```
function addContactsProvider(port) {
  port.onmessage = function (event) {
    switch (event.data.messageType) {
      'search-result': handleSearchResult(event.data.results); break;
      'search-done': handleSearchDone(); break;
      'search-error': handleSearchError(event.data.message); break;
      // ...
    }
  };
};
```

Alternatively, it could be implemented as follows:

```
function addContactsProvider(port) {
  port.addEventListener('message', function (event) {
    if (event.data.messageType == 'search-result')
      handleSearchResult(event.data.results);
  });
  port.addEventListener('message', function (event) {
    if (event.data.messageType == 'search-done')
      handleSearchDone();
  });
  port.addEventListener('message', function (event) {
    if (event.data.messageType == 'search-error')
      handleSearchError(event.data.message);
  });
  // ...
  port.start();
};
```

The key difference is that when using `addEventListener()`, the `start()`<sup>p1004</sup> method must also be invoked. When using `onmessage`<sup>p1004</sup>, the call to `start()`<sup>p1004</sup> is implied.

The `start()`<sup>p1004</sup> method, whether called explicitly or implicitly (by setting `onmessage`<sup>p1004</sup>), starts the flow of messages: messages posted on message ports are initially paused, so that they don't get dropped on the floor before the script has had a chance to set up its handlers.

### 9.5.1.2 Ports as the basis of an object-capability model on the Web <sup>s p1000</sup>

*This section is non-normative.*

Ports can be viewed as a way to expose limited capabilities (in the object-capability model sense) to other actors in the system. This can either be a weak capability system, where the ports are merely used as a convenient model within a particular origin, or as a strong capability model, where they are provided by one origin *provider* as the only mechanism by which another origin *consumer* can effect change in or obtain information from *provider*.

For example, consider a situation in which a social Web site embeds in one `iframe`<sup>p355</sup> the user's e-mail contacts provider (an address book site, from a second origin), and in a second `iframe`<sup>p355</sup> a game (from a third origin). The outer social site and the game in the second `iframe`<sup>p355</sup> cannot access anything inside the first `iframe`<sup>p355</sup>; together they can only:

- [Navigate](#)<sup>p852</sup> the `iframe`<sup>p355</sup> to a new [URL](#), such as the same [URL](#) but with a different [fragment](#), causing the `Window`<sup>p816</sup> in the `iframe`<sup>p355</sup> to receive a [hashchange](#)<sup>p1260</sup> event.
- Resize the `iframe`<sup>p355</sup>, causing the `Window`<sup>p816</sup> in the `iframe`<sup>p355</sup> to receive a [resize](#) event.
- Send a [message](#)<sup>p1261</sup> event to the `Window`<sup>p816</sup> in the `iframe`<sup>p355</sup> using the `window.postMessage()`<sup>p998</sup> API.

The contacts provider can use these methods, most particularly the third one, to provide an API that can be accessed by other origins to manipulate the user's address book. For example, it could respond to a message "add-contact Guillaume Tell <tell@pomme.example.net>" by adding the given person and e-mail address to the user's address book.

To avoid any site on the Web being able to manipulate the user's contacts, the contacts provider might only allow certain trusted sites, such as the social site, to do this.

Now suppose the game wanted to add a contact to the user's address book, and that the social site was willing to allow it to do so on its behalf, essentially "sharing" the trust that the contacts provider had with the social site. There are several ways it could do this; most simply, it could just proxy messages between the game site and the contacts site. However, this solution has a number of difficulties: it requires the social site to either completely trust the game site not to abuse the privilege, or it requires that the social site verify each request to make sure it's not a request that it doesn't want to allow (such as adding multiple contacts, reading the contacts, or deleting them); it also requires some additional complexity if there's ever the possibility of multiple games simultaneously trying to interact with the contacts provider.

Using message channels and `MessagePort`<sup>p1002</sup> objects, however, all of these problems can go away. When the game tells the social

site that it wants to add a contact, the social site can ask the contacts provider not for it to add a contact, but for the *capability* to add a single contact. The contacts provider then creates a pair of [MessagePort](#)<sup>p1002</sup> objects, and sends one of them back to the social site, who forwards it on to the game. The game and the contacts provider then have a direct connection, and the contacts provider knows to only honor a single "add contact" request, nothing else. In other words, the game has been granted the capability to add a single contact.

### 9.5.1.3 Ports as the basis of abstracting out service implementations § p1001

*This section is non-normative.*

Continuing the example from the previous section, consider the contacts provider in particular. While an initial implementation might have simply used [XMLHttpRequest](#) objects in the service's [iframe](#)<sup>p355</sup>, an evolution of the service might instead want to use a [shared worker](#)<sup>p1033</sup> with a single [WebSocket](#)<sup>p988</sup> connection.

If the initial design used [MessagePort](#)<sup>p1002</sup> objects to grant capabilities, or even just to allow multiple simultaneous independent sessions, the service implementation can switch from the [XMLHttpRequests-in-each-iframe](#)<sup>p355</sup> model to the shared-[WebSocket](#)<sup>p988</sup> model without changing the API at all: the ports on the service provider side can all be forwarded to the shared worker without it affecting the users of the API in the slightest.

## 9.5.2 Message channels § p1001

✓ MDN

```
IDL [Constructor, Exposed=(Window,Worker)]
interface MessageChannel {
  readonly attribute MessagePort port1;
  readonly attribute MessagePort port2;
};
```

For web developers (non-normative)

**`channel = new MessageChannel`**<sup>p1001</sup>**( )**

Returns a new [MessageChannel](#)<sup>p1001</sup> object with two new [MessagePort](#)<sup>p1002</sup> objects.

**`channel . port1`**<sup>p1001</sup>

Returns the first [MessagePort](#)<sup>p1002</sup> object.

**`channel . port2`**<sup>p1001</sup>

Returns the second [MessagePort](#)<sup>p1002</sup> object.

When the [MessageChannel](#)<sup>p1001</sup>( ) constructor is called, it must run the following algorithm:

✓ MDN

1. Create a new [MessagePort](#) object<sup>p1002</sup> whose [owner](#)<sup>p1002</sup> is the [incumbent settings object](#)<sup>p911</sup>, and let *port1* be that object.
2. Create a new [MessagePort](#) object<sup>p1002</sup> whose [owner](#)<sup>p1002</sup> is the [incumbent settings object](#)<sup>p911</sup>, and let *port2* be that object.
3. [Entangle](#)<sup>p1003</sup> the *port1* and *port2* objects.
4. Instantiate a new [MessageChannel](#)<sup>p1001</sup> object, and let *channel* be that object.
5. Let the [port1](#)<sup>p1001</sup> attribute of the *channel* object be *port1*.
6. Let the [port2](#)<sup>p1001</sup> attribute of the *channel* object be *port2*.
7. Return *channel*.

The [port1](#) and [port2](#) attributes must return the values they were assigned when the [MessageChannel](#)<sup>p1001</sup> object was created.

✓ MDN

## 9.5.3 Message ports § p1001

✓ MDN

Each channel has two message ports. Data sent through one port is received by the other port, and vice versa.

```

IDL [Exposed=(Window,Worker,AudioWorklet), Transferable]
interface MessagePort : EventTarget {
  void postMessage(any message, sequence<object> transfer);
  void postMessage(any message, optional PostMessageOptions options = {});
  void start();
  void close();

  // event handlers
  attribute EventHandler onmessage;
  attribute EventHandler onmessageerror;
};

dictionary PostMessageOptions {
  sequence<object> transfer = [];
};

```

### For web developers (non-normative)

**port . postMessage<sup>p1004</sup>(message [, transfer] )**

**port . postMessage<sup>p1004</sup>(message [, { transfer } ] )**

Posts a message through the channel. Objects listed in *transfer* are transferred, not just cloned, meaning that they are no longer usable on the sending side.

Throws a "DataCloneError" [DOMException](#) if *transfer* contains duplicate objects or *port*, or if *message* could not be cloned.

**port . start<sup>p1004</sup>()**

Begins dispatching messages received on the port.

**port . close<sup>p1004</sup>()**

Disconnects the port, so that it is no longer active.

Each [MessagePort<sup>p1002</sup>](#) object can be entangled with another (a symmetric relationship). Each [MessagePort<sup>p1002</sup>](#) object also has a [task source<sup>p925</sup>](#) called the **port message queue**, initially empty. A [port message queue<sup>p1002</sup>](#) can be enabled or disabled, and is initially disabled. Once enabled, a port can never be disabled again (though messages in the queue can get moved to another queue or removed altogether, which has much the same effect). A [MessagePort<sup>p1002</sup>](#) also has a **has been shipped** flag, which must initially be false, and an **owner**, which is a [settings object<sup>p895</sup>](#) set when the object is created, as described below.

When a port's [port message queue<sup>p1002</sup>](#) is enabled, the [event loop<sup>p924</sup>](#) must use it as one of its [task sources<sup>p925</sup>](#). When a port's [owner<sup>p1002</sup>](#)'s [responsible event loop<sup>p897</sup>](#) is a [window event loop<sup>p924</sup>](#), all [tasks<sup>p925</sup>](#) [queued<sup>p925</sup>](#) on its [port message queue<sup>p1002</sup>](#) must be associated with the port's [owner<sup>p1002</sup>](#)'s [responsible document<sup>p897</sup>](#).

### Note

*If the port's [owner<sup>p1002</sup>](#)'s [responsible document<sup>p897</sup>](#) is [fully active<sup>p807</sup>](#), but the event listeners all have scripts whose [settings objects<sup>p895</sup>](#) specify [responsible documents<sup>p897</sup>](#) that are not [fully active<sup>p807</sup>](#), then the messages will be lost.*

Each [event loop<sup>p924</sup>](#) has a [task source<sup>p925</sup>](#) called the **unshipped port message queue**. This is a virtual [task source<sup>p925</sup>](#): it must act as if it contained the [tasks<sup>p925</sup>](#) of each [port message queue<sup>p1002</sup>](#) of each [MessagePort<sup>p1002</sup>](#) whose [has been shipped<sup>p1002</sup>](#) flag is false, whose [port message queue<sup>p1002</sup>](#) is enabled, and whose [owner<sup>p1002</sup>](#)'s [responsible event loop<sup>p897</sup>](#) is that [event loop<sup>p924</sup>](#), in the order in which they were added to their respective [task source<sup>p925</sup>](#). When a [task<sup>p925</sup>](#) would be removed from the [unshipped port message queue<sup>p1002</sup>](#), it must instead be removed from its [port message queue<sup>p1002</sup>](#).

When a [MessagePort<sup>p1002</sup>](#)'s [has been shipped<sup>p1002</sup>](#) flag is false, its [port message queue<sup>p1002</sup>](#) must be ignored for the purposes of the [event loop<sup>p924</sup>](#). (The [unshipped port message queue<sup>p1002</sup>](#) is used instead.)

### Note

*The [has been shipped<sup>p1002</sup>](#) flag is set to true when a port, its twin, or the object it was cloned from, is or has been transferred. When a [MessagePort<sup>p1002</sup>](#)'s [has been shipped<sup>p1002</sup>](#) flag is true, its [port message queue<sup>p1002</sup>](#) acts as a first-class [task source<sup>p925</sup>](#), unaffected to any [unshipped port message queue<sup>p1002</sup>](#).*

When the user agent is to **create a new MessagePort object** with a particular [environment settings object<sup>p897</sup>](#) as its *owner*, it must instantiate a new [MessagePort<sup>p1002</sup>](#) object, and let its [owner<sup>p1002</sup>](#) be *owner*.

When the user agent is to **entangle** two [MessagePort<sup>p1002</sup>](#) objects, it must run the following steps:

1. If one of the ports is already entangled, then disentangle it and the port that it was entangled with.

**Note**

*If those two previously entangled ports were the two ports of a [MessageChannel<sup>p1001</sup>](#) object, then that [MessageChannel<sup>p1001</sup>](#) object no longer represents an actual channel: the two ports in that object are no longer entangled.*

2. Associate the two ports to be entangled, so that they form the two parts of a new channel. (There is no [MessageChannel<sup>p1001</sup>](#) object that represents this channel.)

Two ports *A* and *B* that have gone through this step are now said to be entangled; one is entangled to the other, and vice versa.

**Note**

*While this specification describes this process as instantaneous, implementations are more likely to implement it via message passing. As with all algorithms, the key is "merely" that the end result be indistinguishable, in a black-box sense, from the specification.*

[MessagePort<sup>p1002</sup>](#) objects are [transferable objects<sup>p100</sup>](#). Their [transfer steps<sup>p101</sup>](#), given *value* and *dataHolder*, are:

1. Set *value*'s [has been shipped<sup>p1002</sup>](#) flag to true.
2. Set *dataHolder*.[[PortMessageQueue]] to *value*'s [port message queue<sup>p1002</sup>](#).
3. If *value* is entangled with another port *remotePort*, then:
  1. Set *remotePort*'s [has been shipped<sup>p1002</sup>](#) flag to true.
  2. Set *dataHolder*.[[RemotePort]] to *remotePort*.
4. Otherwise, set *dataHolder*.[[RemotePort]] to null.

Their [transfer-receiving steps<sup>p101</sup>](#), given *dataHolder* and *value*, are:

1. Set *value*'s [has been shipped<sup>p1002</sup>](#) flag to true.
2. Set *value*'s [owner<sup>p1002</sup>](#) to *value*'s [relevant settings object<sup>p913</sup>](#).
3. Move all the [tasks<sup>p925</sup>](#) that are to fire [message<sup>p1261</sup>](#) events in *dataHolder*.[[PortMessageQueue]] to the [port message queue<sup>p1002</sup>](#) of *value*, if any, leaving *value*'s [port message queue<sup>p1002</sup>](#) in its initial disabled state, and, if *value*'s [owner<sup>p1002</sup>](#)'s [responsible event loop<sup>p897</sup>](#) is a [window event loop<sup>p924</sup>](#), associating the moved [tasks<sup>p925</sup>](#) with *value*'s [owner<sup>p1002</sup>](#)'s [responsible document<sup>p897</sup>](#).
4. If *dataHolder*.[[RemotePort]] is not null, then [entangle<sup>p1003</sup>](#) *dataHolder*.[[RemotePort]] and *value*. (This will disentangle *dataHolder*.[[RemotePort]] from the original port that was transferred.)

The **message port post message steps**, given a *targetPort*, *message* and *options* are as follows:

1. Let *transfer* be *options*["transfer"].
2. If *transfer* [contains](#) this [MessagePort<sup>p1002</sup>](#), then throw a ["DataCloneError" DOMException](#).
3. Let *doomed* be false.
4. If *targetPort* is not null and *transfer* [contains](#) *targetPort*, then set *doomed* to true and optionally report to a developer console that the target port was posted to itself, causing the communication channel to be lost.
5. Let *serializeWithTransferResult* be [StructuredSerializeWithTransfer<sup>p107</sup>](#)(*message*, *transfer*). Rethrow any exceptions.
6. If *targetPort* is null, or if *doomed* is true, then return.
7. Add a [task<sup>p925</sup>](#) that runs the following steps to the [port message queue<sup>p1002</sup>](#) of *targetPort*:
  1. Let *finalTargetPort* be the [MessagePort<sup>p1002</sup>](#) in whose [port message queue<sup>p1002</sup>](#) the task now finds itself.

**Note**

This can be different from `targetPort`, if `targetPort` itself was transferred and thus all its tasks moved along with it.

- Let `targetRealm` be `finalTargetPort`'s [relevant Realm](#)<sup>p913</sup>.
- Let `deserializeRecord` be [StructuredDeserializeWithTransfer](#)<sup>p108</sup> (`serializeWithTransferResult`, `targetRealm`).  
If this throws an exception, catch it, [fire an event](#) named [messageerror](#)<sup>p1261</sup> at `finalTargetPort`, using [MessageEvent](#)<sup>p978</sup>, and then return.
- Let `messageClone` be `deserializeRecord`.[[Deserialized]].
- Let `newPorts` be a new [frozen array](#) consisting of all [MessagePort](#)<sup>p1002</sup> objects in `deserializeRecord`.[[TransferredValues]], if any, maintaining their relative order.
- [Fire an event](#) named [message](#)<sup>p1261</sup> at `finalTargetPort`, using [MessageEvent](#)<sup>p978</sup>, with the [data](#)<sup>p978</sup> attribute initialized to `messageClone` and the [ports](#)<sup>p979</sup> attribute initialized to `newPorts`.

The [postMessage\(message, options\)](#) method, when invoked on a [MessagePort](#)<sup>p1002</sup> object must run the following steps:

- Let `targetPort` be the port with which this [MessagePort](#)<sup>p1002</sup> is entangled, if any; otherwise let it be null.
- Run the [message port post message steps](#)<sup>p1003</sup> providing `targetPort`, `message` and `options`.

The [postMessage\(message, transfer\)](#) method, when invoked on a [MessagePort](#)<sup>p1002</sup> object must run the following steps:

- Let `targetPort` be the port with which this [MessagePort](#)<sup>p1002</sup> is entangled, if any; otherwise let it be null.
- Let `options` be «[ "transfer" → `transfer` ]».
- Run the [message port post message steps](#)<sup>p1003</sup> providing `targetPort`, `message` and `options`.

The [start\(\)](#) method, when invoked, must enable this [MessagePort](#)<sup>p1002</sup> object's [port message queue](#)<sup>p1002</sup>, if it is not already enabled.

The [close\(\)](#) method, when invoked, must run these steps:

- Set this [MessagePort](#)<sup>p1002</sup> object's [\[\[Detached\]\]](#)<sup>p101</sup> internal slot value to true.
- If this [MessagePort](#)<sup>p1002</sup> object is entangled, disentangle it.

The following are the [event handlers](#)<sup>p934</sup> (and their corresponding [event handler event types](#)<sup>p937</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p935</sup>, by all objects implementing the [MessagePort](#)<sup>p1002</sup> interface:

<a href="#">Event handler</a> <sup>p934</sup>	<a href="#">Event handler event type</a> <sup>p937</sup>
<a href="#">onmessage</a>	<a href="#">message</a> <sup>p1261</sup>
<a href="#">onmessageerror</a>	<a href="#">messageerror</a> <sup>p1261</sup>

The first time a [MessagePort](#)<sup>p1002</sup> object's [onmessage](#)<sup>p1004</sup> IDL attribute is set, the port's [port message queue](#)<sup>p1002</sup> must be enabled, as if the [start\(\)](#)<sup>p1004</sup> method had been called.

## 9.5.4 Broadcasting to many ports §<sup>p1004</sup>

This section is non-normative.

Broadcasting to many ports is in principle relatively simple: keep an array of [MessagePort](#)<sup>p1002</sup> objects to send messages to, and iterate through the array to send a message. However, this has one rather unfortunate effect: it prevents the ports from being garbage collected, even if the other side has gone away. To avoid this problem, implement a simple protocol whereby the other side acknowledges it still exists. If it doesn't do so after a certain amount of time, assume it's gone, close the [MessagePort](#)<sup>p1002</sup> object, and let it be garbage collected.

## 9.5.5 Ports and garbage collection § p10 05

When a [MessagePort<sup>p1002</sup>](#) object *o* is entangled, user agents must either act as if *o*'s entangled [MessagePort<sup>p1002</sup>](#) object has a strong reference to *o*, or as if the [global object<sup>p908</sup>](#) specified by *o*'s [owner<sup>p1002</sup>](#) has a strong reference to *o*.

### Note

*Thus, a message port can be received, given an event listener, and then forgotten, and so long as that event listener could receive a message, the channel will be maintained.*

*Of course, if this was to occur on both sides of the channel, then both ports could be garbage collected, since they would not be reachable from live code, despite having a strong reference to each other.*

Furthermore, a [MessagePort<sup>p1002</sup>](#) object must not be garbage collected while there exists an event referenced by a [task<sup>p925</sup>](#) in a [task queue<sup>p924</sup>](#) that is to be dispatched on that [MessagePort<sup>p1002</sup>](#) object, or while the [MessagePort<sup>p1002</sup>](#) object's [port message queue<sup>p1002</sup>](#) is enabled and not empty.

### Note

*Authors are strongly encouraged to explicitly close [MessagePort<sup>p1002</sup>](#) objects to disentangle them, so that their resources can be reclaimed. Creating many [MessagePort<sup>p1002</sup>](#) objects and discarding them without closing them can lead to high transient memory usage since garbage collection is not necessarily performed promptly, especially for [MessagePort<sup>p1002</sup>](#)s where garbage collection can involve cross-process coordination.*

## 9.6 Broadcasting to other browsing contexts § p10 05

Pages on a single [origin<sup>p829</sup>](#) opened by the same user in the same user agent but in different unrelated [browsing contexts<sup>p804</sup>](#) sometimes need to send notifications to each other, for example "hey, the user logged in over here, check your credentials again".

For elaborate cases, e.g. to manage locking of shared state, to manage synchronization of resources between a server and multiple local clients, to share a [WebSocket<sup>p988</sup>](#) connection with a remote host, and so forth, [shared workers<sup>p1033</sup>](#) are the most appropriate solution.

For simple cases, though, where a shared worker would be an unreasonable overhead, authors can use the simple channel-based broadcast mechanism described in this section.

```
IDL [Exposed=(Window,Worker)]
interface BroadcastChannel : EventTarget {
  constructor(DOMString name);

  readonly attribute DOMString name;
  void postMessage(any message);
  void close();
  attribute EventHandler onmessage;
  attribute EventHandler onmessageerror;
};
```

### For web developers (non-normative)

#### **`broadcastChannel = new BroadcastChannelp1006(name)`**

Returns a new [BroadcastChannel<sup>p1005</sup>](#) object via which messages for the given channel name can be sent and received.

#### **`broadcastChannel . namep1006`**

Returns the channel name (as passed to the constructor).

#### **`broadcastChannel . postMessagep1006(message)`**

Sends the given message to other [BroadcastChannel<sup>p1005</sup>](#) objects set up for this channel. Messages can be structured objects, e.g. nested objects and arrays.

#### **`broadcastChannel . closep1006()`**

Closes the [BroadcastChannel<sup>p1005</sup>](#) object, opening it up to garbage collection.

MDN

A [BroadcastChannel](#)<sup>p1005</sup> object has a **channel name**, a **BroadcastChannel settings object**, and a **closed flag**.

The [BroadcastChannel\(\)](#) constructor, when invoked, must create and return a [BroadcastChannel](#)<sup>p1005</sup> object whose [channel name](#)<sup>p1006</sup> is the constructor's first argument, whose [BroadcastChannel settings object](#)<sup>p1006</sup> is the [incumbent settings object](#)<sup>p911</sup>, and whose [closed flag](#)<sup>p1006</sup> is false.

The **name** attribute must return the [channel name](#)<sup>p1006</sup>.

MDN

The [postMessage\(message\)](#) method, when invoked on a [BroadcastChannel](#)<sup>p1005</sup> object, must run the following steps:

MDN

1. Let *source* be this [BroadcastChannel](#)<sup>p1005</sup>.
2. Let *sourceSettings* be *source*'s [BroadcastChannel settings object](#)<sup>p1006</sup>.
3. If *source*'s [closed flag](#)<sup>p1006</sup> is true, then throw an ["InvalidStateError" DOMException](#).
4. Let *sourceChannel* be *source*'s [channel name](#)<sup>p1006</sup>.
5. Let *targetRealm* be an [implementation-defined](#) Realm.
6. Let *serialized* be [StructuredSerialize](#)<sup>p105</sup>(*message*). Rethrow any exceptions.
7. Let *destinations* be a list of [BroadcastChannel](#)<sup>p1005</sup> objects that match the following criteria:
  - Their [BroadcastChannel settings object](#)<sup>p1006</sup> specifies either:
    - a [global object](#)<sup>p908</sup> that is a [Window](#)<sup>p816</sup> object whose [associated Document](#)<sup>p818</sup> is [fully active](#)<sup>p807</sup>, or
    - a [global object](#)<sup>p908</sup> that is a [WorkerGlobalScope](#)<sup>p1024</sup> object whose [closing](#)<sup>p1027</sup> flag is false and whose [worker](#)<sup>p1032</sup> is not a [suspendable worker](#)<sup>p1028</sup>.
  - Their [BroadcastChannel settings object](#)<sup>p1006</sup>'s [origin](#)<sup>p897</sup> is [same origin](#)<sup>p830</sup> with *sourceSettings*'s [origin](#)<sup>p897</sup>.
  - Their [channel name](#)<sup>p1006</sup> is a [case-sensitive](#)<sup>p65</sup> match for *sourceChannel*.
8. Remove *source* from *destinations*.
9. Sort *destinations* such that all [BroadcastChannel](#)<sup>p1005</sup> objects whose [BroadcastChannel settings objects](#)<sup>p1006</sup> specify the same [responsible event loop](#)<sup>p897</sup> are sorted in creation order, oldest first. (This does not define a complete ordering. Within this constraint, user agents may sort the list in any [implementation-defined](#) manner.)
10. For each [BroadcastChannel](#)<sup>p1005</sup> object *destination* in *destinations*, [queue a task](#)<sup>p925</sup> on the [DOM manipulation task source](#)<sup>p932</sup> of *destination*'s [relevant agent](#)<sup>p919</sup>'s [event loop](#)<sup>p924</sup> that runs the following steps. If that event loop is a [window event loop](#)<sup>p924</sup>, then the [task](#)<sup>p925</sup>'s [document](#)<sup>p925</sup> must be set to *destination*'s [BroadcastChannel settings object](#)<sup>p1006</sup>'s [responsible document](#)<sup>p897</sup>.
  1. If *destination*'s [closed flag](#)<sup>p1006</sup> is true, then return.
  2. Let *targetRealm* be *destination*'s [relevant Realm](#)<sup>p913</sup>.
  3. Let *data* be [StructuredDeserialize](#)<sup>p105</sup>(*serialized*, *targetRealm*).

If this throws an exception, catch it, [fire an event](#) named [messageerror](#)<sup>p1261</sup> at *destination*, using [MessageEvent](#)<sup>p978</sup>, with the [origin](#)<sup>p978</sup> attribute initialized to the [serialization](#)<sup>p830</sup> of *sourceSettings*'s [origin](#)<sup>p897</sup>, and then return.
  4. [Fire an event](#) named [message](#)<sup>p1261</sup> at *destination*, using [MessageEvent](#)<sup>p978</sup>, with the [data](#)<sup>p978</sup> attribute initialized to *data* and the [origin](#)<sup>p978</sup> attribute initialized to the [serialization](#)<sup>p830</sup> of *sourceSettings*'s [origin](#)<sup>p897</sup>.

While a [BroadcastChannel](#)<sup>p1005</sup> object whose [closed flag](#)<sup>p1006</sup> is false has an event listener registered for [message](#)<sup>p1261</sup> events, there must be a strong reference from [global object](#)<sup>p908</sup> specified by the [BroadcastChannel](#)<sup>p1005</sup> object's [BroadcastChannel settings object](#)<sup>p1006</sup> to the [BroadcastChannel](#)<sup>p1005</sup> object itself.

The [close\(\)](#) method must set the [closed flag](#)<sup>p1006</sup> of the [BroadcastChannel](#)<sup>p1005</sup> object on which it was invoked to true.

MDN

#### Note

Authors are strongly encouraged to explicitly close [BroadcastChannel](#)<sup>p1005</sup> objects when they are no longer needed, so that they can be garbage collected. Creating many [BroadcastChannel](#)<sup>p1005</sup> objects and discarding them while leaving them with an event listener and without closing them can lead to an apparent memory leak, since the objects will continue to live for as long as they

have an event listener (or until their page or worker is closed).

The following are the [event handlers<sup>p934</sup>](#) (and their corresponding [event handler event types<sup>p937</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p935</sup>](#), by all objects implementing the [BroadcastChannel<sup>p1005</sup>](#) interface:

<a href="#">Event handler<sup>p934</sup></a>	<a href="#">Event handler event type<sup>p937</sup></a>
<code>onmessage</code>	<a href="#">message<sup>p1261</sup></a>
<code>onmessageerror</code>	<a href="#">messageerror<sup>p1261</sup></a>

MDN

MDN

### Example

Suppose a page wants to know when the user logs out, even when the user does so from another tab at the same site:

```
var authChannel = new BroadcastChannel('auth');
authChannel.onmessage = function (event) {
  if (event.data == 'logout')
    showLogout();
}

function logoutRequested() {
  // called when the user asks us to log them out
  doLogout();
  showLogout();
  authChannel.postMessage('logout');
}

function doLogout() {
  // actually log the user out (e.g. clearing cookies)
  // ...
}

function showLogout() {
  // update the UI to indicate we're logged out
  // ...
}
```

## 10 Web workers §<sup>p10</sup><sub>08</sub>

### 10.1 Introduction §<sup>p10</sup><sub>08</sub>

#### 10.1.1 Scope §<sup>p10</sup><sub>08</sub>

*This section is non-normative.*

This specification defines an API for running scripts in the background independently of any user interface scripts.

This allows for long-running scripts that are not interrupted by scripts that respond to clicks or other user interactions, and allows long tasks to be executed without yielding to keep the page responsive.

Workers (as these background scripts are called herein) are relatively heavy-weight, and are not intended to be used in large numbers. For example, it would be inappropriate to launch one worker for each pixel of a four megapixel image. The examples below show some appropriate uses of workers.

Generally, workers are expected to be long-lived, have a high start-up performance cost, and a high per-instance memory cost.

#### 10.1.2 Examples §<sup>p10</sup><sub>08</sub>

*This section is non-normative.*

There are a variety of uses that workers can be put to. The following subsections show various examples of this use.

##### 10.1.2.1 A background number-crunching worker §<sup>p10</sup><sub>08</sub>

*This section is non-normative.*

The simplest use of workers is for performing a computationally expensive task without interrupting the user interface.

In this example, the main document spawns a worker to (naïvely) compute prime numbers, and progressively displays the most recently found prime number.

The main page is as follows:

```
<!DOCTYPE HTML>
<html>
  <head>
    <meta charset="utf-8">
    <title>Worker example: One-core computation</title>
  </head>
  <body>
    <p>The highest prime number discovered so far is: <output id="result"></output></p>
    <script>
      var worker = new Worker('worker.js');
      worker.onmessage = function (event) {
        document.getElementById('result').textContent = event.data;
      };
    </script>
  </body>
</html>
```

communicate with the worker. That object's [onmessage](#)<sup>p1033</sup> event handler allows the code to receive messages from the worker.

The worker itself is as follows:

```
var n = 1;
search: while (true) {
  n += 1;
  for (var i = 2; i <= Math.sqrt(n); i += 1)
    if (n % i == 0)
      continue search;
  // found a prime!
  postMessage(n);
}
```

The bulk of this code is simply an unoptimized search for a prime number. The [postMessage\(\)](#)<sup>p1026</sup> method is used to send a message back to the page when a prime is found.

[View this example online.](#)

### 10.1.2.2 Using a JavaScript module as a worker §<sup>p10</sup><sub>09</sub>

*This section is non-normative.*

All of our examples so far show workers that run [classic scripts](#)<sup>p896</sup>. Workers can instead be instantiated using [module scripts](#)<sup>p896</sup>, which have the usual benefits: the ability to use the JavaScript `import` statement to import other modules; strict mode by default; and top-level declarations not polluting the worker's global scope.

As the `import` statement is available, the [importScripts\(\)](#)<sup>p1036</sup> method will automatically fail inside module workers.

In this example, the main document uses a worker to do off-main-thread image manipulation. It imports the filters used from another module.

The main page is as follows:

```
<!DOCTYPE html>
<meta charset="utf-8">
<title>Worker example: image decoding</title>

<p>
  <label>
    Type an image URL to decode
    <input type="url" id="image-url" list="image-list">
    <datalist id="image-list">
      <option value="https://html.spec.whatwg.org/images/drawImage.png">
      <option value="https://html.spec.whatwg.org/images/robots.jpeg">
      <option value="https://html.spec.whatwg.org/images/arcTo2.png">
    </datalist>
  </label>
</p>

<p>
  <label>
    Choose a filter to apply
    <select id="filter">
      <option value="none">none</option>
      <option value="grayscale">grayscale</option>
      <option value="brighten">brighten by 20%</option>
    </select>
  </label>
</p>
```

```

<canvas id="output"></canvas>

<script type="module">
  const worker = new Worker("worker.js", { type: "module" });
  worker.onmessage = receiveFromWorker;

  const url = document.querySelector("#image-url");
  const filter = document.querySelector("#filter");
  const output = document.querySelector("#output");

  url.oninput = updateImage;
  filter.oninput = sendToWorker;

  let imageData, context;

  function updateImage() {
    const img = new Image();
    img.src = url.value;

    img.onload = () => {
      output.innerHTML = "";

      const canvas = document.createElement("canvas");
      canvas.width = img.width;
      canvas.height = img.height;

      context = canvas.getContext("2d");
      context.drawImage(img, 0, 0);
      imageData = context.getImageData(0, 0, canvas.width, canvas.height);

      sendToWorker();
      output.appendChild(canvas);
    };
  }

  function sendToWorker() {
    worker.postMessage({ imageData, filter: filter.value });
  }

  function receiveFromWorker(e) {
    context.putImageData(e.data, 0, 0);
  }
</script>

```

The worker file is then:

```

import * as filters from "./filters.js";

self.onmessage = e => {
  const { imageData, filter } = e.data;
  filters[filter](imageData);
  self.postMessage(imageData, [imageData.data.buffer]);
};

```

Which imports the file filters.js:

```

export function none() {}

export function grayscale({ data: d }) {
  for (let i = 0; i < d.length; i += 4) {
    const [r, g, b] = [d[i], d[i + 1], d[i + 2]];

```

```

    // CIE luminance for the RGB
    // The human eye is bad at seeing red and blue, so we de-emphasize them.
    d[i] = d[i + 1] = d[i + 2] = 0.2126 * r + 0.7152 * g + 0.0722 * b;
  }
};

export function brighten({ data: d }) {
  for (let i = 0; i < d.length; ++i) {
    d[i] *= 1.2;
  }
};

```

[View this example online.](#)

### 10.1.2.3 Shared workers introduction §<sup>p10</sup><sub>11</sub>

*This section is non-normative.*

This section introduces shared workers using a Hello World example. Shared workers use slightly different APIs, since each worker can have multiple connections.

This first example shows how you connect to a worker and how a worker can send a message back to the page when it connects to it. Received messages are displayed in a log.

Here is the HTML page:

```

<!DOCTYPE HTML>
<meta charset="utf-8">
<title>Shared workers: demo 1</title>
<pre id="log">Log:</pre>
<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.onmessage = function(e) { // note: not worker.onmessage!
    log.textContent += '\n' + e.data;
  }
</script>

```

Here is the JavaScript worker:

```

onconnect = function(e) {
  var port = e.ports[0];
  port.postMessage('Hello World!');
}

```

[View this example online.](#)

This second example extends the first one by changing two things: first, messages are received using `addEventListener()` instead of an [event handler IDL attribute](#)<sup>p935</sup>, and second, a message is sent to the worker, causing the worker to send another message in return. Received messages are again displayed in a log.

Here is the HTML page:

```

<!DOCTYPE HTML>
<meta charset="utf-8">
<title>Shared workers: demo 2</title>
<pre id="log">Log:</pre>
<script>

```

```

var worker = new SharedWorker('test.js');
var log = document.getElementById('log');
worker.port.addEventListener('message', function(e) {
  log.textContent += '\n' + e.data;
}, false);
worker.port.start(); // note: need this when using addEventListener
worker.port.postMessage('ping');
</script>

```

Here is the JavaScript worker:

```

onconnect = function(e) {
  var port = e.ports[0];
  port.postMessage('Hello World!');
  port.onmessage = function(e) {
    port.postMessage('pong'); // not e.ports[0].postMessage!
    // e.target.postMessage('pong'); would work also
  }
}

```

[View this example online.](#)

Finally, the example is extended to show how two pages can connect to the same worker; in this case, the second page is merely in an [iframe<sup>p355</sup>](#) on the first page, but the same principle would apply to an entirely separate page in a separate [top-level browsing context<sup>p807</sup>](#).

Here is the outer HTML page:

```

<!DOCTYPE HTML>
<meta charset="utf-8">
<title>Shared workers: demo 3</title>
<pre id="log">Log:</pre>
<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.addEventListener('message', function(e) {
    log.textContent += '\n' + e.data;
  }, false);
  worker.port.start();
  worker.port.postMessage('ping');
</script>
<iframe src="inner.html"></iframe>

```

Here is the inner HTML page:

```

<!DOCTYPE HTML>
<meta charset="utf-8">
<title>Shared workers: demo 3 inner frame</title>
<pre id=log>Inner log:</pre>
<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.onmessage = function(e) {
    log.textContent += '\n' + e.data;
  }
</script>

```

Here is the JavaScript worker:

```

var count = 0;

```

```

onconnect = function(e) {
  count += 1;
  var port = e.ports[0];
  port.postMessage('Hello World! You are connection #' + count);
  port.onmessage = function(e) {
    port.postMessage('pong');
  }
}
}

```

#### 10.1.2.4 Shared state using a shared worker § p10 13

*This section is non-normative.*

In this example, multiple windows (viewers) can be opened that are all viewing the same map. All the windows share the same map information, with a single worker coordinating all the viewers. Each viewer can move around independently, but if they set any data on the map, all the viewers are updated.

The main page isn't interesting, it merely provides a way to open the viewers:

```

<!DOCTYPE HTML>
<html>
  <head>
    <meta charset="utf-8">
    <title>Workers example: Multiviewer</title>
    <script>
      function openViewer() {
        window.open('viewer.html');
      }
    </script>
  </head>
  <body>
    <p><button type=button onclick="openViewer()">Open a new
viewer</button></p>
    <p>Each viewer opens in a new window. You can have as many viewers
as you like, they all view the same data.</p>
  </body>
</html>

```

The viewer is more involved:

```

<!DOCTYPE HTML>
<html>
  <head>
    <meta charset="utf-8">
    <title>Workers example: Multiviewer viewer</title>
    <script>
      var worker = new SharedWorker('worker.js', 'core');

      // CONFIGURATION
      function configure(event) {
        if (event.data.substr(0, 4) != 'cfg ') return;
        var name = event.data.substr(4).split(' ', 1)[0];
        // update display to mention our name is name
        document.getElementsByTagName('h1')[0].textContent += ' ' + name;
        // no longer need this listener
        worker.port.removeEventListener('message', configure, false);
      }
      worker.port.addEventListener('message', configure, false);

```

```

// MAP
function paintMap(event) {
  if (event.data.substr(0, 4) !== 'map ') return;
  var data = event.data.substr(4).split(',');
  // display tiles data[0] .. data[8]
  var canvas = document.getElementById('map');
  var context = canvas.getContext('2d');
  for (var y = 0; y < 3; y += 1) {
    for (var x = 0; x < 3; x += 1) {
      var tile = data[y * 3 + x];
      if (tile === '0')
        context.fillStyle = 'green';
      else
        context.fillStyle = 'maroon';
      context.fillRect(x * 50, y * 50, 50, 50);
    }
  }
}
worker.port.addEventListener('message', paintMap, false);

// PUBLIC CHAT
function updatePublicChat(event) {
  if (event.data.substr(0, 4) !== 'txt ') return;
  var name = event.data.substr(4).split(' ', 1)[0];
  var message = event.data.substr(4 + name.length + 1);
  // display "<name> message" in public chat
  var public = document.getElementById('public');
  var p = document.createElement('p');
  var n = document.createElement('button');
  n.textContent = '<' + name + '> ';
  n.onclick = function () { worker.port.postMessage('msg ' + name); };
  p.appendChild(n);
  var m = document.createElement('span');
  m.textContent = message;
  p.appendChild(m);
  public.appendChild(p);
}
worker.port.addEventListener('message', updatePublicChat, false);

// PRIVATE CHAT
function startPrivateChat(event) {
  if (event.data.substr(0, 4) !== 'msg ') return;
  var name = event.data.substr(4).split(' ', 1)[0];
  var port = event.ports[0];
  // display a private chat UI
  var ul = document.getElementById('private');
  var li = document.createElement('li');
  var h3 = document.createElement('h3');
  h3.textContent = 'Private chat with ' + name;
  li.appendChild(h3);
  var div = document.createElement('div');
  var addMessage = function(name, message) {
    var p = document.createElement('p');
    var n = document.createElement('strong');
    n.textContent = '<' + name + '> ';
    p.appendChild(n);
    var t = document.createElement('span');
    t.textContent = message;
    p.appendChild(t);
    div.appendChild(p);
  };
};

```

```

    port.onmessage = function (event) {
      addMessage(name, event.data);
    };
    li.appendChild(div);
    var form = document.createElement('form');
    var p = document.createElement('p');
    var input = document.createElement('input');
    input.size = 50;
    p.appendChild(input);
    p.appendChild(document.createTextNode(' '));
    var button = document.createElement('button');
    button.textContent = 'Post';
    p.appendChild(button);
    form.onsubmit = function () {
      port.postMessage(input.value);
      addMessage('me', input.value);
      input.value = '';
      return false;
    };
    form.appendChild(p);
    li.appendChild(form);
    ul.appendChild(li);
  }
  worker.port.addEventListener('message', startPrivateChat, false);

  worker.port.start();
</script>
</head>
<body>
<h1>Viewer</h1>
<h2>Map</h2>
<p><canvas id="map" height=150 width=150></canvas></p>
<p>
  <button type=button onclick="worker.port.postMessage('mov left')">Left</button>
  <button type=button onclick="worker.port.postMessage('mov up')">Up</button>
  <button type=button onclick="worker.port.postMessage('mov down')">Down</button>
  <button type=button onclick="worker.port.postMessage('mov right')">Right</button>
  <button type=button onclick="worker.port.postMessage('set 0')">Set 0</button>
  <button type=button onclick="worker.port.postMessage('set 1')">Set 1</button>
</p>
<h2>Public Chat</h2>
<div id="public"></div>
<form onsubmit="worker.port.postMessage('txt ' + message.value); message.value = ''; return false;">
  <p>
    <input type="text" name="message" size="50">
    <button>Post</button>
  </p>
</form>
<h2>Private Chat</h2>
<ul id="private"></ul>
</body>
</html>

```

There are several key things worth noting about the way the viewer is written.

**Multiple listeners.** Instead of a single message processing function, the code here attaches multiple event listeners, each one performing a quick check to see if it is relevant for the message. In this example it doesn't make much difference, but if multiple authors wanted to collaborate using a single port to communicate with a worker, it would allow for independent code instead of changes having to all be made to a single event handling function.

Registering event listeners in this way also allows you to unregister specific listeners when you are done with them, as is done with the `configure()` method in this example.

Finally, the worker:

```
var nextName = 0;
function getNextName() {
  // this could use more friendly names
  // but for now just return a number
  return nextName++;
}

var map = [
  [0, 0, 0, 0, 0, 0, 0],
  [1, 1, 0, 1, 0, 1, 1],
  [0, 1, 0, 1, 0, 0, 0],
  [0, 1, 0, 1, 0, 1, 1],
  [0, 0, 0, 1, 0, 0, 0],
  [1, 0, 0, 1, 1, 1, 1],
  [1, 1, 0, 1, 1, 0, 1],
];

function wrapX(x) {
  if (x < 0) return wrapX(x + map[0].length);
  if (x >= map[0].length) return wrapX(x - map[0].length);
  return x;
}

function wrapY(y) {
  if (y < 0) return wrapY(y + map.length);
  if (y >= map[0].length) return wrapY(y - map.length);
  return y;
}

function wrap(val, min, max) {
  if (val < min)
    return val + (max-min)+1;
  if (val > max)
    return val - (max-min)-1;
  return val;
}

function sendMapData(viewer) {
  var data = '';
  for (var y = viewer.y-1; y <= viewer.y+1; y += 1) {
    for (var x = viewer.x-1; x <= viewer.x+1; x += 1) {
      if (data != '')
        data += ',';
      data += map[wrap(y, 0, map[0].length-1)][wrap(x, 0, map.length-1)];
    }
  }
  viewer.port.postMessage('map ' + data);
}

var viewers = {};
onconnect = function (event) {
  var name = getNextName();
  event.ports[0]._data = { port: event.ports[0], name: name, x: 0, y: 0, };
  viewers[name] = event.ports[0]._data;
  event.ports[0].postMessage('cfg ' + name);
  event.ports[0].onmessage = getMessage;
  sendMapData(event.ports[0]._data);
};

function getMessage(event) {
```

```

switch (event.data.substr(0, 4)) {
  case 'mov ':
    var direction = event.data.substr(4);
    var dx = 0;
    var dy = 0;
    switch (direction) {
      case 'up': dy = -1; break;
      case 'down': dy = 1; break;
      case 'left': dx = -1; break;
      case 'right': dx = 1; break;
    }
    event.target._data.x = wrapX(event.target._data.x + dx);
    event.target._data.y = wrapY(event.target._data.y + dy);
    sendMapData(event.target._data);
    break;
  case 'set ':
    var value = event.data.substr(4);
    map[event.target._data.y][event.target._data.x] = value;
    for (var viewer in viewers)
      sendMapData(viewers[viewer]);
    break;
  case 'txt ':
    var name = event.target._data.name;
    var message = event.data.substr(4);
    for (var viewer in viewers)
      viewers[viewer].port.postMessage('txt ' + name + ' ' + message);
    break;
  case 'msg ':
    var party1 = event.target._data;
    var party2 = viewers[event.data.substr(4).split(' ', 1)[0]];
    if (party2) {
      var channel = new MessageChannel();
      party1.port.postMessage('msg ' + party2.name, [channel.port1]);
      party2.port.postMessage('msg ' + party1.name, [channel.port2]);
    }
    break;
}
}
}

```

**Connecting to multiple pages.** The script uses the [onconnect<sup>p1027</sup>](#) event listener to listen for multiple connections.

**Direct channels.** When the worker receives a "msg" message from one viewer naming another viewer, it sets up a direct connection between the two, so that the two viewers can communicate directly without the worker having to proxy all the messages.

[View this example online.](#)

### 10.1.2.5 Delegation §P10 17

*This section is non-normative.*

With multicore CPUs becoming prevalent, one way to obtain better performance is to split computationally expensive tasks amongst multiple workers. In this example, a computationally expensive task that is to be performed for every number from 1 to 10,000,000 is farmed out to ten subworkers.

The main page is as follows, it just reports the result:

```

<!DOCTYPE HTML>
<html>
<head>
<meta charset="utf-8">
<title>Worker example: Multicore computation</title>

```

```

</head>
<body>
<p>Result: <output id="result"></output></p>
<script>
  var worker = new Worker('worker.js');
  worker.onmessage = function (event) {
    document.getElementById('result').textContent = event.data;
  };
</script>
</body>
</html>

```

The worker itself is as follows:

```

// settings
var num_workers = 10;
var items_per_worker = 1000000;

// start the workers
var result = 0;
var pending_workers = num_workers;
for (var i = 0; i < num_workers; i += 1) {
  var worker = new Worker('core.js');
  worker.postMessage(i * items_per_worker);
  worker.postMessage((i+1) * items_per_worker);
  worker.onmessage = storeResult;
}

// handle the results
function storeResult(event) {
  result += 1*event.data;
  pending_workers -= 1;
  if (pending_workers <= 0)
    postMessage(result); // finished!
}

```

It consists of a loop to start the subworkers, and then a handler that waits for all the subworkers to respond.

The subworkers are implemented as follows:

```

var start;
onmessage = getStart;
function getStart(event) {
  start = 1*event.data;
  onmessage = getEnd;
}

var end;
function getEnd(event) {
  end = 1*event.data;
  onmessage = null;
  work();
}

function work() {
  var result = 0;
  for (var i = start; i < end; i += 1) {
    // perform some complex calculation here
    result += 1;
  }
  postMessage(result);
  close();
}

```

```
}
```

They receive two numbers in two events, perform the computation for the range of numbers thus specified, and then report the result back to the parent.

[View this example online.](#)

#### 10.1.2.6 Providing libraries § p10 19

*This section is non-normative.*

Suppose that a cryptography library is made available that provides three tasks:

##### **Generate a public/private key pair**

Takes a port, on which it will send two messages, first the public key and then the private key.

##### **Given a plaintext and a public key, return the corresponding ciphertext**

Takes a port, to which any number of messages can be sent, the first giving the public key, and the remainder giving the plaintext, each of which is encrypted and then sent on that same channel as the ciphertext. The user can close the port when it is done encrypting content.

##### **Given a ciphertext and a private key, return the corresponding plaintext**

Takes a port, to which any number of messages can be sent, the first giving the private key, and the remainder giving the ciphertext, each of which is decrypted and then sent on that same channel as the plaintext. The user can close the port when it is done decrypting content.

The library itself is as follows:

```
function handleMessage(e) {
  if (e.data == "genkeys")
    genkeys(e.ports[0]);
  else if (e.data == "encrypt")
    encrypt(e.ports[0]);
  else if (e.data == "decrypt")
    decrypt(e.ports[0]);
}

function genkeys(p) {
  var keys = _generateKeyPair();
  p.postMessage(keys[0]);
  p.postMessage(keys[1]);
}

function encrypt(p) {
  var key, state = 0;
  p.onmessage = function (e) {
    if (state == 0) {
      key = e.data;
      state = 1;
    } else {
      p.postMessage(_encrypt(key, e.data));
    }
  };
}

function decrypt(p) {
  var key, state = 0;
  p.onmessage = function (e) {
    if (state == 0) {
      key = e.data;
      state = 1;
    }
  };
}
```

```

    } else {
      p.postMessage(_decrypt(key, e.data));
    }
  };
}

// support being used as a shared worker as well as a dedicated worker
if ('onmessage' in this) // dedicated worker
  onmessage = handleMessage;
else // shared worker
  onconnect = function (e) { e.port.onmessage = handleMessage; }

// the "crypto" functions:

function _generateKeyPair() {
  return [Math.random(), Math.random()];
}

function _encrypt(k, s) {
  return 'encrypted-' + k + ' ' + s;
}

function _decrypt(k, s) {
  return s.substr(s.indexOf(' ') + 1);
}

```

Note that the crypto functions here are just stubs and don't do real cryptography.

This library could be used as follows:

```

<!DOCTYPE HTML>
<html>
<head>
<meta charset="utf-8">
<title>Worker example: Crypto library</title>
<script>
const cryptoLib = new Worker('libcrypto-v1.js'); // or could use 'libcrypto-v2.js'
function startConversation(source, message) {
  const messageChannel = new MessageChannel();
  source.postMessage(message, [messageChannel.port2]);
  return messageChannel.port1;
}
function getKeys() {
  let state = 0;
  startConversation(cryptoLib, "genkeys").onmessage = function (e) {
    if (state === 0)
      document.getElementById('public').value = e.data;
    else if (state === 1)
      document.getElementById('private').value = e.data;
    state += 1;
  };
}
function enc() {
  const port = startConversation(cryptoLib, "encrypt");
  port.postMessage(document.getElementById('public').value);
  port.postMessage(document.getElementById('input').value);
  port.onmessage = function (e) {
    document.getElementById('input').value = e.data;
    port.close();
  };
}

```

```

function dec() {
  const port = startConversation(cryptoLib, "decrypt");
  port.postMessage(document.getElementById('private').value);
  port.postMessage(document.getElementById('input').value);
  port.onmessage = function (e) {
    document.getElementById('input').value = e.data;
    port.close();
  };
}
</script>
<style>
  textarea { display: block; }
</style>
</head>
<body onload="getKeys()">
  <fieldset>
    <legend>Keys</legend>
    <p><label>Public Key: <textarea id="public"></textarea></label></p>
    <p><label>Private Key: <textarea id="private"></textarea></label></p>
  </fieldset>
  <p><label>Input: <textarea id="input"></textarea></label></p>
  <p><button onclick="enc()">Encrypt</button> <button onclick="dec()">Decrypt</button></p>
</body>
</html>

```

A later version of the API, though, might want to offload all the crypto work onto subworkers. This could be done as follows:

```

function handleMessage(e) {
  if (e.data == "genkeys")
    genkeys(e.ports[0]);
  else if (e.data == "encrypt")
    encrypt(e.ports[0]);
  else if (e.data == "decrypt")
    decrypt(e.ports[0]);
}

function genkeys(p) {
  var generator = new Worker('libcrypto-v2-generator.js');
  generator.postMessage('', [p]);
}

function encrypt(p) {
  p.onmessage = function (e) {
    var key = e.data;
    var encryptor = new Worker('libcrypto-v2-encryptor.js');
    encryptor.postMessage(key, [p]);
  };
}

function decrypt(p) {
  p.onmessage = function (e) {
    var key = e.data;
    var decryptor = new Worker('libcrypto-v2-decryptor.js');
    decryptor.postMessage(key, [p]);
  };
}

// support being used as a shared worker as well as a dedicated worker
if ('onmessage' in this) // dedicated worker
  onmessage = handleMessage;
else // shared worker
  onconnect = function (e) { e.ports[0].onmessage = handleMessage };

```

The little subworkers would then be as follows.

For generating key pairs:

```
onmessage = function (e) {
  var k = _generateKeyPair();
  e.ports[0].postMessage(k[0]);
  e.ports[0].postMessage(k[1]);
  close();
}

function _generateKeyPair() {
  return [Math.random(), Math.random()];
}
```

For encrypting:

```
onmessage = function (e) {
  var key = e.data;
  e.ports[0].onmessage = function (e) {
    var s = e.data;
    postMessage(_encrypt(key, s));
  }
}

function _encrypt(k, s) {
  return 'encrypted-' + k + ' ' + s;
}
```

For decrypting:

```
onmessage = function (e) {
  var key = e.data;
  e.ports[0].onmessage = function (e) {
    var s = e.data;
    postMessage(_decrypt(key, s));
  }
}

function _decrypt(k, s) {
  return s.substr(s.indexOf(' ')+1);
}
```

Notice how the users of the API don't have to even know that this is happening — the API hasn't changed; the library can delegate to subworkers without changing its API, even though it is accepting data using message channels.

[View this example online.](#)

## 10.1.3 Tutorials §<sup>p10</sup><sub>22</sub>

### 10.1.3.1 Creating a dedicated worker §<sup>p10</sup><sub>22</sub>

*This section is non-normative.*

Creating a worker requires a URL to a JavaScript file. The `Worker()` p1033 constructor is invoked with the URL to that file as its only argument; a worker is then created and returned:

```
var worker = new Worker('helper.js');
```

If you want your worker script to be interpreted as a [module script](#) p896 instead of the default [classic script](#) p896, you need to use a slightly

different signature:

```
var worker = new Worker('helper.mjs', { type: "module" });
```

### 10.1.3.2 Communicating with a dedicated worker § p10 23

*This section is non-normative.*

Dedicated workers use [MessagePort](#)<sup>p1002</sup> objects behind the scenes, and thus support all the same features, such as sending structured data, transferring binary data, and transferring other ports.

To receive messages from a dedicated worker, use the [onmessage](#)<sup>p1033</sup> [event handler IDL attribute](#)<sup>p935</sup> on the [Worker](#)<sup>p1032</sup> object:

```
worker.onmessage = function (event) { ... };
```

You can also use the [addEventListener\(\)](#) method.

#### Note

The implicit [MessagePort](#)<sup>p1002</sup> used by dedicated workers has its [port message queue](#)<sup>p1002</sup> implicitly enabled when it is created, so there is no equivalent to the [MessagePort](#)<sup>p1002</sup> interface's [start\(\)](#)<sup>p1004</sup> method on the [Worker](#)<sup>p1032</sup> interface.

To send data to a worker, use the [postMessage\(\)](#)<sup>p1033</sup> method. Structured data can be sent over this communication channel. To send [ArrayBuffer](#) objects efficiently (by transferring them rather than cloning them), list them in an array in the second argument.

```
worker.postMessage({
  operation: 'find-edges',
  input: buffer, // an ArrayBuffer object
  threshold: 0.6,
}, [buffer]);
```

To receive a message inside the worker, the [onmessage](#)<sup>p1026</sup> [event handler IDL attribute](#)<sup>p935</sup> is used.

```
onmessage = function (event) { ... };
```

You can again also use the [addEventListener\(\)](#) method.

In either case, the data is provided in the event object's [data](#)<sup>p978</sup> attribute.

To send messages back, you again use [postMessage\(\)](#)<sup>p1026</sup>. It supports the structured data in the same manner.

```
postMessage(event.data.input, [event.data.input]); // transfer the buffer back
```

### 10.1.3.3 Shared workers § p10 23

*This section is non-normative.*

Shared workers are identified by the URL of the script used to create it, optionally with an explicit name. The name allows multiple instances of a particular shared worker to be started.

Shared workers are scoped by [origin](#)<sup>p829</sup>. Two different sites using the same names will not collide. However, if a page tries to use the same shared worker name as another page on the same site, but with a different script URL, it will fail.

Creating shared workers is done using the [SharedWorker\(\)](#)<sup>p1034</sup> constructor. This constructor takes the URL to the script to use for its first argument, and the name of the worker, if any, as the second argument.

```
var worker = new SharedWorker('service.js');
```

Communicating with shared workers is done with explicit [MessagePort](#)<sup>p1002</sup> objects. The object returned by the [SharedWorker\(\)](#)<sup>p1034</sup> constructor holds a reference to the port on its [port](#)<sup>p1034</sup> attribute.

```
worker.port.onmessage = function (event) { ... };
worker.port.postMessage('some message');
worker.port.postMessage({ foo: 'structured', bar: ['data', 'also', 'possible']});
```

Inside the shared worker, new clients of the worker are announced using the [connect](#)<sup>p1260</sup> event. The port for the new client is given by the event object's [source](#)<sup>p978</sup> attribute.

```
onconnect = function (event) {
  var newPort = event.source;
  // set up a listener
  newPort.onmessage = function (event) { ... };
  // send a message back to the port
  newPort.postMessage('ready!'); // can also send structured data, of course
};
```

## 10.2 Infrastructure § p10 24

There are two kinds of workers; dedicated workers, and shared workers. Dedicated workers, once created, are linked to their creator; but message ports can be used to communicate from a dedicated worker to multiple other browsing contexts or workers. Shared workers, on the other hand, are named, and once created any script running in the same [origin](#)<sup>p829</sup> can obtain a reference to that worker and communicate with it.

### 10.2.1 The global scope § p10 24

The global scope is the "inside" of a worker.

#### 10.2.1.1 The [WorkerGlobalScope](#)<sup>p1024</sup> common interface § p10 24

```
IDL [Exposed=Worker]
interface WorkerGlobalScope : EventTarget {
  readonly attribute WorkerGlobalScope self;
  readonly attribute WorkerLocation location;
  readonly attribute WorkerNavigator navigator;
  void importScripts(USVString... urls);

  attribute OnErrorEventHandler onerror;
  attribute EventHandler onlanguagechange;
  attribute EventHandler onoffline;
  attribute EventHandler ononline;
  attribute EventHandler onrejectionhandled;
  attribute EventHandler onunhandledrejection;
};
```

[WorkerGlobalScope](#)<sup>p1024</sup> serves as the base class for specific types of worker global scope objects, including [DedicatedWorkerGlobalScope](#)<sup>p1026</sup>, [SharedWorkerGlobalScope](#)<sup>p1027</sup>, and [ServiceWorkerGlobalScope](#).

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **owner set** (a [set](#) of [Document](#)<sup>p111</sup> and [WorkerGlobalScope](#)<sup>p1024</sup> objects). It is initially empty and populated when the worker is created or obtained.

#### Note

*It is a [set](#), instead of a single owner, to accomodate [SharedWorkerGlobalScope](#)<sup>p1027</sup> objects.*

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **worker set** (a [set](#) of [WorkerGlobalScope](#)<sup>p1024</sup> objects). It is initially empty and populated when the worker creates or obtains further workers.

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **type** ("classic" or "module"). It is set during creation.

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **url** (null or a [URL](#)). It is initially null.

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **name** (a string). It is set during creation.

#### Note

The [name](#)<sup>p1025</sup> can have different semantics for each subclass of [WorkerGlobalScope](#)<sup>p1024</sup>. For [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> instances, it is simply a developer-supplied name, useful mostly for debugging purposes. For [SharedWorkerGlobalScope](#)<sup>p1027</sup> instances, it allows obtaining a reference to a common shared worker via the [SharedWorker\(\)](#)<sup>p1034</sup> constructor. For [ServiceWorkerGlobalScope](#) objects, it doesn't make sense (and as such isn't exposed through the JavaScript API at all).

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **HTTPS state** (an [HTTPS state value](#)). It is initially "none".

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **referrer policy** (a [referrer policy](#)). It is initially the empty string.

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **CSP list**, which is a [CSP list](#) containing all of the [Content Security Policy](#) objects active for the worker. It is initially an empty list.

A [WorkerGlobalScope](#)<sup>p1024</sup> object has an associated **module map**. It is a [module map](#)<sup>p916</sup>, initially empty.

#### For web developers (non-normative)

##### **[workerGlobal](#) . [self](#)**<sup>p1025</sup>

Returns [workerGlobal](#).

##### **[workerGlobal](#) . [location](#)**<sup>p1025</sup>

Returns [workerGlobal](#)'s [WorkerLocation](#)<sup>p1037</sup> object.

##### **[workerGlobal](#) . [navigator](#)**<sup>p1036</sup>

Returns [workerGlobal](#)'s [WorkerNavigator](#)<sup>p1036</sup> object.

##### **[workerGlobal](#) . [importScripts](#)**<sup>p1036</sup>(*urls...*)

Fetches each [URL](#) in *urls*, executes them one-by-one in the order they are passed, and then returns (or throws if something went amiss).

The **self** attribute must return the [WorkerGlobalScope](#)<sup>p1024</sup> object itself.

The **location** attribute must return the [WorkerLocation](#)<sup>p1037</sup> object whose associated [WorkerGlobalScope object](#)<sup>p1037</sup> is the [WorkerGlobalScope](#)<sup>p1024</sup> object.

#### Note

While the [WorkerLocation](#)<sup>p1037</sup> object is created after the [WorkerGlobalScope](#)<sup>p1024</sup> object, this is not problematic as it cannot be observed from script.

The following are the [event handlers](#)<sup>p934</sup> (and their corresponding [event handler event types](#)<sup>p937</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p935</sup>, by objects implementing the [WorkerGlobalScope](#)<sup>p1024</sup> interface:

<a href="#">Event handler</a> <sup>p934</sup>	<a href="#">Event handler event type</a> <sup>p937</sup>
<b>onerror</b>	<a href="#">error</a> <sup>p1260</sup>
<b>onlanguagechange</b>	<a href="#">languagechange</a> <sup>p1260</sup>
<b>onoffline</b>	<a href="#">offline</a> <sup>p1261</sup>
<b>ononline</b>	<a href="#">online</a> <sup>p1261</sup>
<b>onrejectionhandled</b>	<a href="#">rejectionhandled</a> <sup>p1261</sup>
<b>onunhandledrejection</b>	<a href="#">unhandledrejection</a> <sup>p1261</sup>

### 10.2.1.2 Dedicated workers and the [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> interface §<sup>p10</sup><sub>26</sub>

```
IDL [Global=(Worker,DedicatedWorker),Exposed=DedicatedWorker]
interface DedicatedWorkerGlobalScope : WorkerGlobalScope {
  [Replaceable] readonly attribute DOMString name;

  void postMessage(any message, sequence<object> transfer);
  void postMessage(any message, optional PostMessageOptions options = {});

  void close();

  attribute EventHandler onmessage;
  attribute EventHandler onmessageerror;
};
```

[DedicatedWorkerGlobalScope](#)<sup>p1026</sup> objects act as if they had an implicit [MessagePort](#)<sup>p1002</sup> associated with them. This port is part of a channel that is set up when the worker is created, but it is not exposed. This object must never be garbage collected before the [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> object.

All messages received by that port must immediately be retargeted at the [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> object.

For web developers (non-normative)

**[dedicatedWorkerGlobal](#) . [name](#)**<sup>p1026</sup>

Returns [dedicatedWorkerGlobal](#)'s [name](#)<sup>p1025</sup>, i.e. the value given to the [Worker](#)<sup>p1032</sup> constructor. Primarily useful for debugging.

**[dedicatedWorkerGlobal](#) . [postMessage](#)**<sup>p1026</sup>(*message* [, *transfer* ])

**[dedicatedWorkerGlobal](#) . [postMessage](#)**<sup>p1026</sup>(*message* [, { *transfer* } ])

Clones *message* and transmits it to the [Worker](#)<sup>p1032</sup> object associated with [dedicatedWorkerGlobal](#). *transfer* can be passed as a list of objects that are to be transferred rather than cloned.

**[dedicatedWorkerGlobal](#) . [close](#)**<sup>p1026</sup>()

Aborts [dedicatedWorkerGlobal](#).

The [name](#) attribute must return the [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> object's [name](#)<sup>p1025</sup>. Its value represents the name given to the worker using the [Worker](#)<sup>p1032</sup> constructor, used primarily for debugging purposes.

The [postMessage\(message, transfer\)](#) and [postMessage\(message, options\)](#) methods on [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> objects act as if, when invoked, it immediately invoked the respective [postMessage\(message, transfer\)](#)<sup>p1004</sup> and [postMessage\(message, options\)](#)<sup>p1004</sup> on the port, with the same arguments, and returned the same return value.

To **close a worker**, given a *workerGlobal*, run these steps:

1. Discard any [tasks](#)<sup>p925</sup> that have been added to *workerGlobal*'s [relevant agent](#)<sup>p919</sup>'s [event loop](#)<sup>p924</sup>'s [task queues](#)<sup>p924</sup>.
2. Set *workerGlobal*'s [closing](#)<sup>p1027</sup> flag to true. (This prevents any further tasks from being queued.)

The [close\(\)](#) method, when invoked, must [close a worker](#)<sup>p1026</sup> with this [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> object.

The following are the [event handlers](#)<sup>p934</sup> (and their corresponding [event handler event types](#)<sup>p937</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p935</sup>, by objects implementing the [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> interface:

<a href="#">Event handler</a> <sup>p934</sup>	<a href="#">Event handler event type</a> <sup>p937</sup>
<a href="#">onmessage</a>	<a href="#">message</a> <sup>p1261</sup>
<a href="#">onmessageerror</a>	<a href="#">messageerror</a> <sup>p1261</sup>

For the purposes of the [application cache](#)<sup>p874</sup> networking model, a dedicated worker is an extension of the [cache host](#)<sup>p875</sup> from which it was created.

### 10.2.1.3 Shared workers and the [SharedWorkerGlobalScope<sup>p1027</sup>](#) interface §<sup>p10</sup><sub>27</sub>

```
IDL [Global=(Worker,SharedWorker),Exposed=SharedWorker]
interface SharedWorkerGlobalScope : WorkerGlobalScope {
  [Replaceable] readonly attribute DOMString name;

  void close();

  attribute EventHandler onconnect;
};
```

A [SharedWorkerGlobalScope<sup>p1027</sup>](#) object has an associated **constructor origin**, **constructor url**, and **credentials**. They are initialized when the [SharedWorkerGlobalScope<sup>p1027</sup>](#) object is created, in the [run a worker<sup>p1028</sup>](#) algorithm.

Shared workers receive message ports through [connect<sup>p1260</sup>](#) events on their [SharedWorkerGlobalScope<sup>p1027</sup>](#) object for each connection.

For web developers (non-normative)

**[sharedWorkerGlobal . name<sup>p1027</sup>](#)**

Returns [sharedWorkerGlobal's name<sup>p1025</sup>](#), i.e. the value given to the [SharedWorker<sup>p1033</sup>](#) constructor. Multiple [SharedWorker<sup>p1033</sup>](#) objects can correspond to the same shared worker (and [SharedWorkerGlobalScope<sup>p1027</sup>](#)), by reusing the same name.

**[sharedWorkerGlobal . close<sup>p1027</sup>\(\)](#)**

Aborts [sharedWorkerGlobal](#).

The **name** attribute must return the [SharedWorkerGlobalScope<sup>p1027</sup>](#) object's [name<sup>p1025</sup>](#). Its value represents the name that can be used to obtain a reference to the worker using the [SharedWorker<sup>p1033</sup>](#) constructor.

The **close()** method, when invoked, must [close a worker<sup>p1026</sup>](#) with this [SharedWorkerGlobalScope<sup>p1027</sup>](#) object.

The following are the [event handlers<sup>p934</sup>](#) (and their corresponding [event handler event types<sup>p937</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p935</sup>](#), by objects implementing the [SharedWorkerGlobalScope<sup>p1027</sup>](#) interface:

<a href="#">Event handler<sup>p934</sup></a>	<a href="#">Event handler event type<sup>p937</sup></a>
<a href="#">onconnect</a>	<a href="#">connect<sup>p1260</sup></a>

## 10.2.2 The event loop §<sup>p10</sup><sub>27</sub>

A [worker event loop<sup>p924</sup>](#)'s [task queues<sup>p924</sup>](#) only have events, callbacks, and networking activity as [tasks<sup>p925</sup>](#). These [worker event loops<sup>p924</sup>](#) are created by the [run a worker<sup>p1028</sup>](#) algorithm.

Each [WorkerGlobalScope<sup>p1024</sup>](#) object has a **closing** flag, which must be initially false, but which can get set to true by the algorithms in the processing model section below.

Once the [WorkerGlobalScope<sup>p1024</sup>](#)'s [closing<sup>p1027</sup>](#) flag is set to true, the [event loop<sup>p924</sup>](#)'s [task queues<sup>p924</sup>](#) must discard any further [tasks<sup>p925</sup>](#) that would be added to them (tasks already on the queue are unaffected except where otherwise specified). Effectively, once the [closing<sup>p1027</sup>](#) flag is true, timers stop firing, notifications for all pending background operations are dropped, etc.

## 10.2.3 The worker's lifetime §<sup>p10</sup><sub>27</sub>

Workers communicate with other workers and with [browsing contexts<sup>p804</sup>](#) through [message channels<sup>p998</sup>](#) and their [MessagePort<sup>p1002</sup>](#) objects.

Each [WorkerGlobalScope<sup>p1024</sup>](#) object *worker global scope* has a list of **the worker's ports**, which consists of all the [MessagePort<sup>p1002</sup>](#) objects that are entangled with another port and that have one (but only one) port owned by *worker global scope*. This list includes the implicit [MessagePort<sup>p1002</sup>](#) in the case of [dedicated workers<sup>p1026</sup>](#).

Given an [environment settings object](#)<sup>p897</sup> *o* when creating or obtaining a worker, the **relevant owner to add** depends on the type of [global object](#)<sup>p908</sup> specified by *o*. If *o* specifies a [global object](#)<sup>p908</sup> that is a [WorkerGlobalScope](#)<sup>p1024</sup> object (i.e., if we are creating a nested worker), then the relevant owner is that global object. Otherwise, *o* specifies a [global object](#)<sup>p908</sup> that is a [Window](#)<sup>p816</sup> object, and the relevant owner is the [responsible document](#)<sup>p897</sup> specified by *o*.

A worker is said to be a **permissible worker** if its [WorkerGlobalScope](#)<sup>p1024</sup>'s [owner set](#)<sup>p1024</sup> is not [empty](#) or:

- its [owner set](#)<sup>p1024</sup> has been [empty](#) for no more than a short [implementation-defined](#) timeout value,
- its [WorkerGlobalScope](#)<sup>p1024</sup> object is a [SharedWorkerGlobalScope](#)<sup>p1027</sup> object (i.e., the worker is a shared worker), and
- the user agent has a [browsing context](#)<sup>p804</sup> whose [Document](#)<sup>p111</sup> object is not [completely loaded](#)<sup>p1145</sup>.

#### Note

*The second part of this definition allows a shared worker to survive for a short time while a page is loading, in case that page is going to contact the shared worker again. This can be used by user agents as a way to avoid the cost of restarting a shared worker used by a site when the user is navigating from page to page within that site.*

A worker is said to be an **active needed worker** if any its [owners](#)<sup>p1024</sup> are either [Document](#)<sup>p111</sup> objects that are [fully active](#)<sup>p807</sup> or [active needed workers](#)<sup>p1028</sup>.

A worker is said to be a **protected worker** if it is an [active needed worker](#)<sup>p1028</sup> and either it has outstanding timers, database transactions, or network connections, or its list of [the worker's ports](#)<sup>p1027</sup> is not empty, or its [WorkerGlobalScope](#)<sup>p1024</sup> is actually a [SharedWorkerGlobalScope](#)<sup>p1027</sup> object (i.e. the worker is a shared worker).

A worker is said to be a **suspendable worker** if it is not an [active needed worker](#)<sup>p1028</sup> but it is a [permissible worker](#)<sup>p1028</sup>.

### 10.2.4 Processing model <sup>p10</sup><sub>28</sub>

When a user agent is to **run a worker** for a script with [Worker](#)<sup>p1032</sup> or [SharedWorker](#)<sup>p1033</sup> object *worker*, [URL](#) *url*, [environment settings object](#)<sup>p897</sup> *outside settings*, [MessagePort](#)<sup>p1002</sup> *outside port*, and a [WorkerOptions](#)<sup>p1032</sup> dictionary *options*, it must run the following steps.

1. Let *is shared* be true if *worker* is a [SharedWorker](#)<sup>p1033</sup> object, and false otherwise.
2. Let *owner* be the [relevant owner to add](#)<sup>p1028</sup> given *outside settings*.
3. Let *parent worker global scope* be null.
4. If *owner* is a [WorkerGlobalScope](#)<sup>p1024</sup> object (i.e., we are creating a nested worker), then set *parent worker global scope* to *owner*.
5. Let *agent* be the result of [obtaining a dedicated/shared worker agent](#)<sup>p920</sup> given *outside settings* and *is shared*. Run the rest of these steps in that agent.

For the purposes of timing APIs, this is the **official moment of creation** of the worker.

6. Let *realm execution context* be the result of [creating a new JavaScript realm](#)<sup>p908</sup> given *agent* and the following customizations:
  - For the global object, if *is shared* is true, create a new [SharedWorkerGlobalScope](#)<sup>p1027</sup> object. Otherwise, create a new [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> object.
7. Let *worker global scope* be the [global object](#)<sup>p907</sup> of *realm execution context*'s Realm component.

#### Note

*This is the [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> or [SharedWorkerGlobalScope](#)<sup>p1027</sup> object created in the previous step.*

8. [Set up a worker environment settings object](#)<sup>p1031</sup> with *realm execution context* and *outside settings*, and let *inside settings* be the result.
9. Set *worker global scope*'s [name](#)<sup>p1025</sup> to the value of *options*'s *name* member.
10. [Append](#) *owner* to *worker global scope*'s [owner set](#)<sup>p1024</sup>.
11. If *parent worker global scope* is not null, then [append](#) *worker global scope* to *parent worker global scope*'s [worker set](#)<sup>p1025</sup>.

12. If *is shared* is true, then:

1. Set *worker global scope*'s [constructor origin](#)<sup>p1027</sup> to *outside settings*'s [origin](#)<sup>p897</sup>.
2. Set *worker global scope*'s [constructor url](#)<sup>p1027</sup> to *url*.
3. Set *worker global scope*'s [type](#)<sup>p1025</sup> to the value of *options*'s *type* member.
4. Set *worker global scope*'s [credentials](#)<sup>p1027</sup> to the value of *options*'s *credentials* member.

13. Let *destination* be "sharedworker" if *is shared* is true, and "worker" otherwise.

14. Obtain *script* by switching on the value of *options*'s *type* member:

↪ "classic"

[Fetch a classic worker script](#)<sup>p899</sup> given *url*, *outside settings*, *destination*, and *inside settings*.

↪ "module"

[Fetch a module worker script graph](#)<sup>p901</sup> given *url*, *outside settings*, *destination*, the value of the *credentials* member of *options*, and *inside settings*.

In both cases, to [perform the fetch](#)<sup>p898</sup> given *request*, perform the following steps if the [is top-level](#)<sup>p898</sup> flag is set:

1. Set *request*'s [reserved client](#) to *inside settings*.
2. [Fetch](#) *request*, and asynchronously wait to run the remaining steps as part of [fetch's process response](#) for the [response](#) *response*.
3. Set *worker global scope*'s [url](#)<sup>p1025</sup> to *response*'s [url](#).
4. Set *worker global scope*'s [HTTPS state](#)<sup>p1025</sup> to *response*'s [HTTPS state](#).
5. Set *worker global scope*'s [referrer policy](#)<sup>p1025</sup> to the result of [parsing the `Referrer-Policy` header](#) of *response*.
6. Execute the [Initialize a global object's CSP list](#) algorithm on *worker global scope* and *response*. [\[CSP\]](#)<sup>p1264</sup>
7. Asynchronously complete the [perform the fetch](#)<sup>p898</sup> steps with *response*.

If the algorithm asynchronously completes with null or with a *script* whose [error to rethrow](#)<sup>p896</sup> is non-null, then:

1. [Queue a task](#)<sup>p925</sup> to [fire an event](#) named [error](#)<sup>p1260</sup> at *worker*.
2. Run the [environment discarding steps](#)<sup>p897</sup> for *inside settings*.
3. Return.

Otherwise, continue the rest of these steps after the algorithm's asynchronous completion, with *script* being the asynchronous completion value.

15. Associate *worker* with *worker global scope*.

16. [Create a new MessagePort object](#)<sup>p1002</sup> whose [owner](#)<sup>p1002</sup> is *inside settings*. Let *inside port* be this new object.

17. Associate *inside port* with *worker global scope*.

18. [Entangle](#)<sup>p1003</sup> *outside port* and *inside port*.

19. Create a new [WorkerLocation](#)<sup>p1037</sup> object and associate it with *worker global scope*.

20. **Closing orphan workers:** Start monitoring the worker such that no sooner than it stops being a [protected worker](#)<sup>p1028</sup>, and no later than it stops being a [permissible worker](#)<sup>p1028</sup>, *worker global scope*'s [closing](#)<sup>p1027</sup> flag is set to true.

21. **Suspending workers:** Start monitoring the worker, such that whenever *worker global scope*'s [closing](#)<sup>p1027</sup> flag is false and the worker is a [suspendable worker](#)<sup>p1028</sup>, the user agent suspends execution of script in that worker until such time as either the [closing](#)<sup>p1027</sup> flag switches to true or the worker stops being a [suspendable worker](#)<sup>p1028</sup>.

22. Set *inside settings*'s [execution ready flag](#)<sup>p897</sup>.

23. If *script* is a [classic script](#)<sup>p896</sup>, then [run the classic script](#)<sup>p906</sup> *script*. Otherwise, it is a [module script](#)<sup>p896</sup>; [run the module script](#)<sup>p906</sup> *script*.

#### Note

In addition to the usual possibilities of returning a value or failing due to an exception, this could be [prematurely aborted](#)<sup>p913</sup> by the [terminate a worker](#)<sup>p1030</sup> algorithm defined below.

24. Enable *outside port*'s [port message queue](#)<sup>p1002</sup>.
25. If *is shared* is false, enable the [port message queue](#)<sup>p1002</sup> of the worker's implicit port.
26. If *is shared* is true, then [queue a task](#)<sup>p925</sup>, using the [DOM manipulation task source](#)<sup>p932</sup>, to [fire an event](#) named [connect](#)<sup>p1260</sup> at *worker global scope*, using [MessageEvent](#)<sup>p978</sup>, with the [data](#)<sup>p978</sup> attribute initialized to the empty string, the [ports](#)<sup>p979</sup> attribute initialized to a new [frozen array](#) containing *inside port*, and the [source](#)<sup>p978</sup> attribute initialized to *inside port*.
27. Enable the [client message queue](#) of the [ServiceWorkerContainer](#) object whose associated [service worker client](#) is *worker global scope*'s [relevant settings object](#)<sup>p913</sup>.
28. **Event loop:** Run the [responsible event loop](#)<sup>p897</sup> specified by *inside settings* until it is destroyed.

#### Note

The handling of events or the execution of callbacks by [tasks](#)<sup>p925</sup> run by the [event loop](#)<sup>p924</sup> might get [prematurely aborted](#)<sup>p913</sup> by the [terminate a worker](#)<sup>p1030</sup> algorithm defined below.

#### Note

The worker processing model remains on this step until the event loop is destroyed, which happens after the [closing](#)<sup>p1027</sup> flag is set to true, as described in the [event loop](#)<sup>p924</sup> processing model.

29. Empty the *worker global scope*'s [list of active timers](#)<sup>p952</sup>.
30. Disentangle all the ports in the list of [the worker's ports](#)<sup>p1027</sup>.
31. [Empty](#) *worker global scope*'s [owner set](#)<sup>p1024</sup>.

When a user agent is to **terminate a worker** it must run the following steps [in parallel](#)<sup>p41</sup> with the worker's main loop (the "[run a worker](#)<sup>p1028</sup>" processing model defined above):

1. Set the worker's [WorkerGlobalScope](#)<sup>p1024</sup> object's [closing](#)<sup>p1027</sup> flag to true.
2. If there are any [tasks](#)<sup>p925</sup> queued in the [WorkerGlobalScope](#)<sup>p1024</sup> object's [relevant agent](#)<sup>p919</sup>'s [event loop](#)<sup>p924</sup>'s [task queues](#)<sup>p924</sup>, discard them without processing them.
3. [Abort the script](#)<sup>p913</sup> currently running in the worker.
4. If the worker's [WorkerGlobalScope](#)<sup>p1024</sup> object is actually a [DedicatedWorkerGlobalScope](#)<sup>p1026</sup> object (i.e. the worker is a dedicated worker), then empty the [port message queue](#)<sup>p1002</sup> of the port that the worker's implicit port is entangled with.

User agents may invoke the [terminate a worker](#)<sup>p1030</sup> algorithm when a worker stops being an [active needed worker](#)<sup>p1028</sup> and the worker continues executing even after its [closing](#)<sup>p1027</sup> flag was set to true.

The [task source](#)<sup>p925</sup> for the tasks mentioned above is the [DOM manipulation task source](#)<sup>p932</sup>.

### 10.2.5 Runtime script errors §<sup>p10</sup><sub>30</sub>

Whenever an uncaught runtime script error occurs in one of the worker's scripts, if the error did not occur while handling a previous script error, the user agent must [report the error](#)<sup>p921</sup> for that [script](#)<sup>p895</sup>, with the position (line number and column number) where the error occurred, using the [WorkerGlobalScope](#)<sup>p1024</sup> object as the target.

For shared workers, if the error is still [not handled](#)<sup>p921</sup> afterwards, the error may be reported to a developer console.

For dedicated workers, if the error is still [not handled](#)<sup>p921</sup> afterwards, the user agent must [queue a task](#)<sup>p925</sup> to run these steps:

1. Let *notHandled* be the result of [firing an event](#) named [error](#)<sup>p1260</sup> at the [Worker](#)<sup>p1032</sup> object associated with the worker, using [ErrorEvent](#)<sup>p922</sup>, with the [cancelable](#) attribute initialized to true, the [message](#)<sup>p922</sup>, [filename](#)<sup>p922</sup>, [lineno](#)<sup>p922</sup>, and [colno](#)<sup>p922</sup>

attributes initialized appropriately, and the [error<sup>p922</sup>](#) attribute initialized to null.

2. If *notHandled* is true, then the user agent must act as if the uncaught runtime script error had occurred in the global scope that the [Worker<sup>p1032</sup>](#) object is in, thus repeating the entire runtime script error reporting process one level up.

If the implicit port connecting the worker to its [Worker<sup>p1032</sup>](#) object has been disentangled (i.e. if the parent worker has been terminated), then the user agent must act as if the [Worker<sup>p1032</sup>](#) object had no [error<sup>p1260</sup>](#) event handler and as if that worker's [onerror<sup>p1025</sup>](#) attribute was null, but must otherwise act as described above.

#### Note

*Thus, error reports propagate up to the chain of dedicated workers up to the original [Document<sup>p111</sup>](#), even if some of the workers along this chain have been terminated and garbage collected.*

The [task source<sup>p925</sup>](#) for the task mentioned above is the [DOM manipulation task source<sup>p932</sup>](#).

## 10.2.6 Creating workers §<sup>p10</sup><sub>31</sub>

### 10.2.6.1 The [AbstractWorker<sup>p1031</sup>](#) mixin §<sup>p10</sup><sub>31</sub>

```
IDL interface mixin AbstractWorker {  
  attribute EventHandler onerror;  
};
```

The following are the [event handlers<sup>p934</sup>](#) (and their corresponding [event handler event types<sup>p937</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p935</sup>](#), by objects implementing the [AbstractWorker<sup>p1031</sup>](#) interface:

<a href="#">Event handler<sup>p934</sup></a>	<a href="#">Event handler event type<sup>p937</sup></a>
<a href="#">onerror</a>	<a href="#">error<sup>p1260</sup></a>

### 10.2.6.2 Script settings for workers §<sup>p10</sup><sub>31</sub>

When the user agent is required to **set up a worker environment settings object**, given a [JavaScript execution context execution context](#) and [environment settings object<sup>p897</sup>](#) *outside settings*, it must run the following steps:

1. Let *inherited origin* be *outside settings*'s [origin<sup>p897</sup>](#).
2. Let *realm* be the value of *execution context*'s Realm component.
3. Let *worker global scope* be *realm*'s [global object<sup>p907</sup>](#).
4. Let *settings object* be a new [environment settings object<sup>p897</sup>](#) whose algorithms are defined as follows:

#### The [realm execution context<sup>p897</sup>](#)

Return *execution context*.

#### The [module map<sup>p897</sup>](#)

Return *worker global scope*'s [module map<sup>p1025</sup>](#).

#### The [responsible document<sup>p897</sup>](#)

Not applicable (the [responsible event loop<sup>p897</sup>](#) is not a [window event loop<sup>p924</sup>](#)).

#### The [API URL character encoding<sup>p897</sup>](#)

Return [UTF-8](#).

#### The [API base URL<sup>p897</sup>](#)

Return *worker global scope*'s [url<sup>p1025</sup>](#).

#### The [origin<sup>p897</sup>](#)

Return a unique [opaque origin<sup>p829</sup>](#) if *worker global scope*'s [url<sup>p1025</sup>](#)'s [scheme](#) is "data", and *inherited origin* otherwise.

### The [top-level origin](#)<sup>p897</sup>

Return *outside settings*'s [top-level origin](#)<sup>p897</sup> for a dedicated worker.

For shared and service workers this is still undefined and is being worked on, since such workers could be associated with multiple [top-level browsing contexts](#)<sup>p807</sup>.

### The [HTTPS state](#)<sup>p897</sup>

Return *worker global scope*'s [HTTPS state](#)<sup>p1025</sup>.

### The [referrer policy](#)<sup>p897</sup>

Return *worker global scope*'s [referrer policy](#)<sup>p1025</sup>.

5. Set *settings object*'s [id](#)<sup>p896</sup> to a new unique opaque string, *settings object*'s [creation URL](#)<sup>p896</sup> to *worker global scope*'s [url](#), *settings object*'s [target browsing context](#)<sup>p896</sup> to null, and *settings object*'s [active service worker](#)<sup>p897</sup> to null.
6. Set *realm*'s [[HostDefined]] field to *settings object*.
7. Return *settings object*.

## 10.2.6.3 Dedicated workers and the [Worker](#)<sup>p1032</sup> interface § p1032

```
IDL [Exposed=(Window,Worker)]
interface Worker : EventTarget {
  constructor(USVString scriptURL, optional WorkerOptions options = {});

  void terminate();

  void postMessage(any message, sequence<object> transfer);
  void postMessage(any message, optional PostMessageOptions options = {});
  attribute EventHandler onmessage;
  attribute EventHandler onmessageerror;
};

dictionary WorkerOptions {
  WorkerType type = "classic";
  RequestCredentials credentials = "same-origin"; // credentials is only used if type is "module"
  DOMString name = "";
};

enum WorkerType { "classic", "module" };

Worker includes AbstractWorker;
```

### For web developers (non-normative)

#### **`worker = new Workerp1033(scriptURL [, options ])`**

Returns a new [Worker](#)<sup>p1032</sup> object. *scriptURL* will be fetched and executed in the background, creating a new global environment for which *worker* represents the communication channel. *options* can be used to define the [name](#)<sup>p1025</sup> of that global environment via the *name* option, primarily for debugging purposes. It can also ensure this new global environment supports JavaScript modules (specify *type*: "module"), and if that is specified, can also be used to specify how *scriptURL* is fetched through the *credentials* option.

#### **`worker . terminatep1033()`**

Aborts *worker*'s associated global environment.

#### **`worker . postMessagep1033(message [, transfer ])`**

#### **`worker . postMessagep1033(message [, { transfer } ])`**

Clones *message* and transmits it to *worker*'s global environment. *transfer* can be passed as a list of objects that are to be transferred rather than cloned.

The `terminate()` method, when invoked, must cause the [terminate a worker](#)<sup>p1030</sup> algorithm to be run on the worker with which the object is associated.

[Worker](#)<sup>p1032</sup> objects act as if they had an implicit [MessagePort](#)<sup>p1002</sup> associated with them. This port is part of a channel that is set up when the worker is created, but it is not exposed. This object must never be garbage collected before the [Worker](#)<sup>p1032</sup> object.

All messages received by that port must immediately be retargeted at the [Worker](#)<sup>p1032</sup> object.

The `postMessage(message, transfer)` and `postMessage(message, options)` methods on [Worker](#)<sup>p1032</sup> objects act as if, when invoked, they immediately invoked the respective `postMessage(message, transfer)`<sup>p1004</sup> and `postMessage(message, options)`<sup>p1004</sup> on the port, with the same arguments, and returned the same return value. MDN

#### Example

The `postMessage()`<sup>p1033</sup> method's first argument can be structured data:

```
worker.postMessage({opcode: 'activate', device: 1938, parameters: [23, 102]});
```

The following are the [event handlers](#)<sup>p934</sup> (and their corresponding [event handler event types](#)<sup>p937</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p935</sup>, by objects implementing the [Worker](#)<sup>p1032</sup> interface:

Event handler <sup>p934</sup>	Event handler event type <sup>p937</sup>
<code>onmessage</code>	<code>message</code> <sup>p1261</sup>
<code>onmessageerror</code>	<code>messageerror</code> <sup>p1261</sup>

MDN  
MDN

When the `Worker(scriptURL, options)` constructor is invoked, the user agent must run the following steps: MDN

1. The user agent may throw a `"SecurityError" DOMException` if the request violates a policy decision (e.g. if the user agent is configured to not allow the page to start dedicated workers).
2. Let *outside settings* be the [current settings object](#)<sup>p913</sup>.
3. [Parse](#)<sup>p87</sup> the *scriptURL* argument relative to *outside settings*.
4. If this fails, throw a `"SyntaxError" DOMException`.
5. Let *worker URL* be the [resulting URL record](#)<sup>p87</sup>.

#### Note

Any [same-origin](#)<sup>p830</sup> URL (including [blob:](#) URLs) can be used. [data:](#) URLs can also be used, but they create a worker with an [opaque origin](#)<sup>p829</sup>.

6. Let *worker* be a new [Worker](#)<sup>p1032</sup> object.
7. [Create a new MessagePort object](#)<sup>p1002</sup> whose [owner](#)<sup>p1002</sup> is *outside settings*. Let this be the *outside port*.
8. Associate the *outside port* with *worker*.
9. Run this step [in parallel](#)<sup>p41</sup>:
  1. [Run a worker](#)<sup>p1028</sup> given *worker*, *worker URL*, *outside settings*, *outside port*, and *options*.
10. Return *worker*.

#### 10.2.6.4 Shared workers and the [SharedWorker](#)<sup>p1033</sup> interface § p10 33

```
IDL [Exposed=(Window,Worker)]  
interface SharedWorker : EventTarget {  
  constructor(USVString scriptURL, optional (DOMString or WorkerOptions) options = {});  
  
  readonly attribute MessagePort port;
```

MDN

```
};  
SharedWorker includes AbstractWorker;
```

For web developers (non-normative)

**`sharedWorker = new SharedWorker`**<sup>p1034</sup>(`scriptURL` [, `name` ])

Returns a new [SharedWorker](#)<sup>p1033</sup> object. `scriptURL` will be fetched and executed in the background, creating a new global environment for which `sharedWorker` represents the communication channel. `name` can be used to define the [name](#)<sup>p1025</sup> of that global environment.

**`sharedWorker = new SharedWorker`**<sup>p1034</sup>(`scriptURL` [, `options` ])

Returns a new [SharedWorker](#)<sup>p1033</sup> object. `scriptURL` will be fetched and executed in the background, creating a new global environment for which `sharedWorker` represents the communication channel. `options` can be used to define the [name](#)<sup>p1025</sup> of that global environment via the `name` option. It can also ensure this new global environment supports JavaScript modules (specify `type`: "module"), and if that is specified, can also be used to specify how `scriptURL` is fetched through the `credentials` option. Note that attempting to construct a shared worker with `options` whose `type` or `credentials` values mismatch an existing shared worker will cause the returned `sharedWorker` to fire an error event and not connect to the existing shared worker.

**`sharedWorker . port`**<sup>p1034</sup>

Returns `sharedWorker`'s [MessagePort](#)<sup>p1002</sup> object which can be used to communicate with the global environment.

The `port` attribute must return the value it was assigned by the object's constructor. It represents the [MessagePort](#)<sup>p1002</sup> for communicating with the shared worker.

MDN

A user agent has an associated **shared worker manager** which is the result of [starting a new parallel queue](#)<sup>p41</sup>.

#### Note

*Each user agent has a single [shared worker manager](#)<sup>p1034</sup> for simplicity. Implementations could use one per [origin](#)<sup>p829</sup>; that would not be observably different and enables more concurrency.*

When the [SharedWorker](#)(`scriptURL`, `options`) constructor is invoked:

MDN

1. Optionally, throw a ["SecurityError" DOMException](#) if the request violates a policy decision (e.g. if the user agent is configured to not allow the page to start shared workers).
2. If `options` is a [DOMString](#), set `options` to a new [WorkerOptions](#)<sup>p1032</sup> dictionary whose `name` member is set to the value of `options` and whose other members are set to their default values.
3. Let `outside settings` be the [current settings object](#)<sup>p913</sup>.
4. [Parse](#)<sup>p87</sup> `scriptURL` relative to `outside settings`.
5. If this fails, throw a ["SyntaxError" DOMException](#).
6. Otherwise, let `urlRecord` be the [resulting URL record](#)<sup>p87</sup>.

#### Note

*Any [same-origin](#)<sup>p830</sup> URL (including [blob:](#) URLs) can be used. [data:](#) URLs can also be used, but they create a worker with an [opaque origin](#)<sup>p829</sup>.*

7. Let `worker` be a new [SharedWorker](#)<sup>p1033</sup> object.
8. [Create a new MessagePort object](#)<sup>p1002</sup> whose [owner](#)<sup>p1002</sup> is `outside settings`. Let this be the `outside port`.
9. Assign `outside port` to the [port](#)<sup>p1034</sup> attribute of `worker`.
10. Let `callerIsSecureContext` be the result of executing [Is environment settings object a secure context?](#) on `outside settings`.
11. [Enqueue the following steps](#)<sup>p41</sup> to the [shared worker manager](#)<sup>p1034</sup>:
  1. Let `worker global scope` be null.
  2. If there exists a [SharedWorkerGlobalScope](#)<sup>p1027</sup> object whose [closing](#)<sup>p1027</sup> flag is false, [constructor origin](#)<sup>p1027</sup> is [same origin](#)<sup>p830</sup> with `outside settings`'s [origin](#)<sup>p897</sup>, [constructor url](#)<sup>p1027</sup> equals `urlRecord`, and [name](#)<sup>p1025</sup> equals the

value of *options*'s *name* member, then set *worker global scope* to that [SharedWorkerGlobalScope<sup>p1027</sup>](#) object.

#### Note

*data:* URLs create a worker with an [opaque origin<sup>p829</sup>](#). Both the [constructor origin<sup>p1027</sup>](#) and [constructor url<sup>p1027</sup>](#) are compared so the same *data:* URL can be used within an [origin<sup>p829</sup>](#) to get to the same [SharedWorkerGlobalScope<sup>p1027</sup>](#) object, but cannot be used to bypass the [same origin<sup>p830</sup>](#) restriction.

3. If *worker global scope* is not null, but the user agent has been configured to disallow communication between the worker represented by the *worker global scope* and the [scripts<sup>p895</sup>](#) whose [settings object<sup>p895</sup>](#) is outside *settings*, then set *worker global scope* to null.

#### Note

For example, a user agent could have a development mode that isolates a particular [top-level browsing context<sup>p807</sup>](#) from all other pages, and scripts in that development mode could be blocked from connecting to shared workers running in the normal browser mode.

4. If *worker global scope* is not null, then check if *worker global scope*'s [type<sup>p1025</sup>](#) and [credentials<sup>p1027</sup>](#) match the *options* values. If not, [queue a task<sup>p925</sup>](#) to [fire an event](#) named [error<sup>p1260</sup>](#) and abort these steps.
  5. If *worker global scope* is not null, then run these subsubsteps:
    1. Let *settings object* be the [relevant settings object<sup>p913</sup>](#) for *worker global scope*.
    2. Let *workerIsSecureContext* be the result of executing [is environment settings object a secure context?](#) on *settings object*.
    3. If *workerIsSecureContext* is not *callerIsSecureContext*, then [queue a task<sup>p925</sup>](#) to [fire an event](#) named [error<sup>p1260</sup>](#) at *worker* and abort these steps. [\[SECURE-CONTEXTS\]<sup>p1270</sup>](#)
    4. Associate *worker* with *worker global scope*.
    5. [Create a new MessagePort object<sup>p1002</sup>](#) whose [owner<sup>p1002</sup>](#) is *settings object*. Let this be the *inside port*.
    6. [Entangle<sup>p1003</sup>](#) *outside port* and *inside port*.
    7. [Queue a task<sup>p925</sup>](#), using the [DOM manipulation task source<sup>p932</sup>](#), to [fire an event](#) named [connect<sup>p1260</sup>](#) at *worker global scope*, using [MessageEvent<sup>p978</sup>](#), with the [data<sup>p978</sup>](#) attribute initialized to the empty string, the [ports<sup>p979</sup>](#) attribute initialized to a new [frozen array](#) containing only *inside port*, and the [source<sup>p978</sup>](#) attribute initialized to *inside port*.
    8. [Append](#) the [relevant owner to add<sup>p1028</sup>](#) given *outside settings* to *worker global scope*'s [owner set<sup>p1024</sup>](#).
    9. If *outside settings*'s [global object<sup>p908</sup>](#) is a [WorkerGlobalScope<sup>p1024</sup>](#) object, then [append](#) *worker global scope* to *outside settings*'s [global object<sup>p908</sup>](#)'s [worker set<sup>p1025</sup>](#).
  6. Otherwise, [in parallel<sup>p41</sup>](#), [run a worker<sup>p1028</sup>](#) given *worker*, *urlRecord*, *outside settings*, *outside port*, and *options*.
12. Return *worker*.

## 10.2.7 Concurrent hardware capabilities §<sup>p10</sup> 35

```
IDL interface mixin NavigatorConcurrentHardware {  
  readonly attribute unsigned long long hardwareConcurrency;  
};
```

### For web developers (non-normative)

**`self.navigatorp959.hardwareConcurrencyp1036`**

Returns the number of logical processors potentially available to the user agent.

MDN

Support:  
hardwarecon  
Chrome f  
Chrome  
iOS Safari  
Safari  
Firefox  
Samsung  
Edge  
UC Brows  
Android  
Opera  
Firefox fo  
Sou

MDN

The `navigator.hardwareConcurrency` attribute's getter must return a number between 1 and the number of logical processors potentially available to the user agent. If this cannot be determined, the getter must return 1.

User agents should err toward exposing the number of logical processors available, using lower values only in cases where there are user-agent specific limits in place (such as a limitation on the number of [workers<sup>p1032</sup>](#) that can be created) or when the user agent desires to limit fingerprinting possibilities.

## 10.3 APIs available to workers §<sup>p10</sup> 36

### 10.3.1 Importing scripts and libraries §<sup>p10</sup> 36

When a script invokes the `importScripts(urls)` method on a [WorkerGlobalScope<sup>p1024</sup>](#) object, the user agent must [import scripts into worker global scope<sup>p1036</sup>](#) given this [WorkerGlobalScope<sup>p1024</sup>](#) object and `urls`.

To **import scripts into worker global scope**, given a [WorkerGlobalScope<sup>p1024</sup>](#) object *worker global scope* and a sequence<DOMString> `urls`, run these steps. The algorithm may optionally be customized by supplying custom [perform the fetch<sup>p898</sup>](#) hooks, which if provided will be used when invoking [fetch a classic worker-imported script<sup>p900</sup>](#).

1. If *worker global scope*'s [type<sup>p1025</sup>](#) is "module", throw a `TypeError` exception.
2. Let *settings object* be the [current settings object<sup>p913</sup>](#).
3. If `urls` is empty, return.
4. [Parse<sup>p87</sup>](#) each value in `urls` relative to *settings object*. If any fail, throw a `"SyntaxError" DOMException`.
5. For each `url` in the [resulting URL records<sup>p87</sup>](#), run these substeps:
  1. [Fetch a classic worker-imported script<sup>p900</sup>](#) given `url` and *settings object*, passing along any custom [perform the fetch<sup>p898</sup>](#) steps provided. If this succeeds, let *script* be the result. Otherwise, rethrow the exception.
  2. [Run the classic script<sup>p906</sup>](#) *script*, with the rethrow errors argument set to true.

#### Note

*script will run until it either returns, fails to parse, fails to catch an exception, or gets [prematurely aborted<sup>p913</sup>](#) by the [terminate a worker<sup>p1030</sup>](#) algorithm defined above.*

If an exception was thrown or if the script was [prematurely aborted<sup>p913</sup>](#), then abort all these steps, letting the exception or aborting continue to be processed by the calling [script<sup>p895</sup>](#).

#### Note

*Service Workers is an example of a specification that runs this algorithm with its own options for the [perform the fetch<sup>p898</sup>](#) hook.*  
[\[SW\]<sup>p1270</sup>](#)

### 10.3.2 The [WorkerNavigator<sup>p1036</sup>](#) interface §<sup>p10</sup> 36

The `navigator` attribute of the [WorkerGlobalScope<sup>p1024</sup>](#) interface must return an instance of the [WorkerNavigator<sup>p1036</sup>](#) interface, which represents the identity and state of the user agent (the client):

```
IDL [Exposed=Worker]
interface WorkerNavigator {};
WorkerNavigator includes NavigatorID;
WorkerNavigator includes NavigatorLanguage;
WorkerNavigator includes NavigatorOnLine;
WorkerNavigator includes NavigatorConcurrentHardware;
```

### 10.3.3 The [WorkerLocation<sup>p1037</sup>](#) interface §<sup>p10</sup> 37

```
IDL [Exposed=Worker]
interface WorkerLocation {
  stringifier readonly attribute USVString href;
  readonly attribute USVString origin;
  readonly attribute USVString protocol;
  readonly attribute USVString host;
  readonly attribute USVString hostname;
  readonly attribute USVString port;
  readonly attribute USVString pathname;
  readonly attribute USVString search;
  readonly attribute USVString hash;
};
```

A [WorkerLocation<sup>p1037</sup>](#) object has an associated [WorkerGlobalScope](#) **object** (a [WorkerGlobalScope<sup>p1024</sup>](#) object).

The **href** attribute's getter must return the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#), [serialized](#).

The **origin** attribute's getter must return the [serialization<sup>p830</sup>](#) of the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#)'s [origin](#).

The **protocol** attribute's getter must return the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#)'s [scheme](#), followed by ":".

The **host** attribute's getter must run these steps:

1. Let *url* be the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#).
2. If *url*'s [host](#) is null, return the empty string.
3. If *url*'s [port](#) is null, return *url*'s [host](#), [serialized](#).
4. Return *url*'s [host](#), [serialized](#), followed by ":" and *url*'s [port](#), [serialized](#).

The **hostname** attribute's getter must run these steps:

1. Let *host* be the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#)'s [host](#).
2. If *host* is null, return the empty string.
3. Return *host*, [serialized](#).

The **port** attribute's getter must run these steps:

1. Let *port* be the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#)'s [port](#).
2. If *port* is null, return the empty string.
3. Return *port*, [serialized](#).

The **pathname** attribute's getter must run these steps:

1. Let *url* be the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#).
2. If *url*'s [cannot-be-a-base-URL](#) flag is set, return the first string in *url*'s [path](#).
3. Return "/", followed by the strings in *url*'s [path](#) (including empty strings), separated from each other by "/".

The **search** attribute's getter must run these steps:

1. Let *query* be the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#)'s [query](#).
2. If *query* is either null or the empty string, return the empty string.
3. Return "?", followed by *query*.

The **hash** attribute's getter must run these steps:

1. Let *fragment* be the associated [WorkerGlobalScope](#) **object<sup>p1037</sup>**'s [url<sup>p1025</sup>](#)'s [fragment](#).

2. If *fragment* is either null or the empty string, return the empty string.
3. Return "#", followed by *fragment*.

## 11 Web storage §<sup>p10</sup> 39

### 11.1 Introduction §<sup>p10</sup> 39

*This section is non-normative.*

This specification introduces two related mechanisms, similar to HTTP session cookies, for storing name-value pairs on the client side. [\[COOKIES\]](#)<sup>p1264</sup>

The first is designed for scenarios where the user is carrying out a single transaction, but could be carrying out multiple transactions in different windows at the same time.

Cookies don't really handle this case well. For example, a user could be buying plane tickets in two different windows, using the same site. If the site used cookies to keep track of which ticket the user was buying, then as the user clicked from page to page in both windows, the ticket currently being purchased would "leak" from one window to the other, potentially causing the user to buy two tickets for the same flight without really noticing.

To address this, this specification introduces the [sessionStorage](#)<sup>p1041</sup> IDL attribute. Sites can add data to the session storage, and it will be accessible to any page from the same site opened in that window.

#### Example

For example, a page could have a checkbox that the user ticks to indicate that they want insurance:

```
<label>
  <input type="checkbox" onchange="sessionStorage.insurance = checked ? 'true' : ''>
  I want insurance on this trip.
</label>
```

A later page could then check, from script, whether the user had checked the checkbox or not:

```
if (sessionStorage.insurance) { ... }
```

If the user had multiple windows opened on the site, each one would have its own individual copy of the session storage object.

The second storage mechanism is designed for storage that spans multiple windows, and lasts beyond the current session. In particular, Web applications might wish to store megabytes of user data, such as entire user-authored documents or a user's mailbox, on the client side for performance reasons.

Again, cookies do not handle this case well, because they are transmitted with every request.

The [localStorage](#)<sup>p1042</sup> IDL attribute is used to access a page's local storage area.

#### Example

The site at example.com can display a count of how many times the user has loaded its page by putting the following at the bottom of its page:

```
<p>
  You have viewed this page
  <span id="count">an untold number of</span>
  time(s).
</p>
<script>
  if (!localStorage.pageLoadCount)
    localStorage.pageLoadCount = 0;
```

```

localStorage.pageLoadCount = parseInt(localStorage.pageLoadCount) + 1;
document.getElementById('count').textContent = localStorage.pageLoadCount;
</script>

```

Each site has its own separate storage area.

## 11.2 The API §<sup>p10</sup><sub>40</sub>

### 11.2.1 The [Storage<sup>p1040</sup>](#) interface §<sup>p10</sup><sub>40</sub>

```

IDL [Exposed=Window]
interface Storage {
  readonly attribute unsigned long length;
  DOMString? key(unsigned long index);
  getter DOMString? getItem(DOMString key);
  setter void setItem(DOMString key, DOMString value);
  deleter void removeItem(DOMString key);
  void clear();
};

```

Each [Storage<sup>p1040</sup>](#) object provides access to a list of key/value pairs, which are sometimes called items. Keys are strings. Any string (including the empty string) is a valid key. Values are similarly strings.

Each [Storage<sup>p1040</sup>](#) object is associated with a list of key/value pairs when it is created, as defined in the sections on the [sessionStorage<sup>p1041</sup>](#) and [localStorage<sup>p1042</sup>](#) attributes. Multiple separate objects implementing the [Storage<sup>p1040</sup>](#) interface can all be associated with the same list of key/value pairs simultaneously.

For web developers (non-normative)

#### **[storage . length<sup>p1040</sup>](#)**

Returns the number of key/value pairs currently present in the list associated with the object.

#### **[storage . key<sup>p1040</sup> \( n \)](#)**

Returns the name of the *n*th key in the list, or null if *n* is greater than or equal to the number of key/value pairs in the object.

#### **[value = storage . getItem<sup>p1041</sup> \( key \)](#)**

#### **[value = storage\[key\]](#)**

Returns the current value associated with the given *key*, or null if the given *key* does not exist in the list associated with the object.

#### **[storage . setItem<sup>p1041</sup> \( key, value \)](#)**

#### **[storage\[key\] = value](#)**

Sets the value of the pair identified by *key* to *value*, creating a new key/value pair if none existed for *key* previously.

Throws a ["QuotaExceededError" DOMException](#) exception if the new value couldn't be set. (Setting could fail if, e.g., the user has disabled storage for the site, or if the quota has been exceeded.)

#### **[storage . removeItem<sup>p1041</sup> \( key \)](#)**

#### **[delete storage\[key\]](#)**

Removes the key/value pair with the given *key* from the list associated with the object, if a key/value pair with the given *key* exists.

#### **[storage . clear<sup>p1041</sup> \(\)](#)**

Empties the list associated with the object of all key/value pairs, if there are any.

The **length** attribute must return the number of key/value pairs currently present in the list associated with the object.

The **key(*n*)** method must return the name of the *n*th key in the list. The order of keys is user-agent defined, but must be consistent within an object so long as the number of keys doesn't change. (Thus, [adding<sup>p1041</sup>](#) or [removing<sup>p1041</sup>](#) a key may change the order of the

keys, but merely changing the value of an existing key must not.) If  $n$  is greater than or equal to the number of key/value pairs in the object, then this method must return null.

The [supported property names](#) on a [Storage](#)<sup>p1040</sup> object are the keys of each key/value pair currently present in the list associated with the object, in the order that the keys were last added to the storage area.

The [getItem\(key\)](#) method must return the current value associated with the given *key*. If the given *key* does not exist in the list associated with the object then this method must return null. MDN

The [setItem\(key, value\)](#) method must first check if a key/value pair with the given *key* already exists in the list associated with the object. MDN

If it does not, then a new key/value pair must be added to the list, with the given *key* and with its value set to *value*.

If the given *key* *does* exist in the list, and its value is not equal to *value*, then it must have its value updated to *value*. If its previous value *is* equal to *value*, then the method must do nothing.

If it couldn't set the new value, the method must throw a ["QuotaExceededError" DOMException](#) exception.

The [removeItem\(key\)](#) method must cause the key/value pair with the given *key* to be removed from the list associated with the object, if it exists. If no item with that key exists, the method must do nothing. MDN

The [setItem\(\)](#)<sup>p1041</sup> and [removeItem\(\)](#)<sup>p1041</sup> methods must be atomic with respect to failure. In the case of failure, the method does nothing. That is, changes to the data storage area must either be successful, or the data storage area must not be changed at all.

The [clear\(\)](#) method must atomically cause the list associated with the object to be emptied of all key/value pairs, if there are any. If there are none, then the method must do nothing. MDN

**Note**  
When the [setItem\(\)](#)<sup>p1041</sup>, [removeItem\(\)](#)<sup>p1041</sup>, and [clear\(\)](#)<sup>p1041</sup> methods are invoked, events are fired on the [relevant global objects](#)<sup>p913</sup> of other [Document](#)<sup>p111</sup> objects that can access the newly stored or removed data, as defined in the sections on the [sessionStorage](#)<sup>p1041</sup> and [localStorage](#)<sup>p1042</sup> attributes.

**Note**  
*This specification does not require that the above methods wait until the data has been physically written to disk. Only consistency in what different scripts accessing the same underlying list of key/value pairs see is required.*

### 11.2.2 The [sessionStorage](#)<sup>p1041</sup> attribute §<sup>p10</sup><sub>41</sub>

```
IDL interface mixin WindowSessionStorage {
  readonly attribute Storage sessionStorage;
};
Window includes WindowSessionStorage;
```

The [sessionStorage](#) attribute represents the set of storage areas specific to the current [top-level browsing context](#)<sup>p807</sup>. MDN

For web developers (non-normative)

**[window.sessionStorage](#)**<sup>p1041</sup>  
Returns the [Storage](#)<sup>p1040</sup> object associated with that origin's session storage area.

Each [top-level browsing context](#)<sup>p807</sup> has a unique set of session storage areas, one for each [origin](#)<sup>p829</sup>.

User agents should not expire data from a browsing context's session storage areas, but may do so when the user requests that such data be deleted, or when the UA detects that it has limited storage space, or for security reasons. User agents should always avoid deleting data while a script that could access that data is running. When a top-level browsing context is destroyed (and therefore permanently inaccessible to the user) the data stored in its session storage areas can be discarded with it, as the API described in this specification provides no way for that data to ever be subsequently retrieved.

## Note

The lifetime of a browsing context can be unrelated to the lifetime of the actual user agent process itself, as the user agent can support resuming sessions after a restart.

When a new [Document](#)<sup>p111</sup> is created in a [browsing context](#)<sup>p804</sup> which has a [top-level browsing context](#)<sup>p807</sup>, the user agent must check to see if that [top-level browsing context](#)<sup>p807</sup> has a session storage area for that document's [origin](#)<sup>p829</sup>. If it does, then that is the [Document](#)<sup>p111</sup>'s assigned session storage area. If it does not, a new storage area for that document's [origin](#)<sup>p829</sup> must be created, and then that is the [Document](#)<sup>p111</sup>'s assigned session storage area. A [Document](#)<sup>p111</sup>'s assigned storage area does not change during the lifetime of a [Document](#)<sup>p111</sup>.

## Note

In the case of an [iframe](#)<sup>p355</sup> being moved to another [Document](#)<sup>p111</sup>, its nested browsing context is destroyed and a new one created.

The [sessionStorage](#)<sup>p1041</sup> attribute must return a [Storage](#)<sup>p1040</sup> object associated with the [Document](#)<sup>p111</sup>'s assigned session storage area. Each [Document](#)<sup>p111</sup> object must have a separate object for its [relevant global object](#)<sup>p913</sup>'s [sessionStorage](#)<sup>p1041</sup> attribute.

While [creating a new auxiliary browsing context](#)<sup>p806</sup>, the session storage area is [copied](#)<sup>p806</sup> over.

When the [setItem\(\)](#)<sup>p1041</sup>, [removeItem\(\)](#)<sup>p1041</sup>, and [clear\(\)](#)<sup>p1041</sup> methods are called on a [Storage](#)<sup>p1040</sup> object x that is associated with a session storage area, if the methods did not throw an exception or "do nothing" as defined above, then for every [Document](#)<sup>p111</sup> object whose [relevant global object](#)<sup>p913</sup>'s [sessionStorage](#)<sup>p1041</sup> attribute's [Storage](#)<sup>p1040</sup> object is associated with the same storage area, other than x, [send a storage notification](#)<sup>p1043</sup>.

### 11.2.3 The [localStorage](#)<sup>p1042</sup> attribute §<sup>p10</sup> 42

```
IDL interface mixin WindowLocalStorage {
  readonly attribute Storage localStorage;
};
Window includes WindowLocalStorage;
```

The [localStorage](#) object provides a [Storage](#)<sup>p1040</sup> object for an [origin](#)<sup>p829</sup>.

## For web developers (non-normative)

### **window . localStorage**<sup>p1042</sup>

Returns the [Storage](#)<sup>p1040</sup> object associated with that origin's local storage area.

Throws a ["SecurityError" DOMException](#) if the [Document](#)<sup>p111</sup>'s [origin](#)<sup>p829</sup> is an [opaque origin](#)<sup>p829</sup> or if the request violates a policy decision (e.g. if the user agent is configured to not allow the page to persist data).

User agents must have a set of local storage areas, one for each [origin](#)<sup>p829</sup>.

User agents should expire data from the local storage areas only for security reasons or when requested to do so by the user. User agents should always avoid deleting data while a script that could access that data is running.

When the [localStorage](#)<sup>p1042</sup> attribute is accessed, the user agent must run the following steps, which are known as the **Storage object initialization steps**:

1. If the request violates a policy decision (e.g. if the user agent is configured to not allow the page to persist data), the user agent may throw a ["SecurityError" DOMException](#) instead of returning a [Storage](#)<sup>p1040</sup> object
2. If the [Document](#)<sup>p111</sup>'s [origin](#)<sup>p829</sup> is an [opaque origin](#)<sup>p829</sup>, then throw a ["SecurityError" DOMException](#).
3. Check to see if the user agent has allocated a local storage area for the [origin](#)<sup>p829</sup> of the [associated Document](#)<sup>p818</sup> of the [Window](#)<sup>p816</sup> object on which the attribute was accessed. If it has not, create a new storage area for that [origin](#)<sup>p829</sup>.
4. Return the [Storage](#)<sup>p1040</sup> object associated with that origin's local storage area. Each [Document](#)<sup>p111</sup> object must have a separate object for its [relevant global object](#)<sup>p913</sup>'s [localStorage](#)<sup>p1042</sup> attribute.

When the [setItem\(\)](#)<sup>p1041</sup>, [removeItem\(\)](#)<sup>p1041</sup>, and [clear\(\)](#)<sup>p1041</sup> methods are called on a [Storage](#)<sup>p1040</sup> object x that is associated with a

local storage area, if the methods did not throw an exception or "do nothing" as defined above, then for every [Document](#)<sup>p111</sup> object whose [relevant global object](#)<sup>p913</sup>'s [localStorage](#)<sup>p1042</sup> attribute's [Storage](#)<sup>p1040</sup> object is associated with the same storage area, other than x, [send a storage notification](#)<sup>p1043</sup>.

#### ⚠Warning!

**The [localStorage](#)<sup>p1042</sup> attribute provides access to shared state. This specification does not define the interaction with other browsing contexts in a multiprocess user agent, and authors are encouraged to assume that there is no locking mechanism. A site could, for instance, try to read the value of a key, increment its value, then write it back out, using the new value as a unique identifier for the session; if the site does this twice in two different browser windows at the same time, it might end up using the same "unique" identifier for both sessions, with potentially disastrous effects.**

### 11.2.4 The [storage](#)<sup>p1261</sup> event § p1043

The [storage](#) event is fired on a [Document](#) object's relevant global object when a storage area changes<sup>p1043</sup>, as described in the previous two sections ([for session storage](#)<sup>p1042</sup>, [for local storage](#)<sup>p1042</sup>).

When a user agent is to **send a storage notification** for a [Document](#)<sup>p111</sup>, the user agent must [queue a task](#)<sup>p925</sup> to [fire an event](#) named [storage](#)<sup>p1040</sup> at the [Document](#)<sup>p111</sup> object's [relevant global object](#)<sup>p913</sup>, using [StorageEvent](#)<sup>p1043</sup>.

#### Note

Such a [Document](#)<sup>p111</sup> object is not necessarily [fully active](#)<sup>p807</sup>, but events fired on such objects are ignored by the [event loop](#)<sup>p924</sup> until the [Document](#)<sup>p111</sup> becomes [fully active](#)<sup>p807</sup> again.

The [task source](#)<sup>p925</sup> for these tasks is the [DOM manipulation task source](#)<sup>p932</sup>.

If the event is being fired due to an invocation of the [setItem\(\)](#)<sup>p1041</sup> or [removeItem\(\)](#)<sup>p1041</sup> methods, the event must have its [key](#)<sup>p1044</sup> attribute initialized to the name of the key in question, its [oldValue](#)<sup>p1044</sup> attribute initialized to the old value of the key in question, or null if the key is newly added, and its [newValue](#)<sup>p1044</sup> attribute initialized to the new value of the key in question, or null if the key was removed.

Otherwise, if the event is being fired due to an invocation of the [clear\(\)](#)<sup>p1041</sup> method, the event must have its [key](#)<sup>p1044</sup>, [oldValue](#)<sup>p1044</sup>, and [newValue](#)<sup>p1044</sup> attributes initialized to null.

In addition, the event must have its [url](#)<sup>p1044</sup> attribute initialized to the URL of the document whose [Storage](#)<sup>p1040</sup> object was affected; and its [storageArea](#)<sup>p1044</sup> attribute initialized to the [Storage](#)<sup>p1040</sup> object from the [relevant global object](#)<sup>p913</sup> of the target [Document](#)<sup>p111</sup> that represents the same kind of [Storage](#)<sup>p1040</sup> area as was affected (i.e. session or local).

#### 11.2.4.1 The [StorageEvent](#)<sup>p1043</sup> interface § p1043

```
IDL [Exposed=Window,
  Constructor(DOMString type, optional StorageEventInit eventInitDict = {})]
interface StorageEvent : Event {
  readonly attribute DOMString? key;
  readonly attribute DOMString? oldValue;
  readonly attribute DOMString? newValue;
  readonly attribute USVString url;
  readonly attribute Storage? storageArea;

  void initStorageEvent(DOMString type, optional boolean bubbles = false, optional boolean cancelable =
false, optional DOMString? key = null, optional DOMString? oldValue = null, optional DOMString?
newValue = null, optional USVString url = "", optional Storage? storageArea = null);
};

dictionary StorageEventInit : EventInit {
  DOMString? key = null;
  DOMString? oldValue = null;
```

```
DOMString? newValue = null;
USVString url = "";
Storage? storageArea = null;
};
```

For web developers (non-normative)

**event . key**<sup>p1044</sup>

Returns the key of the storage item being changed.

**event . oldValue**<sup>p1044</sup>

Returns the old value of the key of the storage item whose value is being changed.

**event . newValue**<sup>p1044</sup>

Returns the new value of the key of the storage item whose value is being changed.

**event . url**<sup>p1044</sup>

Returns the [URL](#) of the document whose storage item changed.

**event . storageArea**<sup>p1044</sup>

Returns the [Storage](#)<sup>p1040</sup> object that was affected.

The **key**, **oldValue**, **newValue**, **url**, and **storageArea** attributes must return the values they were initialized to.

The **initStorageEvent()** method must initialize the event in a manner analogous to the similarly-named **initEvent()** method. [\[DOM\]](#)<sup>p1266</sup>

### 11.3 Disk space §<sup>p10</sup><sub>44</sub>

User agents should limit the total amount of space allowed for storage areas, because hostile authors could otherwise use this feature to exhaust the user's available disk space.

User agents should guard against sites storing data under their origin's other affiliated sites, e.g. storing up to the limit in a1.example.com, a2.example.com, a3.example.com, etc, circumventing the main example.com storage limit.

User agents may prompt the user when quotas are reached, allowing the user to grant a site more space. This enables sites to store many user-created documents on the user's computer, for instance.

User agents should allow users to see how much space each domain is using.

A mostly arbitrary limit of five megabytes per [origin](#)<sup>p829</sup> is suggested. Implementation feedback is welcome and will be used to update this suggestion in the future.

For predictability, quotas should be based on the uncompressed size of data stored.

### 11.4 Privacy §<sup>p10</sup><sub>44</sub>

#### 11.4.1 User tracking §<sup>p10</sup><sub>44</sub>

A third-party advertiser (or any entity capable of getting content distributed to multiple sites) could use a unique identifier stored in its local storage area to track a user across multiple sessions, building a profile of the user's interests to allow for highly targeted advertising. In conjunction with a site that is aware of the user's real identity (for example an e-commerce site that requires authenticated credentials), this could allow oppressive groups to target individuals with greater accuracy than in a world with purely anonymous Web usage.

There are a number of techniques that can be used to mitigate the risk of user tracking:

#### Blocking third-party storage

User agents may restrict access to the [localStorage](#)<sup>p1042</sup> objects to scripts originating at the domain of the [active document](#)<sup>p804</sup> of

the [top-level browsing context](#)<sup>p807</sup>, for instance denying access to the API for pages from other domains running in [iframe](#)<sup>p355</sup>s.

### Expiring stored data

User agents may, possibly in a manner configured by the user, automatically delete stored data after a period of time.

For example, a user agent could be configured to treat third-party local storage areas as session-only storage, deleting the data once the user had closed all the [browsing contexts](#)<sup>p804</sup> that could access it.

This can restrict the ability of a site to track a user, as the site would then only be able to track the user across multiple sessions when they authenticate with the site itself (e.g. by making a purchase or logging in to a service).

However, this also reduces the usefulness of the API as a long-term storage mechanism. It can also put the user's data at risk, if the user does not fully understand the implications of data expiration.

### Treating persistent storage as cookies

If users attempt to protect their privacy by clearing cookies without also clearing data stored in the local storage area, sites can defeat those attempts by using the two features as redundant backup for each other. User agents should present the interfaces for clearing these in a way that helps users to understand this possibility and enables them to delete data in all persistent storage features simultaneously. [\[COOKIES\]](#)<sup>p1264</sup>

### Site-specific safelisting of access to local storage areas

User agents may allow sites to access session storage areas in an unrestricted manner, but require the user to authorize access to local storage areas.

### Origin-tracking of stored data

User agents may record the [origins](#)<sup>p829</sup> of sites that contained content from third-party origins that caused data to be stored.

If this information is then used to present the view of data currently in persistent storage, it would allow the user to make informed decisions about which parts of the persistent storage to prune. Combined with a blocklist ("delete this data and prevent this domain from ever storing data again"), the user can restrict the use of persistent storage to sites that they trust.

### Shared blocklists

User agents may allow users to share their persistent storage domain blocklists.

This would allow communities to act together to protect their privacy.

While these suggestions prevent trivial use of this API for user tracking, they do not block it altogether. Within a single domain, a site can continue to track the user during a session, and can then pass all this information to the third party along with any identifying information (names, credit card numbers, addresses) obtained by the site. If a third party cooperates with multiple sites to obtain such information, a profile can still be created.

However, user tracking is to some extent possible even with no cooperation from the user agent whatsoever, for instance by using session identifiers in URLs, a technique already commonly used for innocuous purposes but easily repurposed for user tracking (even retroactively). This information can then be shared with other sites, using visitors' IP addresses and other user-specific data (e.g. user-agent headers and configuration settings) to combine separate sessions into coherent user profiles.

## 11.4.2 Sensitivity of data §<sup>p10</sup><sub>45</sub>

User agents should treat persistently stored data as potentially sensitive; it's quite possible for e-mails, calendar appointments, health records, or other confidential documents to be stored in this mechanism.

To this end, user agents should ensure that when deleting data, it is promptly deleted from the underlying storage.

## 11.5 Security §<sup>p10</sup><sub>45</sub>

### 11.5.1 DNS spoofing attacks §<sup>p10</sup><sub>45</sub>

Because of the potential for DNS spoofing attacks, one cannot guarantee that a host claiming to be in a certain domain really is from that domain. To mitigate this, pages can use TLS. Pages using TLS can be sure that only the user, software working on behalf of the

user, and other pages using TLS that have certificates identifying them as being from the same domain, can access their storage areas.

### 11.5.2 Cross-directory attacks §<sup>p10</sup><sub>46</sub>

Different authors sharing one host name, for example users hosting content on the now defunct `geocities.com`, all share one local storage object. There is no feature to restrict the access by pathname. Authors on shared hosts are therefore urged to avoid using these features, as it would be trivial for other authors to read the data and overwrite it.

#### Note

*Even if a path-restriction feature was made available, the usual DOM scripting security model would make it trivial to bypass this protection and access the data from any path.*

### 11.5.3 Implementation risks §<sup>p10</sup><sub>46</sub>

The two primary risks when implementing these persistent storage features are letting hostile sites read information from other domains, and letting hostile sites write information that is then read from other domains.

Letting third-party sites read data that is not supposed to be read from their domain causes *information leakage*. For example, a user's shopping wishlist on one domain could be used by another domain for targeted advertising; or a user's work-in-progress confidential documents stored by a word-processing site could be examined by the site of a competing company.

Letting third-party sites write data to the persistent storage of other domains can result in *information spoofing*, which is equally dangerous. For example, a hostile site could add items to a user's wishlist; or a hostile site could set a user's session identifier to a known ID that the hostile site can then use to track the user's actions on the victim site.

Thus, strictly following the [origin<sup>p829</sup>](#) model described in this specification is important for user security.

## 12 The HTML syntax §<sup>p10</sup> 47

### Note

This section only describes the rules for resources labeled with an [HTML MIME type](#). Rules for XML resources are discussed in the section below entitled "[The XML syntax<sup>p1168</sup>](#)".

### 12.1 Writing HTML documents §<sup>p10</sup> 47

This section only applies to documents, authoring tools, and markup generators. In particular, it does not apply to conformance checkers; conformance checkers must use the requirements given in the next section ("parsing HTML documents").

Documents must consist of the following parts, in the given order:

1. Optionally, a single U+FEFF BYTE ORDER MARK (BOM) character.
2. Any number of [comments<sup>p1058</sup>](#) and [ASCII whitespace](#).
3. A [DOCTYPE<sup>p1047</sup>](#).
4. Any number of [comments<sup>p1058</sup>](#) and [ASCII whitespace](#).
5. The [document element](#), in the form of an [html<sup>p149</sup> element<sup>p1048</sup>](#).
6. Any number of [comments<sup>p1058</sup>](#) and [ASCII whitespace](#).

The various types of content mentioned above are described in the next few sections.

In addition, there are some restrictions on how [character encoding declarations<sup>p169</sup>](#) are to be serialized, as discussed in the section on that topic.

### Note

[ASCII whitespace](#) before the [html<sup>p149</sup> element](#), at the start of the [html<sup>p149</sup> element](#) and before the [head<sup>p150</sup> element](#), will be dropped when the document is parsed; [ASCII whitespace](#) after the [html<sup>p149</sup> element](#) will be parsed as if it were at the end of the [body<sup>p174</sup> element](#). Thus, [ASCII whitespace](#) around the [document element](#) does not round-trip.

It is suggested that newlines be inserted after the DOCTYPE, after any comments that are before the document element, after the [html<sup>p149</sup> element's start tag](#) (if it is not [omitted<sup>p1051</sup>](#)), and after any comments that are inside the [html<sup>p149</sup> element](#) but before the [head<sup>p150</sup> element](#).

Many strings in the HTML syntax (e.g. the names of elements and their attributes) are case-insensitive, but only for [ASCII upper alphas](#) and [ASCII lower alphas](#). For convenience, in this section this is just referred to as "case-insensitive".

#### 12.1.1 The DOCTYPE §<sup>p10</sup> 47

A **DOCTYPE** is a required preamble.

### Note

DOCTYPEs are required for legacy reasons. When omitted, browsers tend to use a different rendering mode that is incompatible with some specifications. Including the DOCTYPE in a document ensures that the browser makes a best-effort attempt at following the relevant specifications.

A DOCTYPE must consist of the following components, in this order:

1. A string that is an [ASCII case-insensitive](#) match for the string "<!DOCTYPE".
2. One or more [ASCII whitespace](#).

3. A string that is an [ASCII case-insensitive](#) match for the string "html".
4. Optionally, a [DOCTYPE legacy string](#)<sup>p1048</sup>.
5. Zero or more [ASCII whitespace](#).
6. A U+003E GREATER-THAN SIGN character (>).

#### Note

In other words, `<!DOCTYPE html>`, *case-insensitively*.

For the purposes of HTML generators that cannot output HTML markup with the short DOCTYPE "`<!DOCTYPE html>`", a **DOCTYPE legacy string** may be inserted into the DOCTYPE (in the position defined above). This string must consist of:

1. One or more [ASCII whitespace](#).
2. A string that is an [ASCII case-insensitive](#) match for the string "SYSTEM".
3. One or more [ASCII whitespace](#).
4. A U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (the *quote mark*).
5. The literal string "`about:legacy-compat`"<sup>p86</sup>.
6. A matching U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (i.e. the same character as in the earlier step labeled *quote mark*).

#### Note

In other words, `<!DOCTYPE html SYSTEM "about:legacy-compat">` or `<!DOCTYPE html SYSTEM 'about:legacy-compat'>`, *case-insensitively except for the part in single or double quotes*.

The [DOCTYPE legacy string](#)<sup>p1048</sup> should not be used unless the document is generated from a system that cannot output the shorter string.

## 12.1.2 Elements §<sup>p10</sup> 48

There are six different kinds of **elements**: [void elements](#)<sup>p1048</sup>, [the template element](#)<sup>p1048</sup>, [raw text elements](#)<sup>p1048</sup>, [escapable raw text elements](#)<sup>p1048</sup>, [foreign elements](#)<sup>p1048</sup>, and [normal elements](#)<sup>p1048</sup>.

### Void elements

[area](#)<sup>p437</sup>, [base](#)<sup>p152</sup>, [br](#)<sup>p275</sup>, [col](#)<sup>p453</sup>, [embed](#)<sup>p363</sup>, [hr](#)<sup>p210</sup>, [img](#)<sup>p314</sup>, [input](#)<sup>p486</sup>, [link](#)<sup>p154</sup>, [meta](#)<sup>p160</sup>, [param](#)<sup>p372</sup>, [source](#)<sup>p311</sup>, [track](#)<sup>p379</sup>, [wbr](#)<sup>p277</sup>

### The *template* element

[template](#)<sup>p623</sup>

### Raw text elements

[script](#)<sup>p607</sup>, [style](#)<sup>p170</sup>

### Escapable raw text elements

[textarea](#)<sup>p541</sup>, [title](#)<sup>p151</sup>

### Foreign elements

Elements from the [MathML namespace](#) and the [SVG namespace](#).

### Normal elements

All other allowed [HTML elements](#)<sup>p43</sup> are normal elements.

**Tags** are used to delimit the start and end of elements in the markup. [Raw text](#)<sup>p1048</sup>, [escapable raw text](#)<sup>p1048</sup>, and [normal](#)<sup>p1048</sup> elements have a [start tag](#)<sup>p1049</sup> to indicate where they begin, and an [end tag](#)<sup>p1050</sup> to indicate where they end. The start and end tags of certain [normal elements](#)<sup>p1048</sup> can be [omitted](#)<sup>p1051</sup>, as described below in the section on [optional tags](#)<sup>p1051</sup>. Those that cannot be omitted must not be omitted. [Void elements](#)<sup>p1048</sup> only have a start tag; end tags must not be specified for [void elements](#)<sup>p1048</sup>. [Foreign elements](#)<sup>p1048</sup> must either have a start tag and an end tag, or a start tag that is marked as self-closing, in which case they must not have an end tag.

The [contents](#)<sup>p126</sup> of the element must be placed between just after the start tag (which [might be implied, in certain cases](#)<sup>p1051</sup>) and just before the end tag (which again, [might be implied in certain cases](#)<sup>p1051</sup>). The exact allowed contents of each individual element depend on the [content model](#)<sup>p126</sup> of that element, as described earlier in this specification. Elements must not contain content that their content model disallows. In addition to the restrictions placed on the contents by those content models, however, the five types of elements have additional *syntactic* requirements.

[Void elements](#)<sup>p1048</sup> can't have any contents (since there's no end tag, no content can be put between the start tag and the end tag).

The [template element](#)<sup>p1048</sup> can have [template contents](#)<sup>p624</sup>, but such [template contents](#)<sup>p624</sup> are not children of the [template](#)<sup>p623</sup> element itself. Instead, they are stored in a [DocumentFragment](#) associated with a different [Document](#)<sup>p111</sup> — without a [browsing context](#)<sup>p804</sup> — so as to avoid the [template](#)<sup>p623</sup> contents interfering with the main [Document](#)<sup>p111</sup>. The markup for the [template contents](#)<sup>p624</sup> of a [template](#)<sup>p623</sup> element is placed just after the [template](#)<sup>p623</sup> element's start tag and just before [template](#)<sup>p623</sup> element's end tag (as with other elements), and may consist of any [text](#)<sup>p1057</sup>, [character references](#)<sup>p1057</sup>, [elements](#)<sup>p1048</sup>, and [comments](#)<sup>p1058</sup>, but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand](#)<sup>p1058</sup>.

[Raw text elements](#)<sup>p1048</sup> can have [text](#)<sup>p1057</sup>, though it has [restrictions](#)<sup>p1057</sup> described below.

[Escapable raw text elements](#)<sup>p1048</sup> can have [text](#)<sup>p1057</sup> and [character references](#)<sup>p1057</sup>, but the text must not contain an [ambiguous ampersand](#)<sup>p1058</sup>. There are also [further restrictions](#)<sup>p1057</sup> described below.

[Foreign elements](#)<sup>p1048</sup> whose start tag is marked as self-closing can't have any contents (since, again, as there's no end tag, no content can be put between the start tag and the end tag). [Foreign elements](#)<sup>p1048</sup> whose start tag is *not* marked as self-closing can have [text](#)<sup>p1057</sup>, [character references](#)<sup>p1057</sup>, [CDATA sections](#)<sup>p1058</sup>, other [elements](#)<sup>p1048</sup>, and [comments](#)<sup>p1058</sup>, but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand](#)<sup>p1058</sup>.

#### Note

*The HTML syntax does not support namespace declarations, even in [foreign elements](#)<sup>p1048</sup>.*

*For instance, consider the following HTML fragment:*

```
<p>
  <svg>
    <metadata>
      <!-- this is invalid -->
      <cdr:license xmlns:cdr="https://www.example.com/cdr/metadata" name="MIT"/>
    </metadata>
  </svg>
</p>
```

*The innermost element, `cdr:license`, is actually in the SVG namespace, as the `xmlns:cdr` attribute has no effect (unlike in XML). In fact, as the comment in the fragment above says, the fragment is actually non-conforming. This is because SVG 2 does not define any elements called `cdr:license` in the SVG namespace.*

[Normal elements](#)<sup>p1048</sup> can have [text](#)<sup>p1057</sup>, [character references](#)<sup>p1057</sup>, other [elements](#)<sup>p1048</sup>, and [comments](#)<sup>p1058</sup>, but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand](#)<sup>p1058</sup>. Some [normal elements](#)<sup>p1048</sup> also have [yet more restrictions](#)<sup>p1057</sup> on what content they are allowed to hold, beyond the restrictions imposed by the content model and those described in this paragraph. Those restrictions are described below.

Tags contain a **tag name**, giving the element's name. HTML elements all have names that only use [ASCII alphanumerics](#). In the HTML syntax, tag names, even those for [foreign elements](#)<sup>p1048</sup>, may be written with any mix of lower- and uppercase letters that, when converted to all-lowercase, matches the element's tag name; tag names are case-insensitive.

#### 12.1.2.1 Start tags § p1049

**Start tags** must have the following format:

1. The first character of a start tag must be a U+003C LESS-THAN SIGN character (<).
2. The next few characters of a start tag must be the element's [tag name](#)<sup>p1049</sup>.
3. If there are to be any attributes in the next step, there must first be one or more [ASCII whitespace](#).
4. Then, the start tag may have a number of attributes, the [syntax for which](#)<sup>p1050</sup> is described below. Attributes must be separated from each other by one or more [ASCII whitespace](#).
5. After the attributes, or after the [tag name](#)<sup>p1049</sup> if there are no attributes, there may be one or more [ASCII whitespace](#). (Some attributes are required to be followed by a space. See the [attributes section](#)<sup>p1050</sup> below.)
6. Then, if the element is one of the [void elements](#)<sup>p1048</sup>, or if the element is a [foreign element](#)<sup>p1048</sup>, then there may be a single U+002F SOLIDUS character (/). This character has no effect on [void elements](#)<sup>p1048</sup>, but on [foreign elements](#)<sup>p1048</sup> it marks the

start tag as self-closing.

7. Finally, start tags must be closed by a U+003E GREATER-THAN SIGN character (>).

### 12.1.2.2 End tags § p10 50

**End tags** must have the following format:

1. The first character of an end tag must be a U+003C LESS-THAN SIGN character (<).
2. The second character of an end tag must be a U+002F SOLIDUS character (/).
3. The next few characters of an end tag must be the element's [tag name](#)<sup>p1049</sup>.
4. After the tag name, there may be one or more [ASCII whitespace](#).
5. Finally, end tags must be closed by a U+003E GREATER-THAN SIGN character (>).

### 12.1.2.3 Attributes § p10 50

**Attributes** for an element are expressed inside the element's start tag.

Attributes have a name and a value. **Attribute names** must consist of one or more characters other than [controls](#), U+0020 SPACE, U+0022 ("), U+0027 ('), U+003E (>), U+002F (/), U+003D (=), and [noncharacters](#). In the HTML syntax, attribute names, even those for [foreign elements](#)<sup>p1048</sup>, may be written with any mix of [ASCII lower](#) and [ASCII upper alphas](#).

**Attribute values** are a mixture of [text](#)<sup>p1057</sup> and [character references](#)<sup>p1057</sup>, except with the additional restriction that the text cannot contain an [ambiguous ampersand](#)<sup>p1058</sup>.

Attributes can be specified in four different ways:

#### Empty attribute syntax

Just the [attribute name](#)<sup>p1050</sup>. The value is implicitly the empty string.

#### Example

In the following example, the [disabled](#)<sup>p563</sup> attribute is given with the empty attribute syntax:

```
<input disabled>
```

If an attribute using the empty attribute syntax is to be followed by another attribute, then there must be [ASCII whitespace](#) separating the two.

#### Unquoted attribute value syntax

The [attribute name](#)<sup>p1050</sup>, followed by zero or more [ASCII whitespace](#), followed by a single U+003D EQUALS SIGN character, followed by zero or more [ASCII whitespace](#), followed by the [attribute value](#)<sup>p1050</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal [ASCII whitespace](#), any U+0022 QUOTATION MARK characters ("), U+0027 APOSTROPHE characters ('), U+003D EQUALS SIGN characters (=), U+003C LESS-THAN SIGN characters (<), U+003E GREATER-THAN SIGN characters (>), or U+0060 GRAVE ACCENT characters (`), and must not be the empty string.

#### Example

In the following example, the [value](#)<sup>p490</sup> attribute is given with the unquoted attribute value syntax:

```
<input value=yes>
```

If an attribute using the unquoted attribute syntax is to be followed by another attribute or by the optional U+002F SOLIDUS character (/) allowed in step 6 of the [start tag](#)<sup>p1049</sup> syntax above, then there must be [ASCII whitespace](#) separating the two.

### Single-quoted attribute value syntax

The [attribute name](#)<sup>p1050</sup>, followed by zero or more [ASCII whitespace](#), followed by a single U+003D EQUALS SIGN character, followed by zero or more [ASCII whitespace](#), followed by a single U+0027 APOSTROPHE character ('), followed by the [attribute value](#)<sup>p1050</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal U+0027 APOSTROPHE characters ('), and finally followed by a second single U+0027 APOSTROPHE character (').

#### Example

In the following example, the [type](#)<sup>p488</sup> attribute is given with the single-quoted attribute value syntax:

```
<input type='checkbox'>
```

If an attribute using the single-quoted attribute syntax is to be followed by another attribute, then there must be [ASCII whitespace](#) separating the two.

### Double-quoted attribute value syntax

The [attribute name](#)<sup>p1050</sup>, followed by zero or more [ASCII whitespace](#), followed by a single U+003D EQUALS SIGN character, followed by zero or more [ASCII whitespace](#), followed by a single U+0022 QUOTATION MARK character ("), followed by the [attribute value](#)<sup>p1050</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal U+0022 QUOTATION MARK characters ("), and finally followed by a second single U+0022 QUOTATION MARK character (").

#### Example

In the following example, the [name](#)<sup>p561</sup> attribute is given with the double-quoted attribute value syntax:

```
<input name="be evil">
```

If an attribute using the double-quoted attribute syntax is to be followed by another attribute, then there must be [ASCII whitespace](#) separating the two.

There must never be two or more attributes on the same start tag whose names are an [ASCII case-insensitive](#) match for each other.

When a [foreign element](#)<sup>p1048</sup> has one of the namespaced attributes given by the local name and namespace of the first and second cells of a row from the following table, it must be written using the name given by the third cell from the same row.

Local name	Namespace	Attribute name
actuate	<a href="#">XLink namespace</a>	xlink:actuate
arcrole	<a href="#">XLink namespace</a>	xlink:arcrole
href	<a href="#">XLink namespace</a>	xlink:href
role	<a href="#">XLink namespace</a>	xlink:role
show	<a href="#">XLink namespace</a>	xlink:show
title	<a href="#">XLink namespace</a>	xlink:title
type	<a href="#">XLink namespace</a>	xlink:type
lang	<a href="#">XML namespace</a>	xml:lang
space	<a href="#">XML namespace</a>	xml:space
xmlns	<a href="#">XMLNS namespace</a>	xmlns
xlink	<a href="#">XMLNS namespace</a>	xmlns:xlink

No other namespaced attribute can be expressed in [the HTML syntax](#)<sup>p1047</sup>.

#### Note

*Whether the attributes in the table above are conforming or not is defined by other specifications (e.g. SVG 2 and MathML); this section only describes the syntax rules if the attributes are serialized using the HTML syntax.*

### 12.1.2.4 Optional tags <sup>p10</sup><sub>51</sub>

Certain tags can be **omitted**.

## Note

Omitting an element's [start tag](#)<sup>p1049</sup> in the situations described below does not mean the element is not present; it is implied, but it is still there. For example, an HTML document always has a root [html](#)<sup>p149</sup> element, even if the string `<html>` doesn't appear anywhere in the markup.

An [html](#)<sup>p149</sup> element's [start tag](#)<sup>p1049</sup> may be omitted if the first thing inside the [html](#)<sup>p149</sup> element is not a [comment](#)<sup>p1058</sup>.

## Example

For example, in the following case it's ok to remove the "`<html>`" tag:

```
<!DOCTYPE HTML>
<html>
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>
```

Doing so would make the document look like this:

```
<!DOCTYPE HTML>

  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>
```

This has the exact same DOM. In particular, note that whitespace around the [document element](#) is ignored by the parser. The following example would also have the exact same DOM:

```
<!DOCTYPE HTML><head>
  <title>Hello</title>
</head>
<body>
  <p>Welcome to this example.</p>
</body>
</html>
```

However, in the following example, removing the start tag moves the comment to before the [html](#)<sup>p149</sup> element:

```
<!DOCTYPE HTML>
<html>
  <!-- where is this comment in the DOM? -->
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>
```

With the tag removed, the document actually turns into the same as this:

```
<!DOCTYPE HTML>
```

```

<!-- where is this comment in the DOM? -->
<html>
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>

```

This is why the tag can only be removed if it is not followed by a comment: removing the tag when there is a comment there changes the document's resulting parse tree. Of course, if the position of the comment does not matter, then the tag can be omitted, as if the comment had been moved to before the start tag in the first place.

An [html<sup>p149</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [html<sup>p149</sup>](#) element is not immediately followed by a [comment<sup>p1058</sup>](#).

A [head<sup>p150</sup>](#) element's [start tag<sup>p1049</sup>](#) may be omitted if the element is empty, or if the first thing inside the [head<sup>p150</sup>](#) element is an element.

A [head<sup>p150</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [head<sup>p150</sup>](#) element is not immediately followed by [ASCII whitespace](#) or a [comment<sup>p1058</sup>](#).

A [body<sup>p174</sup>](#) element's [start tag<sup>p1049</sup>](#) may be omitted if the element is empty, or if the first thing inside the [body<sup>p174</sup>](#) element is not [ASCII whitespace](#) or a [comment<sup>p1058</sup>](#), except if the first thing inside the [body<sup>p174</sup>](#) element is a [meta<sup>p160</sup>](#), [link<sup>p154</sup>](#), [script<sup>p607</sup>](#), [style<sup>p170</sup>](#), or [template<sup>p623</sup>](#) element.

A [body<sup>p174</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [body<sup>p174</sup>](#) element is not immediately followed by a [comment<sup>p1058</sup>](#).

### Example

Note that in the example above, the [head<sup>p150</sup>](#) element start and end tags, and the [body<sup>p174</sup>](#) element start tag, can't be omitted, because they are surrounded by whitespace:

```

<!DOCTYPE HTML>
<html>
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>

```

(The [body<sup>p174</sup>](#) and [html<sup>p149</sup>](#) element end tags could be omitted without trouble; any spaces after those get parsed into the [body<sup>p174</sup>](#) element anyway.)

Usually, however, whitespace isn't an issue. If we first remove the whitespace we don't care about:

```

<!DOCTYPE HTML><html><head><title>Hello</title></head><body><p>Welcome to this
example.</p></body></html>

```

Then we can omit a number of tags without affecting the DOM:

```

<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.</p>

```

At that point, we can also add some whitespace back:

```

<!DOCTYPE HTML>
<title>Hello</title>

```

```
<p>Welcome to this example.</p>
```

This would be equivalent to this document, with the omitted tags shown in their parser-implied positions; the only whitespace text node that results from this is the newline at the end of the [head<sup>p150</sup>](#) element:

```
<!DOCTYPE HTML>
<html><head><title>Hello</title>
</head><body><p>Welcome to this example.</p></body></html>
```

An [li<sup>p220</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [li<sup>p220</sup>](#) element is immediately followed by another [li<sup>p220</sup>](#) element or if there is no more content in the parent element.

A [dt<sup>p226</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [dt<sup>p226</sup>](#) element is immediately followed by another [dt<sup>p226</sup>](#) element or a [dd<sup>p227</sup>](#) element.

A [dd<sup>p227</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [dd<sup>p227</sup>](#) element is immediately followed by another [dd<sup>p227</sup>](#) element or a [dt<sup>p226</sup>](#) element, or if there is no more content in the parent element.

A [p<sup>p207</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [p<sup>p207</sup>](#) element is immediately followed by an [address<sup>p193</sup>](#), [article<sup>p176</sup>](#), [aside<sup>p183</sup>](#), [blockquote<sup>p213</sup>](#), [details<sup>p597</sup>](#), [div<sup>p233</sup>](#), [dl<sup>p222</sup>](#), [fieldset<sup>p555</sup>](#), [figcaption<sup>p231</sup>](#), [figure<sup>p228</sup>](#), [footer<sup>p191</sup>](#), [form<sup>p479</sup>](#), [h1<sup>p186</sup>](#), [h2<sup>p186</sup>](#), [h3<sup>p186</sup>](#), [h4<sup>p186</sup>](#), [h5<sup>p186</sup>](#), [h6<sup>p186</sup>](#), [header<sup>p190</sup>](#), [hgroup<sup>p187</sup>](#), [hr<sup>p210</sup>](#), [main<sup>p231</sup>](#), [menu<sup>p219</sup>](#), [nav<sup>p180</sup>](#), [ol<sup>p216</sup>](#), [p<sup>p207</sup>](#), [pre<sup>p212</sup>](#), [section<sup>p178</sup>](#), [table<sup>p443</sup>](#), or [ul<sup>p218</sup>](#) element, or if there is no more content in the parent element and the parent element is an [HTML element<sup>p43</sup>](#) that is not an [a<sup>p234</sup>](#), [audio<sup>p377</sup>](#), [del<sup>p307</sup>](#), [ins<sup>p306</sup>](#), [map<sup>p435</sup>](#), [noscript<sup>p620</sup>](#), or [video<sup>p373</sup>](#) element, or an [autonomous custom element<sup>p696</sup>](#).

#### Example

We can thus simplify the earlier example further:

```
<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.
```

An [rt<sup>p253</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [rt<sup>p253</sup>](#) element is immediately followed by an [rt<sup>p253</sup>](#) or [rp<sup>p253</sup>](#) element, or if there is no more content in the parent element.

An [rp<sup>p253</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [rp<sup>p253</sup>](#) element is immediately followed by an [rt<sup>p253</sup>](#) or [rp<sup>p253</sup>](#) element, or if there is no more content in the parent element.

An [optgroup<sup>p537</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [optgroup<sup>p537</sup>](#) element is immediately followed by another [optgroup<sup>p537</sup>](#) element, or if there is no more content in the parent element.

An [option<sup>p539</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [option<sup>p539</sup>](#) element is immediately followed by another [option<sup>p539</sup>](#) element, or if it is immediately followed by an [optgroup<sup>p537</sup>](#) element, or if there is no more content in the parent element.

A [colgroup<sup>p452</sup>](#) element's [start tag<sup>p1049</sup>](#) may be omitted if the first thing inside the [colgroup<sup>p452</sup>](#) element is a [col<sup>p453</sup>](#) element, and if the element is not immediately preceded by another [colgroup<sup>p452</sup>](#) element whose [end tag<sup>p1050</sup>](#) has been omitted. (It can't be omitted if the element is empty.)

A [colgroup<sup>p452</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [colgroup<sup>p452</sup>](#) element is not immediately followed by [ASCII whitespace](#) or a [comment<sup>p1058</sup>](#).

A [caption<sup>p451</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [caption<sup>p451</sup>](#) element is not immediately followed by [ASCII whitespace](#) or a [comment<sup>p1058</sup>](#).

A [thead<sup>p455</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [thead<sup>p455</sup>](#) element is immediately followed by a [tbody<sup>p454</sup>](#) or [tfoot<sup>p456</sup>](#) element.

A [tbody<sup>p454</sup>](#) element's [start tag<sup>p1049</sup>](#) may be omitted if the first thing inside the [tbody<sup>p454</sup>](#) element is a [tr<sup>p457</sup>](#) element, and if the element is not immediately preceded by a [tbody<sup>p454</sup>](#), [thead<sup>p455</sup>](#), or [tfoot<sup>p456</sup>](#) element whose [end tag<sup>p1050</sup>](#) has been omitted. (It can't be omitted if the element is empty.)

A [tbody<sup>p454</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [tbody<sup>p454</sup>](#) element is immediately followed by a [tbody<sup>p454</sup>](#) or [tfoot<sup>p456</sup>](#) element, or if there is no more content in the parent element.

A [tfoot<sup>p456</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if there is no more content in the parent element.

A [tr<sup>p457</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [tr<sup>p457</sup>](#) element is immediately followed by another [tr<sup>p457</sup>](#) element, or if there is no more content in the parent element.

A [td<sup>p459</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [td<sup>p459</sup>](#) element is immediately followed by a [td<sup>p459</sup>](#) or [th<sup>p460</sup>](#) element, or if there is no more content in the parent element.

A [th<sup>p460</sup>](#) element's [end tag<sup>p1050</sup>](#) may be omitted if the [th<sup>p460</sup>](#) element is immediately followed by a [td<sup>p459</sup>](#) or [th<sup>p460</sup>](#) element, or if there is no more content in the parent element.

## Example

The ability to omit all these table-related tags makes table markup much terser.

Take this example:

```
<table>
  <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)</caption>
  <colgroup><col><col><col></colgroup>
  <thead>
    <tr>
      <th>Function</th>
      <th>Control Unit</th>
      <th>Central Station</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td>Headlights</td>
      <td>✓</td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Interior Lights</td>
      <td>✓</td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Electric locomotive operating sounds</td>
      <td>✓</td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Engineer's cab lighting</td>
      <td></td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Station Announcements - Swiss</td>
      <td></td>
      <td>✓</td>
    </tr>
  </tbody>
</table>
```

The exact same table, modulo some whitespace differences, could be marked up as follows:

```
<table>
  <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)
  <colgroup><col><col><col>
  <thead>
```

```

<tr>
  <th>Function
  <th>Control Unit
  <th>Central Station
</thead>
<tbody>
<tr>
  <td>Headlights
  <td>✓
  <td>✓
</tr>
<tr>
  <td>Interior Lights
  <td>✓
  <td>✓
</tr>
<tr>
  <td>Electric locomotive operating sounds
  <td>✓
  <td>✓
</tr>
<tr>
  <td>Engineer's cab lighting
  <td>
  <td>✓
</tr>
<tr>
  <td>Station Announcements - Swiss
  <td>
  <td>✓
</tr>
</tbody>
</table>

```

Since the cells take up much less room this way, this can be made even terser by having each row on one line:

```

<table>
  <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)
  <colgroup><col><col><col>
  <thead>
    <tr> <th>Function           <th>Control Unit       <th>Central Station
  </thead>
  <tbody>
    <tr> <td>Headlights         <td>✓                 <td>✓
    <tr> <td>Interior Lights    <td>✓                 <td>✓
    <tr> <td>Electric locomotive operating sounds <td>✓                 <td>✓
    <tr> <td>Engineer's cab lighting <td>                 <td>✓
    <tr> <td>Station Announcements - Swiss <td>                 <td>✓
  </tbody>
</table>

```

The only differences between these tables, at the DOM level, is with the precise position of the (in any case semantically-neutral) whitespace.

**However**, a [start tag](#)<sup>p1049</sup> must never be omitted if it has any attributes.

### Example

Returning to the earlier example with all the whitespace removed and then all the optional tags removed:

```
<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.
```

If the [body](#)<sup>p174</sup> element in this example had to have a [class](#)<sup>p134</sup> attribute and the [html](#)<sup>p149</sup> element had to have a [lang](#)<sup>p137</sup> attribute, the markup would have to become:

```
<!DOCTYPE HTML><html lang="en"><title>Hello</title><body class="demo"><p>Welcome to this example.
```

## Note

This section assumes that the document is conforming, in particular, that there are no [content model](#)<sup>p126</sup> violations. Omitting tags in the fashion described in this section in a document that does not conform to the [content models](#)<sup>p126</sup> described in this specification is likely to result in unexpected DOM differences (this is, in part, what the content models are designed to avoid).

### 12.1.2.5 Restrictions on content models § p10 57

For historical reasons, certain elements have extra restrictions beyond even the restrictions given by their content model.

A [table](#)<sup>p443</sup> element must not contain [tr](#)<sup>p457</sup> elements, even though these elements are technically allowed inside [table](#)<sup>p443</sup> elements according to the content models described in this specification. (If a [tr](#)<sup>p457</sup> element is put inside a [table](#)<sup>p443</sup> in the markup, it will in fact imply a [tbody](#)<sup>p454</sup> start tag before it.)

A single [newline](#)<sup>p1057</sup> may be placed immediately after the [start tag](#)<sup>p1049</sup> of [pre](#)<sup>p212</sup> and [textarea](#)<sup>p541</sup> elements. This does not affect the processing of the element. The otherwise optional [newline](#)<sup>p1057</sup> *must* be included if the element's contents themselves start with a [newline](#)<sup>p1057</sup> (because otherwise the leading newline in the contents would be treated like the optional newline, and ignored).

## Example

The following two [pre](#)<sup>p212</sup> blocks are equivalent:

```
<pre>Hello</pre>

<pre>
Hello</pre>
```

### 12.1.2.6 Restrictions on the contents of raw text and escapable raw text elements § p10 57

The text in [raw text](#)<sup>p1048</sup> and [escapable raw text elements](#)<sup>p1048</sup> must not contain any occurrences of the string "</" (U+003C LESS-THAN SIGN, U+002F SOLIDUS) followed by characters that case-insensitively match the tag name of the element followed by one of U+0009 CHARACTER TABULATION (tab), U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), U+0020 SPACE, U+003E GREATER-THAN SIGN (>), or U+002F SOLIDUS (/).

### 12.1.3 Text § p10 57

**Text** is allowed inside elements, attribute values, and comments. Extra constraints are placed on what is and what is not allowed in text based on where the text is to be put, as described in the other sections.

#### 12.1.3.1 Newlines § p10 57

**Newlines** in HTML may be represented either as U+000D CARRIAGE RETURN (CR) characters, U+000A LINE FEED (LF) characters, or pairs of U+000D CARRIAGE RETURN (CR), U+000A LINE FEED (LF) characters in that order.

Where [character references](#)<sup>p1057</sup> are allowed, a character reference of a U+000A LINE FEED (LF) character (but not a U+000D CARRIAGE RETURN (CR) character) also represents a [newline](#)<sup>p1057</sup>.

#### 12.1.4 Character references § p10 57

In certain cases described in other sections, [text](#)<sup>p1057</sup> may be mixed with **character references**. These can be used to escape characters that couldn't otherwise legally be included in [text](#)<sup>p1057</sup>.

Character references must start with a U+0026 AMPERSAND character (&). Following this, there are three possible kinds of character references:

## Named character references

The ampersand must be followed by one of the names given in the [named character references](#)<sup>p1158</sup> section, using the same case. The name must be one that is terminated by a U+003B SEMICOLON character (;).

## Decimal numeric character reference

The ampersand must be followed by a U+0023 NUMBER SIGN character (#), followed by one or more [ASCII digits](#), representing a base-ten integer that corresponds to a code point that is allowed according to the definition below. The digits must then be followed by a U+003B SEMICOLON character (;).

## Hexadecimal numeric character reference

The ampersand must be followed by a U+0023 NUMBER SIGN character (#), which must be followed by either a U+0078 LATIN SMALL LETTER X character (x) or a U+0058 LATIN CAPITAL LETTER X character (X), which must then be followed by one or more [ASCII hex digits](#), representing a hexadecimal integer that corresponds to a code point that is allowed according to the definition below. The digits must then be followed by a U+003B SEMICOLON character (;).

The numeric character reference forms described above are allowed to reference any code point excluding U+000D CR, [noncharacters](#), and [controls](#) other than [ASCII whitespace](#).

An **ambiguous ampersand** is a U+0026 AMPERSAND character (&) that is followed by one or more [ASCII alphanumerics](#), followed by a U+003B SEMICOLON character (;), where these characters do not match any of the names given in the [named character references](#)<sup>p1158</sup> section.

## 12.1.5 CDATA sections §<sup>p10</sup><sub>58</sub>

**CDATA sections** must consist of the following components, in this order:

1. The string "<![CDATA[".
2. Optionally, [text](#)<sup>p1057</sup>, with the additional restriction that the text must not contain the string "]]>".
3. The string "]]>".

### Example

CDATA sections can only be used in foreign content (MathML or SVG). In this example, a CDATA section is used to escape the contents of a [MathML](#) `ms` element:

```
<p>You can add a string to a number, but this stringifies the number:</p>
<math>
  <ms><![CDATA[x<y]]></ms>
  <mo>+</mo>
  <mn>3</mn>
  <mo>=</mo>
  <ms><![CDATA[x<y3]]></ms>
</math>
```

## 12.1.6 Comments §<sup>p10</sup><sub>58</sub>

**Comments** must have the following format:

1. The string "<!--".
2. Optionally, [text](#)<sup>p1057</sup>, with the additional restriction that the text must not start with the string ">", nor start with the string "--", nor contain the strings "<!--", "-->", or "--!>", nor end with the string "<!--".
3. The string "-->".

### Note

The [text](#)<sup>p1057</sup> is allowed to end with the string "<!", as in `<!--My favorite operators are > and <!-->`.

## 12.2 Parsing HTML documents <sup>§<sup>p10</sup></sup> 59

This section only applies to user agents, data mining tools, and conformance checkers.

### Note

The rules for parsing XML documents into DOM trees are covered by the next section, entitled "[The XML syntax<sup>p1168</sup>](#)".

User agents must use the parsing rules described in this section to generate the DOM trees from [text/html<sup>p1231</sup>](#) resources. Together, these rules define what is referred to as the **HTML parser**.

### Note

While the HTML syntax described in this specification bears a close resemblance to SGML and XML, it is a separate language with its own parsing rules.

Some earlier versions of HTML (in particular from HTML2 to HTML4) were based on SGML and used SGML parsing rules. However, few (if any) web browsers ever implemented true SGML parsing for HTML documents; the only user agents to strictly handle HTML as an SGML application have historically been validators. The resulting confusion — with validators claiming documents to have one representation while widely deployed Web browsers interoperably implemented a different representation — has wasted decades of productivity. This version of HTML thus returns to a non-SGML basis.

Authors interested in using SGML tools in their authoring pipeline are encouraged to use XML tools and the XML serialization of HTML.

For the purposes of conformance checkers, if a resource is determined to be in [the HTML syntax<sup>p1047</sup>](#), then it is an [HTML document](#).

### Note

As stated [in the terminology section<sup>p43</sup>](#), references to [element types<sup>p43</sup>](#) that do not explicitly specify a namespace always refer to elements in the [HTML namespace](#). For example, if the spec talks about "a [menu<sup>p219</sup>](#) element", then that is an element with the local name "menu", the namespace "[http://www.w3.org/1999/xhtml](#)", and the interface [HTMLMenuElement<sup>p219</sup>](#). Where possible, references to such elements are hyperlinked to their definition.

## 12.2.1 Overview of the parsing model § p10 60

The input to the HTML parsing process consists of a stream of [code points](#)<sup>p1077</sup>, which is passed through a [tokenization](#)<sup>p1077</sup> stage followed by a [tree construction](#)<sup>p1105</sup> stage. The output is a [Document](#)<sup>p111</sup> object.

### Note

*Implementations that [do not support scripting](#)<sup>p46</sup> do not have to actually create a [DOM Document](#)<sup>p111</sup> object, but the DOM tree in such cases is still used as the model for the rest of the specification.*

In the common case, the data handled by the tokenization stage comes from the network, but [it can also come from script](#)<sup>p947</sup> running in the user agent, e.g. using the [document.write\(\)](#)<sup>p950</sup> API.

There is only one set of states for the tokenizer stage and the tree construction stage, but the tree construction stage is reentrant, meaning that while the tree construction stage is handling one token, the tokenizer might be resumed, causing further tokens to be emitted and processed before the first token's processing is complete.

### Example

In the following example, the tree construction stage will be called upon to handle a "p" start tag token while handling the "script" end tag token:

```
...
<script>
  document.write('<p>');
</script>
...
```

To handle these cases, parsers have a **script nesting level**, which must be initially set to zero, and a **parser pause flag**, which must be initially set to false.

## 12.2.2 Parse errors <sup>§<sup>p10</sup></sup><sub>61</sub>

This specification defines the parsing rules for HTML documents, whether they are syntactically correct or not. Certain points in the parsing algorithm are said to be [parse errors<sup>p1061</sup>](#). The error handling for parse errors is well-defined (that's the processing rules described throughout this specification), but user agents, while parsing an HTML document, may [abort the parser<sup>p1146</sup>](#) at the first [parse error<sup>p1061</sup>](#) that they encounter for which they do not wish to apply the rules described in this specification.

Conformance checkers must report at least one parse error condition to the user if one or more parse error conditions exist in the document and must not report parse error conditions if none exist in the document. Conformance checkers may report more than one parse error condition if more than one parse error condition exists in the document.

### Note

*Parse errors are only errors with the syntax of HTML. In addition to checking for parse errors, conformance checkers will also verify that the document obeys all the other conformance requirements described in this specification.*

Some parse errors have dedicated codes outlined in the table below that should be used by conformance checkers in reports.

*Error descriptions in the table below are non-normative.*

Code	Description
<b>abrupt-closing-of-empty-comment</b>	This error occurs if the parser encounters an empty <a href="#">comment<sup>p1058</sup></a> that is abruptly closed by a U+003E (>) <a href="#">code point</a> (i.e., <!--> or <!-->). The parser behaves as if the comment is closed correctly.
<b>abrupt-doctype-public-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> in the <a href="#">DOCTYPE<sup>p1047</sup></a> public identifier (e.g., <!DOCTYPE html PUBLIC "foo>). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document<sup>p111</sup></a> to <a href="#">quirks mode</a> .
<b>abrupt-doctype-system-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> in the <a href="#">DOCTYPE<sup>p1047</sup></a> system identifier (e.g., <!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01//EN" "foo>). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document<sup>p111</sup></a> to <a href="#">quirks mode</a> .
<b>absence-of-digits-in-numeric-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference<sup>p1057</sup></a> that doesn't contain any digits (e.g., &#qux;). In this case the parser doesn't resolve the character reference.
<b>cdata-in-html-content</b>	This error occurs if the parser encounters a <a href="#">CDATA section<sup>p1058</sup></a> outside of foreign content (SVG or MathML). The parser treats such CDATA sections (including leading "[CDATA[" and trailing "]" strings) as comments.
<b>character-reference-outside-unicode-range</b>	This error occurs if the parser encounters a numeric <a href="#">character reference<sup>p1057</sup></a> that references a <a href="#">code point</a> that is greater than the valid Unicode range. The parser resolves such a character reference to a U+FFFD REPLACEMENT CHARACTER.
<b>control-character-in-input-stream</b>	This error occurs if the <a href="#">input stream<sup>p1071</sup></a> contains a <a href="#">control code point</a> that is not <a href="#">ASCII whitespace</a> or U+0000 NULL. Such code points are parsed as-is and usually, where parsing rules don't apply any additional restrictions, make their way into the DOM.
<b>control-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference<sup>p1057</sup></a> that references a <a href="#">control code point</a> that is not <a href="#">ASCII whitespace</a> or is a U+000D CARRIAGE RETURN. The parser resolves such character references as-is except C1 control references that are replaced according to the <a href="#">numeric character reference end state<sup>p1104</sup></a> .
<b>end-tag-with-attributes</b>	This error occurs if the parser encounters an <a href="#">end tag<sup>p1050</sup></a> with <a href="#">attributes<sup>p1050</sup></a> . Attributes in end tags are completely ignored and do not make their way into the DOM.
<b>duplicate-attribute</b>	This error occurs if the parser encounters an <a href="#">attribute<sup>p1050</sup></a> in a tag that already has an attribute with the same name. The parser ignores all such duplicate occurrences of the attribute.
<b>end-tag-with-trailing-solidus</b>	This error occurs if the parser encounters an <a href="#">end tag<sup>p1050</sup></a> that has a U+002F (/) <a href="#">code point</a> right before the closing U+003E (>) code point (e.g., </div/>). Such a tag is treated as a regular end tag.
<b>eof-before-tag-name</b>	This error occurs if the parser encounters the end of the <a href="#">input stream<sup>p1071</sup></a> where a tag name is expected. In this case the parser treats the beginning of a <a href="#">start tag<sup>p1049</sup></a> (i.e., <) or an <a href="#">end tag<sup>p1050</sup></a> (i.e., </) as text content.

Code	Description
<b>eof-in-cdata</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1071</sup> in a <a href="#">CDATA section</a> <sup>p1058</sup> . The parser treats such CDATA sections as if they are closed immediately before the end of the input stream.
<b>eof-in-comment</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1071</sup> in a <a href="#">comment</a> <sup>p1058</sup> . The parser treats such comments as if they are closed immediately before the end of the input stream.
<b>eof-in-doctype</b>	This error occurs if the parser encounters the end of the input stream in a <a href="#">DOCTYPE</a> <sup>p1047</sup> . In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p111</sup> to <a href="#">quirks mode</a> .
<b>eof-in-script-html-comment-like-text</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1071</sup> in text that resembles an <a href="#">HTML comment</a> <sup>p1058</sup> inside <a href="#">script</a> <sup>p607</sup> element content (e.g., <code>&lt;script&gt;&lt;!-- foo</code> ). <b>Note</b> <i>Syntactic structures that resemble HTML comments in <a href="#">script</a><sup>p607</sup> elements are parsed as text content. They can be a part of a scripting language-specific syntactic structure or be treated as an HTML-like comment, if the scripting language supports them (e.g., parsing rules for HTML-like comments can be found in Annex B of the JavaScript specification). The common reason for this error is a violation of the <a href="#">restrictions for contents of script elements</a><sup>p617</sup>. <a href="#">[JAVASCRIPT]</a><sup>p1267</sup></i>
<b>eof-in-tag</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1071</sup> in a <a href="#">start tag</a> <sup>p1049</sup> or an <a href="#">end tag</a> <sup>p1050</sup> (e.g., <code>&lt;div id=</code> ). Such a tag is completely ignored.
<b>incorrectly-closed-comment</b>	This error occurs if the parser encounters a <a href="#">comment</a> <sup>p1058</sup> that is closed by the <code>"-!&gt;"</code> <a href="#">code point</a> sequence. The parser treats such comments as if they are correctly closed by the <code>"-&gt;"</code> code point sequence.
<b>incorrectly-opened-comment</b>	This error occurs if the parser encounters the <code>"&lt;!"</code> <a href="#">code point</a> sequence that is not immediately followed by two U+002D (-) code points and that is not the start of a <a href="#">DOCTYPE</a> <sup>p1047</sup> or a <a href="#">CDATA section</a> <sup>p1058</sup> . All content that follows the <code>"&lt;!"</code> code point sequence up to a U+003E (>) code point (if present) or to the end of the <a href="#">input stream</a> <sup>p1071</sup> is treated as a comment. <b>Note</b> <i>One possible cause of this error is using an XML markup declaration (e.g., <code>&lt;!ELEMENT br EMPTY&gt;</code>) in HTML.</i>
<b>invalid-character-sequence-after-doctype-name</b>	This error occurs if the parser encounters any <a href="#">code point</a> sequence other than "PUBLIC" and "SYSTEM" keywords after a <a href="#">DOCTYPE</a> <sup>p1047</sup> name. In such a case, the parser ignores any following public or system identifiers, and if the DOCTYPE is correctly placed as a document preamble, sets the <a href="#">Document</a> <sup>p111</sup> to <a href="#">quirks mode</a> .
<b>invalid-first-character-of-tag-name</b>	This error occurs if the parser encounters a <a href="#">code point</a> that is not an <a href="#">ASCII alpha</a> where first code point of a <a href="#">start tag</a> <sup>p1049</sup> name or an <a href="#">end tag</a> <sup>p1050</sup> name is expected. If a start tag was expected such code point and a preceding U+003C (<) is treated as text content, and all content that follows is treated as markup. Whereas, if an end tag was expected, such code point and all content that follows up to a U+003E (>) code point (if present) or to the end of the <a href="#">input stream</a> <sup>p1071</sup> is treated as a comment. <b>Example</b> For example, consider the following markup: <pre>&lt;42&gt;&lt;/42&gt;</pre> This will be parsed into: <pre>L html<sup>p149</sup>   L head<sup>p150</sup>   L body<sup>p174</sup>     L #text: &lt;42&gt;     L #comment: 42</pre> <b>Note</b> <i>While the first code point of a tag name is limited to an <a href="#">ASCII alpha</a>, a wide range of code points (including <a href="#">ASCII digits</a>) is allowed in subsequent positions.</i>
<b>missing-attribute-value</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where an <a href="#">attribute</a> <sup>p1050</sup> value is expected (e.g., <code>&lt;div id=&gt;</code> ). The parser treats the attribute as having an empty value.
<b>missing-doctype-name</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE</a> <sup>p1047</sup> that is missing a name (e.g., <code>&lt;!DOCTYPE&gt;</code> ). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p111</sup> to <a href="#">quirks mode</a> .
<b>missing-doctype-public-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where start of the <a href="#">DOCTYPE</a> <sup>p1047</sup> public identifier is expected (e.g., <code>&lt;!DOCTYPE html PUBLIC &gt;</code> ). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p111</sup> to <a href="#">quirks mode</a> .

Code	Description
<b>missing-doctype-system-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where start of the <a href="#">DOCTYPE<sup>p1047</sup></a> system identifier is expected (e.g., <!DOCTYPE html SYSTEM >). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document<sup>p111</sup></a> to <a href="#">quirks mode</a> .
<b>missing-end-tag-name</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where an <a href="#">end tag<sup>p1050</sup></a> name is expected, i.e., </>. The parser completely ignores whole "</>" code point sequence.
<b>missing-quote-before-doctype-public-identifier</b>	This error occurs if the parser encounters the <a href="#">DOCTYPE<sup>p1047</sup></a> public identifier that is not preceded by a quote (e.g., <!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01//EN">). In such a case, the parser ignores the public identifier, and if the DOCTYPE is correctly placed as a document preamble, sets the <a href="#">Document<sup>p111</sup></a> to <a href="#">quirks mode</a> .
<b>missing-quote-before-doctype-system-identifier</b>	This error occurs if the parser encounters the <a href="#">DOCTYPE<sup>p1047</sup></a> system identifier that is not preceded by a quote (e.g., <!DOCTYPE html SYSTEM http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">). In such a case, the parser ignores the system identifier, and if the DOCTYPE is correctly placed as a document preamble, sets the <a href="#">Document<sup>p111</sup></a> to <a href="#">quirks mode</a> .
<b>missing-semicolon-after-character-reference</b>	This error occurs if the parser encounters a <a href="#">character reference<sup>p1057</sup></a> that is not terminated by a U+003B (;) <a href="#">code point</a> . Usually the parser behaves as if character reference is terminated by the U+003B (;) code point; however, there are some ambiguous cases in which the parser includes subsequent code points in the character reference.  <b>Example</b> For example, &not;in will be parsed as "-in" whereas &not;in will be parsed as "¢".
<b>missing-whitespace-after-doctype-public-keyword</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1047</sup></a> whose "PUBLIC" keyword and public identifier are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-after-doctype-system-keyword</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1047</sup></a> whose "SYSTEM" keyword and system identifier are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-before-doctype-name</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1047</sup></a> whose "DOCTYPE" keyword and name are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-between-attributes</b>	This error occurs if the parser encounters <a href="#">attributes<sup>p1050</sup></a> that are not separated by <a href="#">ASCII whitespace</a> (e.g., <div id="foo" class="bar">). In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-between-doctype-public-and-system-identifiers</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1047</sup></a> whose public and system identifiers are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>nested-comment</b>	This error occurs if the parser encounters a nested <a href="#">comment<sup>p1058</sup></a> (e.g., <!-- <!-- nested --> -->). Such a comment will be closed by the first occurring "-->" <a href="#">code point</a> sequence and everything that follows will be treated as markup.
<b>noncharacter-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference<sup>p1057</sup></a> that references a <a href="#">noncharacter</a> . The parser resolves such character references as-is.
<b>noncharacter-in-input-stream</b>	This error occurs if the <a href="#">input stream<sup>p1071</sup></a> contains a <a href="#">noncharacter</a> . Such <a href="#">code points</a> are parsed as-is and usually, where parsing rules don't apply any additional restrictions, make their way into the DOM.
<b>non-void-html-element-start-tag-with-trailing-solidus</b>	This error occurs if the parser encounters a <a href="#">start tag<sup>p1049</sup></a> for an element that is not in the list of <a href="#">void elements<sup>p1048</sup></a> or is not a part of foreign content (i.e., not an SVG or MathML element) that has a U+002F (/) <a href="#">code point</a> right before the closing U+003E (>) code point. The parser behaves as if the U+002F (/) is not present.  <b>Example</b> For example, consider the following markup: <pre>&lt;div/&gt;&lt;span&gt;&lt;/span&gt;&lt;span&gt;&lt;/span&gt;</pre> This will be parsed into: <pre>L html<sup>p149</sup>   L head<sup>p150</sup>     L body<sup>p174</sup>       L div<sup>p233</sup></pre>

Code	Description
	<div data-bbox="354 176 448 226" style="border-left: 1px solid black; padding-left: 5px;"> <span style="color: purple;">span</span><sup>p275</sup>  <span style="color: purple;">span</span><sup>p275</sup> </div> <div data-bbox="285 268 1529 359" style="background-color: #e0ffe0; padding: 5px;"> <p><b>Note</b></p> <p>The trailing U+002F (/) in a start tag name can be used only in foreign content to specify self-closing tags. (Self-closing tags don't exist in HTML.) It is also allowed for void elements, but doesn't have any effect in this case.</p> </div>
<b>null-character-reference</b>	<p>This error occurs if the parser encounters a numeric <a href="#">character reference</a><sup>p1057</sup> that references a U+0000 NULL <a href="#">code point</a>. The parser resolves such character references to a U+FFFD REPLACEMENT CHARACTER.</p>
<b>surrogate-character-reference</b>	<p>This error occurs if the parser encounters a numeric <a href="#">character reference</a><sup>p1057</sup> that references a <a href="#">surrogate</a>. The parser resolves such character references to a U+FFFD REPLACEMENT CHARACTER.</p>
<b>surrogate-in-input-stream</b>	<p>This error occurs if the <a href="#">input stream</a><sup>p1071</sup> contains a <a href="#">surrogate</a>. Such <a href="#">code points</a> are parsed as-is and usually, where parsing rules don't apply any additional restrictions, make their way into the DOM.</p> <div data-bbox="285 646 1529 716" style="background-color: #e0ffe0; padding: 5px;"> <p><b>Note</b></p> <p>Surrogates can only find their way into the input stream via script APIs such as <code>document.write()</code><sup>p950</sup>.</p> </div>
<b>unexpected-character-after-doctype-system-identifier</b>	<p>This error occurs if the parser encounters any <a href="#">code points</a> other than <a href="#">ASCII whitespace</a> or closing U+003E (&gt;) after the <a href="#">DOCTYPE</a><sup>p1047</sup> system identifier. The parser ignores these code points.</p>
<b>unexpected-character-in-attribute-name</b>	<p>This error occurs if the parser encounters a U+0022 ("), U+0027 ('), or U+003C (&lt;) <a href="#">code point</a> in an <a href="#">attribute name</a><sup>p1050</sup>. The parser includes such code points in the attribute name.</p> <div data-bbox="285 940 1529 1031" style="background-color: #e0ffe0; padding: 5px;"> <p><b>Note</b></p> <p>Code points that trigger this error are usually a part of another syntactic construct and can be a sign of a typo around the attribute name.</p> </div> <div data-bbox="285 1062 1529 1455" style="background-color: #f0f0f0; padding: 5px;"> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;">&lt;div foo&lt;div&gt;</pre> <p>Due to a forgotten U+003E (&gt;) code point after <code>foo</code> the parser treats this markup as a single <a href="#">div</a><sup>p233</sup> element with a "foo&lt;div" attribute.</p> <p>As another example of this error, consider the following markup:</p> <pre style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;">&lt;div id'bar'&gt;</pre> <p>Due to a forgotten U+003D (=) code point between an attribute name and value the parser treats this markup as a <a href="#">div</a><sup>p233</sup> element with the attribute "id'bar'" that has an empty value.</p> </div>
<b>unexpected-character-in-unquoted-attribute-value</b>	<p>This error occurs if the parser encounters a U+0022 ("), U+0027 ('), U+003C (&lt;), U+003D (=), or U+0060 (`) <a href="#">code point</a> in an unquoted <a href="#">attribute value</a><sup>p1050</sup>. The parser includes such code points in the attribute value.</p> <div data-bbox="285 1577 1529 1667" style="background-color: #e0ffe0; padding: 5px;"> <p><b>Note</b></p> <p>Code points that trigger this error are usually a part of another syntactic construct and can be a sign of a typo around the attribute value.</p> </div> <div data-bbox="285 1698 1529 1768" style="background-color: #e0ffe0; padding: 5px;"> <p><b>Note</b></p> <p>U+0060 (`) is in the list of code points that trigger this error because certain legacy user agents treat it as a quote.</p> </div> <div data-bbox="285 1799 1529 1982" style="background-color: #f0f0f0; padding: 5px;"> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;">&lt;div foo=b'ar'&gt;</pre> <p>Due to a misplaced U+0027 (' ) code point the parser sets the value of the "foo" attribute to "b'ar".</p> </div>

Code	Description
<b>unexpected-equals-sign-before-attribute-name</b>	<p>This error occurs if the parser encounters a U+003D (=) <a href="#">code point</a> before an attribute name. In this case the parser treats U+003D (=) as the first code point of the attribute name.</p> <p><b>Note</b></p> <p><i>The common reason for this error is a forgotten attribute name.</i></p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;div foo="bar" ="baz"&gt;</pre> <p>Due to a forgotten attribute name the parser treats this markup as a <a href="#">div<sup>p233</sup></a> element with two attributes: a "foo" attribute with a "bar" value and a "="baz"" attribute with an empty value.</p>
<b>unexpected-null-character</b>	<p>This error occurs if the parser encounters a U+0000 NULL <a href="#">code point</a> in the <a href="#">input stream<sup>p1071</sup></a> in certain positions. In general, such code points are either completely ignored or, for security reasons, replaced with a U+FFFD REPLACEMENT CHARACTER.</p>
<b>unexpected-question-mark-instead-of-tag-name</b>	<p>This error occurs if the parser encounters a U+003F (?) <a href="#">code point</a> where first code point of a <a href="#">start tag<sup>p1049</sup></a> name is expected. The U+003F (?) and all content that follows up to a U+003E (&gt;) code point (if present) or to the end of the <a href="#">input stream<sup>p1071</sup></a> is treated as a comment.</p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;?xml-stylesheet type="text/css" href="style.css"?&gt;</pre> <p>This will be parsed into:</p> <pre>#comment: ?xml-stylesheet type="text/css" href="style.css"? html<sup>p149</sup> ├ head<sup>p150</sup> └ body<sup>p174</sup></pre> <p><b>Note</b></p> <p><i>The common reason for this error is an XML processing instruction (e.g., <code>&lt;?xml-stylesheet type="text/css" href="style.css"?&gt;</code>) or an XML declaration (e.g., <code>&lt;?xml version="1.0" encoding="UTF-8"?&gt;</code>) being used in HTML.</i></p>
<b>unexpected-solidus-in-tag</b>	<p>This error occurs if the parser encounters a U+002F (/) <a href="#">code point</a> that is not a part of a quoted <a href="#">attribute<sup>p1050</sup></a> value and not immediately followed by a U+003E (&gt;) code point in a tag (e.g., <code>&lt;div / id="foo"&gt;</code>). In this case the parser behaves as if it encountered <a href="#">ASCII whitespace</a>.</p>
<b>unknown-named-character-reference</b>	<p>This error occurs if the parser encounters an <a href="#">ambiguous ampersand<sup>p1058</sup></a>. In this case the parser doesn't resolve the <a href="#">character reference<sup>p1057</sup></a>.</p>

### 12.2.3 The input byte stream §<sup>p10</sup> 65

The stream of code points that comprises the input to the tokenization stage will be initially seen by the user agent as a stream of bytes (typically coming over the network or from the local file system). The bytes encode the actual characters according to a particular *character encoding*, which the user agent uses to decode the bytes into characters.

**Note**

*For XML documents, the algorithm user agents are required to use to determine the character encoding is given by XML. This section does not apply to XML documents. [\[XML\]<sup>p1271</sup>](#)*

Usually, the [encoding sniffing algorithm<sup>p1066</sup>](#) defined below is used to determine the character encoding.

Given a character encoding, the bytes in the [input byte stream<sup>p1065</sup>](#) must be converted to characters for the tokenizer's [input stream<sup>p1071</sup>](#), by passing the [input byte stream<sup>p1065</sup>](#) and character encoding to [decode](#).

**Note**

*A leading Byte Order Mark (BOM) causes the character encoding argument to be ignored and will itself be skipped.*

## Note

Bytes or sequences of bytes in the original byte stream that did not conform to the Encoding standard (e.g. invalid UTF-8 byte sequences in a UTF-8 input byte stream) are errors that conformance checkers are expected to report. [\[ENCODING\]<sup>p1266</sup>](#)

## Warning!

**The decoder algorithms describe how to handle invalid input; for security reasons, it is imperative that those rules be followed precisely. Differences in how invalid byte sequences are handled can result in, amongst other problems, script injection vulnerabilities ("XSS").**

When the HTML parser is decoding an input byte stream, it uses a character encoding and a **confidence**. The confidence is either *tentative*, *certain*, or *irrelevant*. The encoding used, and whether the confidence in that encoding is *tentative* or *certain*, is [used during the parsing<sup>p1115</sup>](#) to determine whether to [change the encoding<sup>p1071</sup>](#). If no encoding is necessary, e.g. because the parser is operating on a Unicode stream and doesn't have to use a character encoding at all, then the [confidence<sup>p1066</sup>](#) is *irrelevant*.

## Note

Some algorithms feed the parser by directly adding characters to the [input stream<sup>p1071</sup>](#) rather than adding bytes to the [input byte stream<sup>p1065</sup>](#).

### 12.2.3.1 Parsing with a known character encoding §<sup>p10</sup><sub>66</sub>

When the HTML parser is to operate on an input byte stream that has a **known definite encoding**, then the character encoding is that encoding and the [confidence<sup>p1066</sup>](#) is *certain*.

### 12.2.3.2 Determining the character encoding §<sup>p10</sup><sub>66</sub>

In some cases, it might be impractical to unambiguously determine the encoding before parsing the document. Because of this, this specification provides for a two-pass mechanism with an optional pre-scan. Implementations are allowed, as described below, to apply a simplified parsing algorithm to whatever bytes they have available before beginning to parse the document. Then, the real parser is started, using a tentative encoding derived from this pre-parse and other out-of-band metadata. If, while the document is being loaded, the user agent discovers a character encoding declaration that conflicts with this information, then the parser can get reinvoked to perform a parse of the document with the real encoding.

User agents must use the following algorithm, called the **encoding sniffing algorithm**, to determine the character encoding to use when decoding a document in the first pass. This algorithm takes as input any out-of-band metadata available to the user agent (e.g. the [Content-Type metadata<sup>p88</sup>](#) of the document) and all the bytes available so far, and returns a character encoding and a [confidence<sup>p1066</sup>](#) that is either *tentative* or *certain*.

1. If the result of [BOM sniffing](#) is an encoding, return that encoding with [confidence<sup>p1066</sup>](#) *certain*.

## Note

Although the [decode](#) algorithm will itself change the encoding to use based on the presence of a byte order mark, this algorithm sniffs the BOM as well in order to set the correct [document's character encoding](#) and [confidence<sup>p1066</sup>](#).

2. If the user has explicitly instructed the user agent to override the document's character encoding with a specific encoding, optionally return that encoding with the [confidence<sup>p1066</sup>](#) *certain*.

## Note

Typically, user agents remember such user requests across sessions, and in some cases apply them to documents in [iframe<sup>p355</sup>](#)s as well.

3. The user agent may wait for more bytes of the resource to be available, either in this step or at any later step in this algorithm. For instance, a user agent might wait 500ms or 1024 bytes, whichever came first. In general preparing the source to find the encoding improves performance, as it reduces the need to throw away the data structures used when parsing upon finding the encoding information. However, if the user agent delays too long to obtain data to determine the encoding, then the cost of the delay could outweigh any performance improvements from the preparse.

**Note**

The authoring conformance requirements for character encoding declarations limit them to only appearing [in the first 1024 bytes](#)<sup>p170</sup>. User agents are therefore encouraged to use the prescan algorithm below (as invoked by these steps) on the first 1024 bytes, but not to stall beyond that.

4. If the transport layer specifies a character encoding, and it is supported, return that encoding with the [confidence](#)<sup>p1066</sup> *certain*.
5. Optionally [prescan the byte stream to determine its encoding](#)<sup>p1068</sup>. The *end condition* is that the user agent decides that scanning further bytes would not be efficient. User agents are encouraged to only prescan the first 1024 bytes. User agents may decide that scanning *any* bytes is not efficient, in which case these substeps are entirely skipped.

The aforementioned algorithm either aborts unsuccessfully or returns a character encoding. If it returns a character encoding, then return the same encoding, with [confidence](#)<sup>p1066</sup> *tentative*.

6. If the [HTML parser](#)<sup>p1059</sup> for which this algorithm is being run is associated with a [Document](#)<sup>p111</sup> *d* whose [browsing context](#)<sup>p804</sup> is non-null and a [child browsing context](#)<sup>p806</sup>, then:
  1. Let *parentDocument* be *d*'s [browsing context](#)<sup>p804</sup>'s [container document](#)<sup>p806</sup>.
  2. If *parentDocument*'s [origin](#)<sup>p829</sup> is [same origin](#)<sup>p830</sup> with *d*'s [origin](#)<sup>p829</sup> and *parentDocument*'s [character encoding](#) is an [ASCII-compatible encoding](#)<sup>p45</sup>, then return *parentDocument*'s [character encoding](#), with the [confidence](#)<sup>p1066</sup> *tentative*.
7. Otherwise, if the user agent has information on the likely encoding for this page, e.g. based on the encoding of the page when it was last visited, then return that encoding, with the [confidence](#)<sup>p1066</sup> *tentative*.
8. The user agent may attempt to autodetect the character encoding from applying frequency analysis or other algorithms to the data stream. Such algorithms may use information about the resource other than the resource's contents, including the address of the resource. If autodetection succeeds in determining a character encoding, and that encoding is a supported encoding, then return that encoding, with the [confidence](#)<sup>p1066</sup> *tentative*. [\[UNIVCHARDET\]](#)<sup>p1270</sup>

**Note**

User agents are generally discouraged from attempting to autodetect encodings for resources obtained over the network, since doing so involves inherently non-interoperable heuristics. Attempting to detect encodings based on an HTML document's preamble is especially tricky since HTML markup typically uses only ASCII characters, and HTML documents tend to begin with a lot of markup rather than with text content.

**Note**

The UTF-8 encoding has a highly detectable bit pattern. Files from the local file system that contain bytes with values greater than 0x7F which match the UTF-8 pattern are very likely to be UTF-8, while documents with byte sequences that do not match it are very likely not. When a user agent can examine the whole file, rather than just the preamble, detecting for UTF-8 specifically can be especially effective. [\[PPUTF8\]](#)<sup>p1269</sup> [\[UTF8DET\]](#)<sup>p1271</sup>

9. Otherwise, return an [implementation-defined](#) or user-specified default character encoding, with the [confidence](#)<sup>p1066</sup> *tentative*.

In controlled environments or in environments where the encoding of documents can be prescribed (for example, for user agents intended for dedicated use in new networks), the comprehensive UTF-8 encoding is suggested.

In other environments, the default encoding is typically dependent on the user's locale (an approximation of the languages, and thus often encodings, of the pages that the user is likely to frequent). The following table gives suggested defaults based on the user's locale, for compatibility with legacy content. Locales are identified by BCP 47 language tags. [\[BCP47\]](#)<sup>p1264</sup> [\[ENCODING\]](#)<sup>p1266</sup>

Locale language		Suggested default encoding
ar	Arabic	<a href="#">windows-1256</a>

	All other locales	<a href="#">windows-1252</a>

The contents of this table are derived from the intersection of Windows, Chrome, and Firefox defaults.

The [document's character encoding](#) must immediately be set to the value returned from this algorithm, at the same time as the user agent uses the returned value to select the decoder to use for the input byte stream.

When an algorithm requires a user agent to **prescan a byte stream to determine its encoding**, given some defined *end condition*, then it must run the following steps. These steps either abort unsuccessfully or return a character encoding. If at any point during these steps (including during instances of the [get an attribute](#)<sup>p1069</sup> algorithm invoked by this one) the user agent either runs out of bytes (meaning the *position* pointer created in the first step below goes beyond the end of the byte stream obtained so far) or reaches its *end condition*, then abort the [prescan a byte stream to determine its encoding](#)<sup>p1068</sup> algorithm unsuccessfully.

1. Let *position* be a pointer to a byte in the input byte stream, initially pointing at the first byte.
2. *Loop*: If *position* points to:
  - ↪ **A sequence of bytes starting with: 0x3C 0x21 0x2D 0x2D ('<!--')**

Advance the *position* pointer so that it points at the first 0x3E byte which is preceded by two 0x2D bytes (i.e. at the end of an ASCII '-->' sequence) and comes after the 0x3C byte that was found. (The two 0x2D bytes can be the same as those in the '<!--' sequence.)
  - ↪ **A sequence of bytes starting with: 0x3C, 0x4D or 0x6D, 0x45 or 0x65, 0x54 or 0x74, 0x41 or 0x61, and one of 0x09, 0x0A, 0x0C, 0x0D, 0x20, 0x2F (case-insensitive ASCII '<meta' followed by a space or slash)**
    1. Advance the *position* pointer so that it points at the next 0x09, 0x0A, 0x0C, 0x0D, 0x20, or 0x2F byte (the one in sequence of characters matched above).
    2. Let *attribute list* be an empty list of strings.
    3. Let *got pragma* be false.
    4. Let *need pragma* be null.
    5. Let *charset* be the null value (which, for the purposes of this algorithm, is distinct from an unrecognized encoding or the empty string).

6. *Attributes*: [Get an attribute<sup>p1069</sup>](#) and its value. If no attribute was sniffed, then jump to the *processing* step below.
7. If the attribute's name is already in *attribute list*, then return to the step labeled *attributes*.
8. Add the attribute's name to *attribute list*.
9. Run the appropriate step from the following list, if one applies:
  - ↪ **If the attribute's name is "http-equiv"**  
If the attribute's value is "content-type", then set *got pragma* to true.
  - ↪ **If the attribute's name is "content"**  
Apply the [algorithm for extracting a character encoding from a meta element<sup>p89</sup>](#), giving the attribute's value as the string to parse. If a character encoding is returned, and if *charset* is still set to null, let *charset* be the encoding returned, and set *need pragma* to true.
  - ↪ **If the attribute's name is "charset"**  
Let *charset* be the result of [getting an encoding](#) from the attribute's value, and set *need pragma* to false.
10. Return to the step labeled *attributes*.
11. *Processing*: If *need pragma* is null, then jump to the step below labeled *next byte*.
12. If *need pragma* is true but *got pragma* is false, then jump to the step below labeled *next byte*.
13. If *charset* is failure, then jump to the step below labeled *next byte*.
14. If *charset* is a [UTF-16 encoding<sup>p45</sup>](#), then set *charset* to [UTF-8](#).
15. If *charset* is [x-user-defined](#), then set *charset* to [windows-1252](#).
16. Abort the [prescan a byte stream to determine its encoding<sup>p1068</sup>](#) algorithm, returning the encoding given by *charset*.

↪ **A sequence of bytes starting with a 0x3C byte (<), optionally a 0x2F byte (/), and finally a byte in the range 0x41-0x5A or 0x61-0x7A (A-Z or a-z)**

1. Advance the *position* pointer so that it points at the next 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), 0x20 (SP), or 0x3E (>) byte.
2. Repeatedly [get an attribute<sup>p1069</sup>](#) until no further attributes can be found, then jump to the step below labeled *next byte*.

↪ **A sequence of bytes starting with: 0x3C 0x21 (`<!`)**

↪ **A sequence of bytes starting with: 0x3C 0x2F (`</`)**

↪ **A sequence of bytes starting with: 0x3C 0x3F (`<?`)**

Advance the *position* pointer so that it points at the first 0x3E byte (>) that comes after the 0x3C byte that was found.

↪ **Any other byte**

Do nothing with that byte.

3. *Next byte*: Move *position* so it points at the next byte in the input byte stream, and return to the step above labeled *loop*.

When the [prescan a byte stream to determine its encoding<sup>p1068</sup>](#) algorithm says to **get an attribute**, it means doing this:

1. If the byte at *position* is one of 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), 0x20 (SP), or 0x2F (/) then advance *position* to the next byte and redo this step.
2. If the byte at *position* is 0x3E (>), then abort the [get an attribute<sup>p1069</sup>](#) algorithm. There isn't one.
3. Otherwise, the byte at *position* is the start of the attribute name. Let *attribute name* and *attribute value* be the empty string.
4. Process the byte at *position* as follows:

↪ **If it is 0x3D (=), and the attribute name is longer than the empty string**

Advance *position* to the next byte and jump to the step below labeled *value*.

↪ **If it is 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), or 0x20 (SP)**

Jump to the step below labeled *spaces*.

↪ **If it is 0x2F (/) or 0x3E (>)**

Abort the [get an attribute<sup>p1069</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.

↪ **If it is in the range 0x41 (A) to 0x5A (Z)**

Append the code point  $b+0x20$  to *attribute name* (where  $b$  is the value of the byte at *position*). (This converts the input to lowercase.)

↪ **Anything else**

Append the code point with the same value as the byte at *position* to *attribute name*. (It doesn't actually matter how bytes outside the ASCII range are handled here, since only ASCII bytes can contribute to the detection of a character encoding.)

5. Advance *position* to the next byte and return to the previous step.
6. *Spaces*: If the byte at *position* is one of 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), or 0x20 (SP) then advance *position* to the next byte, then, repeat this step.
7. If the byte at *position* is *not* 0x3D (=), abort the [get an attribute<sup>p1069</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.
8. Advance *position* past the 0x3D (=) byte.
9. *Value*: If the byte at *position* is one of 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), or 0x20 (SP) then advance *position* to the next byte, then, repeat this step.
10. Process the byte at *position* as follows:

↪ **If it is 0x22 (") or 0x27 (')**

1. Let  $b$  be the value of the byte at *position*.
2. *Quote loop*: Advance *position* to the next byte.
3. If the value of the byte at *position* is the value of  $b$ , then advance *position* to the next byte and abort the "get an attribute" algorithm. The attribute's name is the value of *attribute name*, and its value is the value of *attribute value*.
4. Otherwise, if the value of the byte at *position* is in the range 0x41 (A) to 0x5A (Z), then append a code point to *attribute value* whose value is 0x20 more than the value of the byte at *position*.
5. Otherwise, append a code point to *attribute value* whose value is the same as the value of the byte at *position*.
6. Return to the step above labeled *quote loop*.

↪ **If it is 0x3E (>)**

Abort the [get an attribute<sup>p1069</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.

↪ **If it is in the range 0x41 (A) to 0x5A (Z)**

Append a code point  $b+0x20$  to *attribute value* (where  $b$  is the value of the byte at *position*). Advance *position* to the next byte.

↪ **Anything else**

Append a code point with the same value as the byte at *position* to *attribute value*. Advance *position* to the next byte.

11. Process the byte at *position* as follows:

↪ **If it is 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), 0x20 (SP), or 0x3E (>)**

Abort the [get an attribute<sup>p1069</sup>](#) algorithm. The attribute's name is the value of *attribute name* and its value is the value of *attribute value*.

↪ **If it is in the range 0x41 (A) to 0x5A (Z)**

Append a code point  $b+0x20$  to *attribute value* (where  $b$  is the value of the byte at *position*).

#### ↪ Anything else

Append a code point with the same value as the byte at *position* to *attribute value*.

12. Advance *position* to the next byte and return to the previous step.

For the sake of interoperability, user agents should not use a pre-scan algorithm that returns different results than the one described above. (But, if you do, please at least let us know, so that we can improve this algorithm and benefit everyone...)

### 12.2.3.3 Character encodings §<sup>p10</sup><sub>71</sub>

User agents must support the encodings defined in *Encoding*, including, but not limited to, [UTF-8](#), [ISO-8859-2](#), [ISO-8859-7](#), [ISO-8859-8](#), [windows-874](#), [windows-1250](#), [windows-1251](#), [windows-1252](#), [windows-1254](#), [windows-1255](#), [windows-1256](#), [windows-1257](#), [windows-1258](#), [gb18030](#), [Big5](#), [ISO-2022-JP](#), [Shift\\_JIS](#), [EUC-KR](#), [UTF-16BE](#), [UTF-16LE](#), and [x-user-defined](#). User agents must not support other encodings.

#### Note

*The above prohibits supporting, for example, CESU-8, UTF-7, BOCU-1, SCSU, EBCDIC, and UTF-32. This specification does not make any attempt to support prohibited encodings in its algorithms; support and use of prohibited encodings would thus lead to unexpected behavior. [\[CESU8\]](#)<sup>p1264</sup> [\[UTF7\]](#)<sup>p1271</sup> [\[BOCU1\]](#)<sup>p1264</sup> [\[SCSU\]](#)<sup>p1270</sup>*

### 12.2.3.4 Changing the encoding while parsing §<sup>p10</sup><sub>71</sub>

When the parser requires the user agent to **change the encoding**, it must run the following steps. This might happen if the [encoding sniffing algorithm](#)<sup>p1066</sup> described above failed to find a character encoding, or if it found a character encoding that was not the actual encoding of the file.

1. If the encoding that is already being used to interpret the input stream is a [UTF-16 encoding](#)<sup>p45</sup>, then set the [confidence](#)<sup>p1066</sup> to *certain* and return. The new encoding is ignored; if it was anything but the same encoding, then it would be clearly incorrect.
2. If the new encoding is a [UTF-16 encoding](#)<sup>p45</sup>, then change it to [UTF-8](#).
3. If the new encoding is [x-user-defined](#), then change it to [windows-1252](#).
4. If the new encoding is identical or equivalent to the encoding that is already being used to interpret the input stream, then set the [confidence](#)<sup>p1066</sup> to *certain* and return. This happens when the encoding information found in the file matches what the [encoding sniffing algorithm](#)<sup>p1066</sup> determined to be the encoding, and in the second pass through the parser if the first pass found that the encoding sniffing algorithm described in the earlier section failed to find the right encoding.
5. If all the bytes up to the last byte converted by the current decoder have the same Unicode interpretations in both the current encoding and the new encoding, and if the user agent supports changing the converter on the fly, then the user agent may change to the new converter for the encoding on the fly. Set the [document's character encoding](#) and the encoding used to convert the input stream to the new encoding, set the [confidence](#)<sup>p1066</sup> to *certain*, and return.
6. Otherwise, [navigate](#)<sup>p852</sup> to the document again, with [replacement enabled](#)<sup>p865</sup>, and using the same [source browsing context](#)<sup>p852</sup>, but this time skip the [encoding sniffing algorithm](#)<sup>p1066</sup> and instead just set the encoding to the new encoding and the [confidence](#)<sup>p1066</sup> to *certain*. Whenever possible, this should be done without actually contacting the network layer (the bytes should be re-parsed from memory), even if, e.g., the document is marked as not being cacheable. If this is not possible and contacting the network layer would involve repeating a request that uses a method other than `GET`, then instead set the [confidence](#)<sup>p1066</sup> to *certain* and ignore the new encoding. The resource will be misinterpreted. User agents may notify the user of the situation, to aid in application development.

#### Note

*This algorithm is only invoked when a new encoding is found declared on a [meta](#)<sup>p160</sup> element.*

### 12.2.3.5 Preprocessing the input stream §<sup>p10</sup><sub>71</sub>

The **input stream** consists of the characters pushed into it as the [input byte stream](#)<sup>p1065</sup> is decoded or from the various APIs that

directly manipulate the input stream.

Any occurrences of [surrogates](#) are [surrogate-in-input-stream<sup>p1064</sup>](#) [parse errors<sup>p1061</sup>](#). Any occurrences of [noncharacters](#) are [noncharacter-in-input-stream<sup>p1063</sup>](#) [parse errors<sup>p1061</sup>](#) and any occurrences of [controls](#) other than [ASCII whitespace](#) and U+0000 NULL characters are [control-character-in-input-stream<sup>p1061</sup>](#) [parse errors<sup>p1061</sup>](#).

#### Note

*The handling of U+0000 NULL characters varies based on where the characters are found and happens at the later stages of the parsing. They are either ignored or, for security reasons, replaced with a U+FFFD REPLACEMENT CHARACTER. This handling is, by necessity, spread across both the tokenization stage and the tree construction stage.*

Before the [tokenization<sup>p1077</sup>](#) stage, the input stream must be preprocessed by [normalizing newlines](#). Thus, newlines in HTML DOMs are represented by U+000A LF characters, and there are never any U+000D CR characters in the input to the [tokenization<sup>p1077</sup>](#) stage.

The **next input character** is the first character in the [input stream<sup>p1071</sup>](#) that has not yet been **consumed** or explicitly ignored by the requirements in this section. Initially, the [next input character<sup>p1072</sup>](#) is the first character in the input. The **current input character** is the last character to have been *consumed*.

The **insertion point** is the position (just before a character or just before the end of the input stream) where content inserted using [document.write\(\)<sup>p950</sup>](#) is actually inserted. The insertion point is relative to the position of the character immediately after it, it is not an absolute offset into the input stream. Initially, the insertion point is undefined.

The "EOF" character in the tables below is a conceptual character representing the end of the [input stream<sup>p1071</sup>](#). If the parser is a [script-created parser<sup>p948</sup>](#), then the end of the [input stream<sup>p1071</sup>](#) is reached when an **explicit "EOF" character** (inserted by the [document.close\(\)<sup>p949</sup>](#) method) is consumed. Otherwise, the "EOF" character is not a real character in the stream, but rather the lack of any further characters.

## 12.2.4 Parse state §<sup>p10</sup><sub>72</sub>

### 12.2.4.1 The insertion mode §<sup>p10</sup><sub>72</sub>

The **insertion mode** is a state variable that controls the primary operation of the tree construction stage.

Initially, the [insertion mode<sup>p1072</sup>](#) is "[initial<sup>p1112</sup>](#)". It can change to "[before html<sup>p1113</sup>](#)", "[before head<sup>p1114</sup>](#)", "[in head<sup>p1115</sup>](#)", "[in head noscript<sup>p1117</sup>](#)", "[after head<sup>p1118</sup>](#)", "[in body<sup>p1119</sup>](#)", "[text<sup>p1129</sup>](#)", "[in table<sup>p1130</sup>](#)", "[in table text<sup>p1132</sup>](#)", "[in caption<sup>p1132</sup>](#)", "[in column group<sup>p1133</sup>](#)", "[in table body<sup>p1134</sup>](#)", "[in row<sup>p1135</sup>](#)", "[in cell<sup>p1136</sup>](#)", "[in select<sup>p1137</sup>](#)", "[in select in table<sup>p1138</sup>](#)", "[in template<sup>p1139</sup>](#)", "[after body<sup>p1140</sup>](#)", "[in frameset<sup>p1140</sup>](#)", "[after frameset<sup>p1141</sup>](#)", "[after after body<sup>p1142</sup>](#)", and "[after after frameset<sup>p1142</sup>](#)" during the course of the parsing, as described in the [tree construction<sup>p1105</sup>](#) stage. The insertion mode affects how tokens are processed and whether CDATA sections are supported.

Several of these modes, namely "[in head<sup>p1115</sup>](#)", "[in body<sup>p1119</sup>](#)", "[in table<sup>p1130</sup>](#)", and "[in select<sup>p1137</sup>](#)", are special, in that the other modes defer to them at various times. When the algorithm below says that the user agent is to do something "**using the rules for the *m* insertion mode**", where *m* is one of these modes, the user agent must use the rules described under the *m* [insertion mode<sup>p1072</sup>](#)'s section, but must leave the [insertion mode<sup>p1072</sup>](#) unchanged unless the rules in *m* themselves switch the [insertion mode<sup>p1072</sup>](#) to a new value.

When the insertion mode is switched to "[text<sup>p1129</sup>](#)" or "[in table text<sup>p1132</sup>](#)", the **original insertion mode** is also set. This is the insertion mode to which the tree construction stage will return.

Similarly, to parse nested [template<sup>p623</sup>](#) elements, a **stack of template insertion modes** is used. It is initially empty. The **current template insertion mode** is the insertion mode that was most recently added to the [stack of template insertion modes<sup>p1072</sup>](#). The algorithms in the sections below will *push* insertion modes onto this stack, meaning that the specified insertion mode is to be added to the stack, and *pop* insertion modes from the stack, which means that the most recently added insertion mode must be removed from the stack.

When the steps below require the UA to **reset the insertion mode appropriately**, it means the UA must follow these steps:

1. Let *last* be false.
2. Let *node* be the last node in the [stack of open elements<sup>p1073</sup>](#).

3. *Loop*: If *node* is the first node in the stack of open elements, then set *last* to true, and, if the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup> ([fragment case](#)<sup>p1157</sup>), set *node* to the [context](#)<sup>p1157</sup> element passed to that algorithm.
4. If *node* is a [select](#)<sup>p530</sup> element, run these substeps:
  1. If *last* is true, jump to the step below labeled *done*.
  2. Let *ancestor* be *node*.
  3. *Loop*: If *ancestor* is the first node in the [stack of open elements](#)<sup>p1073</sup>, jump to the step below labeled *done*.
  4. Let *ancestor* be the node before *ancestor* in the [stack of open elements](#)<sup>p1073</sup>.
  5. If *ancestor* is a [template](#)<sup>p623</sup> node, jump to the step below labeled *done*.
  6. If *ancestor* is a [table](#)<sup>p443</sup> node, switch the [insertion mode](#)<sup>p1072</sup> to "[in select in table](#)<sup>p1138</sup>" and return.
  7. Jump back to the step labeled *loop*.
  8. *Done*: Switch the [insertion mode](#)<sup>p1072</sup> to "[in select](#)<sup>p1137</sup>" and return.
5. If *node* is a [td](#)<sup>p459</sup> or [th](#)<sup>p460</sup> element and *last* is false, then switch the [insertion mode](#)<sup>p1072</sup> to "[in cell](#)<sup>p1136</sup>" and return.
6. If *node* is a [tr](#)<sup>p457</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in row](#)<sup>p1135</sup>" and return.
7. If *node* is a [tbody](#)<sup>p454</sup>, [thead](#)<sup>p455</sup>, or [tfoot](#)<sup>p456</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in table body](#)<sup>p1134</sup>" and return.
8. If *node* is a [caption](#)<sup>p451</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in caption](#)<sup>p1132</sup>" and return.
9. If *node* is a [colgroup](#)<sup>p452</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in column group](#)<sup>p1133</sup>" and return.
10. If *node* is a [table](#)<sup>p443</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in table](#)<sup>p1130</sup>" and return.
11. If *node* is a [template](#)<sup>p623</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to the [current template insertion mode](#)<sup>p1072</sup> and return.
12. If *node* is a [head](#)<sup>p150</sup> element and *last* is false, then switch the [insertion mode](#)<sup>p1072</sup> to "[in head](#)<sup>p1115</sup>" and return.
13. If *node* is a [body](#)<sup>p174</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in body](#)<sup>p1119</sup>" and return.
14. If *node* is a [frameset](#)<sup>p1219</sup> element, then switch the [insertion mode](#)<sup>p1072</sup> to "[in frameset](#)<sup>p1140</sup>" and return. ([fragment case](#)<sup>p1157</sup>)
15. If *node* is an [html](#)<sup>p149</sup> element, run these substeps:
  1. If the [head element pointer](#)<sup>p1076</sup> is null, switch the [insertion mode](#)<sup>p1072</sup> to "[before head](#)<sup>p1114</sup>" and return. ([fragment case](#)<sup>p1157</sup>)
  2. Otherwise, the [head element pointer](#)<sup>p1076</sup> is not null, switch the [insertion mode](#)<sup>p1072</sup> to "[after head](#)<sup>p1118</sup>" and return.
16. If *last* is true, then switch the [insertion mode](#)<sup>p1072</sup> to "[in body](#)<sup>p1119</sup>" and return. ([fragment case](#)<sup>p1157</sup>)
17. Let *node* now be the node before *node* in the [stack of open elements](#)<sup>p1073</sup>.
18. Return to the step labeled *loop*.

#### 12.2.4.2 The stack of open elements §<sup>p10</sup><sub>73</sub>

Initially, the **stack of open elements** is empty. The stack grows downwards; the topmost node on the stack is the first one added to the stack, and the bottommost node of the stack is the most recently added node in the stack (notwithstanding when the stack is manipulated in a random access fashion as part of [the handling for misnested tags](#)<sup>p1127</sup>).

#### Note

The "[before html](#)<sup>p1113</sup>" [insertion mode](#)<sup>p1072</sup> creates the [html](#)<sup>p149</sup> document element, which is then added to the stack.

#### Note

In the [fragment case](#)<sup>p1157</sup>, the [stack of open elements](#)<sup>p1073</sup> is initialized to contain an [html](#)<sup>p149</sup> element that is created as part of [that algorithm](#)<sup>p1157</sup>. (The [fragment case](#)<sup>p1157</sup> skips the "[before html](#)<sup>p1113</sup>" [insertion mode](#)<sup>p1072</sup>.)

The [html<sup>p149</sup>](#) node, however it is created, is the topmost node of the stack. It only gets popped off the stack when the parser [finishes<sup>p1145</sup>](#).

The **current node** is the bottommost node in this [stack of open elements<sup>p1073</sup>](#).

The **adjusted current node** is the [context<sup>p1157</sup>](#) element if the parser was created as part of the [HTML fragment parsing algorithm<sup>p1157</sup>](#) and the [stack of open elements<sup>p1073</sup>](#) has only one element in it ([fragment case<sup>p1157</sup>](#)); otherwise, the [adjusted current node<sup>p1074</sup>](#) is the [current node<sup>p1074</sup>](#).

Elements in the [stack of open elements<sup>p1073</sup>](#) fall into the following categories:

### Special

The following elements have varying levels of special parsing rules: HTML's [address<sup>p193</sup>](#), [applet<sup>p1212</sup>](#), [area<sup>p437</sup>](#), [article<sup>p176</sup>](#), [aside<sup>p183</sup>](#), [base<sup>p152</sup>](#), [basefont<sup>p1213</sup>](#), [bgound<sup>p1212</sup>](#), [blockquote<sup>p213</sup>](#), [body<sup>p174</sup>](#), [br<sup>p275</sup>](#), [button<sup>p528</sup>](#), [caption<sup>p451</sup>](#), [center<sup>p1213</sup>](#), [col<sup>p453</sup>](#), [colgroup<sup>p452</sup>](#), [dd<sup>p227</sup>](#), [details<sup>p597</sup>](#), [dir<sup>p1212</sup>](#), [div<sup>p233</sup>](#), [dl<sup>p222</sup>](#), [dt<sup>p226</sup>](#), [embed<sup>p363</sup>](#), [fieldset<sup>p555</sup>](#), [figcaption<sup>p231</sup>](#), [figure<sup>p228</sup>](#), [footer<sup>p191</sup>](#), [form<sup>p479</sup>](#), [frame<sup>p1220</sup>](#), [frameset<sup>p1219</sup>](#), [h1<sup>p186</sup>](#), [h2<sup>p186</sup>](#), [h3<sup>p186</sup>](#), [h4<sup>p186</sup>](#), [h5<sup>p186</sup>](#), [h6<sup>p186</sup>](#), [head<sup>p150</sup>](#), [header<sup>p190</sup>](#), [hgroup<sup>p187</sup>](#), [hr<sup>p210</sup>](#), [html<sup>p149</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [input<sup>p486</sup>](#), [keygen<sup>p1212</sup>](#), [li<sup>p220</sup>](#), [link<sup>p154</sup>](#), [listing<sup>p1212</sup>](#), [main<sup>p231</sup>](#), [marquee<sup>p1217</sup>](#), [menu<sup>p219</sup>](#), [meta<sup>p160</sup>](#), [nav<sup>p180</sup>](#), [noembed<sup>p1212</sup>](#), [noframes<sup>p1212</sup>](#), [noscript<sup>p620</sup>](#), [object<sup>p367</sup>](#), [ol<sup>p216</sup>](#), [p<sup>p207</sup>](#), [param<sup>p372</sup>](#), [plaintext<sup>p1212</sup>](#), [pre<sup>p212</sup>](#), [script<sup>p607</sup>](#), [section<sup>p178</sup>](#), [select<sup>p530</sup>](#), [source<sup>p311</sup>](#), [style<sup>p170</sup>](#), [summary<sup>p600</sup>](#), [table<sup>p443</sup>](#), [tbody<sup>p454</sup>](#), [td<sup>p459</sup>](#), [template<sup>p623</sup>](#), [textarea<sup>p541</sup>](#), [tfoot<sup>p456</sup>](#), [th<sup>p460</sup>](#), [thead<sup>p455</sup>](#), [title<sup>p151</sup>](#), [tr<sup>p457</sup>](#), [track<sup>p379</sup>](#), [ul<sup>p218</sup>](#), [wbr<sup>p277</sup>](#), [xmp<sup>p1213</sup>](#); [MathML mi](#), [MathML mo](#), [MathML mn](#), [MathML ms](#), [MathML mtext](#), and [MathML annotation-xml](#); and [SVG foreignObject](#), [SVG desc](#), and [SVG title](#).

#### Note

An image start tag token is handled by the tree builder, but it is not in this list because it is not an element; it gets turned into an [img<sup>p314</sup>](#) element.

### Formatting

The following HTML elements are those that end up in the [list of active formatting elements<sup>p1075</sup>](#): [a<sup>p234</sup>](#), [b<sup>p268</sup>](#), [big<sup>p1213</sup>](#), [code<sup>p262</sup>](#), [em<sup>p236</sup>](#), [font<sup>p1213</sup>](#), [i<sup>p267</sup>](#), [nobr<sup>p1213</sup>](#), [s<sup>p241</sup>](#), [small<sup>p239</sup>](#), [strike<sup>p1213</sup>](#), [strong<sup>p238</sup>](#), [tt<sup>p1213</sup>](#), and [u<sup>p270</sup>](#).

### Ordinary

All other elements found while parsing an HTML document.

#### Note

Typically, the [special<sup>p1074</sup>](#) elements have the start and end tag tokens handled specifically, while [ordinary<sup>p1074</sup>](#) elements' tokens fall into "any other start tag" and "any other end tag" clauses, and some parts of the tree builder check if a particular element in the [stack of open elements<sup>p1073</sup>](#) is in the [special<sup>p1074</sup>](#) category. However, some elements (e.g., the [option<sup>p539</sup>](#) element) have their start or end tag tokens handled specifically, but are still not in the [special<sup>p1074</sup>](#) category, so that they get the [ordinary<sup>p1074</sup>](#) handling elsewhere.

The [stack of open elements<sup>p1073</sup>](#) is said to **have an element target node in a specific scope** consisting of a list of element types *list* when the following algorithm terminates in a match state:

1. Initialize *node* to be the [current node<sup>p1074</sup>](#) (the bottommost node of the stack).
2. If *node* is the target node, terminate in a match state.
3. Otherwise, if *node* is one of the element types in *list*, terminate in a failure state.
4. Otherwise, set *node* to the previous entry in the [stack of open elements<sup>p1073</sup>](#) and return to step 2. (This will never fail, since the loop will always terminate in the previous step if the top of the stack — an [html<sup>p149</sup>](#) element — is reached.)

The [stack of open elements<sup>p1073</sup>](#) is said to **have a particular element in scope** when it [has that element in the specific scope<sup>p1074</sup>](#) consisting of the following element types:

- [applet<sup>p1212</sup>](#)
- [caption<sup>p451</sup>](#)
- [html<sup>p149</sup>](#)
- [table<sup>p443</sup>](#)
- [td<sup>p459</sup>](#)
- [th<sup>p460</sup>](#)
- [marquee<sup>p1217</sup>](#)
- [object<sup>p367</sup>](#)
- [template<sup>p623</sup>](#)

- [MathML mi](#)
- [MathML mo](#)
- [MathML mn](#)
- [MathML ms](#)
- [MathML mtext](#)
- [MathML annotation-xml](#)
- [SVG foreignObject](#)
- [SVG desc](#)
- [SVG title](#)

The [stack of open elements](#)<sup>p1073</sup> is said to **have a particular element in list item scope** when it [has that element in the specific scope](#)<sup>p1074</sup> consisting of the following element types:

- All the element types listed above for the [has an element in scope](#)<sup>p1074</sup> algorithm.
- [ol](#)<sup>p216</sup> in the [HTML namespace](#)
- [ul](#)<sup>p218</sup> in the [HTML namespace](#)

The [stack of open elements](#)<sup>p1073</sup> is said to **have a particular element in button scope** when it [has that element in the specific scope](#)<sup>p1074</sup> consisting of the following element types:

- All the element types listed above for the [has an element in scope](#)<sup>p1074</sup> algorithm.
- [button](#)<sup>p528</sup> in the [HTML namespace](#)

The [stack of open elements](#)<sup>p1073</sup> is said to **have a particular element in table scope** when it [has that element in the specific scope](#)<sup>p1074</sup> consisting of the following element types:

- [html](#)<sup>p149</sup> in the [HTML namespace](#)
- [table](#)<sup>p443</sup> in the [HTML namespace](#)
- [template](#)<sup>p623</sup> in the [HTML namespace](#)

The [stack of open elements](#)<sup>p1073</sup> is said to **have a particular element in select scope** when it [has that element in the specific scope](#)<sup>p1074</sup> consisting of all element types *except* the following:

- [optgroup](#)<sup>p537</sup> in the [HTML namespace](#)
- [option](#)<sup>p539</sup> in the [HTML namespace](#)

Nothing happens if at any time any of the elements in the [stack of open elements](#)<sup>p1073</sup> are moved to a new location in, or removed from, the [Document](#)<sup>p111</sup> tree. In particular, the stack is not changed in this situation. This can cause, amongst other strange effects, content to be appended to nodes that are no longer in the DOM.

#### Note

*In some cases (namely, when [closing misnested formatting elements](#)<sup>p1127</sup>), the stack is manipulated in a random-access fashion.*

### 12.2.4.3 The list of active formatting elements §<sup>p10</sup> 75

Initially, the **list of active formatting elements** is empty. It is used to handle mis-nested [formatting element tags](#)<sup>p1074</sup>.

The list contains elements in the [formatting](#)<sup>p1074</sup> category, and [markers](#)<sup>p1075</sup>. The **markers** are inserted when entering [applet](#)<sup>p1212</sup>, [object](#)<sup>p367</sup>, [marquee](#)<sup>p1217</sup>, [template](#)<sup>p623</sup>, [td](#)<sup>p459</sup>, [th](#)<sup>p460</sup>, and [caption](#)<sup>p451</sup> elements, and are used to prevent formatting from "leaking" into [applet](#)<sup>p1212</sup>, [object](#)<sup>p367</sup>, [marquee](#)<sup>p1217</sup>, [template](#)<sup>p623</sup>, [td](#)<sup>p459</sup>, [th](#)<sup>p460</sup>, and [caption](#)<sup>p451</sup> elements.

In addition, each element in the [list of active formatting elements](#)<sup>p1075</sup> is associated with the token for which it was created, so that further elements can be created for that token if necessary.

When the steps below require the UA to **push onto the list of active formatting elements** an element *element*, the UA must perform the following steps:

1. If there are already three elements in the [list of active formatting elements](#)<sup>p1075</sup> after the last [marker](#)<sup>p1075</sup>, if any, or anywhere in the list if there are no [markers](#)<sup>p1075</sup>, that have the same tag name, namespace, and attributes as *element*, then remove the earliest such element from the [list of active formatting elements](#)<sup>p1075</sup>. For these purposes, the attributes must be compared as they were when the elements were created by the parser; two elements have the same attributes if all their parsed attributes can be paired such that the two attributes in each pair have identical names, namespaces, and values (the order of the attributes does not matter).

## Note

*This is the Noah's Ark clause. But with three per family instead of two.*

2. Add *element* to the [list of active formatting elements](#)<sup>p1075</sup>.

When the steps below require the UA to **reconstruct the active formatting elements**, the UA must perform the following steps:

1. If there are no entries in the [list of active formatting elements](#)<sup>p1075</sup>, then there is nothing to reconstruct; stop this algorithm.
2. If the last (most recently added) entry in the [list of active formatting elements](#)<sup>p1075</sup> is a [marker](#)<sup>p1075</sup>, or if it is an element that is in the [stack of open elements](#)<sup>p1073</sup>, then there is nothing to reconstruct; stop this algorithm.
3. Let *entry* be the last (most recently added) element in the [list of active formatting elements](#)<sup>p1075</sup>.
4. *Rewind*: If there are no entries before *entry* in the [list of active formatting elements](#)<sup>p1075</sup>, then jump to the step labeled *create*.
5. Let *entry* be the entry one earlier than *entry* in the [list of active formatting elements](#)<sup>p1075</sup>.
6. If *entry* is neither a [marker](#)<sup>p1075</sup> nor an element that is also in the [stack of open elements](#)<sup>p1073</sup>, go to the step labeled *rewind*.
7. *Advance*: Let *entry* be the element one later than *entry* in the [list of active formatting elements](#)<sup>p1075</sup>.
8. *Create*: [Insert an HTML element](#)<sup>p1109</sup> for the token for which the element *entry* was created, to obtain *new element*.
9. Replace the entry for *entry* in the list with an entry for *new element*.
10. If the entry for *new element* in the [list of active formatting elements](#)<sup>p1075</sup> is not the last entry in the list, return to the step labeled *advance*.

This has the effect of reopening all the formatting elements that were opened in the current body, cell, or caption (whichever is youngest) that haven't been explicitly closed.

## Note

*The way this specification is written, the [list of active formatting elements](#)<sup>p1075</sup> always consists of elements in chronological order with the least recently added element first and the most recently added element last (except for while steps 7 to 10 of the above algorithm are being executed, of course).*

When the steps below require the UA to **clear the list of active formatting elements up to the last marker**, the UA must perform the following steps:

1. Let *entry* be the last (most recently added) entry in the [list of active formatting elements](#)<sup>p1075</sup>.
2. Remove *entry* from the [list of active formatting elements](#)<sup>p1075</sup>.
3. If *entry* was a [marker](#)<sup>p1075</sup>, then stop the algorithm at this point. The list has been cleared up to the last [marker](#)<sup>p1075</sup>.
4. Go to step 1.

### 12.2.4.4 The element pointers § p10 76

Initially, the **head element pointer** and the **form element pointer** are both null.

Once a [head](#)<sup>p150</sup> element has been parsed (whether implicitly or explicitly) the [head element pointer](#)<sup>p1076</sup> gets set to point to this node.

The [form element pointer](#)<sup>p1076</sup> points to the last [form](#)<sup>p479</sup> element that was opened and whose end tag has not yet been seen. It is used to make form controls associate with forms in the face of dramatically bad markup, for historical reasons. It is ignored inside [template](#)<sup>p623</sup> elements.

### 12.2.4.5 Other parsing state flags § p10 76

The **scripting flag** is set to "enabled" if [scripting was enabled](#)<sup>p895</sup> for the [Document](#)<sup>p111</sup> with which the parser is associated when the parser was created, and "disabled" otherwise.

## Note

The [scripting flag](#)<sup>p1076</sup> can be enabled even when the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, even though [script](#)<sup>p697</sup> elements don't execute in that case.

The **frameset-ok flag** is set to "ok" when the parser is created. It is set to "not ok" after certain tokens are seen.

## 12.2.5 Tokenization <sup>§ p10</sup> <sub>77</sub>

Implementations must act as if they used the following state machine to tokenize HTML. The state machine must start in the [data state](#)<sup>p1078</sup>. Most states consume a single character, which may have various side-effects, and either switches the state machine to a new state to [reconsume](#)<sup>p1077</sup> the [current input character](#)<sup>p1072</sup>, or switches it to a new state to consume the [next character](#)<sup>p1072</sup>, or stays in the same state to consume the next character. Some states have more complicated behavior and can consume several characters before switching to another state. In some cases, the tokenizer state is also changed by the tree construction stage.

When a state says to **reconsume** a matched character in a specified state, that means to switch to that state, but when it attempts to consume the [next input character](#)<sup>p1072</sup>, provide it with the [current input character](#)<sup>p1072</sup> instead.

The exact behavior of certain states depends on the [insertion mode](#)<sup>p1072</sup> and the [stack of open elements](#)<sup>p1073</sup>. Certain states also use a **temporary buffer** to track progress, and the [character reference state](#)<sup>p1102</sup> uses a **return state** to return to the state it was invoked from.

The output of the tokenization step is a series of zero or more of the following tokens: DOCTYPE, start tag, end tag, comment, character, end-of-file. DOCTYPE tokens have a name, a public identifier, a system identifier, and a **force-quirks flag**. When a DOCTYPE token is created, its name, public identifier, and system identifier must be marked as missing (which is a distinct state from the empty string), and the [force-quirks flag](#)<sup>p1077</sup> must be set to *off* (its other state is *on*). Start and end tag tokens have a tag name, a **self-closing flag**, and a list of attributes, each of which has a name and a value. When a start or end tag token is created, its [self-closing flag](#)<sup>p1077</sup> must be unset (its other state is that it be set), and its attributes list must be empty. Comment and character tokens have data.

When a token is emitted, it must immediately be handled by the [tree construction](#)<sup>p1105</sup> stage. The tree construction stage can affect the state of the tokenization stage, and can insert additional characters into the stream. (For example, the [script](#)<sup>p697</sup> element can result in scripts executing and using the [dynamic markup insertion](#)<sup>p947</sup> APIs to insert characters into the stream being tokenized.)

## Note

Creating a token and emitting it are distinct actions. It is possible for a token to be created but implicitly abandoned (never emitted), e.g. if the file ends unexpectedly while processing the characters that are being parsed into a start tag token.

When a start tag token is emitted with its [self-closing flag](#)<sup>p1077</sup> set, if the flag is not **acknowledged** when it is processed by the tree construction stage, that is a [non-void-html-element-start-tag-with-trailing-solidus](#)<sup>p1063</sup> [parse error](#)<sup>p1061</sup>.

When an end tag token is emitted with attributes, that is an [end-tag-with-attributes](#)<sup>p1061</sup> [parse error](#)<sup>p1061</sup>.

When an end tag token is emitted with its [self-closing flag](#)<sup>p1077</sup> set, that is an [end-tag-with-trailing-solidus](#)<sup>p1061</sup> [parse error](#)<sup>p1061</sup>.

An **appropriate end tag token** is an end tag token whose tag name matches the tag name of the last start tag to have been emitted from this tokenizer, if any. If no start tag has been emitted from this tokenizer, then no end tag token is appropriate.

A [character reference](#)<sup>p1057</sup> is said to be **consumed as part of an attribute** if the [return state](#)<sup>p1077</sup> is either [attribute value \(double-quoted\) state](#)<sup>p1089</sup>, [attribute value \(single-quoted\) state](#)<sup>p1090</sup> or [attribute value \(unquoted\) state](#)<sup>p1090</sup>.

When a state says to **flush code points consumed as a character reference**, it means that for each [code point](#) in the [temporary buffer](#)<sup>p1077</sup> (in the order they were added to the buffer) user agent must append the code point from the buffer to the current attribute's value if the character reference was [consumed as part of an attribute](#)<sup>p1077</sup>, or emit the code point as a character token otherwise.

Before each step of the tokenizer, the user agent must first check the [parser pause flag](#)<sup>p1061</sup>. If it is true, then the tokenizer must abort the processing of any nested invocations of the tokenizer, yielding control back to the caller.

The tokenizer state machine consists of the states defined in the following subsections.

### 12.2.5.1 Data state §<sup>p10</sup><sub>78</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1077</sup>](#) to the [data state<sup>p1078</sup>](#). Switch to the [character reference state<sup>p1102</sup>](#).

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [tag open state<sup>p1079</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

### 12.2.5.2 RCDATA state §<sup>p10</sup><sub>78</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1077</sup>](#) to the [RCDATA state<sup>p1078</sup>](#). Switch to the [character reference state<sup>p1102</sup>](#).

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [RCDATA less-than sign state<sup>p1080</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

### 12.2.5.3 RAWTEXT state §<sup>p10</sup><sub>78</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [RAWTEXT less-than sign state<sup>p1081</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

### 12.2.5.4 Script data state §<sup>p10</sup><sub>78</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data less-than sign state<sup>p1082</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

**12.2.5.5 PLAINTEXT state** §<sup>p10</sup><sub>79</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

**12.2.5.6 Tag open state** §<sup>p10</sup><sub>79</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0021 EXCLAMATION MARK (!)**

Switch to the [markup declaration open state<sup>p1092</sup>](#).

↪ **U+002F SOLIDUS (/)**

Switch to the [end tag open state<sup>p1079</sup>](#).

↪ **ASCII alpha**

Create a new start tag token, set its tag name to the empty string. [Reconsume<sup>p1077</sup>](#) in the [tag name state<sup>p1080</sup>](#).

↪ **U+003F QUESTION MARK (?)**

This is an [unexpected-question-mark-instead-of-tag-name<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Create a comment token whose data is the empty string. [Reconsume<sup>p1077</sup>](#) in the [bogus comment state<sup>p1091</sup>](#).

↪ **EOF**

This is an [eof-before-tag-name<sup>p1061</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+003C LESS-THAN SIGN character token and an end-of-file token.

↪ **Anything else**

This is an [invalid-first-character-of-tag-name<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1077</sup>](#) in the [data state<sup>p1078</sup>](#).

**12.2.5.7 End tag open state** §<sup>p10</sup><sub>79</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1077</sup>](#) in the [tag name state<sup>p1080</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-end-tag-name<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). Switch to the [data state<sup>p1078</sup>](#).

↪ **EOF**

This is an [eof-before-tag-name<sup>p1061</sup>](#) [parse error<sup>p1061</sup>](#). Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token and an end-of-file token.

#### ↪ Anything else

This is an [invalid-first-character-of-tag-name<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Create a comment token whose data is the empty string. [Reconsume<sup>p1077</sup>](#) in the [bogus comment state<sup>p1091</sup>](#).

#### 12.2.5.8 Tag name state §<sup>p10</sup> 80

Consume the [next input character<sup>p1072</sup>](#):

#### ↪ U+0009 CHARACTER TABULATION (tab)

#### ↪ U+000A LINE FEED (LF)

#### ↪ U+000C FORM FEED (FF)

#### ↪ U+0020 SPACE

Switch to the [before attribute name state<sup>p1088</sup>](#).

#### ↪ U+002F SOLIDUS (/)

Switch to the [self-closing start tag state<sup>p1091</sup>](#).

#### ↪ U+003E GREATER-THAN SIGN (>)

Switch to the [data state<sup>p1078</sup>](#). Emit the current tag token.

#### ↪ ASCII upper alpha

Append the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name.

#### ↪ U+0000 NULL

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current tag token's tag name.

#### ↪ EOF

This is an [eof-in-tag<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

#### ↪ Anything else

Append the [current input character<sup>p1072</sup>](#) to the current tag token's tag name.

#### 12.2.5.9 RCDATA less-than sign state §<sup>p10</sup> 80

Consume the [next input character<sup>p1072</sup>](#):

#### ↪ U+002F SOLIDUS (/)

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Switch to the [RCDATA end tag open state<sup>p1080</sup>](#).

#### ↪ Anything else

Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1077</sup>](#) in the [RCDATA state<sup>p1078</sup>](#).

#### 12.2.5.10 RCDATA end tag open state §<sup>p10</sup> 80

Consume the [next input character<sup>p1072</sup>](#):

#### ↪ ASCII alpha

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1077</sup>](#) in the [RCDATA end tag name state<sup>p1081</sup>](#).

#### ↪ Anything else

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume<sup>p1077</sup>](#) in the [RCDATA state<sup>p1078</sup>](#).

### 12.2.5.11 RCDATA end tag name state §<sup>p10</sup><sub>81</sub>

Consume the [next input character<sup>p1072</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token<sup>p1077</sup>](#), then switch to the [before attribute name state<sup>p1088</sup>](#). Otherwise, treat it as per the "anything else" entry below.

- ↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token<sup>p1077</sup>](#), then switch to the [self-closing start tag state<sup>p1091</sup>](#). Otherwise, treat it as per the "anything else" entry below.

- ↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token<sup>p1077</sup>](#), then switch to the [data state<sup>p1078</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

- ↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#).

- ↪ **ASCII lower alpha**

Append the [current input character<sup>p1072</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#).

- ↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p1077</sup>](#) (in the order they were added to the buffer). [Reconsume<sup>p1077</sup>](#) in the [RCDATA state<sup>p1078</sup>](#).

### 12.2.5.12 RAWTEXT less-than sign state §<sup>p10</sup><sub>81</sub>

Consume the [next input character<sup>p1072</sup>](#):

- ↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Switch to the [RAWTEXT end tag open state<sup>p1081</sup>](#).

- ↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1077</sup>](#) in the [RAWTEXT state<sup>p1078</sup>](#).

### 12.2.5.13 RAWTEXT end tag open state §<sup>p10</sup><sub>81</sub>

Consume the [next input character<sup>p1072</sup>](#):

- ↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1077</sup>](#) in the [RAWTEXT end tag name state<sup>p1081</sup>](#).

- ↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume<sup>p1077</sup>](#) in the [RAWTEXT state<sup>p1078</sup>](#).

### 12.2.5.14 RAWTEXT end tag name state §<sup>p10</sup><sub>81</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token](#)<sup>p1077</sup>, then switch to the [before attribute name state](#)<sup>p1088</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1077</sup>, then switch to the [self-closing start tag state](#)<sup>p1091</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1077</sup>, then switch to the [data state](#)<sup>p1078</sup> and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1072</sup> (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character](#)<sup>p1072</sup> to the [temporary buffer](#)<sup>p1077</sup>.

↪ **ASCII lower alpha**

Append the [current input character](#)<sup>p1072</sup> to the current tag token's tag name. Append the [current input character](#)<sup>p1072</sup> to the [temporary buffer](#)<sup>p1077</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer](#)<sup>p1077</sup> (in the order they were added to the buffer). [Reconsume](#)<sup>p1077</sup> in the [RAWTEXT state](#)<sup>p1078</sup>.

**12.2.5.15 Script data less-than sign state** §<sup>p10</sup><sub>82</sub>

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer](#)<sup>p1077</sup> to the empty string. Switch to the [script data end tag open state](#)<sup>p1082</sup>.

↪ **U+0021 EXCLAMATION MARK (!)**

Switch to the [script data escape start state](#)<sup>p1083</sup>. Emit a U+003C LESS-THAN SIGN character token and a U+0021 EXCLAMATION MARK character token.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume](#)<sup>p1077</sup> in the [script data state](#)<sup>p1078</sup>.

**12.2.5.16 Script data end tag open state** §<sup>p10</sup><sub>82</sub>

Consume the [next input character](#)<sup>p1072</sup>:

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume](#)<sup>p1077</sup> in the [script data end tag name state](#)<sup>p1082</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume](#)<sup>p1077</sup> in the [script data state](#)<sup>p1078</sup>.

**12.2.5.17 Script data end tag name state** §<sup>p10</sup><sub>82</sub>

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token](#)<sup>p1077</sup>, then switch to the [before attribute name state](#)<sup>p1088</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1077</sup>, then switch to the [self-closing start tag state](#)<sup>p1091</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1077</sup>, then switch to the [data state](#)<sup>p1078</sup> and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1072</sup> (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character](#)<sup>p1072</sup> to the [temporary buffer](#)<sup>p1077</sup>.

↪ **ASCII lower alpha**

Append the [current input character](#)<sup>p1072</sup> to the current tag token's tag name. Append the [current input character](#)<sup>p1072</sup> to the [temporary buffer](#)<sup>p1077</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer](#)<sup>p1077</sup> (in the order they were added to the buffer). [Reconsume](#)<sup>p1077</sup> in the [script data state](#)<sup>p1078</sup>.

**12.2.5.18 Script data escape start state** §<sup>p10</sup><sub>83</sub>

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escape start dash state](#)<sup>p1083</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **Anything else**

[Reconsume](#)<sup>p1077</sup> in the [script data state](#)<sup>p1078</sup>.

**12.2.5.19 Script data escape start dash state** §<sup>p10</sup><sub>83</sub>

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash dash state](#)<sup>p1084</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **Anything else**

[Reconsume](#)<sup>p1077</sup> in the [script data state](#)<sup>p1078</sup>.

**12.2.5.20 Script data escaped state** §<sup>p10</sup><sub>83</sub>

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash state](#)<sup>p1084</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state](#)<sup>p1084</sup>.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1065</sup> [parse error](#)<sup>p1061</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

**12.2.5.21 Script data escaped dash state** §<sup>p10</sup><sub>84</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash dash state<sup>p1084</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p1084</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Switch to the [script data escaped state<sup>p1083</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data escaped state<sup>p1083</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

**12.2.5.22 Script data escaped dash dash state** §<sup>p10</sup><sub>84</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p1084</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [script data state<sup>p1078</sup>](#). Emit a U+003E GREATER-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Switch to the [script data escaped state<sup>p1083</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data escaped state<sup>p1083</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

**12.2.5.23 Script data escaped less-than sign state** §<sup>p10</sup><sub>84</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Switch to the [script data escaped end tag open state<sup>p1085</sup>](#).

↪ **ASCII alpha**

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1077</sup>](#) in the [script data double escape start state<sup>p1085</sup>](#).

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1077</sup>](#) in the [script data escaped state<sup>p1083</sup>](#).

**12.2.5.24 Script data escaped end tag open state** §<sup>p10</sup><sub>85</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1077</sup>](#) in the [script data escaped end tag name state<sup>p1085</sup>](#).

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume<sup>p1077</sup>](#) in the [script data escaped state<sup>p1083</sup>](#).

**12.2.5.25 Script data escaped end tag name state** §<sup>p10</sup><sub>85</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token<sup>p1077</sup>](#), then switch to the [before attribute name state<sup>p1088</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token<sup>p1077</sup>](#), then switch to the [self-closing start tag state<sup>p1091</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token<sup>p1077</sup>](#), then switch to the [data state<sup>p1078</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#).

↪ **ASCII lower alpha**

Append the [current input character<sup>p1072</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#).

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p1077</sup>](#) (in the order they were added to the buffer). [Reconsume<sup>p1077</sup>](#) in the [script data escaped state<sup>p1083</sup>](#).

**12.2.5.26 Script data double escape start state** §<sup>p10</sup><sub>85</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

If the [temporary buffer<sup>p1077</sup>](#) is the string "script", then switch to the [script data double escaped state<sup>p1086</sup>](#). Otherwise, switch to the [script data escaped state<sup>p1083</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point) to the [temporary buffer<sup>p1077</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **ASCII lower alpha**

Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [script data escaped state<sup>p1083</sup>](#).

### 12.2.5.27 Script data double escaped state §<sup>p10</sup><sub>86</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data double escaped dash state<sup>p1086</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state<sup>p1087</sup>](#). Emit a U+003C LESS-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

### 12.2.5.28 Script data double escaped dash state §<sup>p10</sup><sub>86</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data double escaped dash dash state<sup>p1087</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state<sup>p1087</sup>](#). Emit a U+003C LESS-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Switch to the [script data double escaped state<sup>p1086</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data double escaped state<sup>p1086</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

### 12.2.5.29 Script data double escaped dash dash state §<sup>p10</sup><sub>87</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state<sup>p1087</sup>](#). Emit a U+003C LESS-THAN SIGN character token.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [script data state<sup>p1078</sup>](#). Emit a U+003E GREATER-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Switch to the [script data double escaped state<sup>p1086</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data double escaped state<sup>p1086</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

### 12.2.5.30 Script data double escaped less-than sign state §<sup>p10</sup><sub>87</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Switch to the [script data double escape end state<sup>p1087</sup>](#). Emit a U+002F SOLIDUS character token.

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [script data double escaped state<sup>p1086</sup>](#).

### 12.2.5.31 Script data double escape end state §<sup>p10</sup><sub>87</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

If the [temporary buffer<sup>p1077</sup>](#) is the string "script", then switch to the [script data escaped state<sup>p1083</sup>](#). Otherwise, switch to the [script data double escaped state<sup>p1086</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point) to the [temporary buffer<sup>p1077</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **ASCII lower alpha**

Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#). Emit the [current input character<sup>p1072</sup>](#) as a character token.

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [script data double escaped state<sup>p1086</sup>](#).

### 12.2.5.32 Before attribute name state § p10 88

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

↪ **EOF**

[Reconsume](#)<sup>p1077</sup> in the [after attribute name state](#)<sup>p1089</sup>.

↪ **U+003D EQUALS SIGN (=)**

This is an [unexpected-equals-sign-before-attribute-name](#)<sup>p1065</sup> [parse error](#)<sup>p1061</sup>. Start a new attribute in the current tag token. Set that attribute's name to the [current input character](#)<sup>p1072</sup>, and its value to the empty string. Switch to the [attribute name state](#)<sup>p1088</sup>.

↪ **Anything else**

Start a new attribute in the current tag token. Set that attribute name and value to the empty string. [Reconsume](#)<sup>p1077</sup> in the [attribute name state](#)<sup>p1088</sup>.

### 12.2.5.33 Attribute name state § p10 88

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

↪ **EOF**

[Reconsume](#)<sup>p1077</sup> in the [after attribute name state](#)<sup>p1089</sup>.

↪ **U+003D EQUALS SIGN (=)**

Switch to the [before attribute value state](#)<sup>p1089</sup>.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1072</sup> (add 0x0020 to the character's code point) to the current attribute's name.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1065</sup> [parse error](#)<sup>p1061</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's name.

↪ **U+0022 QUOTATION MARK (")**

↪ **U+0027 APOSTROPHE (')**

↪ **U+003C LESS-THAN SIGN (<)**

This is an [unexpected-character-in-attribute-name](#)<sup>p1064</sup> [parse error](#)<sup>p1061</sup>. Treat it as per the "anything else" entry below.

↪ **Anything else**

Append the [current input character](#)<sup>p1072</sup> to the current attribute's name.

When the user agent leaves the attribute name state (and before emitting the tag token, if appropriate), the complete attribute's name must be compared to the other attributes on the same token; if there is already an attribute on the token with the exact same name, then this is a [duplicate-attribute](#)<sup>p1061</sup> [parse error](#)<sup>p1061</sup> and the new attribute must be removed from the token.

**Note**

If an attribute is so removed from a token, it, and the value that gets associated with it, if any, are never subsequently used by the parser, and are therefore effectively discarded. Removing the attribute in this way does not change its status as the "current attribute" for the purposes of the tokenizer, however.

#### 12.2.5.34 After attribute name state § p10 89

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+002F SOLIDUS (/)**

Switch to the [self-closing start tag state](#)<sup>p1091</sup>.

↪ **U+003D EQUALS SIGN (=)**

Switch to the [before attribute value state](#)<sup>p1089</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state](#)<sup>p1078</sup>. Emit the current tag token.

↪ **EOF**

This is an [eof-in-tag](#)<sup>p1062</sup> [parse error](#)<sup>p1061</sup>. Emit an end-of-file token.

↪ **Anything else**

Start a new attribute in the current tag token. Set that attribute name and value to the empty string. [Reconsume](#)<sup>p1077</sup> in the [attribute name state](#)<sup>p1088</sup>.

#### 12.2.5.35 Before attribute value state § p10 89

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+0022 QUOTATION MARK (")**

Switch to the [attribute value \(double-quoted\) state](#)<sup>p1089</sup>.

↪ **U+0027 APOSTROPHE (')**

Switch to the [attribute value \(single-quoted\) state](#)<sup>p1090</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-attribute-value](#)<sup>p1062</sup> [parse error](#)<sup>p1061</sup>. Switch to the [data state](#)<sup>p1078</sup>. Emit the current tag token.

↪ **Anything else**

[Reconsume](#)<sup>p1077</sup> in the [attribute value \(unquoted\) state](#)<sup>p1090</sup>.

#### 12.2.5.36 Attribute value (double-quoted) state § p10 89

Consume the [next input character](#)<sup>p1072</sup>:

↪ **U+0022 QUOTATION MARK (")**

Switch to the [after attribute value \(quoted\) state<sup>p1091</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1077</sup>](#) to the [attribute value \(double-quoted\) state<sup>p1089</sup>](#). Switch to the [character reference state<sup>p1102</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **EOF**

This is an [eof-in-tag<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current attribute's value.

**12.2.5.37 Attribute value (single-quoted) state** §<sup>p10</sup><sub>90</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0027 APOSTROPHE (')**

Switch to the [after attribute value \(quoted\) state<sup>p1091</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1077</sup>](#) to the [attribute value \(single-quoted\) state<sup>p1090</sup>](#). Switch to the [character reference state<sup>p1102</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **EOF**

This is an [eof-in-tag<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current attribute's value.

**12.2.5.38 Attribute value (unquoted) state** §<sup>p10</sup><sub>90</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before attribute name state<sup>p1088</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1077</sup>](#) to the [attribute value \(unquoted\) state<sup>p1090</sup>](#). Switch to the [character reference state<sup>p1102</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current tag token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

- ↪ **U+0022 QUOTATION MARK (")**
- ↪ **U+0027 APOSTROPHE (')**
- ↪ **U+003C LESS-THAN SIGN (<)**
- ↪ **U+003D EQUALS SIGN (=)**
- ↪ **U+0060 GRAVE ACCENT (`)**

This is an [unexpected-character-in-unquoted-attribute-value<sup>p1064</sup>](#) [parse error<sup>p1061</sup>](#). Treat it as per the "anything else" entry below.

↪ **EOF**

This is an [eof-in-tag<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current attribute's value.

### 12.2.5.39 After attribute value (quoted) state §<sup>p10</sup><sub>91</sub>

Consume the [next input character<sup>p1072</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**

Switch to the [before attribute name state<sup>p1088</sup>](#).

↪ **U+002F SOLIDUS (/)**

Switch to the [self-closing start tag state<sup>p1091</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current tag token.

↪ **EOF**

This is an [eof-in-tag<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

This is a [missing-whitespace-between-attributes<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). [Reconsume<sup>p1077</sup>](#) in the [before attribute name state<sup>p1088</sup>](#).

### 12.2.5.40 Self-closing start tag state §<sup>p10</sup><sub>91</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+003E GREATER-THAN SIGN (>)**

Set the [self-closing flag<sup>p1077</sup>](#) of the current tag token. Switch to the [data state<sup>p1078</sup>](#). Emit the current tag token.

↪ **EOF**

This is an [eof-in-tag<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↪ **Anything else**

This is an [unexpected-solidus-in-tag<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). [Reconsume<sup>p1077</sup>](#) in the [before attribute name state<sup>p1088</sup>](#).

### 12.2.5.41 Bogus comment state §<sup>p10</sup><sub>91</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the comment token.

↪ **EOF**

Emit the comment. Emit an end-of-file token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the comment token's data.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the comment token's data.

**12.2.5.42 Markup declaration open state** §<sup>p10</sup><sub>92</sub>

If the next few characters are:

↪ **Two U+002D HYPHEN-MINUS characters (-)**

Consume those two characters, create a comment token whose data is the empty string, and switch to the [comment start state<sup>p1092</sup>](#).

↪ **ASCII case-insensitive match for the word "DOCTYPE"**

Consume those characters and switch to the [DOCTYPE state<sup>p1095</sup>](#).

↪ **Case-sensitive<sup>p65</sup> match for the string "[CDATA[" (the five uppercase letters "CDATA" with a U+005B LEFT SQUARE BRACKET character before and after)**

Consume those characters. If there is an [adjusted current node<sup>p1074</sup>](#) and it is not an element in the [HTML namespace](#), then switch to the [CDATA section state<sup>p1101</sup>](#). Otherwise, this is a [CDATA-in-html-content<sup>p1061</sup> parse error<sup>p1061</sup>](#). Create a comment token whose data is the "[CDATA[" string. Switch to the [bogus comment state<sup>p1091</sup>](#).

↪ **Anything else**

This is an [incorrectly-opened-comment<sup>p1062</sup> parse error<sup>p1061</sup>](#). Create a comment token whose data is the empty string. Switch to the [bogus comment state<sup>p1091</sup>](#) (don't consume anything in the current state).

**12.2.5.43 Comment start state** §<sup>p10</sup><sub>92</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment start dash state<sup>p1092</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-closing-of-empty-comment<sup>p1061</sup> parse error<sup>p1061</sup>](#). Switch to the [data state<sup>p1078</sup>](#). Emit the comment token.

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

**12.2.5.44 Comment start dash state** §<sup>p10</sup><sub>92</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end state<sup>p1094</sup>](#)

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-closing-of-empty-comment<sup>p1061</sup> parse error<sup>p1061</sup>](#). Switch to the [data state<sup>p1078</sup>](#). Emit the comment token.

↪ **EOF**

This is an [eof-in-comment<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit the comment token. Emit an end-of-file token.

↪ **Anything else**

Append a U+002D HYPHEN-MINUS character (-) to the comment token's data. [Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

#### 12.2.5.45 Comment state §<sup>p10</sup><sub>93</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+003C LESS-THAN SIGN (<)**

Append the [current input character<sup>p1072</sup>](#) to the comment token's data. Switch to the [comment less-than sign state<sup>p1093</sup>](#).

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end dash state<sup>p1094</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the comment token's data.

↪ **EOF**

This is an [eof-in-comment<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit the comment token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the comment token's data.

#### 12.2.5.46 Comment less-than sign state §<sup>p10</sup><sub>93</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0021 EXCLAMATION MARK (!)**

Append the [current input character<sup>p1072</sup>](#) to the comment token's data. Switch to the [comment less-than sign bang state<sup>p1093</sup>](#).

↪ **U+003C LESS-THAN SIGN (<)**

Append the [current input character<sup>p1072</sup>](#) to the comment token's data.

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

#### 12.2.5.47 Comment less-than sign bang state §<sup>p10</sup><sub>93</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment less-than sign bang dash state<sup>p1093</sup>](#).

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

#### 12.2.5.48 Comment less-than sign bang dash state §<sup>p10</sup><sub>93</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment less-than sign bang dash dash state<sup>p1093</sup>](#).

↪ **Anything else**

[Reconsume<sup>p1077</sup>](#) in the [comment end dash state<sup>p1094</sup>](#).

#### 12.2.5.49 Comment less-than sign bang dash dash state §<sup>p10</sup><sub>93</sub>

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+003E GREATER-THAN SIGN (>)**

↳ **EOF**

↳ [Reconsume<sup>p1077</sup>](#) in the [comment end state<sup>p1094</sup>](#).

↳ **Anything else**

This is a [nested-comment<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). [Reconsume<sup>p1077</sup>](#) in the [comment end state<sup>p1094</sup>](#).

#### 12.2.5.50 Comment end dash state §<sup>p10</sup><sub>94</sub>

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end state<sup>p1094</sup>](#)

↳ **EOF**

This is an [eof-in-comment<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit the comment token. Emit an end-of-file token.

↳ **Anything else**

Append a U+002D HYPHEN-MINUS character (-) to the comment token's data. [Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

#### 12.2.5.51 Comment end state §<sup>p10</sup><sub>94</sub>

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the comment token.

↳ **U+0021 EXCLAMATION MARK (!)**

Switch to the [comment end bang state<sup>p1094</sup>](#).

↳ **U+002D HYPHEN-MINUS (-)**

Append a U+002D HYPHEN-MINUS character (-) to the comment token's data.

↳ **EOF**

This is an [eof-in-comment<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit the comment token. Emit an end-of-file token.

↳ **Anything else**

Append two U+002D HYPHEN-MINUS characters (-) to the comment token's data. [Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

#### 12.2.5.52 Comment end bang state §<sup>p10</sup><sub>94</sub>

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+002D HYPHEN-MINUS (-)**

Append two U+002D HYPHEN-MINUS characters (-) and a U+0021 EXCLAMATION MARK character (!) to the comment token's data. Switch to the [comment end dash state<sup>p1094</sup>](#).

↳ **U+003E GREATER-THAN SIGN (>)**

This is an [incorrectly-closed-comment<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Switch to the [data state<sup>p1078</sup>](#). Emit the comment token.

↳ **EOF**

This is an [eof-in-comment<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Emit the comment token. Emit an end-of-file token.

↳ **Anything else**

Append two U+002D HYPHEN-MINUS characters (-) and a U+0021 EXCLAMATION MARK character (!) to the comment token's data. [Reconsume<sup>p1077</sup>](#) in the [comment state<sup>p1093</sup>](#).

### 12.2.5.53 DOCTYPE state § p<sup>10</sup><sub>95</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE name state<sup>p1095</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

[Reconsume<sup>p1077</sup>](#) in the [before DOCTYPE name state<sup>p1095</sup>](#).

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Create a new DOCTYPE token. Set its [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit the token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-whitespace-before-doctype-name<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). [Reconsume<sup>p1077</sup>](#) in the [before DOCTYPE name state<sup>p1095</sup>](#).

### 12.2.5.54 Before DOCTYPE name state § p<sup>10</sup><sub>95</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **ASCII upper alpha**

Create a new DOCTYPE token. Set the token's name to the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point). Switch to the [DOCTYPE name state<sup>p1095</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Create a new DOCTYPE token. Set the token's name to a U+FFFD REPLACEMENT CHARACTER character. Switch to the [DOCTYPE name state<sup>p1095</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-name<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Create a new DOCTYPE token. Set its [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit the token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Create a new DOCTYPE token. Set its [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit the token. Emit an end-of-file token.

↪ **Anything else**

Create a new DOCTYPE token. Set the token's name to the [current input character<sup>p1072</sup>](#). Switch to the [DOCTYPE name state<sup>p1095</sup>](#).

### 12.2.5.55 DOCTYPE name state § p<sup>10</sup><sub>95</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [after DOCTYPE name state<sup>p1096</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current DOCTYPE token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1072</sup>](#) (add 0x0020 to the character's code point) to the current DOCTYPE token's name.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's name.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current DOCTYPE token's name.

**12.2.5.56 After DOCTYPE name state** §<sup>p10</sup><sub>96</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

If the six characters starting from the [current input character<sup>p1072</sup>](#) are an [ASCII case-insensitive](#) match for the word "PUBLIC", then consume those characters and switch to the [after DOCTYPE public keyword state<sup>p1096</sup>](#).

Otherwise, if the six characters starting from the [current input character<sup>p1072</sup>](#) are an [ASCII case-insensitive](#) match for the word "SYSTEM", then consume those characters and switch to the [after DOCTYPE system keyword state<sup>p1099</sup>](#).

Otherwise, this is an [invalid-character-sequence-after-doctype-name<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

**12.2.5.57 After DOCTYPE public keyword state** §<sup>p10</sup><sub>96</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE public identifier state<sup>p1097</sup>](#).

↪ **U+0022 QUOTATION MARK (")**

This is a [missing-whitespace-after-doctype-public-keyword<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(double-quoted\) state<sup>p1097</sup>](#).

↪ **U+0027 APOSTROPHE (')**

This is a [missing-whitespace-after-doctype-public-keyword<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's public identifier to the

empty string (not missing), then switch to the [DOCTYPE public identifier \(single-quoted\) state<sup>p1098</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-public-identifier<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-public-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

### 12.2.5.58 Before DOCTYPE public identifier state §<sup>p10</sup><sub>97</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+0022 QUOTATION MARK (")**

Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(double-quoted\) state<sup>p1097</sup>](#).

↪ **U+0027 APOSTROPHE (')**

Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(single-quoted\) state<sup>p1098</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-public-identifier<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-public-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

### 12.2.5.59 DOCTYPE public identifier (double-quoted) state §<sup>p10</sup><sub>97</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0022 QUOTATION MARK (")**

Switch to the [after DOCTYPE public identifier state<sup>p1098</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's public identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-doctype-public-identifier<sup>p1061</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current DOCTYPE token's public identifier.

**12.2.5.60 DOCTYPE public identifier (single-quoted) state** §<sup>p10</sup><sub>98</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0027 APOSTROPHE (')**

Switch to the [after DOCTYPE public identifier state<sup>p1098</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup>](#) [parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's public identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-doctype-public-identifier<sup>p1061</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current DOCTYPE token's public identifier.

**12.2.5.61 After DOCTYPE public identifier state** §<sup>p10</sup><sub>98</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [between DOCTYPE public and system identifiers state<sup>p1098</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current DOCTYPE token.

↪ **U+0022 QUOTATION MARK (")**

This is a [missing-whitespace-between-doctype-public-and-system-identifiers<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p1100</sup>](#).

↪ **U+0027 APOSTROPHE (')**

This is a [missing-whitespace-between-doctype-public-and-system-identifiers<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p1100</sup>](#).

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

**12.2.5.62 Between DOCTYPE public and system identifiers state** §<sup>p10</sup><sub>98</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current DOCTYPE token.

↪ **U+0022 QUOTATION MARK (")**

Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p1100</sup>](#).

↪ **U+0027 APOSTROPHE (')**

Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p1100</sup>](#).

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

### 12.2.5.63 After DOCTYPE system keyword state §<sup>p10</sup><sub>99</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE system identifier state<sup>p1099</sup>](#).

↪ **U+0022 QUOTATION MARK (")**

This is a [missing-whitespace-after-doctype-system-keyword<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p1100</sup>](#).

↪ **U+0027 APOSTROPHE (')**

This is a [missing-whitespace-after-doctype-system-keyword<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p1100</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-system-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

### 12.2.5.64 Before DOCTYPE system identifier state §<sup>p10</sup><sub>99</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+0022 QUOTATION MARK (")**

Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p1100</sup>](#).

↪ **U+0027 APOSTROPHE (')**

Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p1100</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-system-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier<sup>p1063</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#).

#### 12.2.5.65 DOCTYPE system identifier (double-quoted) state §<sup>p11</sup><sub>00</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0022 QUOTATION MARK (")**

Switch to the [after DOCTYPE system identifier state<sup>p1101</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's system identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-doctype-system-identifier<sup>p1061</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current DOCTYPE token's system identifier.

#### 12.2.5.66 DOCTYPE system identifier (single-quoted) state §<sup>p11</sup><sub>00</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+0027 APOSTROPHE (')**

Switch to the [after DOCTYPE system identifier state<sup>p1101</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's system identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-doctype-system-identifier<sup>p1061</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Switch to

the [data state<sup>p1078</sup>](#). Emit that DOCTYPE token.

↳ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↳ **Anything else**

Append the [current input character<sup>p1072</sup>](#) to the current DOCTYPE token's system identifier.

### 12.2.5.67 After DOCTYPE system identifier state § p1101

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+0009 CHARACTER TABULATION (tab)**

↳ **U+000A LINE FEED (LF)**

↳ **U+000C FORM FEED (FF)**

↳ **U+0020 SPACE**

Ignore the character.

↳ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the current DOCTYPE token.

↳ **EOF**

This is an [eof-in-doctype<sup>p1062</sup> parse error<sup>p1061</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*. Emit that DOCTYPE token. Emit an end-of-file token.

↳ **Anything else**

This is an [unexpected-character-after-doctype-system-identifier<sup>p1064</sup> parse error<sup>p1061</sup>](#). [Reconsume<sup>p1077</sup>](#) in the [bogus DOCTYPE state<sup>p1101</sup>](#). (This does *not* set the DOCTYPE token's [force-quirks flag<sup>p1077</sup>](#) to *on*.)

### 12.2.5.68 Bogus DOCTYPE state § p1101

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1078</sup>](#). Emit the DOCTYPE token.

↳ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1065</sup> parse error<sup>p1061</sup>](#). Ignore the character.

↳ **EOF**

Emit the DOCTYPE token. Emit an end-of-file token.

↳ **Anything else**

Ignore the character.

### 12.2.5.69 CDATA section state § p1101

Consume the [next input character<sup>p1072</sup>](#):

↳ **U+005D RIGHT SQUARE BRACKET (])**

Switch to the [CDATA section bracket state<sup>p1102</sup>](#).

↳ **EOF**

This is an [eof-in-cdata<sup>p1062</sup> parse error<sup>p1061</sup>](#). Emit an end-of-file token.

↳ **Anything else**

Emit the [current input character<sup>p1072</sup>](#) as a character token.

**Note**

*U+0000 NULL characters are handled in the tree construction stage, as part of the [in foreign content<sup>p1142</sup>](#) insertion mode, which is the only place where CDATA sections can appear.*

**12.2.5.70 CDATA section bracket state** §<sup>p11</sup><sub>02</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+005D RIGHT SQUARE BRACKET (])**

Switch to the [CDATA section end state<sup>p1102</sup>](#).

↪ **Anything else**

Emit a U+005D RIGHT SQUARE BRACKET character token. [Reconsume<sup>p1077</sup>](#) in the [CDATA section state<sup>p1101</sup>](#).

**12.2.5.71 CDATA section end state** §<sup>p11</sup><sub>02</sub>

Consume the [next input character<sup>p1072</sup>](#):

↪ **U+005D RIGHT SQUARE BRACKET (])**

Emit a U+005D RIGHT SQUARE BRACKET character token.

↪ **U+003E GREATER-THAN SIGN character**

Switch to the [data state<sup>p1078</sup>](#).

↪ **Anything else**

Emit two U+005D RIGHT SQUARE BRACKET character tokens. [Reconsume<sup>p1077</sup>](#) in the [CDATA section state<sup>p1101</sup>](#).

**12.2.5.72 Character reference state** §<sup>p11</sup><sub>02</sub>

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Append a U+0026 AMPERSAND (&) character to the [temporary buffer<sup>p1077</sup>](#). Consume the [next input character<sup>p1072</sup>](#):

↪ **ASCII alphanumeric**

[Reconsume<sup>p1077</sup>](#) in the [named character reference state<sup>p1102</sup>](#).

↪ **U+0023 NUMBER SIGN (#)**

Append the [current input character<sup>p1072</sup>](#) to the [temporary buffer<sup>p1077</sup>](#). Switch to the [numeric character reference state<sup>p1103</sup>](#).

↪ **Anything else**

[Flush code points consumed as a character reference<sup>p1077</sup>](#). [Reconsume<sup>p1077</sup>](#) in the [return state<sup>p1077</sup>](#).

**12.2.5.73 Named character reference state** §<sup>p11</sup><sub>02</sub>

Consume the maximum number of characters possible, with the consumed characters matching one of the identifiers in the first column of the [named character references<sup>p1158</sup>](#) table (in a [case-sensitive<sup>p65</sup>](#) manner). Append each character to the [temporary buffer<sup>p1077</sup>](#) when it's consumed.

↪ **If there is a match**

If the character reference was [consumed as part of an attribute<sup>p1077</sup>](#), and the last character matched is not a U+003B SEMICOLON character (;), and the [next input character<sup>p1072</sup>](#) is either a U+003D EQUALS SIGN character (=) or an [ASCII alphanumeric](#), then, for historical reasons, [flush code points consumed as a character reference<sup>p1077</sup>](#) and switch to the [return state<sup>p1077</sup>](#).

Otherwise:

1. If the last character matched is not a U+003B SEMICOLON character (;), then this is a [missing-semicolon-after-character-reference<sup>p1063</sup>](#) [parse error<sup>p1061</sup>](#).

2. Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Append one or two characters corresponding to the character reference name (as given by the second column of the [named character references<sup>p1158</sup>](#) table) to the [temporary buffer<sup>p1077</sup>](#).
3. [Flush code points consumed as a character reference<sup>p1077</sup>](#). Switch to the [return state<sup>p1077</sup>](#).

↳ **Otherwise**

[Flush code points consumed as a character reference<sup>p1077</sup>](#). Switch to the [ambiguous ampersand state<sup>p1103</sup>](#).

### Example

If the markup contains (not in an attribute) the string I'm &notit; I tell you, the character reference is parsed as "not", as in, I'm -it; I tell you (and this is a parse error). But if the markup was I'm &notin; I tell you, the character reference would be parsed as "notin;", resulting in I'm ∉ I tell you (and no parse error).

However, if the markup contains the string I'm &notit; I tell you in an attribute, no character reference is parsed and string remains intact (and there is no parse error).

#### 12.2.5.74 Ambiguous ampersand state §<sup>p11</sup><sub>03</sub>

Consume the [next input character<sup>p1072</sup>](#):

↳ **ASCII alphanumeric**

If the character reference was [consumed as part of an attribute<sup>p1077</sup>](#), then append the [current input character<sup>p1072</sup>](#) to the current attribute's value. Otherwise, emit the [current input character<sup>p1072</sup>](#) as a character token.

↳ **U+003B SEMICOLON (;)**

0x9F	0x0178 LATIN CAPITAL LETTER Y WITH DIAERESIS (ÿ)

Set the [temporary buffer<sup>p1077</sup>](#) to the empty string. Append a code point equal to the [character reference code<sup>p1103</sup>](#) to the [temporary buffer<sup>p1077</sup>](#). Flush code points consumed as a [character reference<sup>p1077</sup>](#). Switch to the [return state<sup>p1077</sup>](#).

## 12.2.6 Tree construction §<sup>p11</sup><sub>05</sub>

The input to the tree construction stage is a sequence of tokens from the [tokenization<sup>p1077</sup>](#) stage. The tree construction stage is associated with a DOM [Document<sup>p111</sup>](#) object when a parser is created. The "output" of this stage consists of dynamically modifying or extending that document's DOM tree.

This specification does not define when an interactive user agent has to render the [Document<sup>p111</sup>](#) so that it is available to the user, or when it has to begin accepting user input.

As each token is emitted from the tokenizer, the user agent must follow the appropriate steps from the following list, known as the **tree construction dispatcher**:

- ↪ If the [stack of open elements](#)<sup>p1073</sup> is empty
- ↪ If the [adjusted current node](#)<sup>p1074</sup> is an element in the [HTML namespace](#)
- ↪ If the [adjusted current node](#)<sup>p1074</sup> is a [MathML text integration point](#)<sup>p1106</sup> and the token is a start tag whose tag name is neither "mglyph" nor "malignmark"
- ↪ If the [adjusted current node](#)<sup>p1074</sup> is a [MathML text integration point](#)<sup>p1106</sup> and the token is a character token
- ↪ If the [adjusted current node](#)<sup>p1074</sup> is a [MathML annotation-xml](#) element and the token is a start tag whose tag name is "svg"
- ↪ If the [adjusted current node](#)<sup>p1074</sup> is an [HTML integration point](#)<sup>p1106</sup> and the token is a start tag
- ↪ If the [adjusted current node](#)<sup>p1074</sup> is an [HTML integration point](#)<sup>p1106</sup> and the token is a character token
- ↪ If the token is an end-of-file token
  - Process the token according to the rules given in the section corresponding to the current [insertion mode](#)<sup>p1072</sup> in HTML content.
- ↪ Otherwise
  - Process the token according to the rules given in the section for parsing tokens [in foreign content](#)<sup>p1142</sup>.

The **next token** is the token that is about to be processed by the [tree construction dispatcher](#)<sup>p1105</sup> (even if the token is subsequently just ignored).

A node is a **MathML text integration point** if it is one of the following elements:

- A [MathML mi](#) element
- A [MathML mo](#) element
- A [MathML mn](#) element
- A [MathML ms](#) element
- A [MathML mtext](#) element

A node is an **HTML integration point** if it is one of the following elements:

- A [MathML annotation-xml](#) element whose start tag token had an attribute with the name "encoding" whose value was an [ASCII case-insensitive](#) match for the string "text/html"
- A [MathML annotation-xml](#) element whose start tag token had an attribute with the name "encoding" whose value was an [ASCII case-insensitive](#) match for the string "application/xhtml+xml"
- An [SVG foreignObject](#) element
- An [SVG desc](#) element
- An [SVG title](#) element

#### Note

If the node in question is the [context](#)<sup>p1157</sup> element passed to the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, then the start tag token for that element is the "fake" token created during by that [HTML fragment parsing algorithm](#)<sup>p1157</sup>.

#### Note

Not all of the tag names mentioned below are conformant tag names in this specification; many are included to handle legacy content. They still form part of the algorithm that implementations are required to implement to claim conformance.

#### Note

The algorithm described below places no limit on the depth of the DOM tree generated, or on the length of tag names, attribute names, attribute values, [Text](#) nodes, etc. While implementers are encouraged to avoid arbitrary limits, it is recognized that [practical concerns](#)<sup>p47</sup> will likely force user agents to impose nesting depth constraints.

### 12.2.6.1 Creating and inserting nodes § p1106

While the parser is processing a token, it can enable or disable **foster parenting**. This affects the following algorithm.

The **appropriate place for inserting a node**, optionally using a particular *override target*, is the position in an element returned by running the following steps:

1. If there was an *override target* specified, then let *target* be the *override target*.  
Otherwise, let *target* be the [current node](#)<sup>p1074</sup>.
2. Determine the *adjusted insertion location* using the first matching steps from the following list:

↪ If [foster parenting](#)<sup>p1106</sup> is enabled and *target* is a [table](#)<sup>p443</sup>, [tbody](#)<sup>p454</sup>, [tfoot](#)<sup>p456</sup>, [thead](#)<sup>p455</sup>, or [tr](#)<sup>p457</sup> element

#### Note

*Foster parenting happens when content is misnested in tables.*

Run these substeps:

1. Let *last template* be the last [template](#)<sup>p623</sup> element in the [stack of open elements](#)<sup>p1073</sup>, if any.
2. Let *last table* be the last [table](#)<sup>p443</sup> element in the [stack of open elements](#)<sup>p1073</sup>, if any.
3. If there is a *last template* and either there is no *last table*, or there is one, but *last template* is lower (more recently added) than *last table* in the [stack of open elements](#)<sup>p1073</sup>, then: let *adjusted insertion location* be inside *last template*'s [template contents](#)<sup>p624</sup>, after its last child (if any), and abort these steps.
4. If there is no *last table*, then let *adjusted insertion location* be inside the first element in the [stack of open elements](#)<sup>p1073</sup> (the [html](#)<sup>p149</sup> element), after its last child (if any), and abort these steps. ([fragment case](#)<sup>p1157</sup>)
5. If *last table* has a parent node, then let *adjusted insertion location* be inside *last table*'s parent node, immediately before *last table*, and abort these steps.
6. Let *previous element* be the element immediately above *last table* in the [stack of open elements](#)<sup>p1073</sup>.
7. Let *adjusted insertion location* be inside *previous element*, after its last child (if any).

#### Note

*These steps are involved in part because it's possible for elements, the [table](#)<sup>p443</sup> element in this case in particular, to have been moved by a script around in the DOM, or indeed removed from the DOM entirely, after the element was inserted by the parser.*

#### ↪ Otherwise

Let *adjusted insertion location* be inside *target*, after its last child (if any).

3. If the *adjusted insertion location* is inside a [template](#)<sup>p623</sup> element, let it instead be inside the [template](#)<sup>p623</sup> element's [template contents](#)<sup>p624</sup>, after its last child (if any).
4. Return the *adjusted insertion location*.

When the steps below require the UA to **create an element for a token** in a particular *given namespace* and with a particular *intended parent*, the UA must run the following steps:

1. Let *document* be *intended parent*'s [node document](#).
2. Let *local name* be the tag name of the token.
3. Let *is* be the value of the "[is](#)<sup>p696</sup>" attribute in the given token, if such an attribute exists, or null otherwise.
4. Let *definition* be the result of [looking up a custom element definition](#)<sup>p698</sup> given *document*, *given namespace*, *local name*, and *is*.
5. If *definition* is non-null and the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, then let *will execute script* be true. Otherwise, let it be false.
6. If *will execute script* is true, then:
  1. Increment *document*'s [throw-on-dynamic-markup-insertion counter](#)<sup>p947</sup>.
  2. If the [JavaScript execution context stack](#) is empty, then [perform a microtask checkpoint](#)<sup>p929</sup>.
  3. Push a new [element queue](#)<sup>p705</sup> onto *document*'s [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>.
7. Let *element* be the result of [creating an element](#) given *document*, *localName*, *given namespace*, null, and *is*. If *will execute script* is true, set the *synchronous custom elements flag*; otherwise, leave it unset.

**Note**

This will cause [custom element constructors](#)<sup>p696</sup> to run, if `will execute script` is true. However, since we incremented the [throw-on-dynamic-markup-insertion counter](#)<sup>p947</sup>, this cannot cause [new characters to be inserted into the tokenizer](#)<sup>p950</sup>, or [the document to be blown away](#)<sup>p949</sup>.

- Append each attribute in the given token to *element*.

**Note**

This can [enqueue a custom element callback reaction](#)<sup>p706</sup> for the `attributeChangedCallback`, which might run immediately (in the next step).

**Note**

Even though the `is`<sup>p696</sup> attribute governs the [creation](#) of a [customized built-in element](#)<sup>p696</sup>, it is not present during the execution of the relevant [custom element constructor](#)<sup>p696</sup>; it is appended in this step, along with all other attributes.

- If `will execute script` is true, then:
  - Let *queue* be the result of popping from *document*'s [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>. (This will be the same [element queue](#)<sup>p705</sup> as was pushed above.)
  - [Invoke custom element reactions](#)<sup>p706</sup> in *queue*.
  - Decrement *document*'s [throw-on-dynamic-markup-insertion counter](#)<sup>p947</sup>.
- If *element* has an `xmlns` attribute in the [XMLNS namespace](#) whose value is not exactly the same as the element's namespace, that is a [parse error](#)<sup>p1061</sup>. Similarly, if *element* has an `xmlns:xlink` attribute in the [XMLNS namespace](#) whose value is not the [XLink Namespace](#), that is a [parse error](#)<sup>p1061</sup>.
- If *element* is a [resettable element](#)<sup>p479</sup>, invoke its [reset algorithm](#)<sup>p597</sup>. (This initializes the element's [value](#)<sup>p559</sup> and [checkedness](#)<sup>p559</sup> based on the element's attributes.)
- If *element* is a [form-associated element](#)<sup>p479</sup> and not a [form-associated custom element](#)<sup>p697</sup>, the [form element pointer](#)<sup>p1076</sup> is not null, there is no [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, *element* is either not [listed](#)<sup>p479</sup> or doesn't have a [form](#)<sup>p559</sup> attribute, and the *intended parent* is in the same [tree](#) as the element pointed to by the [form element pointer](#)<sup>p1076</sup>, then [associate](#)<sup>p560</sup> *element* with the [form](#)<sup>p479</sup> element pointed to by the [form element pointer](#)<sup>p1076</sup> and set *element*'s [parser inserted flag](#)<sup>p559</sup>.
- Return *element*.

When the steps below require the user agent to **insert a foreign element** for a token in a given namespace, the user agent must run these steps:

- Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1106</sup>.
- Let *element* be the result of [creating an element for the token](#)<sup>p1107</sup> in the given namespace, with the intended parent being the element in which the *adjusted insertion location* finds itself.
- If it is possible to insert *element* at the *adjusted insertion location*, then:
  - If the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, then push a new [element queue](#)<sup>p705</sup> onto *element*'s [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>.
  - Insert *element* at the *adjusted insertion location*.
  - If the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, then pop the [element queue](#)<sup>p705</sup> from *element*'s [relevant agent](#)<sup>p919</sup>'s [custom element reactions stack](#)<sup>p705</sup>, and [invoke custom element reactions](#)<sup>p706</sup> in that queue.

**Note**

If the adjusted insertion location cannot accept more elements, e.g. because it's a [Document](#)<sup>p111</sup> that already has an element child, then *element* is dropped on the floor.

- Push *element* onto the [stack of open elements](#)<sup>p1073</sup> so that it is the new [current node](#)<sup>p1074</sup>.
- Return *element*.

When the steps below require the user agent to **insert an HTML element** for a token, the user agent must [insert a foreign element](#)<sup>p1108</sup> for the token, in the [HTML namespace](#).

When the steps below require the user agent to **adjust MathML attributes** for a token, then, if the token has an attribute named `definitionurl`, change its name to `definitionURL` (note the case difference).

When the steps below require the user agent to **adjust SVG attributes** for a token, then, for each attribute on the token whose attribute name is one of the ones in the first column of the following table, change the attribute's name to the name given in the corresponding cell in the second column. (This fixes the case of SVG attributes that are not all lowercase.)

<b>Attribute name on token</b>	<b>Attribute name on element</b>
attributename	attributeName
attributetype	attributeType
basefrequency	baseFrequency
baseprofile	baseProfile
calcmode	calcMode
clippathunits	clipPathUnits
diffuseconstant	diffuseConstant
edgemode	edgeMode
filterunits	filterUnits
glyphref	glyphRef
gradienttransform	gradientTransform

refx	refX
refy	refY
repeatcount	repeatCount
repeatdur	repeatDur
requiredextensions	requiredExtensions
requiredfeatures	requiredFeatures
specularconstant	specularConstant
specularexponent	specularExponent
spreadmethod	spreadMethod
startoffset	startOffset
stddeviation	stdDeviation

Attribute name on token	Attribute name on element
stitchtiles	stitchTiles
surfacescale	surfaceScale
systemlanguage	systemLanguage
tablevalues	tableValues
targetx	targetX
targety	targetY
textlength	textLength
viewbox	viewBox
viewtarget	viewTarget
xchannelselector	xChannelSelector
ychannelselector	yChannelSelector
zoomandpan	zoomAndPan

When the steps below require the user agent to **adjust foreign attributes** for a token, then, if any of the attributes on the token match the strings given in the first column of the following table, let the attribute be a namespaced attribute, with the prefix being the string given in the corresponding cell in the second column, the local name being the string given in the corresponding cell in the third column, and the namespace being the namespace given in the corresponding cell in the fourth column. (This fixes the use of namespaced attributes, in particular [lang attributes in the XML namespace](#)<sup>p137</sup>.)

Attribute name	Prefix	Local name	Namespace
xlink:actuate	xlink	actuate	<a href="#">XLink namespace</a>
xlink:arcrole	xlink	arcrole	<a href="#">XLink namespace</a>
xlink:href	xlink	href	<a href="#">XLink namespace</a>
xlink:role	xlink	role	<a href="#">XLink namespace</a>
xlink:show	xlink	show	<a href="#">XLink namespace</a>
xlink:title	xlink	title	<a href="#">XLink namespace</a>
xlink:type	xlink	type	<a href="#">XLink namespace</a>
xml:lang	xml	lang	<a href="#">XML namespace</a>
xml:space	xml	space	<a href="#">XML namespace</a>
xmlns	(none)	xmlns	<a href="#">XMLNS namespace</a>
xmlns:xlink	xmlns	xlink	<a href="#">XMLNS namespace</a>

When the steps below require the user agent to **insert a character** while processing a token, the user agent must run the following steps:

1. Let *data* be the characters passed to the algorithm, or, if no characters were explicitly specified, the character of the character token being processed.
2. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1106</sup>.
3. If the *adjusted insertion location* is in a [Document](#)<sup>p111</sup> node, then return.

**Note**

The DOM will not let [Document](#)<sup>p111</sup> nodes have [Text](#) node children, so they are dropped on the floor.

4. If there is a [Text](#) node immediately before the *adjusted insertion location*, then append *data* to that [Text](#) node's data.

Otherwise, create a new [Text](#) node whose data is *data* and whose [node document](#) is the same as that of the element in which the *adjusted insertion location* finds itself, and insert the newly created node at the *adjusted insertion location*.

**Example**

Here are some sample inputs to the parser and the corresponding number of [Text](#) nodes that they result in, assuming a user agent that executes scripts.

Input	Number of <a href="#">Text</a> nodes
<pre>A&lt;script&gt; var script = document.getElementsByTagName('script')[0];</pre>	One <a href="#">Text</a> node in the document, containing "AB".

Input	Number of <b>Text</b> nodes
<pre>document.body.removeChild(script); &lt;/script&gt;B</pre>	
<pre>A&lt;script&gt; var text = document.createTextNode('B'); document.body.appendChild(text); &lt;/script&gt;C</pre>	Three <b>Text</b> nodes; "A" before the script, the script's contents, and "BC" after the script (the parser appends to the <b>Text</b> node created by the script).
<pre>A&lt;script&gt; var text = document.getElementsByTagName('script')[0].firstChild; text.data = 'B'; document.body.appendChild(text); &lt;/script&gt;C</pre>	Two adjacent <b>Text</b> nodes in the document, containing "A" and "BC".
<pre>A&lt;table&gt;B&lt;tr&gt;C&lt;/tr&gt;D&lt;/table&gt;</pre>	One <b>Text</b> node before the table, containing "ABCD". (This is caused by <a href="#">foster parenting</a> <sup>p1106</sup> .)
<pre>A&lt;table&gt;&lt;tr&gt; B&lt;/tr&gt; C&lt;/table&gt;</pre>	One <b>Text</b> node before the table, containing "A B C" (A-space-B-space-C). (This is caused by <a href="#">foster parenting</a> <sup>p1106</sup> .)
<pre>A&lt;table&gt;&lt;tr&gt; B&lt;/tr&gt; &lt;/em&gt;C&lt;/table&gt;</pre>	One <b>Text</b> node before the table, containing "A BC" (A-space-B-C), and one <b>Text</b> node inside the table (as a child of a <a href="#">tbody</a> <sup>p454</sup> ) with a single space character. (Space characters separated from non-space characters by non-character tokens are not affected by <a href="#">foster parenting</a> <sup>p1106</sup> , even if those other tokens then get ignored.)

When the steps below require the user agent to **insert a comment** while processing a comment token, optionally with an explicitly insertion position *position*, the user agent must run the following steps:

1. Let *data* be the data given in the comment token being processed.
2. If *position* was specified, then let the *adjusted insertion location* be *position*. Otherwise, let *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1106</sup>.
3. Create a **Comment** node whose *data* attribute is set to *data* and whose [node document](#) is the same as that of the node in which the *adjusted insertion location* finds itself.
4. Insert the newly created node at the *adjusted insertion location*.

DOM mutation events must not fire for changes caused by the UA parsing the document. This includes the parsing of any content inserted using [document.write\(\)](#)<sup>p950</sup> and [document.writeln\(\)](#)<sup>p950</sup> calls. [\[UIEVENTS\]](#)<sup>p1270</sup>

However, [mutation observers](#) *do* fire, as required by *DOM*.

### 12.2.6.2 Parsing elements that contain only text § p11

The **generic raw text element parsing algorithm** and the **generic RCDATA element parsing algorithm** consist of the following steps. These algorithms are always invoked in response to a start tag token.

1. [Insert an HTML element](#)<sup>p1109</sup> for the token.
2. If the algorithm that was invoked is the [generic raw text element parsing algorithm](#)<sup>p1111</sup>, switch the tokenizer to the [RAWTEXT state](#)<sup>p1078</sup>; otherwise the algorithm invoked was the [generic RCDATA element parsing algorithm](#)<sup>p1111</sup>, switch the tokenizer to the [RCDATA state](#)<sup>p1078</sup>.
3. Let the [original insertion mode](#)<sup>p1072</sup> be the current [insertion mode](#)<sup>p1072</sup>.
4. Then, switch the [insertion mode](#)<sup>p1072</sup> to "[text](#)<sup>p1129</sup>".

### 12.2.6.3 Closing elements that have implied end tags <sup>§ p11</sup><sub>12</sub>

When the steps below require the UA to **generate implied end tags**, then, while the [current node](#)<sup>p1074</sup> is a [dd](#)<sup>p227</sup> element, a [dt](#)<sup>p226</sup> element, an [li](#)<sup>p220</sup> element, an [optgroup](#)<sup>p537</sup> element, an [option](#)<sup>p539</sup> element, a [p](#)<sup>p207</sup> element, an [rb](#)<sup>p1212</sup> element, an [rp](#)<sup>p253</sup> element, an [rt](#)<sup>p253</sup> element, or an [rtc](#)<sup>p1212</sup> element, the UA must pop the [current node](#)<sup>p1074</sup> off the [stack of open elements](#)<sup>p1073</sup>.

If a step requires the UA to generate implied end tags but lists an element to exclude from the process, then the UA must perform the above steps as if that element was not in the above list.

When the steps below require the UA to **generate all implied end tags thoroughly**, then, while the [current node](#)<sup>p1074</sup> is a [caption](#)<sup>p451</sup> element, a [colgroup](#)<sup>p452</sup> element, a [dd](#)<sup>p227</sup> element, a [dt](#)<sup>p226</sup> element, an [li](#)<sup>p220</sup> element, an [optgroup](#)<sup>p537</sup> element, an [option](#)<sup>p539</sup> element, a [p](#)<sup>p207</sup> element, an [rb](#)<sup>p1212</sup> element, an [rp](#)<sup>p253</sup> element, an [rt](#)<sup>p253</sup> element, an [rtc](#)<sup>p1212</sup> element, a [tbody](#)<sup>p454</sup> element, a [td](#)<sup>p459</sup> element, a [tfoot](#)<sup>p456</sup> element, a [th](#)<sup>p460</sup> element, a [thead](#)<sup>p455</sup> element, or a [tr](#)<sup>p457</sup> element, the UA must pop the [current node](#)<sup>p1074</sup> off the [stack of open elements](#)<sup>p1073</sup>.

### 12.2.6.4 The rules for parsing tokens in HTML content <sup>§ p11</sup><sub>12</sub>

#### 12.2.6.4.1 The "initial" insertion mode <sup>§ p11</sup><sub>12</sub>

When the user agent is to apply the rules for the "[initial](#)<sup>p1112</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Ignore the token.

↪ **A comment token**

[Insert a comment](#)<sup>p1111</sup> as the last child of the [Document](#)<sup>p111</sup> object.

↪ **A DOCTYPE token**

If the DOCTYPE token's name is not a [case-sensitive](#)<sup>p65</sup> match for the string "html", or the token's public identifier is not missing, or the token's system identifier is neither missing nor a [case-sensitive](#)<sup>p65</sup> match for the string "[about:legacy-compat](#)<sup>p86</sup>", then there is a [parse error](#)<sup>p1061</sup>.

Append a [DocumentType](#) node to the [Document](#)<sup>p111</sup> node, with the name attribute set to the name given in the DOCTYPE token, or the empty string if the name was missing; the [publicId](#) attribute set to the public identifier given in the DOCTYPE token, or the empty string if the public identifier was missing; the [systemId](#) attribute set to the system identifier given in the DOCTYPE token, or the empty string if the system identifier was missing; and the other attributes specific to [DocumentType](#) objects set to null and empty lists as appropriate. Associate the [DocumentType](#) node with the [Document](#)<sup>p111</sup> object so that it is returned as the value of the [doctype](#) attribute of the [Document](#)<sup>p111</sup> object.

Then, if the document is *not* an [iframe srcdoc document](#)<sup>p356</sup>, and the DOCTYPE token matches one of the conditions in the following list, then set the [Document](#)<sup>p111</sup> to [quirks mode](#):

- The [force-quirks flag](#)<sup>p1077</sup> is set to on.
- The name is set to anything other than "html" (compared [case-sensitively](#)<sup>p65</sup>).
- The public identifier is set to: "-//W30//DTD W3 HTML Strict 3.0//EN//"
- The public identifier is set to: "-//W3C/DTD HTML 4.0 Transitional/EN"
- The public identifier is set to: "HTML"
- The system identifier is set to: "http://www.ibm.com/data/dtd/v11/ibmhtml1-transitional.dtd"
- The public identifier starts with: "+//Silmaril//dtd html Pro v0r11 19970101//"
- The public identifier starts with: "-//AS//DTD HTML 3.0 asWedit + extensions//"
- The public identifier starts with: "-//AdvaSoft Ltd//DTD HTML 3.0 asWedit + extensions//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0//"
- The public identifier starts with: "-//IETF//DTD HTML 2.1E//"
- The public identifier starts with: "-//IETF//DTD HTML 3.0//"
- The public identifier starts with: "-//IETF//DTD HTML 3.2 Final//"
- The public identifier starts with: "-//IETF//DTD HTML 3.2//"
- The public identifier starts with: "-//IETF//DTD HTML 3//"
- The public identifier starts with: "-//IETF//DTD HTML Level 0//"
- The public identifier starts with: "-//IETF//DTD HTML Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML Level 3//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 0//"

- The public identifier starts with: "-//IETF//DTD HTML Strict Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 3//"
- The public identifier starts with: "-//IETF//DTD HTML Strict//"
- The public identifier starts with: "-//IETF//DTD HTML//"
- The public identifier starts with: "-//Metrius//DTD Metrius Presentational//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 HTML Strict//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 HTML//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 Tables//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 HTML Strict//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 HTML//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 Tables//"
- The public identifier starts with: "-//Netscape Comm. Corp.//DTD HTML//"
- The public identifier starts with: "-//Netscape Comm. Corp.//DTD Strict HTML//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML 2.0//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML Extended 1.0//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML Extended Relaxed 1.0//"
- The public identifier starts with: "-//SQ//DTD HTML 2.0 HoTMetaL + extensions//"
- The public identifier starts with: "-//SoftQuad Software//DTD HoTMetaL PRO 6.0::19990601::extensions to HTML 4.0//"
- The public identifier starts with: "-//SoftQuad//DTD HoTMetaL PRO 4.0::19971010::extensions to HTML 4.0//"
- The public identifier starts with: "-//Spyglass//DTD HTML 2.0 Extended//"
- The public identifier starts with: "-//Sun Microsystems Corp.//DTD HotJava HTML//"
- The public identifier starts with: "-//Sun Microsystems Corp.//DTD HotJava Strict HTML//"
- The public identifier starts with: "-//W3C//DTD HTML 3 1995-03-24//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2 Draft//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2 Final//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2S Draft//"
- The public identifier starts with: "-//W3C//DTD HTML 4.0 Frameset//"
- The public identifier starts with: "-//W3C//DTD HTML 4.0 Transitional//"
- The public identifier starts with: "-//W3C//DTD HTML Experimental 19960712//"
- The public identifier starts with: "-//W3C//DTD HTML Experimental 970421//"
- The public identifier starts with: "-//W3C//DTD W3 HTML//"
- The public identifier starts with: "-//W30//DTD W3 HTML 3.0//"
- The public identifier starts with: "-//WebTechs//DTD Mozilla HTML 2.0//"
- The public identifier starts with: "-//WebTechs//DTD Mozilla HTML//"
- The system identifier is missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Frameset//"
- The system identifier is missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Transitional//"

Otherwise, if the document is *not* an [iframe srcdoc document](#)<sup>p356</sup>, and the DOCTYPE token matches one of the conditions in the following list, then set the [Document](#)<sup>p111</sup> to [limited-quirks mode](#):

- The public identifier starts with: "-//W3C//DTD XHTML 1.0 Frameset//"
- The public identifier starts with: "-//W3C//DTD XHTML 1.0 Transitional//"
- The system identifier is not missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Frameset//"
- The system identifier is not missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Transitional//"

The system identifier and public identifier strings must be compared to the values given in the lists above in an [ASCII case-insensitive](#) manner. A system identifier whose value is the empty string is not considered missing for the purposes of the conditions above.

Then, switch the [insertion mode](#)<sup>p1072</sup> to "[before html](#)<sup>p1113</sup>".

#### ↪ Anything else

If the document is *not* an [iframe srcdoc document](#)<sup>p356</sup>, then this is a [parse error](#)<sup>p1061</sup>; set the [Document](#)<sup>p111</sup> to [quirks mode](#).

In any case, switch the [insertion mode](#)<sup>p1072</sup> to "[before html](#)<sup>p1113</sup>", then reprocess the token.

#### 12.2.6.4.2 The "[before html](#)" insertion mode §<sup>p11</sup> 13

When the user agent is to apply the rules for the "[before html](#)<sup>p1113</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

##### ↪ A DOCTYPE token

[Parse error](#)<sup>p1061</sup>. Ignore the token.

##### ↪ A comment token

[Insert a comment](#)<sup>p1111</sup> as the last child of the [Document](#)<sup>p111</sup> object.

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Ignore the token.

↪ **A start tag whose tag name is "html"**

Create an element for the token<sup>p1107</sup> in the [HTML namespace](#), with the [Document](#)<sup>p111</sup> as the intended parent. Append it to the [Document](#)<sup>p111</sup> object. Put this element in the [stack of open elements](#)<sup>p1073</sup>.

If the [Document](#)<sup>p111</sup> is being loaded as part of [navigation](#)<sup>p852</sup> of a [browsing context](#)<sup>p804</sup> and the result of executing [is environment settings object a secure context?](#) on the [Document](#)<sup>p111</sup>'s [relevant settings object](#)<sup>p913</sup> is true, then:

1. If the result of running [match service worker registration](#) for the document's [URL](#) is non-null, run the [application cache selection algorithm](#)<sup>p888</sup> passing the [Document](#)<sup>p111</sup> object with no manifest.
2. Otherwise, run these substeps:
  1. If the newly created element has a [manifest](#)<sup>p149</sup> attribute whose value is not the empty string, then [parse](#)<sup>p87</sup> the value of that attribute, relative to the newly created element's [node document](#), and if that is successful, run the [application cache selection algorithm](#)<sup>p888</sup> passing the [Document](#)<sup>p111</sup> object with the result of applying the [URL serializer](#) algorithm to the [resulting URL record](#)<sup>p87</sup> with the *exclude fragment flag* set.
  2. Otherwise, run the [application cache selection algorithm](#)<sup>p888</sup> passing the [Document](#)<sup>p111</sup> object with no manifest.

Switch the [insertion mode](#)<sup>p1072</sup> to "[before head](#)<sup>p1114</sup>".

↪ **An end tag whose tag name is one of: "head", "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **Any other end tag**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **Anything else**

Create an [html](#)<sup>p149</sup> element whose [node document](#) is the [Document](#)<sup>p111</sup> object. Append it to the [Document](#)<sup>p111</sup> object. Put this element in the [stack of open elements](#)<sup>p1073</sup>.

If the [Document](#)<sup>p111</sup> is being loaded as part of [navigation](#)<sup>p852</sup> of a [browsing context](#)<sup>p804</sup>, then: run the [application cache selection algorithm](#)<sup>p888</sup> with no manifest, passing it the [Document](#)<sup>p111</sup> object.

Switch the [insertion mode](#)<sup>p1072</sup> to "[before head](#)<sup>p1114</sup>", then reprocess the token.

The [document element](#) can end up being removed from the [Document](#)<sup>p111</sup> object, e.g. by scripts; nothing in particular happens in such cases, content continues being appended to the nodes as described in the next section.

#### 12.2.6.4.3 The "[before head](#)" insertion mode §<sup>p11</sup> 14

When the user agent is to apply the rules for the "[before head](#)<sup>p1114</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Ignore the token.

↪ **A comment token**

[Insert a comment](#)<sup>p1111</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is "head"**

[Insert an HTML element<sup>p1109</sup>](#) for the token.

Set the [head element pointer<sup>p1076</sup>](#) to the newly created [head<sup>p150</sup>](#) element.

Switch the [insertion mode<sup>p1072</sup>](#) to "[in head<sup>p1115</sup>](#)".

↪ **An end tag whose tag name is one of: "head", "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **Any other end tag**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **Anything else**

[Insert an HTML element<sup>p1109</sup>](#) for a "head" start tag token with no attributes.

Set the [head element pointer<sup>p1076</sup>](#) to the newly created [head<sup>p150</sup>](#) element.

Switch the [insertion mode<sup>p1072</sup>](#) to "[in head<sup>p1115</sup>](#)".

Reprocess the current token.

#### 12.2.6.4.4 The "in head" insertion mode §<sup>p11</sup><sub>15</sub>

When the user agent is to apply the rules for the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character<sup>p1110</sup>](#).

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link"**

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

↪ **A start tag whose tag name is "meta"**

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

If the element has a [charset<sup>p161</sup>](#) attribute, and [getting an encoding](#) from its value results in an [encoding](#), and the [confidence<sup>p1066</sup>](#) is currently *tentative*, then [change the encoding<sup>p1071</sup>](#) to the resulting encoding.

Otherwise, if the element has an [http-equiv<sup>p165</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "Content-Type", and the element has a [content<sup>p161</sup>](#) attribute, and applying the [algorithm for extracting a character encoding from a meta element<sup>p89</sup>](#) to that attribute's value returns an [encoding](#), and the [confidence<sup>p1066</sup>](#) is currently *tentative*, then [change the encoding<sup>p1071</sup>](#) to the extracted encoding.

↪ **A start tag whose tag name is "title"**

Follow the [generic RCDATA element parsing algorithm<sup>p1111</sup>](#).

↪ **A start tag whose tag name is "noscript", if the [scripting flag](#)<sup>p1076</sup> is enabled**

↪ **A start tag whose tag name is one of: "noframes", "style"**

Follow the [generic raw text element parsing algorithm](#)<sup>p1111</sup>.

↪ **A start tag whose tag name is "noscript", if the [scripting flag](#)<sup>p1076</sup> is disabled**

[Insert an HTML element](#)<sup>p1109</sup> for the token.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in head noscript](#)<sup>p1117</sup>".

↪ **A start tag whose tag name is "script"**

Run these steps:

1. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1106</sup>.
2. [Create an element for the token](#)<sup>p1107</sup> in the [HTML namespace](#), with the intended parent being the element in which the *adjusted insertion location* finds itself.
3. Set the element's [parser document](#)<sup>p612</sup> to the [Document](#)<sup>p111</sup>, and unset the element's "[non-blocking](#)"<sup>p612</sup> flag.

#### Note

*This ensures that, if the script is external, any [document.write\(\)](#)<sup>p950</sup> calls in the script will execute in-line, instead of blowing the document away, as would happen in most other cases. It also prevents the script from executing until the end tag is seen.*

4. If the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, then mark the [script](#)<sup>p607</sup> element as "[already started](#)"<sup>p612</sup>. ([fragment case](#)<sup>p1157</sup>)
5. If the parser was invoked via the [document.write\(\)](#)<sup>p950</sup> or [document.writeln\(\)](#)<sup>p950</sup> methods, then optionally mark the [script](#)<sup>p607</sup> element as "[already started](#)"<sup>p612</sup>. (For example, the user agent might use this clause to prevent execution of [cross-origin](#)<sup>p829</sup> scripts inserted via [document.write\(\)](#)<sup>p950</sup> under slow network conditions, or when the page has already taken a long time to load.)
6. Insert the newly created element at the *adjusted insertion location*.
7. Push the element onto the [stack of open elements](#)<sup>p1073</sup> so that it is the new [current node](#)<sup>p1074</sup>.
8. Switch the tokenizer to the [script data state](#)<sup>p1078</sup>.
9. Let the [original insertion mode](#)<sup>p1072</sup> be the current [insertion mode](#)<sup>p1072</sup>.
10. Switch the [insertion mode](#)<sup>p1072</sup> to "[text](#)<sup>p1129</sup>".

↪ **An end tag whose tag name is "head"**

Pop the [current node](#)<sup>p1074</sup> (which will be the [head](#)<sup>p150</sup> element) off the [stack of open elements](#)<sup>p1073</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[after head](#)<sup>p1118</sup>".

↪ **An end tag whose tag name is one of: "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **A start tag whose tag name is "template"**

[Insert an HTML element](#)<sup>p1109</sup> for the token.

Insert a [marker](#)<sup>p1075</sup> at the end of the [list of active formatting elements](#)<sup>p1075</sup>.

Set the [frameset-ok flag](#)<sup>p1077</sup> to "not ok".

Switch the [insertion mode](#)<sup>p1072</sup> to "[in template](#)<sup>p1139</sup>".

Push "[in template](#)<sup>p1139</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.

↪ **An end tag whose tag name is "template"**

If there is no [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate all implied end tags thoroughly](#)<sup>p1112</sup>.
2. If the [current node](#)<sup>p1074</sup> is not a [template](#)<sup>p623</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [template](#)<sup>p623</sup> element has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker](#)<sup>p1076</sup>.
5. Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.
6. [Reset the insertion mode appropriately](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is "head"**

↪ **Any other end tag**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **Anything else**

Pop the [current node](#)<sup>p1074</sup> (which will be the [head](#)<sup>p150</sup> element) off the [stack of open elements](#)<sup>p1073</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[after head](#)<sup>p1118</sup>".

Reprocess the token.

#### 12.2.6.4.5 The "in head noscript" insertion mode §<sup>p11</sup> 17

When the user agent is to apply the rules for the "[in head noscript](#)<sup>p1117</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **An end tag whose tag name is "noscript"**

Pop the [current node](#)<sup>p1074</sup> (which will be a [noscript](#)<sup>p620</sup> element) from the [stack of open elements](#)<sup>p1073</sup>; the new [current node](#)<sup>p1074</sup> will be a [head](#)<sup>p150</sup> element.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in head](#)<sup>p1115</sup>".

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

↪ **A comment token**

↪ **A start tag whose tag name is one of: "basefont", "bgsound", "link", "meta", "noframes", "style"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in head](#)<sup>p1115</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **An end tag whose tag name is "br"**

Act as described in the "anything else" entry below.

↪ **A start tag whose tag name is one of: "head", "noscript"**

↪ **Any other end tag**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **Anything else**

[Parse error](#)<sup>p1061</sup>.

Pop the [current node](#)<sup>p1074</sup> (which will be a [noscript](#)<sup>p620</sup> element) from the [stack of open elements](#)<sup>p1073</sup>; the new [current node](#)<sup>p1074</sup> will be a [head](#)<sup>p150</sup> element.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in head](#)<sup>p1115</sup>".

Reprocess the token.

#### 12.2.6.4.6 The "after head" insertion mode §<sup>p11</sup><sub>18</sub>

When the user agent is to apply the rules for the "[after head<sup>p1118</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character<sup>p1110</sup>](#).

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **A start tag whose tag name is "body"**

[Insert an HTML element<sup>p1109</sup>](#) for the token.

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

Switch the [insertion mode<sup>p1072</sup>](#) to "[in body<sup>p1119</sup>](#)".

↪ **A start tag whose tag name is "frameset"**

[Insert an HTML element<sup>p1109</sup>](#) for the token.

Switch the [insertion mode<sup>p1072</sup>](#) to "[in frameset<sup>p1140</sup>](#)".

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"**

[Parse error<sup>p1061</sup>](#).

Push the node pointed to by the [head element pointer<sup>p1076</sup>](#) onto the [stack of open elements<sup>p1073</sup>](#).

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

Remove the node pointed to by the [head element pointer<sup>p1076</sup>](#) from the [stack of open elements<sup>p1073</sup>](#). (It might not be the [current node<sup>p1074</sup>](#) at this point.)

#### Note

*The [head element pointer<sup>p1076</sup>](#) cannot be null at this point.*

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **An end tag whose tag name is one of: "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **A start tag whose tag name is "head"**

↪ **Any other end tag**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **Anything else**

[Insert an HTML element<sup>p1109</sup>](#) for a "body" start tag token with no attributes.

Switch the [insertion mode<sup>p1072</sup>](#) to "[in body<sup>p1119</sup>](#)".

Reprocess the current token.

#### 12.2.6.4.7 The "in body" insertion mode §<sup>p11</sup><sub>19</sub>

When the user agent is to apply the rules for the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is U+0000 NULL**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert the token's character<sup>p1110</sup>](#).

↪ **Any other character token**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert the token's character<sup>p1110</sup>](#).

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

[Parse error<sup>p1061</sup>](#).

If there is a [template<sup>p623</sup>](#) element on the [stack of open elements<sup>p1073</sup>](#), then ignore the token.

Otherwise, for each attribute on the token, check to see if the attribute is already present on the top element of the [stack of open elements<sup>p1073</sup>](#). If it is not, add the attribute and its corresponding value to that element.

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **A start tag whose tag name is "body"**

[Parse error<sup>p1061</sup>](#).

If the second element on the [stack of open elements<sup>p1073</sup>](#) is not a [body<sup>p174</sup>](#) element, if the [stack of open elements<sup>p1073</sup>](#) has only one node on it, or if there is a [template<sup>p623</sup>](#) element on the [stack of open elements<sup>p1073</sup>](#), then ignore the token. ([fragment case<sup>p1157</sup>](#))

Otherwise, set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok"; then, for each attribute on the token, check to see if the attribute is already present on the [body<sup>p174</sup>](#) element (the second element) on the [stack of open elements<sup>p1073</sup>](#), and if it is not, add the attribute and its corresponding value to that element.

↪ **A start tag whose tag name is "frameset"**

[Parse error<sup>p1061</sup>](#).

If the [stack of open elements<sup>p1073</sup>](#) has only one node on it, or if the second element on the [stack of open elements<sup>p1073</sup>](#) is not a [body<sup>p174</sup>](#) element, then ignore the token. ([fragment case<sup>p1157</sup>](#))

If the [frameset-ok flag<sup>p1077</sup>](#) is set to "not ok", ignore the token.

Otherwise, run the following steps:

1. Remove the second element on the [stack of open elements](#)<sup>p1073</sup> from its parent node, if it has one.
2. Pop all the nodes from the bottom of the [stack of open elements](#)<sup>p1073</sup>, from the [current node](#)<sup>p1074</sup> up to, but not including, the root [html](#)<sup>p149</sup> element.
3. [Insert an HTML element](#)<sup>p1109</sup> for the token.
4. Switch the [insertion mode](#)<sup>p1072</sup> to "[in frameset](#)<sup>p1140</sup>".

↪ **An end-of-file token**

If the [stack of template insertion modes](#)<sup>p1072</sup> is not empty, then process the token [using the rules for](#)<sup>p1072</sup> the "[in template](#)<sup>p1139</sup>" [insertion mode](#)<sup>p1072</sup>.

Otherwise, follow these steps:

1. If there is a node in the [stack of open elements](#)<sup>p1073</sup> that is not either a [dd](#)<sup>p227</sup> element, a [dt](#)<sup>p226</sup> element, an [li](#)<sup>p220</sup> element, an [optgroup](#)<sup>p537</sup> element, an [option](#)<sup>p539</sup> element, a [p](#)<sup>p207</sup> element, an [rb](#)<sup>p1212</sup> element, an [rp](#)<sup>p253</sup> element, an [rt](#)<sup>p253</sup> element, an [rtc](#)<sup>p1212</sup> element, a [tbody](#)<sup>p454</sup> element, a [td](#)<sup>p459</sup> element, a [tfoot](#)<sup>p456</sup> element, a [th](#)<sup>p460</sup> element, a [thead](#)<sup>p455</sup> element, a [tr](#)<sup>p457</sup> element, the [body](#)<sup>p174</sup> element, or the [html](#)<sup>p149</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
2. [Stop parsing](#)<sup>p1145</sup>.

↪ **An end tag whose tag name is "body"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have a body element in scope](#)<sup>p1074</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, if there is a node in the [stack of open elements](#)<sup>p1073</sup> that is not either a [dd](#)<sup>p227</sup> element, a [dt](#)<sup>p226</sup> element, an [li](#)<sup>p220</sup> element, an [optgroup](#)<sup>p537</sup> element, an [option](#)<sup>p539</sup> element, a [p](#)<sup>p207</sup> element, an [rb](#)<sup>p1212</sup> element, an [rp](#)<sup>p253</sup> element, an [rt](#)<sup>p253</sup> element, an [rtc](#)<sup>p1212</sup> element, a [tbody](#)<sup>p454</sup> element, a [td](#)<sup>p459</sup> element, a [tfoot](#)<sup>p456</sup> element, a [th](#)<sup>p460</sup> element, a [thead](#)<sup>p455</sup> element, a [tr](#)<sup>p457</sup> element, the [body](#)<sup>p174</sup> element, or the [html](#)<sup>p149</sup> element, then this is a [parse error](#)<sup>p1061</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[after body](#)<sup>p1140</sup>".

↪ **An end tag whose tag name is "html"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have a body element in scope](#)<sup>p1074</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, if there is a node in the [stack of open elements](#)<sup>p1073</sup> that is not either a [dd](#)<sup>p227</sup> element, a [dt](#)<sup>p226</sup> element, an [li](#)<sup>p220</sup> element, an [optgroup](#)<sup>p537</sup> element, an [option](#)<sup>p539</sup> element, a [p](#)<sup>p207</sup> element, an [rb](#)<sup>p1212</sup> element, an [rp](#)<sup>p253</sup> element, an [rt](#)<sup>p253</sup> element, an [rtc](#)<sup>p1212</sup> element, a [tbody](#)<sup>p454</sup> element, a [td](#)<sup>p459</sup> element, a [tfoot](#)<sup>p456</sup> element, a [th](#)<sup>p460</sup> element, a [thead](#)<sup>p455</sup> element, a [tr](#)<sup>p457</sup> element, the [body](#)<sup>p174</sup> element, or the [html](#)<sup>p149</sup> element, then this is a [parse error](#)<sup>p1061</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[after body](#)<sup>p1140</sup>".

Reprocess the token.

↪ **A start tag whose tag name is one of: "address", "article", "aside", "blockquote", "center", "details", "dialog", "dir", "div", "dl", "fieldset", "figcaption", "figure", "footer", "header", "hgroup", "main", "menu", "nav", "ol", "p", "section", "summary", "ul"**

If the [stack of open elements](#)<sup>p1073</sup> [has a p element in button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token.

↪ **A start tag whose tag name is one of: "h1", "h2", "h3", "h4", "h5", "h6"**

If the [stack of open elements](#)<sup>p1073</sup> [has a p element in button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.

If the [current node](#)<sup>p1074</sup> is an [HTML element](#)<sup>p43</sup> whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6", then this is a [parse error](#)<sup>p1061</sup>; pop the [current node](#)<sup>p1074</sup> off the [stack of open elements](#)<sup>p1073</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token.

↪ **A start tag whose tag name is one of: "pre", "listing"**

If the [stack of open elements](#)<sup>p1073</sup> [has a p element in button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token.

If the [next token](#)<sup>p1106</sup> is a U+000A LINE FEED (LF) character token, then ignore that token and move on to the next one.

(Newlines at the start of [pre](#)<sup>p212</sup> blocks are ignored as an authoring convenience.)

Set the [frameset-ok flag](#)<sup>p1077</sup> to "not ok".

#### ↪ A start tag whose tag name is "form"

If the [form element pointer](#)<sup>p1076</sup> is not null, and there is no [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise:

If the [stack of open elements](#)<sup>p1073</sup> has a [p element in button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token, and, if there is no [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, set the [form element pointer](#)<sup>p1076</sup> to point to the element created.

#### ↪ A start tag whose tag name is "li"

Run these steps:

1. Set the [frameset-ok flag](#)<sup>p1077</sup> to "not ok".
2. Initialize *node* to be the [current node](#)<sup>p1074</sup> (the bottommost node of the stack).
3. *Loop*: If *node* is an [li](#)<sup>p229</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p1112</sup>, except for [li](#)<sup>p229</sup> elements.
  2. If the [current node](#)<sup>p1074</sup> is not an [li](#)<sup>p229</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until an [li](#)<sup>p229</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.
4. If *node* is in the [special](#)<sup>p1074</sup> category, but is not an [address](#)<sup>p193</sup>, [div](#)<sup>p233</sup>, or [p](#)<sup>p207</sup> element, then jump to the step labeled *done* below.
5. Otherwise, set *node* to the previous entry in the [stack of open elements](#)<sup>p1073</sup> and return to the step labeled *loop*.
6. *Done*: If the [stack of open elements](#)<sup>p1073</sup> has a [p element in button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.
7. Finally, [insert an HTML element](#)<sup>p1109</sup> for the token.

#### ↪ A start tag whose tag name is one of: "dd", "dt"

Run these steps:

1. Set the [frameset-ok flag](#)<sup>p1077</sup> to "not ok".
2. Initialize *node* to be the [current node](#)<sup>p1074</sup> (the bottommost node of the stack).
3. *Loop*: If *node* is a [dd](#)<sup>p227</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p1112</sup>, except for [dd](#)<sup>p227</sup> elements.
  2. If the [current node](#)<sup>p1074</sup> is not a [dd](#)<sup>p227</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [dd](#)<sup>p227</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.
4. If *node* is a [dt](#)<sup>p226</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p1112</sup>, except for [dt](#)<sup>p226</sup> elements.
  2. If the [current node](#)<sup>p1074</sup> is not a [dt](#)<sup>p226</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [dt](#)<sup>p226</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.
5. If *node* is in the [special](#)<sup>p1074</sup> category, but is not an [address](#)<sup>p193</sup>, [div](#)<sup>p233</sup>, or [p](#)<sup>p207</sup> element, then jump to the step labeled *done* below.

6. Otherwise, set *node* to the previous entry in the [stack of open elements](#)<sup>p1073</sup> and return to the step labeled *loop*.
7. *Done*: If the [stack of open elements](#)<sup>p1073</sup> has a **p** element in [button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.
8. Finally, [insert an HTML element](#)<sup>p1109</sup> for the token.

↪ **A start tag whose tag name is "plaintext"**

If the [stack of open elements](#)<sup>p1073</sup> has a **p** element in [button scope](#)<sup>p1075</sup>, then [close a p element](#)<sup>p1127</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token.

Switch the tokenizer to the [PLAINTEXT state](#)<sup>p1079</sup>.

**Note**

*Once a start tag with the tag name "plaintext" has been seen, that will be the last token ever seen other than character tokens (and the end-of-file token), because there is no way to switch out of the [PLAINTEXT state](#)<sup>p1079</sup>.*

↪ **A start tag whose tag name is "button"**

1. If the [stack of open elements](#)<sup>p1073</sup> has a **button** element in [scope](#)<sup>p1074</sup>, then run these substeps:
  1. [Parse error](#)<sup>p1061</sup>.
  2. [Generate implied end tags](#)<sup>p1112</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a **button**<sup>p528</sup> element has been popped from the stack.
2. [Reconstruct the active formatting elements](#)<sup>p1076</sup>, if any.
3. [Insert an HTML element](#)<sup>p1109</sup> for the token.
4. Set the [frameset-ok flag](#)<sup>p1077</sup> to "not ok".

↪ **An end tag whose tag name is one of: "address", "article", "aside", "blockquote", "button", "center", "details", "dialog", "dir", "div", "dl", "fieldset", "figcaption", "figure", "footer", "header", "hgroup", "listing", "main", "menu", "nav", "ol", "pre", "section", "summary", "ul"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in scope](#)<sup>p1074</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1112</sup>.
2. If the [current node](#)<sup>p1074</sup> is not an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until an [HTML element](#)<sup>p43</sup> with the same tag name as the token has been popped from the stack.

↪ **An end tag whose tag name is "form"**

If there is no [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, then run these substeps:

1. Let *node* be the element that the [form element pointer](#)<sup>p1076</sup> is set to, or null if it is not set to an element.
2. Set the [form element pointer](#)<sup>p1076</sup> to null.
3. If *node* is null or if the [stack of open elements](#)<sup>p1073</sup> does not [have node in scope](#)<sup>p1074</sup>, then this is a [parse error](#)<sup>p1061</sup>; return and ignore the token.
4. [Generate implied end tags](#)<sup>p1112</sup>.
5. If the [current node](#)<sup>p1074</sup> is not *node*, then this is a [parse error](#)<sup>p1061</sup>.
6. Remove *node* from the [stack of open elements](#)<sup>p1073</sup>.

If there is a [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, then run these substeps instead:

1. If the [stack of open elements](#)<sup>p1073</sup> does not [have a form element in scope](#)<sup>p1074</sup>, then this is a [parse error](#)<sup>p1061</sup>; return and ignore the token.
2. [Generate implied end tags](#)<sup>p1112</sup>.
3. If the [current node](#)<sup>p1074</sup> is not a [form](#)<sup>p479</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
4. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [form](#)<sup>p479</sup> element has been popped from the stack.

↪ **An end tag whose tag name is "p"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have a p element in button scope](#)<sup>p1075</sup>, then this is a [parse error](#)<sup>p1061</sup>; [insert an HTML element](#)<sup>p1109</sup> for a "p" start tag token with no attributes.

[Close a p element](#)<sup>p1127</sup>.

↪ **An end tag whose tag name is "li"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have an li element in list item scope](#)<sup>p1075</sup>, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1112</sup>, except for [li](#)<sup>p220</sup> elements.
2. If the [current node](#)<sup>p1074</sup> is not an [li](#)<sup>p220</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until an [li](#)<sup>p220</sup> element has been popped from the stack.

↪ **An end tag whose tag name is one of: "dd", "dt"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in scope](#)<sup>p1074</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1112</sup>, except for [HTML elements](#)<sup>p43</sup> with the same tag name as the token.
2. If the [current node](#)<sup>p1074</sup> is not an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until an [HTML element](#)<sup>p43</sup> with the same tag name as the token has been popped from the stack.

↪ **An end tag whose tag name is one of: "h1", "h2", "h3", "h4", "h5", "h6"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in scope](#)<sup>p1074</sup> that is an [HTML element](#)<sup>p43</sup> and whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6", then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1112</sup>.
2. If the [current node](#)<sup>p1074</sup> is not an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> until an [HTML element](#)<sup>p43</sup> whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6" has been popped from the stack.

↪ **An end tag whose tag name is "sarcasm"**

Take a deep breath, then act as described in the "any other end tag" entry below.

↪ **A start tag whose tag name is "a"**

If the [list of active formatting elements](#)<sup>p1075</sup> contains an [a](#)<sup>p234</sup> element between the end of the list and the last [marker](#)<sup>p1075</sup> on the list (or the start of the list if there is no [marker](#)<sup>p1075</sup> on the list), then this is a [parse error](#)<sup>p1061</sup>; run the [adoption agency algorithm](#)<sup>p1127</sup> for the token, then remove that element from the [list of active formatting elements](#)<sup>p1075</sup> and the [stack of open elements](#)<sup>p1073</sup> if the [adoption agency algorithm](#)<sup>p1127</sup> didn't already remove it (it might not have if the element is not [in table scope](#)<sup>p1075</sup>).

## Example

In the non-conforming stream `<a href="a">a<table><a href="b">b</table>x`, the first [a<sup>p234</sup>](#) element would be closed upon seeing the second one, and the "x" character would be inside a link to "b", not to "a". This is despite the fact that the outer [a<sup>p234</sup>](#) element is not in table scope (meaning that a regular `</a>` end tag at the start of the table wouldn't close the outer [a<sup>p234</sup>](#) element). The result is that the two [a<sup>p234</sup>](#) elements are indirectly nested inside each other — non-conforming markup will often result in non-conforming DOMs when parsed.

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token. [Push onto the list of active formatting elements<sup>p1075</sup>](#) that element.

↪ **A start tag whose tag name is one of: "b", "big", "code", "em", "font", "i", "s", "small", "strike", "strong", "tt", "u"**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token. [Push onto the list of active formatting elements<sup>p1075</sup>](#) that element.

↪ **A start tag whose tag name is "nobr"**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

If the [stack of open elements<sup>p1073</sup>](#) has a `nobr` element in scope<sup>p1074</sup>, then this is a [parse error<sup>p1061</sup>](#); run the [adoption agency algorithm<sup>p1127</sup>](#) for the token, then once again [reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token. [Push onto the list of active formatting elements<sup>p1075</sup>](#) that element.

↪ **An end tag whose tag name is one of: "a", "b", "big", "code", "em", "font", "i", "nobr", "s", "small", "strike", "strong", "tt", "u"**

Run the [adoption agency algorithm<sup>p1127</sup>](#) for the token.

↪ **A start tag whose tag name is one of: "applet", "marquee", "object"**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token.

Insert a [marker<sup>p1075</sup>](#) at the end of the [list of active formatting elements<sup>p1075</sup>](#).

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

↪ **An end tag token whose tag name is one of: "applet", "marquee", "object"**

If the [stack of open elements<sup>p1073</sup>](#) does not [have an element in scope<sup>p1074</sup>](#) that is an [HTML element<sup>p43</sup>](#) with the same tag name as that of the token, then this is a [parse error<sup>p1061</sup>](#); ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags<sup>p1112</sup>](#).
2. If the [current node<sup>p1074</sup>](#) is not an [HTML element<sup>p43</sup>](#) with the same tag name as that of the token, then this is a [parse error<sup>p1061</sup>](#).
3. Pop elements from the [stack of open elements<sup>p1073</sup>](#) until an [HTML element<sup>p43</sup>](#) with the same tag name as the token has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker<sup>p1076</sup>](#).

↪ **A start tag whose tag name is "table"**

If the [Document<sup>p111</sup>](#) is not set to [quirks mode](#), and the [stack of open elements<sup>p1073</sup>](#) has a `p` element in button scope<sup>p1075</sup>, then [close a p element<sup>p1127</sup>](#).

[Insert an HTML element<sup>p1109</sup>](#) for the token.

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

Switch the [insertion mode<sup>p1072</sup>](#) to "[in table<sup>p1130</sup>](#)".

↪ **An end tag whose tag name is "br"**

[Parse error<sup>p1061</sup>](#). Drop the attributes from the token, and act as described in the next entry; i.e. act as if this was a "br" start tag token with no attributes, rather than the end tag token that it actually is.

↪ **A start tag whose tag name is one of: "area", "br", "embed", "img", "keygen", "wbr"**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

↪ **A start tag whose tag name is "input"**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

If the token does not have an attribute with the name "type", or if it does, but that attribute's value is not an [ASCII case-insensitive](#) match for the string "hidden", then: set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

↪ **A start tag whose tag name is one of: "param", "source", "track"**

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

↪ **A start tag whose tag name is "hr"**

If the [stack of open elements<sup>p1073</sup>](#) has a [p element in button scope<sup>p1075</sup>](#), then [close a p element<sup>p1127</sup>](#).

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

↪ **A start tag whose tag name is "image"**

[Parse error<sup>p1061</sup>](#). Change the token's tag name to "img" and reprocess it. (Don't ask.)

↪ **A start tag whose tag name is "textarea"**

Run these steps:

1. [Insert an HTML element<sup>p1109</sup>](#) for the token.
2. If the [next token<sup>p1106</sup>](#) is a U+000A LINE FEED (LF) character token, then ignore that token and move on to the next one. (Newlines at the start of [textarea<sup>p541</sup>](#) elements are ignored as an authoring convenience.)
3. Switch the tokenizer to the [RCDATA state<sup>p1078</sup>](#).
4. Let the [original insertion mode<sup>p1072</sup>](#) be the current [insertion mode<sup>p1072</sup>](#).
5. Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".
6. Switch the [insertion mode<sup>p1072</sup>](#) to "[text<sup>p1129</sup>](#)".

↪ **A start tag whose tag name is "xmp"**

If the [stack of open elements<sup>p1073</sup>](#) has a [p element in button scope<sup>p1075</sup>](#), then [close a p element<sup>p1127</sup>](#).

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

Follow the [generic raw text element parsing algorithm<sup>p1111</sup>](#).

- ↪ **A start tag whose tag name is "iframe"**
  - Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".
  - Follow the [generic raw text element parsing algorithm<sup>p1111</sup>](#).
- ↪ **A start tag whose tag name is "noembed"**
- ↪ **A start tag whose tag name is "noscript", if the [scripting flag<sup>p1076</sup>](#) is enabled**
  - Follow the [generic raw text element parsing algorithm<sup>p1111</sup>](#).
- ↪ **A start tag whose tag name is "select"**
  - [Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.
  - [Insert an HTML element<sup>p1109</sup>](#) for the token.
  - Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".
  - If the [insertion mode<sup>p1072</sup>](#) is one of "[in table<sup>p1130</sup>](#)", "[in caption<sup>p1132</sup>](#)", "[in table body<sup>p1134</sup>](#)", "[in row<sup>p1135</sup>](#)", or "[in cell<sup>p1136</sup>](#)", then switch the [insertion mode<sup>p1072</sup>](#) to "[in select in table<sup>p1138</sup>](#)". Otherwise, switch the [insertion mode<sup>p1072</sup>](#) to "[in select<sup>p1137</sup>](#)".
- ↪ **A start tag whose tag name is one of: "optgroup", "option"**
  - If the [current node<sup>p1074</sup>](#) is an [option<sup>p539</sup>](#) element, then pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).
  - [Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.
  - [Insert an HTML element<sup>p1109</sup>](#) for the token.
- ↪ **A start tag whose tag name is one of: "rb", "rtc"**
  - If the [stack of open elements<sup>p1073</sup>](#) has a [ruby element in scope<sup>p1074</sup>](#), then [generate implied end tags<sup>p1112</sup>](#). If the [current node<sup>p1074</sup>](#) is not now a [ruby<sup>p247</sup>](#) element, this is a [parse error<sup>p1061</sup>](#).
  - [Insert an HTML element<sup>p1109</sup>](#) for the token.
- ↪ **A start tag whose tag name is one of: "rp", "rt"**
  - If the [stack of open elements<sup>p1073</sup>](#) has a [ruby element in scope<sup>p1074</sup>](#), then [generate implied end tags<sup>p1112</sup>](#), except for [rtc<sup>p1212</sup>](#) elements. If the [current node<sup>p1074</sup>](#) is not now a [rtc<sup>p1212</sup>](#) element or a [ruby<sup>p247</sup>](#) element, this is a [parse error<sup>p1061</sup>](#).
  - [Insert an HTML element<sup>p1109</sup>](#) for the token.
- ↪ **A start tag whose tag name is "math"**
  - [Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.
  - [Adjust MathML attributes<sup>p1109</sup>](#) for the token. (This fixes the case of MathML attributes that are not all lowercase.)
  - [Adjust foreign attributes<sup>p1110</sup>](#) for the token. (This fixes the use of namespaced attributes, in particular XLink.)
  - [Insert a foreign element<sup>p1108</sup>](#) for the token, in the [MathML namespace](#).
  - If the token has its [self-closing flag<sup>p1077</sup>](#) set, pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#) and [acknowledge the token's self-closing flag<sup>p1077</sup>](#).
- ↪ **A start tag whose tag name is "svg"**
  - [Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.
  - [Adjust SVG attributes<sup>p1109</sup>](#) for the token. (This fixes the case of SVG attributes that are not all lowercase.)
  - [Adjust foreign attributes<sup>p1110</sup>](#) for the token. (This fixes the use of namespaced attributes, in particular XLink in SVG.)
  - [Insert a foreign element<sup>p1108</sup>](#) for the token, in the [SVG namespace](#).
  - If the token has its [self-closing flag<sup>p1077</sup>](#) set, pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#) and [acknowledge the token's self-closing flag<sup>p1077</sup>](#).

↪ **A start tag whose tag name is one of:** "caption", "col", "colgroup", "frame", "head", "tbody", "td", "tfoot", "th", "thead", "tr"

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **Any other start tag**

[Reconstruct the active formatting elements<sup>p1076</sup>](#), if any.

[Insert an HTML element<sup>p1109</sup>](#) for the token.

#### Note

This element will be an [ordinary<sup>p1074</sup>](#) element.

↪ **Any other end tag**

Run these steps:

1. Initialize *node* to be the [current node<sup>p1074</sup>](#) (the bottommost node of the stack).
2. *Loop*: If *node* is an [HTML element<sup>p43</sup>](#) with the same tag name as the token, then:
  1. [Generate implied end tags<sup>p1112</sup>](#), except for [HTML elements<sup>p43</sup>](#) with the same tag name as the token.
  2. If *node* is not the [current node<sup>p1074</sup>](#), then this is a [parse error<sup>p1061</sup>](#).
  3. Pop all the nodes from the [current node<sup>p1074</sup>](#) up to *node*, including *node*, then stop these steps.
3. Otherwise, if *node* is in the [special<sup>p1074</sup>](#) category, then this is a [parse error<sup>p1061</sup>](#); ignore the token, and return.
4. Set *node* to the previous entry in the [stack of open elements<sup>p1073</sup>](#).
5. Return to the step labeled *loop*.

When the steps above say the user agent is to **close a p element**, it means that the user agent must run the following steps:

1. [Generate implied end tags<sup>p1112</sup>](#), except for [p<sup>p207</sup>](#) elements.
2. If the [current node<sup>p1074</sup>](#) is not a [p<sup>p207</sup>](#) element, then this is a [parse error<sup>p1061</sup>](#).
3. Pop elements from the [stack of open elements<sup>p1073</sup>](#) until a [p<sup>p207</sup>](#) element has been popped from the stack.

The **adoption agency algorithm**, which takes as its only argument a token *token* for which the algorithm is being run, consists of the following steps:

1. Let *subject* be *token*'s tag name.
2. If the [current node<sup>p1074</sup>](#) is an [HTML element<sup>p43</sup>](#) whose tag name is *subject*, and the [current node<sup>p1074</sup>](#) is not in the [list of active formatting elements<sup>p1075</sup>](#), then pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#), and return.
3. Let *outer loop counter* be zero.
4. *Outer loop*: If *outer loop counter* is greater than or equal to eight, then return.
5. Increment *outer loop counter* by one.
6. Let *formatting element* be the last element in the [list of active formatting elements<sup>p1075</sup>](#) that:
  - is between the end of the list and the last [marker<sup>p1075</sup>](#) in the list, if any, or the start of the list otherwise, and
  - has the tag name *subject*.

If there is no such element, then return and instead act as described in the "any other end tag" entry above.

7. If *formatting element* is not in the [stack of open elements<sup>p1073</sup>](#), then this is a [parse error<sup>p1061</sup>](#); remove the element from the list, and return.
8. If *formatting element* is in the [stack of open elements<sup>p1073</sup>](#), but the element is not [in scope<sup>p1074</sup>](#), then this is a [parse error<sup>p1061</sup>](#); return.
9. If *formatting element* is not the [current node<sup>p1074</sup>](#), this is a [parse error<sup>p1061</sup>](#). (But do not return.)

10. Let *furthest block* be the topmost node in the [stack of open elements](#)<sup>p1073</sup> that is lower in the stack than *formatting element*, and is an element in the [special](#)<sup>p1074</sup> category. There might not be one.
11. If there is no *furthest block*, then the UA must first pop all the nodes from the bottom of the [stack of open elements](#)<sup>p1073</sup>, from the [current node](#)<sup>p1074</sup> up to and including *formatting element*, then remove *formatting element* from the [list of active formatting elements](#)<sup>p1075</sup>, and finally return.
12. Let *common ancestor* be the element immediately above *formatting element* in the [stack of open elements](#)<sup>p1073</sup>.
13. Let a bookmark note the position of *formatting element* in the [list of active formatting elements](#)<sup>p1075</sup> relative to the elements on either side of it in the list.
14. Let *node* and *last node* be *furthest block*. Follow these steps:
  1. Let *inner loop counter* be zero.
  2. *Inner loop*: Increment *inner loop counter* by one.
  3. Let *node* be the element immediately above *node* in the [stack of open elements](#)<sup>p1073</sup>, or if *node* is no longer in the [stack of open elements](#)<sup>p1073</sup> (e.g. because it got removed by this algorithm), the element that was immediately above *node* in the [stack of open elements](#)<sup>p1073</sup> before *node* was removed.
  4. If *node* is *formatting element*, then go to the next step in the overall algorithm.
  5. If *inner loop counter* is greater than three and *node* is in the [list of active formatting elements](#)<sup>p1075</sup>, then remove *node* from the [list of active formatting elements](#)<sup>p1075</sup>.
  6. If *node* is not in the [list of active formatting elements](#)<sup>p1075</sup>, then remove *node* from the [stack of open elements](#)<sup>p1073</sup> and then go back to the step labeled *inner loop*.
  7. [Create an element for the token](#)<sup>p1107</sup> for which the element *node* was created, in the [HTML namespace](#), with *common ancestor* as the intended parent; replace the entry for *node* in the [list of active formatting elements](#)<sup>p1075</sup> with an entry for the new element, replace the entry for *node* in the [stack of open elements](#)<sup>p1073</sup> with an entry for the new element, and let *node* be the new element.
  8. If *last node* is *furthest block*, then move the aforementioned bookmark to be immediately after the new *node* in the [list of active formatting elements](#)<sup>p1075</sup>.
  9. Insert *last node* into *node*, first removing it from its previous parent node if any.
  10. Let *last node* be *node*.
  11. Return to the step labeled *inner loop*.
15. Insert whatever *last node* ended up being in the previous step at the [appropriate place for inserting a node](#)<sup>p1106</sup>, but using *common ancestor* as the *override target*.
16. [Create an element for the token](#)<sup>p1107</sup> for which *formatting element* was created, in the [HTML namespace](#), with *furthest block* as the intended parent.
17. Take all of the child nodes of *furthest block* and append them to the element created in the last step.
18. Append that new element to *furthest block*.
19. Remove *formatting element* from the [list of active formatting elements](#)<sup>p1075</sup>, and insert the new element into the [list of active formatting elements](#)<sup>p1075</sup> at the position of the aforementioned bookmark.
20. Remove *formatting element* from the [stack of open elements](#)<sup>p1073</sup>, and insert the new element into the [stack of open elements](#)<sup>p1073</sup> immediately below the position of *furthest block* in that stack.
21. Jump back to the step labeled *outer loop*.

#### Note

This algorithm's name, the "adoption agency algorithm", comes from the way it causes elements to change parents, and is in contrast with [other possible algorithms](#) for dealing with misnested content.

#### 12.2.6.4.8 The "text" insertion mode §<sup>p11</sup> 29

When the user agent is to apply the rules for the "[text<sup>p1129</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

##### ↪ A character token

[Insert the token's character<sup>p1110</sup>](#).

##### Note

*This can never be a U+0000 NULL character; the tokenizer converts those to U+FFFD REPLACEMENT CHARACTER characters.*

##### ↪ An end-of-file token

[Parse error<sup>p1061</sup>](#).

If the [current node<sup>p1074</sup>](#) is a [script<sup>p607</sup>](#) element, mark the [script<sup>p607</sup>](#) element as "[already started<sup>p612</sup>](#)".

Pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

Switch the [insertion mode<sup>p1072</sup>](#) to the [original insertion mode<sup>p1072</sup>](#) and reprocess the token.

##### ↪ An end tag whose tag name is "script"

If the [JavaScript execution context stack](#) is empty, [perform a microtask checkpoint<sup>p929</sup>](#).

Let *script* be the [current node<sup>p1074</sup>](#) (which will be a [script<sup>p607</sup>](#) element).

Pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

Switch the [insertion mode<sup>p1072</sup>](#) to the [original insertion mode<sup>p1072</sup>](#).

Let the *old insertion point* have the same value as the current [insertion point<sup>p1072</sup>](#). Let the [insertion point<sup>p1072</sup>](#) be just before the [next input character<sup>p1072</sup>](#).

Increment the parser's [script nesting level<sup>p1061</sup>](#) by one.

[Prepare<sup>p613</sup>](#) the *script*. This might cause some script to execute, which might cause [new characters to be inserted into the tokenizer<sup>p950</sup>](#), and might cause the tokenizer to output more tokens, resulting in a [reentrant invocation of the parser<sup>p1060</sup>](#).

Decrement the parser's [script nesting level<sup>p1061</sup>](#) by one. If the parser's [script nesting level<sup>p1061</sup>](#) is zero, then set the [parser pause flag<sup>p1061</sup>](#) to false.

Let the [insertion point<sup>p1072</sup>](#) have the value of the *old insertion point*. (In other words, restore the [insertion point<sup>p1072</sup>](#) to its previous value. This value might be the "undefined" value.)

At this stage, if there is a [pending parsing-blocking script<sup>p616</sup>](#), then:

##### ↪ If the [script nesting level<sup>p1061</sup>](#) is not zero:

Set the [parser pause flag<sup>p1061</sup>](#) to true, and abort the processing of any nested invocations of the tokenizer, yielding control back to the caller. (Tokenization will resume when the caller returns to the "outer" tree construction stage.)

##### Note

*The tree construction stage of this particular parser is [being called reentrantly<sup>p1060</sup>](#), say from a call to [document.write\(\)<sup>p950</sup>](#).*

##### ↪ Otherwise:

Run these steps:

1. Let *the script* be the [pending parsing-blocking script<sup>p616</sup>](#). There is no longer a [pending parsing-blocking script<sup>p616</sup>](#).
2. Block the [tokenizer<sup>p1077</sup>](#) for this instance of the [HTML parser<sup>p1059</sup>](#), such that the [event loop<sup>p924</sup>](#) will not run [tasks<sup>p925</sup>](#) that invoke the [tokenizer<sup>p1077</sup>](#).
3. If the parser's [Document<sup>p111</sup>](#) has a [style sheet that is blocking scripts<sup>p174</sup>](#) or *the script's* "[ready to be parser-](#)

`executed`<sup>p612</sup> flag is not set: `spin the event loop`<sup>p929</sup> until the parser's `Document`<sup>p111</sup> has no style sheet that is `blocking scripts`<sup>p174</sup> and the script's `"ready to be parser-executed"`<sup>p612</sup> flag is set.

4. If this `parser has been aborted`<sup>p1146</sup> in the meantime, return.

#### Note

*This could happen if, e.g., while the `spin the event loop`<sup>p929</sup> algorithm is running, the `browsing context`<sup>p804</sup> gets closed, or the `document.open()`<sup>p949</sup> method gets invoked on the `Document`<sup>p111</sup>.*

5. Unblock the `tokenizer`<sup>p1077</sup> for this instance of the `HTML parser`<sup>p1059</sup>, such that `tasks`<sup>p925</sup> that invoke the `tokenizer`<sup>p1077</sup> can again be run.
6. Let the `insertion point`<sup>p1072</sup> be just before the `next input character`<sup>p1072</sup>.
7. Increment the parser's `script nesting level`<sup>p1061</sup> by one (it should be zero before this step, so this sets it to one).
8. `Execute`<sup>p616</sup> the script.
9. Decrement the parser's `script nesting level`<sup>p1061</sup> by one. If the parser's `script nesting level`<sup>p1061</sup> is zero (which it always should be at this point), then set the `parser pause flag`<sup>p1061</sup> to false.
10. Let the `insertion point`<sup>p1072</sup> be undefined again.
11. If there is once again a `pending parsing-blocking script`<sup>p616</sup>, then repeat these steps from step 1.

#### ↪ Any other end tag

Pop the `current node`<sup>p1074</sup> off the `stack of open elements`<sup>p1073</sup>.

Switch the `insertion mode`<sup>p1072</sup> to the `original insertion mode`<sup>p1072</sup>.

#### 12.2.6.4.9 The "in table" insertion mode §<sup>p11</sup><sub>30</sub>

When the user agent is to apply the rules for the `"in table"`<sup>p1130</sup> `insertion mode`<sup>p1072</sup>, the user agent must handle the token as follows:

#### ↪ A character token, if the `current node`<sup>p1074</sup> is `table`<sup>p443</sup>, `tbody`<sup>p454</sup>, `tfoot`<sup>p456</sup>, `thead`<sup>p455</sup>, or `tr`<sup>p457</sup> element

Let the `pending table character tokens` be an empty list of tokens.

Let the `original insertion mode`<sup>p1072</sup> be the current `insertion mode`<sup>p1072</sup>.

Switch the `insertion mode`<sup>p1072</sup> to `"in table text"`<sup>p1132</sup> and reprocess the token.

#### ↪ A comment token

`Insert a comment`<sup>p1111</sup>.

#### ↪ A DOCTYPE token

`Parse error`<sup>p1061</sup>. Ignore the token.

#### ↪ A start tag whose tag name is "caption"

`Clear the stack back to a table context`<sup>p1132</sup>. (See below.)

Insert a `marker`<sup>p1075</sup> at the end of the `list of active formatting elements`<sup>p1075</sup>.

`Insert an HTML element`<sup>p1109</sup> for the token, then switch the `insertion mode`<sup>p1072</sup> to `"in caption"`<sup>p1132</sup>.

#### ↪ A start tag whose tag name is "colgroup"

`Clear the stack back to a table context`<sup>p1132</sup>. (See below.)

`Insert an HTML element`<sup>p1109</sup> for the token, then switch the `insertion mode`<sup>p1072</sup> to `"in column group"`<sup>p1133</sup>.

#### ↪ A start tag whose tag name is "col"

`Clear the stack back to a table context`<sup>p1132</sup>. (See below.)

`Insert an HTML element`<sup>p1109</sup> for a "colgroup" start tag token with no attributes, then switch the `insertion mode`<sup>p1072</sup> to `"in column`

[group<sup>p1133</sup>](#)".

Reprocess the current token.

↔ **A start tag whose tag name is one of: "tbody", "tfoot", "thead"**

[Clear the stack back to a table context<sup>p1132</sup>](#). (See below.)

[Insert an HTML element<sup>p1109</sup>](#) for the token, then switch the [insertion mode<sup>p1072</sup>](#) to "[in table body<sup>p1134</sup>](#)".

↔ **A start tag whose tag name is one of: "td", "th", "tr"**

[Clear the stack back to a table context<sup>p1132</sup>](#). (See below.)

[Insert an HTML element<sup>p1109</sup>](#) for a "tbody" start tag token with no attributes, then switch the [insertion mode<sup>p1072</sup>](#) to "[in table body<sup>p1134</sup>](#)".

Reprocess the current token.

↔ **A start tag whose tag name is "table"**

[Parse error<sup>p1061</sup>](#).

If the [stack of open elements<sup>p1073</sup>](#) does not [have a table element in table scope<sup>p1075</sup>](#), ignore the token.

Otherwise:

Pop elements from this stack until a [table<sup>p443</sup>](#) element has been popped from the stack.

[Reset the insertion mode appropriately<sup>p1072</sup>](#).

Reprocess the token.

↔ **An end tag whose tag name is "table"**

If the [stack of open elements<sup>p1073</sup>](#) does not [have a table element in table scope<sup>p1075</sup>](#), this is a [parse error<sup>p1061</sup>](#); ignore the token.

Otherwise:

Pop elements from this stack until a [table<sup>p443</sup>](#) element has been popped from the stack.

[Reset the insertion mode appropriately<sup>p1072</sup>](#).

↔ **An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "tbody", "td", "tfoot", "th", "thead", "tr"**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↔ **A start tag whose tag name is one of: "style", "script", "template"**

↔ **An end tag whose tag name is "template"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↔ **A start tag whose tag name is "input"**

If the token does not have an attribute with the name "type", or if it does, but that attribute's value is not an [ASCII case-insensitive](#) match for the string "hidden", then: act as described in the "anything else" entry below.

Otherwise:

[Parse error<sup>p1061</sup>](#).

[Insert an HTML element<sup>p1109</sup>](#) for the token.

Pop that [input<sup>p486</sup>](#) element off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

↔ **A start tag whose tag name is "form"**

[Parse error<sup>p1061</sup>](#).

If there is a [template<sup>p623</sup>](#) element on the [stack of open elements<sup>p1073</sup>](#), or if the [form element pointer<sup>p1076</sup>](#) is not null, ignore the token.

Otherwise:

[Insert an HTML element<sup>p1109</sup>](#) for the token, and set the [form element pointer<sup>p1076</sup>](#) to point to the element created.

Pop that [form<sup>p479</sup>](#) element off the [stack of open elements<sup>p1073</sup>](#).

↪ **An end-of-file token**

Process the token [using the rules for<sup>p1072</sup>](#) the "in body<sup>p1119</sup>" [insertion mode<sup>p1072</sup>](#).

↪ **Anything else**

[Parse error<sup>p1061</sup>](#). Enable [foster parenting<sup>p1106</sup>](#), process the token [using the rules for<sup>p1072</sup>](#) the "in body<sup>p1119</sup>" [insertion mode<sup>p1072</sup>](#), and then disable [foster parenting<sup>p1106</sup>](#).

When the steps above require the UA to **clear the stack back to a table context**, it means that the UA must, while the [current node<sup>p1074</sup>](#) is not a [table<sup>p443</sup>](#), [template<sup>p623</sup>](#), or [html<sup>p149</sup>](#) element, pop elements from the [stack of open elements<sup>p1073</sup>](#).

**Note**

*This is the same list of elements as used in the [has an element in table scope<sup>p1075</sup>](#) steps.*

**Note**

*The [current node<sup>p1074</sup>](#) being an [html<sup>p149</sup>](#) element after this process is a [fragment case<sup>p1157</sup>](#).*

**12.2.6.4.10 The "in table text" insertion mode** §<sup>p11</sup>  
32

When the user agent is to apply the rules for the "in table text<sup>p1132</sup>" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is U+0000 NULL**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **Any other character token**

Append the character token to the [pending table character tokens<sup>p1130</sup>](#) list.

↪ **Anything else**

If any of the tokens in the [pending table character tokens<sup>p1130</sup>](#) list are character tokens that are not [ASCII whitespace](#), then this is a [parse error<sup>p1061</sup>](#): reprocess the character tokens in the [pending table character tokens<sup>p1130</sup>](#) list using the rules given in the "anything else" entry in the "in table<sup>p1130</sup>" insertion mode.

Otherwise, [insert the characters<sup>p1110</sup>](#) given by the [pending table character tokens<sup>p1130</sup>](#) list.

Switch the [insertion mode<sup>p1072</sup>](#) to the [original insertion mode<sup>p1072</sup>](#) and reprocess the token.

**12.2.6.4.11 The "in caption" insertion mode** §<sup>p11</sup>  
32

When the user agent is to apply the rules for the "in caption<sup>p1132</sup>" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **An end tag whose tag name is "caption"**

If the [stack of open elements<sup>p1073</sup>](#) does not [have a caption element in table scope<sup>p1075</sup>](#), this is a [parse error<sup>p1061</sup>](#); ignore the token. ([fragment case<sup>p1157</sup>](#))

Otherwise:

[Generate implied end tags<sup>p1112</sup>](#).

Now, if the [current node<sup>p1074</sup>](#) is not a [caption<sup>p451</sup>](#) element, then this is a [parse error<sup>p1061</sup>](#).

Pop elements from this stack until a [caption<sup>p451</sup>](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p1076</sup>](#).

Switch the [insertion mode<sup>p1072</sup>](#) to "[in table<sup>p1130</sup>](#)".

↪ **A start tag whose tag name is one of:** "caption", "col", "colgroup", "tbody", "td", "tfoot", "th", "thead", "tr"

↪ **An end tag whose tag name is "table"**

If the [stack of open elements<sup>p1073</sup>](#) does not [have a caption element in table scope<sup>p1075</sup>](#), this is a [parse error<sup>p1061</sup>](#); ignore the token. ([fragment case<sup>p1157</sup>](#))

Otherwise:

[Generate implied end tags<sup>p1112</sup>](#).

Now, if the [current node<sup>p1074</sup>](#) is not a [caption<sup>p451</sup>](#) element, then this is a [parse error<sup>p1061</sup>](#).

Pop elements from this stack until a [caption<sup>p451</sup>](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p1076</sup>](#).

Switch the [insertion mode<sup>p1072</sup>](#) to "[in table<sup>p1130</sup>](#)".

Reprocess the token.

↪ **An end tag whose tag name is one of:** "body", "col", "colgroup", "html", "tbody", "td", "tfoot", "th", "thead", "tr"

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **Anything else**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

#### 12.2.6.4.12 The "in column group" insertion mode §<sup>p11</sup> 33

When the user agent is to apply the rules for the "[in column group<sup>p1133</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character<sup>p1110</sup>](#).

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **A start tag whose tag name is "col"**

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

↪ **An end tag whose tag name is "colgroup"**

If the [current node<sup>p1074</sup>](#) is not a [colgroup<sup>p452</sup>](#) element, then this is a [parse error<sup>p1061</sup>](#); ignore the token.

Otherwise, pop the [current node<sup>p1074</sup>](#) from the [stack of open elements<sup>p1073</sup>](#). Switch the [insertion mode<sup>p1072</sup>](#) to "[in table<sup>p1130</sup>](#)".

↪ **An end tag whose tag name is "col"**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "template"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for](#)<sup>p1072</sup> the ["in head"](#)<sup>p1115</sup> [insertion mode](#)<sup>p1072</sup>.

↪ **An end-of-file token**

Process the token [using the rules for](#)<sup>p1072</sup> the ["in body"](#)<sup>p1119</sup> [insertion mode](#)<sup>p1072</sup>.

↪ **Anything else**

If the [current node](#)<sup>p1074</sup> is not a [colgroup](#)<sup>p452</sup> element, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, pop the [current node](#)<sup>p1074</sup> from the [stack of open elements](#)<sup>p1073</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to ["in table"](#)<sup>p1130</sup>.

Reprocess the token.

#### 12.2.6.4.13 The "in table body" insertion mode §<sup>p11</sup> 34

When the user agent is to apply the rules for the ["in table body"](#)<sup>p1134</sup> [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A start tag whose tag name is "tr"**

[Clear the stack back to a table body context](#)<sup>p1135</sup>. (See below.)

[Insert an HTML element](#)<sup>p1109</sup> for the token, then switch the [insertion mode](#)<sup>p1072</sup> to ["in row"](#)<sup>p1135</sup>.

↪ **A start tag whose tag name is one of: "th", "td"**

[Parse error](#)<sup>p1061</sup>.

[Clear the stack back to a table body context](#)<sup>p1135</sup>. (See below.)

[Insert an HTML element](#)<sup>p1109</sup> for a "tr" start tag token with no attributes, then switch the [insertion mode](#)<sup>p1072</sup> to ["in row"](#)<sup>p1135</sup>.

Reprocess the current token.

↪ **An end tag whose tag name is one of: "tbody", "tfoot", "thead"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in table scope](#)<sup>p1075</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as the token, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table body context](#)<sup>p1135</sup>. (See below.)

Pop the [current node](#)<sup>p1074</sup> from the [stack of open elements](#)<sup>p1073</sup>. Switch the [insertion mode](#)<sup>p1072</sup> to ["in table"](#)<sup>p1130</sup>.

↪ **A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "tfoot", "thead"**

↪ **An end tag whose tag name is "table"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have a tbody, tthead, or ttfoot element in table scope](#)<sup>p1075</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table body context](#)<sup>p1135</sup>. (See below.)

Pop the [current node](#)<sup>p1074</sup> from the [stack of open elements](#)<sup>p1073</sup>. Switch the [insertion mode](#)<sup>p1072</sup> to ["in table"](#)<sup>p1130</sup>.

Reprocess the token.

↪ **An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "td", "th", "tr"**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

#### ↪ Anything else

Process the token [using the rules for](#)<sup>p1072</sup> the "[in table](#)<sup>p1130</sup>" [insertion mode](#)<sup>p1072</sup>.

When the steps above require the UA to **clear the stack back to a table body context**, it means that the UA must, while the [current node](#)<sup>p1074</sup> is not a [tbody](#)<sup>p454</sup>, [tfoot](#)<sup>p456</sup>, [thead](#)<sup>p455</sup>, [template](#)<sup>p623</sup>, or [html](#)<sup>p149</sup> element, pop elements from the [stack of open elements](#)<sup>p1073</sup>.

#### Note

The [current node](#)<sup>p1074</sup> being an [html](#)<sup>p149</sup> element after this process is a [fragment case](#)<sup>p1157</sup>.

#### 12.2.6.4.14 The "in row" insertion mode §<sup>p11</sup><sub>35</sub>

When the user agent is to apply the rules for the "[in row](#)<sup>p1135</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

##### ↪ A start tag whose tag name is one of: "th", "td"

[Clear the stack back to a table row context](#)<sup>p1136</sup>. (See below.)

[Insert an HTML element](#)<sup>p1109</sup> for the token, then switch the [insertion mode](#)<sup>p1072</sup> to "[in cell](#)<sup>p1136</sup>".

Insert a [marker](#)<sup>p1075</sup> at the end of the [list of active formatting elements](#)<sup>p1075</sup>.

##### ↪ An end tag whose tag name is "tr"

If the [stack of open elements](#)<sup>p1073</sup> does not [have a tr element in table scope](#)<sup>p1075</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table row context](#)<sup>p1136</sup>. (See below.)

Pop the [current node](#)<sup>p1074</sup> (which will be a [tr](#)<sup>p457</sup> element) from the [stack of open elements](#)<sup>p1073</sup>. Switch the [insertion mode](#)<sup>p1072</sup> to "[in table body](#)<sup>p1134</sup>".

##### ↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "tfoot", "thead", "tr"

##### ↪ An end tag whose tag name is "table"

If the [stack of open elements](#)<sup>p1073</sup> does not [have a tr element in table scope](#)<sup>p1075</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table row context](#)<sup>p1136</sup>. (See below.)

Pop the [current node](#)<sup>p1074</sup> (which will be a [tr](#)<sup>p457</sup> element) from the [stack of open elements](#)<sup>p1073</sup>. Switch the [insertion mode](#)<sup>p1072</sup> to "[in table body](#)<sup>p1134</sup>".

Reprocess the token.

##### ↪ An end tag whose tag name is one of: "tbody", "tfoot", "thead"

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in table scope](#)<sup>p1075</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as the token, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

If the [stack of open elements](#)<sup>p1073</sup> does not [have a tr element in table scope](#)<sup>p1075</sup>, ignore the token.

Otherwise:

[Clear the stack back to a table row context](#)<sup>p1136</sup>. (See below.)

Pop the [current node](#)<sup>p1074</sup> (which will be a [tr](#)<sup>p457</sup> element) from the [stack of open elements](#)<sup>p1073</sup>. Switch the [insertion mode](#)<sup>p1072</sup> to "[in table body](#)<sup>p1134</sup>".

Reprocess the token.

##### ↪ An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "td", "th"

[Parse error](#)<sup>p1061</sup>. Ignore the token.

#### ↪ Anything else

Process the token [using the rules for](#)<sup>p1072</sup> the "in table<sup>p1130</sup>" [insertion mode](#)<sup>p1072</sup>.

When the steps above require the UA to **clear the stack back to a table row context**, it means that the UA must, while the [current node](#)<sup>p1074</sup> is not a [tr](#)<sup>p457</sup>, [template](#)<sup>p623</sup>, or [html](#)<sup>p149</sup> element, pop elements from the [stack of open elements](#)<sup>p1073</sup>.

#### Note

The [current node](#)<sup>p1074</sup> being an [html](#)<sup>p149</sup> element after this process is a [fragment case](#)<sup>p1157</sup>.

#### 12.2.6.4.15 The "in cell" insertion mode <sup>§<sup>p11</sup><sub>36</sub></sup>

When the user agent is to apply the rules for the "in cell<sup>p1136</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

#### ↪ An end tag whose tag name is one of: "td", "th"

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in table scope](#)<sup>p1075</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise:

[Generate implied end tags](#)<sup>p1112</sup>.

Now, if the [current node](#)<sup>p1074</sup> is not an [HTML element](#)<sup>p43</sup> with the same tag name as the token, then this is a [parse error](#)<sup>p1061</sup>.

Pop elements from the [stack of open elements](#)<sup>p1073</sup> stack until an [HTML element](#)<sup>p43</sup> with the same tag name as the token has been popped from the stack.

[Clear the list of active formatting elements up to the last marker](#)<sup>p1076</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "in row<sup>p1135</sup>".

#### ↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "td", "tfoot", "th", "thead", "tr"

If the [stack of open elements](#)<sup>p1073</sup> does *not* [have a td or th element in table scope](#)<sup>p1075</sup>, then this is a [parse error](#)<sup>p1061</sup>; ignore the token. ([fragment case](#)<sup>p1157</sup>)

Otherwise, [close the cell](#)<sup>p1136</sup> (see below) and reprocess the token.

#### ↪ An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html"

[Parse error](#)<sup>p1061</sup>. Ignore the token.

#### ↪ An end tag whose tag name is one of: "table", "tbody", "tfoot", "thead", "tr"

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in table scope](#)<sup>p1075</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1061</sup>; ignore the token.

Otherwise, [close the cell](#)<sup>p1136</sup> (see below) and reprocess the token.

#### ↪ Anything else

Process the token [using the rules for](#)<sup>p1072</sup> the "in body<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

Where the steps above say to **close the cell**, they mean to run the following algorithm:

1. [Generate implied end tags](#)<sup>p1112</sup>.
2. If the [current node](#)<sup>p1074</sup> is not now a [td](#)<sup>p459</sup> element or a [th](#)<sup>p460</sup> element, then this is a [parse error](#)<sup>p1061</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1073</sup> stack until a [td](#)<sup>p459</sup> element or a [th](#)<sup>p460</sup> element has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker](#)<sup>p1076</sup>.
5. Switch the [insertion mode](#)<sup>p1072</sup> to "in row<sup>p1135</sup>".

**Note**

The [stack of open elements](#)<sup>p1073</sup> cannot have both a [td](#)<sup>p459</sup> and a [th](#)<sup>p460</sup> element [in table scope](#)<sup>p1075</sup> at the same time, nor can it have neither when the [close the cell](#)<sup>p1136</sup> algorithm is invoked.

#### 12.2.6.4.16 The "in select" insertion mode §<sup>p11</sup> 37

When the user agent is to apply the rules for the "[in select](#)<sup>p1137</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A character token that is U+0000 NULL**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **Any other character token**

[Insert the token's character](#)<sup>p1110</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1111</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is "option"**

If the [current node](#)<sup>p1074</sup> is an [option](#)<sup>p539</sup> element, pop that node from the [stack of open elements](#)<sup>p1073</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token.

↪ **A start tag whose tag name is "optgroup"**

If the [current node](#)<sup>p1074</sup> is an [option](#)<sup>p539</sup> element, pop that node from the [stack of open elements](#)<sup>p1073</sup>.

If the [current node](#)<sup>p1074</sup> is an [optgroup](#)<sup>p537</sup> element, pop that node from the [stack of open elements](#)<sup>p1073</sup>.

[Insert an HTML element](#)<sup>p1109</sup> for the token.

↪ **An end tag whose tag name is "optgroup"**

First, if the [current node](#)<sup>p1074</sup> is an [option](#)<sup>p539</sup> element, and the node immediately before it in the [stack of open elements](#)<sup>p1073</sup> is an [optgroup](#)<sup>p537</sup> element, then pop the [current node](#)<sup>p1074</sup> from the [stack of open elements](#)<sup>p1073</sup>.

If the [current node](#)<sup>p1074</sup> is an [optgroup](#)<sup>p537</sup> element, then pop that node from the [stack of open elements](#)<sup>p1073</sup>. Otherwise, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

↪ **An end tag whose tag name is "option"**

If the [current node](#)<sup>p1074</sup> is an [option](#)<sup>p539</sup> element, then pop that node from the [stack of open elements](#)<sup>p1073</sup>. Otherwise, this is a [parse error](#)<sup>p1061</sup>; ignore the token.

↪ **An end tag whose tag name is "select"**

If the [stack of open elements](#)<sup>p1073</sup> does not [have a select element in select scope](#)<sup>p1075</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token. ([fragment case](#)<sup>p1157</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [select](#)<sup>p539</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is "select"**

[Parse error](#)<sup>p1061</sup>.

If the [stack of open elements](#)<sup>p1073</sup> does not [have a select element in select scope](#)<sup>p1075</sup>, ignore the token. ([fragment case](#)<sup>p1157</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [select](#)<sup>p530</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1072</sup>.

#### Note

*It just gets treated like an end tag.*

↪ **A start tag whose tag name is one of: "input", "keygen", "textarea"**

[Parse error](#)<sup>p1061</sup>.

If the [stack of open elements](#)<sup>p1073</sup> does not [have a select element in select scope](#)<sup>p1075</sup>, ignore the token. ([fragment case](#)<sup>p1157</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [select](#)<sup>p530</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1072</sup>.

Reprocess the token.

↪ **A start tag whose tag name is one of: "script", "template"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in head](#)<sup>p1115</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **An end-of-file token**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **Anything else**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

#### 12.2.6.4.17 The "[in select in table](#)" insertion mode §<sup>p11</sup><sub>38</sub>

When the user agent is to apply the rules for the "[in select in table](#)<sup>p1138</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A start tag whose tag name is one of: "caption", "table", "tbody", "tfoot", "thead", "tr", "td", "th"**

[Parse error](#)<sup>p1061</sup>.

Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [select](#)<sup>p530</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1072</sup>.

Reprocess the token.

↪ **An end tag whose tag name is one of: "caption", "table", "tbody", "tfoot", "thead", "tr", "td", "th"**

[Parse error](#)<sup>p1061</sup>.

If the [stack of open elements](#)<sup>p1073</sup> does not [have an element in table scope](#)<sup>p1075</sup> that is an [HTML element](#)<sup>p43</sup> with the same tag name as that of the token, then ignore the token.

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [select](#)<sup>p530</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1072</sup>.

Reprocess the token.

↪ **Anything else**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in select](#)<sup>p1137</sup>" [insertion mode](#)<sup>p1072</sup>.

**12.2.6.4.18 The "in template" insertion mode** §<sup>p11</sup><sub>39</sub>

When the user agent is to apply the rules for the "[in template](#)<sup>p1139</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A character token**

↪ **A comment token**

↪ **A DOCTYPE token**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in head](#)<sup>p1115</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is one of: "caption", "colgroup", "tbody", "tfoot", "thead"**

Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.

Push "[in table](#)<sup>p1130</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in table](#)<sup>p1130</sup>", and reprocess the token.

↪ **A start tag whose tag name is "col"**

Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.

Push "[in column group](#)<sup>p1133</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in column group](#)<sup>p1133</sup>", and reprocess the token.

↪ **A start tag whose tag name is "tr"**

Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.

Push "[in table body](#)<sup>p1134</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in table body](#)<sup>p1134</sup>", and reprocess the token.

↪ **A start tag whose tag name is one of: "td", "th"**

Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.

Push "[in row](#)<sup>p1135</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in row](#)<sup>p1135</sup>", and reprocess the token.

↪ **Any other start tag**

Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.

Push "[in body](#)<sup>p1119</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.

Switch the [insertion mode](#)<sup>p1072</sup> to "[in body](#)<sup>p1119</sup>", and reprocess the token.

↪ **Any other end tag**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **An end-of-file token**

If there is no [template](#)<sup>p623</sup> element on the [stack of open elements](#)<sup>p1073</sup>, then [stop parsing](#)<sup>p1145</sup>. ([fragment case](#)<sup>p1157</sup>)

Otherwise, this is a [parse error](#)<sup>p1061</sup>.

Pop elements from the [stack of open elements](#)<sup>p1073</sup> until a [template](#)<sup>p623</sup> element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker](#)<sup>p1076</sup>.

Pop the [current template insertion mode](#)<sup>p1072</sup> off the [stack of template insertion modes](#)<sup>p1072</sup>.

[Reset the insertion mode appropriately](#)<sup>p1072</sup>.

Reprocess the token.

#### 12.2.6.4.19 The "after body" insertion mode §<sup>p11</sup><sub>40</sub>

When the user agent is to apply the rules for the "[after body](#)<sup>p1140</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1111</sup> as the last child of the first element in the [stack of open elements](#)<sup>p1073</sup> (the [html](#)<sup>p149</sup> element).

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **An end tag whose tag name is "html"**

If the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1157</sup>, this is a [parse error](#)<sup>p1061</sup>; ignore the token. ([fragment case](#)<sup>p1157</sup>)

Otherwise, switch the [insertion mode](#)<sup>p1072</sup> to "[after after body](#)<sup>p1142</sup>".

↪ **An end-of-file token**

[Stop parsing](#)<sup>p1145</sup>.

↪ **Anything else**

[Parse error](#)<sup>p1061</sup>. Switch the [insertion mode](#)<sup>p1072</sup> to "[in body](#)<sup>p1119</sup>" and reprocess the token.

#### 12.2.6.4.20 The "in frameset" insertion mode §<sup>p11</sup><sub>40</sub>

When the user agent is to apply the rules for the "[in frameset](#)<sup>p1140</sup>" [insertion mode](#)<sup>p1072</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character](#)<sup>p1110</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1111</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1061</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1072</sup> the "[in body](#)<sup>p1119</sup>" [insertion mode](#)<sup>p1072</sup>.

↪ **A start tag whose tag name is "frameset"**

[Insert an HTML element<sup>p1109</sup>](#) for the token.

↪ **An end tag whose tag name is "frameset"**

If the [current node<sup>p1074</sup>](#) is the root [html<sup>p149</sup>](#) element, then this is a [parse error<sup>p1061</sup>](#); ignore the token. ([fragment case<sup>p1157</sup>](#))

Otherwise, pop the [current node<sup>p1074</sup>](#) from the [stack of open elements<sup>p1073</sup>](#).

If the parser was not created as part of the [HTML fragment parsing algorithm<sup>p1157</sup>](#) ([fragment case<sup>p1157</sup>](#)), and the [current node<sup>p1074</sup>](#) is no longer a [frameset<sup>p1219</sup>](#) element, then switch the [insertion mode<sup>p1072</sup>](#) to "[after frameset<sup>p1141</sup>](#)".

↪ **A start tag whose tag name is "frame"**

[Insert an HTML element<sup>p1109</sup>](#) for the token. Immediately pop the [current node<sup>p1074</sup>](#) off the [stack of open elements<sup>p1073</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1077</sup>](#), if it is set.

↪ **A start tag whose tag name is "noframes"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **An end-of-file token**

If the [current node<sup>p1074</sup>](#) is not the root [html<sup>p149</sup>](#) element, then this is a [parse error<sup>p1061</sup>](#).

#### Note

The [current node<sup>p1074</sup>](#) can only be the root [html<sup>p149</sup>](#) element in the [fragment case<sup>p1157</sup>](#).

[Stop parsing<sup>p1145</sup>](#).

↪ **Anything else**

[Parse error<sup>p1061</sup>](#). Ignore the token.

#### 12.2.6.4.21 The "after frameset" insertion mode §<sup>p11</sup><sub>41</sub>

When the user agent is to apply the rules for the "[after frameset<sup>p1141</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character<sup>p1110</sup>](#).

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **An end tag whose tag name is "html"**

Switch the [insertion mode<sup>p1072</sup>](#) to "[after after frameset<sup>p1142</sup>](#)".

↪ **A start tag whose tag name is "noframes"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **An end-of-file token**

[Stop parsing<sup>p1145</sup>](#).

↪ **Anything else**

[Parse error<sup>p1061</sup>](#). Ignore the token.

#### 12.2.6.4.22 The "after after body" insertion mode §<sup>p11</sup><sub>42</sub>

When the user agent is to apply the rules for the "[after after body<sup>p1142</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#) as the last child of the [Document<sup>p111</sup>](#) object.

↪ **A DOCTYPE token**

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **An end-of-file token**

[Stop parsing<sup>p1145</sup>](#).

↪ **Anything else**

[Parse error<sup>p1061</sup>](#). Switch the [insertion mode<sup>p1072</sup>](#) to "[in body<sup>p1119</sup>](#)" and reprocess the token.

#### 12.2.6.4.23 The "after after frameset" insertion mode §<sup>p11</sup><sub>42</sub>

When the user agent is to apply the rules for the "[after after frameset<sup>p1142</sup>](#)" [insertion mode<sup>p1072</sup>](#), the user agent must handle the token as follows:

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#) as the last child of the [Document<sup>p111</sup>](#) object.

↪ **A DOCTYPE token**

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in body<sup>p1119</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **An end-of-file token**

[Stop parsing<sup>p1145</sup>](#).

↪ **A start tag whose tag name is "noframes"**

Process the token [using the rules for<sup>p1072</sup>](#) the "[in head<sup>p1115</sup>](#)" [insertion mode<sup>p1072</sup>](#).

↪ **Anything else**

[Parse error<sup>p1061</sup>](#). Ignore the token.

#### 12.2.6.5 The rules for parsing tokens in foreign content §<sup>p11</sup><sub>42</sub>

When the user agent is to apply the rules for parsing tokens in foreign content, the user agent must handle the token as follows:

↪ **A character token that is U+0000 NULL**

[Parse error<sup>p1061</sup>](#). [Insert a U+FFFD REPLACEMENT CHARACTER character<sup>p1110</sup>](#).

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the token's character<sup>p1110</sup>](#).

↪ **Any other character token**

[Insert the token's character<sup>p1110</sup>](#).

Set the [frameset-ok flag<sup>p1077</sup>](#) to "not ok".

↪ **A comment token**

[Insert a comment<sup>p1111</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1061</sup>](#). Ignore the token.

↪ **A start tag whose tag name is one of: "b", "big", "blockquote", "body", "br", "center", "code", "dd", "div", "dl", "dt", "em", "embed", "h1", "h2", "h3", "h4", "h5", "h6", "head", "hr", "i", "img", "li", "listing", "menu", "meta", "nobr", "ol", "p", "pre", "ruby", "s", "small", "span", "strong", "strike", "sub", "sup", "table", "tt", "u", "ul", "var"**

↪ **A start tag whose tag name is "font", if the token has any attributes named "color", "face", or "size"**

[Parse error<sup>p1061</sup>](#).

If the parser was created as part of the [HTML fragment parsing algorithm<sup>p1157</sup>](#), then act as described in the "any other start tag" entry below. ([fragment case<sup>p1157</sup>](#))

Otherwise:

Pop an element from the [stack of open elements<sup>p1073</sup>](#), and then keep popping more elements from the [stack of open elements<sup>p1073</sup>](#) until the [current node<sup>p1074</sup>](#) is a [MathML text integration point<sup>p1106</sup>](#), an [HTML integration point<sup>p1106</sup>](#), or an element in the [HTML namespace](#).

Then, reprocess the token.

↪ **Any other start tag**

If the [adjusted current node<sup>p1074</sup>](#) is an element in the [MathML namespace](#), [adjust MathML attributes<sup>p1109</sup>](#) for the token. (This fixes the case of MathML attributes that are not all lowercase.)

If the [adjusted current node<sup>p1074</sup>](#) is an element in the [SVG namespace](#), and the token's tag name is one of the ones in the first column of the following table, change the tag name to the name given in the corresponding cell in the second column. (This fixes the case of SVG elements that are not all lowercase.)

Tag name	Element name
altglyph	altGlyph
altglyphdef	altGlyphDef
altglyphitem	altGlyphItem
animatecolor	animateColor
animatemotion	animateMotion
animatetransform	animateTransform
clippath	clipPath
feblend	feBlend
fecolormatrix	feColorMatrix
fecomponenttransfer	feComponentTransfer
fecomposite	feComposite
feconvolvematrix	feConvolveMatrix
fediffuselighting	feDiffuseLighting
fedisplacementmap	feDisplacementMap
fedistantlight	feDistantLight
fedropshadow	feDropShadow
feflood	feFlood
fefuncA	feFuncA
fefuncB	feFuncB
fefuncG	feFuncG
fefuncR	feFuncR
fegaussianblur	feGaussianBlur
feimage	feImage
femerge	feMerge
femergenode	feMergeNode
femorphology	feMorphology
feoffset	feOffset
fepointlight	fePointLight

Tag name	Element name
fespecularlighting	feSpecularLighting
fespotlight	feSpotLight
fetile	feTile
feturbulence	feTurbulence
foreignobject	foreignObject
glyphref	glyphRef
lineargradient	linearGradient
radialgradient	radialGradient
textpath	textPath

If the [adjusted current node](#)<sup>p1074</sup> is an element in the [SVG namespace](#), [adjust SVG attributes](#)<sup>p1109</sup> for the token. (This fixes the case of SVG attributes that are not all lowercase.)

[Adjust foreign attributes](#)<sup>p1110</sup> for the token. (This fixes the use of namespaced attributes, in particular XLink in SVG.)

[Insert a foreign element](#)<sup>p1108</sup> for the token, in the same namespace as the [adjusted current node](#)<sup>p1074</sup>.

If the token has its [self-closing flag](#)<sup>p1077</sup> set, then run the appropriate steps from the following list:

↪ **If the token's tag name is "script", and the new [current node](#)**<sup>p1074</sup> **is in the [SVG namespace](#)**  
[Acknowledge the token's self-closing flag](#)<sup>p1077</sup>, and then act as described in the steps for a "script" end tag below.

↪ **Otherwise**

Pop the [current node](#)<sup>p1074</sup> off the [stack of open elements](#)<sup>p1073</sup> and [acknowledge the token's self-closing flag](#)<sup>p1077</sup>.

↪ **An end tag whose tag name is "script", if the [current node](#)**<sup>p1074</sup> **is an [SVG script](#) element**

Pop the [current node](#)<sup>p1074</sup> off the [stack of open elements](#)<sup>p1073</sup>.

Let the *old insertion point* have the same value as the current [insertion point](#)<sup>p1072</sup>. Let the [insertion point](#)<sup>p1072</sup> be just before the [next input character](#)<sup>p1072</sup>.

Increment the parser's [script nesting level](#)<sup>p1061</sup> by one. Set the [parser pause flag](#)<sup>p1061</sup> to true.

[Process the SVG script element](#) according to the SVG rules, if the user agent supports SVG. [\[SVG\]](#)<sup>p1270</sup>

#### Note

*Even if this causes [new characters to be inserted into the tokenizer](#)<sup>p950</sup>, the parser will not be executed reentrantly, since the [parser pause flag](#)<sup>p1061</sup> is true.*

Decrement the parser's [script nesting level](#)<sup>p1061</sup> by one. If the parser's [script nesting level](#)<sup>p1061</sup> is zero, then set the [parser pause flag](#)<sup>p1061</sup> to false.

Let the [insertion point](#)<sup>p1072</sup> have the value of the *old insertion point*. (In other words, restore the [insertion point](#)<sup>p1072</sup> to its previous value. This value might be the "undefined" value.)

↪ **Any other end tag**

Run these steps:

1. Initialize *node* to be the [current node](#)<sup>p1074</sup> (the bottommost node of the stack).
2. If *node*'s tag name, [converted to ASCII lowercase](#), is not the same as the tag name of the token, then this is a [parse error](#)<sup>p1061</sup>.
3. *Loop*: If *node* is the topmost element in the [stack of open elements](#)<sup>p1073</sup>, then return. ([fragment case](#)<sup>p1157</sup>)
4. If *node*'s tag name, [converted to ASCII lowercase](#), is the same as the tag name of the token, pop elements from the [stack of open elements](#)<sup>p1073</sup> until *node* has been popped from the stack, and then return.
5. Set *node* to the previous entry in the [stack of open elements](#)<sup>p1073</sup>.
6. If *node* is not an element in the [HTML namespace](#), return to the step labeled *loop*.
7. Otherwise, process the token according to the rules given in the section corresponding to the current [insertion](#)

[mode<sup>p1072</sup>](#) in HTML content.

## 12.2.7 The end <sup>p11</sup><sub>45</sub>

Once the user agent **stops parsing** the document, the user agent must run the following steps:

1. Set the [current document readiness<sup>p114</sup>](#) to "interactive" and the [insertion point<sup>p1072</sup>](#) to undefined.
2. Pop *all* the nodes off the [stack of open elements<sup>p1073</sup>](#).
3. If the [list of scripts that will execute when the document has finished parsing<sup>p615</sup>](#) is not empty, run these substeps:
  1. [Spin the event loop<sup>p929</sup>](#) until the first [script<sup>p607</sup>](#) in the [list of scripts that will execute when the document has finished parsing<sup>p615</sup>](#) has its "ready to be parser-executed"<sup>p612</sup> flag set *and* the parser's [Document<sup>p111</sup> has no style sheet that is blocking scripts<sup>p174</sup>](#).
  2. [Execute<sup>p616</sup>](#) the first [script<sup>p607</sup>](#) in the [list of scripts that will execute when the document has finished parsing<sup>p615</sup>](#).
  3. Remove the first [script<sup>p607</sup>](#) element from the [list of scripts that will execute when the document has finished parsing<sup>p615</sup>](#) (i.e. shift out the first entry in the list).
  4. If the [list of scripts that will execute when the document has finished parsing<sup>p615</sup>](#) is still not empty, repeat these substeps again from substep 1.
4. [Queue a task<sup>p925</sup>](#) to run the following substeps:
  1. [Fire an event](#) named [DOMContentLoaded<sup>p1260</sup>](#) at the [Document<sup>p111</sup>](#) object, with its [bubbles](#) attribute initialized to true.
  2. Enable the [client message queue](#) of the [ServiceWorkerContainer](#) object whose associated [service worker client](#) is the [Document<sup>p111</sup>](#) object's [relevant settings object<sup>p913</sup>](#).
5. [Spin the event loop<sup>p929</sup>](#) until the [set of scripts that will execute as soon as possible<sup>p616</sup>](#) and the [list of scripts that will execute in order as soon as possible<sup>p616</sup>](#) are empty.
6. [Spin the event loop<sup>p929</sup>](#) until there is nothing that **delays the load event** in the [Document<sup>p111</sup>](#).
7. [Queue a task<sup>p925</sup>](#) to run the following substeps:
  1. Set the [current document readiness<sup>p114</sup>](#) to "complete".
  2. *Load event*: If the [Document<sup>p111</sup>](#) object's [browsing context<sup>p804</sup>](#) is non-null, then [fire an event](#) named [load<sup>p1261</sup>](#) at the [Document<sup>p111</sup>](#) object's [relevant global object<sup>p913</sup>](#), with *legacy target override flag* set.
8. If the [Document<sup>p111</sup>](#) object's [browsing context<sup>p804</sup>](#) is non-null, then [queue a task<sup>p925</sup>](#) to run these steps:
  1. If the [Document<sup>p111</sup>](#)'s [page showing<sup>p869</sup>](#) flag is true, then return (i.e. don't fire the event below).
  2. Set the [Document<sup>p111</sup>](#)'s [page showing<sup>p869</sup>](#) flag to true.
  3. [Fire an event](#) named [pageshow<sup>p1261</sup>](#) at the [Document<sup>p111</sup>](#) object's [relevant global object<sup>p913</sup>](#), using [PageTransitionEvent<sup>p868</sup>](#), with the [persisted<sup>p868</sup>](#) attribute initialized to false, and *legacy target override flag* set.
9. If the [Document<sup>p111</sup>](#) has any [pending application cache download process tasks<sup>p888</sup>](#), then [queue<sup>p925</sup>](#) each such [task<sup>p925</sup>](#) in the order they were added to the list of [pending application cache download process tasks<sup>p888</sup>](#), and then empty the list of [pending application cache download process tasks<sup>p888</sup>](#). The [task source<sup>p925</sup>](#) for these [tasks<sup>p925</sup>](#) is the [networking task source<sup>p932</sup>](#).
10. If the [Document<sup>p111</sup>](#)'s [print when loaded<sup>p958</sup>](#) flag is set, then run the [printing steps<sup>p958</sup>](#).
11. The [Document<sup>p111</sup>](#) is now **ready for post-load tasks**.
12. [Queue a task<sup>p925</sup>](#) to mark the [Document<sup>p111</sup>](#) as **completely loaded**.

When the user agent is to **abort a parser**, it must run the following steps:

1. Throw away any pending content in the [input stream](#)<sup>p1071</sup>, and discard any future content that would have been added to it.
2. Set the [current document readiness](#)<sup>p114</sup> to "interactive".
3. Pop *all* the nodes off the [stack of open elements](#)<sup>p1073</sup>.
4. Set the [current document readiness](#)<sup>p114</sup> to "complete".

Except where otherwise specified, the [task source](#)<sup>p925</sup> for the [tasks](#)<sup>p925</sup> mentioned in this section is the [DOM manipulation task source](#)<sup>p932</sup>.

## 12.2.8 Coercing an HTML DOM into an infoset §<sup>p11</sup><sub>46</sub>

When an application uses an [HTML parser](#)<sup>p1059</sup> in conjunction with an XML pipeline, it is possible that the constructed DOM is not compatible with the XML tool chain in certain subtle ways. For example, an XML toolchain might not be able to represent attributes with the name `xmlns`, since they conflict with the Namespaces in XML syntax. There is also some data that the [HTML parser](#)<sup>p1059</sup> generates that isn't included in the DOM itself. This section specifies some rules for handling these issues.

If the XML API being used doesn't support DOCTYPEs, the tool may drop DOCTYPEs altogether.

If the XML API doesn't support attributes in no namespace that are named "xmlns", attributes whose names start with "xmlns:", or attributes in the [XMLNS namespace](#), then the tool may drop such attributes.

The tool may annotate the output with any namespace declarations required for proper operation.

If the XML API being used restricts the allowable characters in the local names of elements and attributes, then the tool may map all element and attribute local names that the API wouldn't support to a set of names that *are* allowed, by replacing any character that isn't supported with the uppercase letter U and the six digits of the character's code point when expressed in hexadecimal, using digits 0-9 and capital letters A-F as the symbols, in increasing numeric order.

### Example

For example, the element name `foo<bar`, which can be output by the [HTML parser](#)<sup>p1059</sup>, though it is neither a legal HTML element name nor a well-formed XML element name, would be converted into `fooU000003Cbar`, which *is* a well-formed XML element name (though it's still not legal in HTML by any means).

### Example

As another example, consider the attribute `xlink:href`. Used on a MathML element, it becomes, after being [adjusted](#)<sup>p1110</sup>, an attribute with a prefix "xlink" and a local name "href". However, used on an HTML element, it becomes an attribute with no prefix and the local name "xlink:href", which is not a valid NCName, and thus might not be accepted by an XML API. It could thus get converted, becoming "xlinkU000003Ahref".

### Note

*The resulting names from this conversion conveniently can't clash with any attribute generated by the [HTML parser](#)<sup>p1059</sup>, since those are all either lowercase or those listed in the [adjust foreign attributes](#)<sup>p1110</sup> algorithm's table.*

If the XML API restricts comments from having two consecutive U+002D HYPHEN-MINUS characters (--), the tool may insert a single U+0020 SPACE character between any such offending characters.

If the XML API restricts comments from ending in a U+002D HYPHEN-MINUS character (-), the tool may insert a single U+0020 SPACE character at the end of such comments.

If the XML API restricts allowed characters in character data, attribute values, or comments, the tool may replace any U+000C FORM FEED (FF) character with a U+0020 SPACE character, and any other literal non-XML character with a U+FFFD REPLACEMENT CHARACTER.

If the tool has no way to convey out-of-band information, then the tool may drop the following information:

- Whether the document is set to [no-quirks mode](#), [limited-quirks mode](#), or [quirks mode](#)

- The association between form controls and forms that aren't their nearest [form](#)<sup>p479</sup> element ancestor (use of the [form element pointer](#)<sup>p1076</sup> in the parser)
- The [template contents](#)<sup>p624</sup> of any [template](#)<sup>p623</sup> elements.

## Note

The mutations allowed by this section apply after the [HTML parser](#)<sup>p1059</sup>'s rules have been applied. For example, a `<a :>` start tag will be closed by a `</a :>` end tag, and never by a `</aU000003AU000003A>` end tag, even if the user agent is using the rules above to then generate an actual element in the DOM with the name `aU000003AU000003A` for that start tag.

## 12.2.9 An introduction to error handling and strange cases in the parser § p11 47

This section is non-normative.

This section examines some erroneous markup and discusses how the [HTML parser](#)<sup>p1059</sup> handles these cases.

### 12.2.9.1 Misnested tags: `<b><i></b></i>` § p11 47

This section is non-normative.

The most-often discussed example of erroneous markup is as follows:

```
<p>1<b>2<i>3</b>4</i>5</p>
```

The parsing of this markup is straightforward up to the "3". At this point, the DOM looks like this:

Here, the [stack of open elements](#)<sup>p1073</sup> has five elements on it: [html](#)<sup>p149</sup>, [body](#)<sup>p174</sup>, [p](#)<sup>p207</sup>, [b](#)<sup>p268</sup>, and [i](#)<sup>p267</sup>. The [list of active formatting elements](#)<sup>p1075</sup> just has two: [b](#)<sup>p268</sup> and [i](#)<sup>p267</sup>. The [insertion mode](#)<sup>p1072</sup> is "[in body](#)<sup>p1119</sup>".

Upon receiving the end tag token with the tag name "b", the "[adoption agency algorithm](#)<sup>p1127</sup>" is invoked. This is a simple case, in that the *formatting element* is the [b](#)<sup>p268</sup> element, and there is no *furthest block*. Thus, the [stack of open elements](#)<sup>p1073</sup> ends up with just three elements: [html](#)<sup>p149</sup>, [body](#)<sup>p174</sup>, and [p](#)<sup>p207</sup>, while the [list of active formatting elements](#)<sup>p1075</sup> has just one: [i](#)<sup>p267</sup>. The DOM tree is unmodified at this point.

The next token is a character ("4"), triggers the [reconstruction of the active formatting elements](#)<sup>p1076</sup>, in this case just the [i](#)<sup>p267</sup> element. A new [i](#)<sup>p267</sup> element is thus created for the "4" [Text](#) node. After the end tag token for the "i" is also received, and the "5" [Text](#) node is inserted, the DOM looks as follows:

```

└─ #text: 4
└─ #text: 5

```

### 12.2.9.2 Misnested tags: `<b><p></b></p>` § p1148

This section is non-normative.

A case similar to the previous one is the following:

```
<b>1<p>2</b>3</p>
```

Up to the "2" the parsing here is straightforward:

```

└─ html p149
  └─ head p150
    └─ body p174
      └─ b p268
        └─ #text: 1
          └─ p p207
            └─ #text: 2

```

The interesting part is when the end tag token with the tag name "b" is parsed.

Before that token is seen, the [stack of open elements](#) p1073 has four elements on it: [html](#) p149, [body](#) p174, [b](#) p268, and [p](#) p207. The [list of active formatting elements](#) p1075 just has the one: [b](#) p268. The [insertion mode](#) p1072 is "in body" p1119.

Upon receiving the end tag token with the tag name "b", the "[adoption agency algorithm](#) p1127" is invoked, as in the previous example. However, in this case, there is a *furthest block*, namely the [p](#) p207 element. Thus, this time the adoption agency algorithm isn't skipped over.

The *common ancestor* is the [body](#) p174 element. A conceptual "bookmark" marks the position of the [b](#) p268 in the [list of active formatting elements](#) p1075, but since that list has only one element in it, the bookmark won't have much effect.

As the algorithm progresses, *node* ends up set to the formatting element ([b](#) p268), and *last node* ends up set to the *furthest block* ([p](#) p207).

The *last node* gets appended (moved) to the *common ancestor*, so that the DOM looks like:

```

└─ html p149
  └─ head p150
    └─ body p174
      └─ b p268
        └─ #text: 1
          └─ p p207
            └─ #text: 2

```

A new [b](#) p268 element is created, and the children of the [p](#) p207 element are moved to it:

```

└─ html p149
  └─ head p150
    └─ body p174
      └─ b p268
        └─ #text: 1
          └─ p p207
            └─ #text: 2

```

Finally, the new [b](#) p268 element is appended to the [p](#) p207 element, so that the DOM looks like:

```

└─ html p149
  └─ head p150
    └─ body p174

```

The [b<sup>p268</sup>](#) element is removed from the [list of active formatting elements<sup>p1075</sup>](#) and the [stack of open elements<sup>p1073</sup>](#), so that when the "3" is parsed, it is appended to the [p<sup>p207</sup>](#) element:

### 12.2.9.3 Unexpected markup in tables §<sup>p11</sup> 49

*This section is non-normative.*

Error handling in tables is, for historical reasons, especially strange. For example, consider the following markup:

```
<table><b><tr><td>aaa</td></tr>bbb</table>ccc
```

The highlighted [b<sup>p268</sup>](#) element start tag is not allowed directly inside a table like that, and the parser handles this case by placing the element *before* the table. (This is called [foster parenting<sup>p1106</sup>](#).) This can be seen by examining the DOM tree as it stands just after the [table<sup>p443</sup>](#) element's start tag has been seen:

...and then immediately after the [b<sup>p268</sup>](#) element start tag has been seen:

At this point, the [stack of open elements<sup>p1073</sup>](#) has on it the elements [html<sup>p149</sup>](#), [body<sup>p174</sup>](#), [table<sup>p443</sup>](#), and [b<sup>p268</sup>](#) (in that order, despite the resulting DOM tree); the [list of active formatting elements<sup>p1075</sup>](#) just has the [b<sup>p268</sup>](#) element in it; and the [insertion mode<sup>p1072</sup>](#) is "[in table<sup>p1130</sup>](#)".

The [tr<sup>p457</sup>](#) start tag causes the [b<sup>p268</sup>](#) element to be popped off the stack and a [tbody<sup>p454</sup>](#) start tag to be implied; the [tbody<sup>p454</sup>](#) and [tr<sup>p457</sup>](#) elements are then handled in a rather straight-forward manner, taking the parser through the "[in table body<sup>p1134</sup>](#)" and "[in row<sup>p1135</sup>](#)" insertion modes, after which the DOM looks as follows:

Here, the [stack of open elements<sup>p1073</sup>](#) has on it the elements [html<sup>p149</sup>](#), [body<sup>p174</sup>](#), [table<sup>p443</sup>](#), [tbody<sup>p454</sup>](#), and [tr<sup>p457</sup>](#); the [list of active](#)

[formatting elements](#)<sup>p1075</sup> still has the [b](#)<sup>p268</sup> element in it; and the [insertion mode](#)<sup>p1072</sup> is "[in row](#)<sup>p1135</sup>".

The [td](#)<sup>p459</sup> element start tag token, after putting a [td](#)<sup>p459</sup> element on the tree, puts a [marker](#)<sup>p1075</sup> on the [list of active formatting elements](#)<sup>p1075</sup> (it also switches to the "[in cell](#)<sup>p1136</sup>" [insertion mode](#)<sup>p1072</sup>).

The [marker](#)<sup>p1075</sup> means that when the "aaa" character tokens are seen, no [b](#)<sup>p268</sup> element is created to hold the resulting [Text](#) node:

The end tags are handled in a straight-forward manner; after handling them, the [stack of open elements](#)<sup>p1073</sup> has on it the elements [html](#)<sup>p149</sup>, [body](#)<sup>p174</sup>, [table](#)<sup>p443</sup>, and [tbody](#)<sup>p454</sup>; the [list of active formatting elements](#)<sup>p1075</sup> still has the [b](#)<sup>p268</sup> element in it (the [marker](#)<sup>p1075</sup> having been removed by the "td" end tag token); and the [insertion mode](#)<sup>p1072</sup> is "[in table body](#)<sup>p1134</sup>".

Thus it is that the "bbb" character tokens are found. These trigger the "[in table text](#)<sup>p1132</sup>" insertion mode to be used (with the [original insertion mode](#)<sup>p1072</sup> set to "[in table body](#)<sup>p1134</sup>"). The character tokens are collected, and when the next token (the [table](#)<sup>p443</sup> element end tag) is seen, they are processed as a group. Since they are not all spaces, they are handled as per the "anything else" rules in the "[in table](#)<sup>p1130</sup>" insertion mode, which defer to the "[in body](#)<sup>p1119</sup>" insertion mode but with [foster parenting](#)<sup>p1106</sup>.

When [the active formatting elements are reconstructed](#)<sup>p1076</sup>, a [b](#)<sup>p268</sup> element is created and [foster parented](#)<sup>p1106</sup>, and then the "bbb" [Text](#) node is appended to it:

The [stack of open elements](#)<sup>p1073</sup> has on it the elements [html](#)<sup>p149</sup>, [body](#)<sup>p174</sup>, [table](#)<sup>p443</sup>, [tbody](#)<sup>p454</sup>, and the new [b](#)<sup>p268</sup> (again, note that this doesn't match the resulting tree!); the [list of active formatting elements](#)<sup>p1075</sup> has the new [b](#)<sup>p268</sup> element in it; and the [insertion mode](#)<sup>p1072</sup> is still "[in table body](#)<sup>p1134</sup>".

Had the character tokens been only [ASCII whitespace](#) instead of "bbb", then that [ASCII whitespace](#) would just be appended to the [tbody](#)<sup>p454</sup> element.

Finally, the [table](#)<sup>p443</sup> is closed by a "table" end tag. This pops all the nodes from the [stack of open elements](#)<sup>p1073</sup> up to and including the [table](#)<sup>p443</sup> element, but it doesn't affect the [list of active formatting elements](#)<sup>p1075</sup>, so the "ccc" character tokens after the table result in yet another [b](#)<sup>p268</sup> element being created, this time after the table:

#### 12.2.9.4 Scripts that modify the page as it is being parsed §<sup>p11</sup> 51

This section is non-normative.

Consider the following markup, which for this example we will assume is the document with [URL https://example.com/inner](https://example.com/inner), being rendered as the content of an [iframe<sup>p355</sup>](https://example.com/outer) in another document with the [URL https://example.com/outer](https://example.com/outer):

```

<div id=a>
  <script>
    var div = document.getElementById('a');
    parent.document.body.appendChild(div);
  </script>
  <script>
    alert(document.URL);
  </script>
</div>
<script>
  alert(document.URL);
</script>

```

Up to the first "script" end tag, before the script is parsed, the result is relatively straightforward:

After the script is parsed, though, the [div<sup>p233</sup>](#) element and its child [script<sup>p607</sup>](#) element are gone:

They are, at this point, in the [Document<sup>p111</sup>](#) of the aforementioned outer [browsing context<sup>p804</sup>](#). However, the [stack of open elements<sup>p1073</sup>](#) still contains the [div<sup>p233</sup>](#) element.

Thus, when the second [script<sup>p607</sup>](#) element is parsed, it is inserted *into the outer Document<sup>p111</sup> object*.

Those parsed into different [Document<sup>p111</sup>](#)s than the one the parser was created for do not execute, so the first alert does not show.

Once the [div<sup>p233</sup>](#) element's end tag is parsed, the [div<sup>p233</sup>](#) element is popped off the stack, and so the next [script<sup>p607</sup>](#) element is in the inner [Document<sup>p111</sup>](#):

Note how the second [p<sup>p207</sup>](#) element in the markup has no explicit [b<sup>p268</sup>](#) elements, but in the resulting DOM, up to three of each kind of formatting element (in this case three [b<sup>p268</sup>](#) elements with the class attribute, and two unadorned [b<sup>p268</sup>](#) elements) get reconstructed before the element's "X".

Also note how this means that in the final paragraph only six [b<sup>p268</sup>](#) end tags are needed to completely clear the [list of active formatting elements<sup>p1075</sup>](#), even though nine [b<sup>p268</sup>](#) start tags have been seen up to this point.

## 12.3 Serializing HTML fragments §<sup>p11</sup> 53

For the purposes of the following algorithm, an element **serializes as void** if its element type is one of the [void elements<sup>p1048</sup>](#), or is [basefont<sup>p1213</sup>](#), [bgsound<sup>p1212</sup>](#), [frame<sup>p1220</sup>](#), or [keygen<sup>p1212</sup>](#).

The following steps form the **HTML fragment serialization algorithm**. The algorithm takes as input a DOM [Element](#), [Document<sup>p111</sup>](#), or [DocumentFragment](#) referred to as *the node*, and returns a string.

### Note

*This algorithm serializes the children of the node being serialized, not the node itself.*

1. If *the node* [serializes as void<sup>p1153</sup>](#), then return the empty string.
2. Let *s* be a string, and initialize it to the empty string.
3. If *the node* is a [template<sup>p623</sup>](#) element, then let *the node* instead be the [template<sup>p623</sup>](#) element's [template contents<sup>p624</sup>](#) (a [DocumentFragment](#) node).
4. For each child node of *the node*, in [tree order](#), run the following steps:
  1. Let *current node* be the child node being processed.
  2. Append the appropriate string from the following list to *s*:

#### ↪ If *current node* is an [Element](#)

If *current node* is an element in the [HTML namespace](#), the [MathML namespace](#), or the [SVG namespace](#), then let *tagname* be *current node*'s local name. Otherwise, let *tagname* be *current node*'s qualified name.

Append a U+003C LESS-THAN SIGN character (<), followed by *tagname*.

### Note

*For [HTML elements<sup>p43</sup>](#) created by the [HTML parser<sup>p1059</sup>](#) or [createElement\(\)](#), *tagname* will be lowercase.*

If *current node*'s [is value](#) is not null, and the element does not have an [is<sup>p696</sup>](#) attribute in its attribute list, then append the string " is=", followed by *current node*'s [is value escaped as described below<sup>p1157</sup>](#) in *attribute mode*, followed by a U+0022 QUOTATION MARK character (").

For each attribute that the element has, append a U+0020 SPACE character, the [attribute's serialized name as described below<sup>p1153</sup>](#), a U+003D EQUALS SIGN character (=), a U+0022 QUOTATION MARK character ("), the attribute's value, [escaped as described below<sup>p1157</sup>](#) in *attribute mode*, and a second U+0022 QUOTATION MARK character (").

An **attribute's serialized name** for the purposes of the previous paragraph must be determined as follows:

↪ **If the attribute has no namespace**

The attribute's serialized name is the attribute's local name.

**Note**

For attributes on [HTML elements<sup>p43</sup>](#) set by the [HTML parser<sup>p1059</sup>](#) or by `setAttribute()`, the local name will be lowercase.

↪ **If the attribute is in the [XML namespace](#)**

The attribute's serialized name is the string "xml:" followed by the attribute's local name.

↪ **If the attribute is in the [XMLNS namespace](#) and the attribute's local name is `xmlns`**

The attribute's serialized name is the string "xmlns".

↪ **If the attribute is in the [XMLNS namespace](#) and the attribute's local name is not `xmlns`**

The attribute's serialized name is the string "xmlns:" followed by the attribute's local name.

↪ **If the attribute is in the [XLink namespace](#)**

The attribute's serialized name is the string "xlink:" followed by the attribute's local name.

↪ **If the attribute is in some other namespace**

The attribute's serialized name is the attribute's qualified name.

While the exact order of attributes is [implementation-defined](#), and may depend on factors such as the order that the attributes were given in the original markup, the sort order must be stable, such that consecutive invocations of this algorithm serialize an element's attributes in the same order.

Append a U+003E GREATER-THAN SIGN character (>).

If *current node* [serializes as void<sup>p1153</sup>](#), then continue on to the next child node at this point.

Append the value of running the [HTML fragment serialization algorithm<sup>p1153</sup>](#) on the *current node* element (thus recursing into this algorithm for that element), followed by a U+003C LESS-THAN SIGN character (<), a U+002F SOLIDUS character (/), *tagname* again, and finally a U+003E GREATER-THAN SIGN character (>).

↪ **If *current node* is a Text node**

If the parent of *current node* is a [style<sup>p170</sup>](#), [script<sup>p607</sup>](#), [xmp<sup>p1213</sup>](#), [iframe<sup>p355</sup>](#), [noembed<sup>p1212</sup>](#), [noframes<sup>p1212</sup>](#), or [plaintext<sup>p1212</sup>](#) element, or if the parent of *current node* is a [noscript<sup>p620</sup>](#) element and [scripting is enabled<sup>p895</sup>](#) for the node, then append the value of *current node*'s *data* IDL attribute literally.

Otherwise, append the value of *current node*'s *data* IDL attribute, [escaped as described below<sup>p1157</sup>](#).

↪ **If *current node* is a Comment**

Append the literal string "<!--" (U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS), followed by the value of *current node*'s *data* IDL attribute, followed by the literal string "-->" (U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS, U+003E GREATER-THAN SIGN).

↪ **If *current node* is a ProcessingInstruction**

Append the literal string "<?" (U+003C LESS-THAN SIGN, U+003F QUESTION MARK), followed by the value of *current node*'s *target* IDL attribute, followed by a single U+0020 SPACE character, followed by the value of *current node*'s *data* IDL attribute, followed by a single U+003E GREATER-THAN SIGN character (>).

↪ **If *current node* is a DocumentType**

Append the literal string "<!DOCTYPE" (U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+0044 LATIN CAPITAL LETTER D, U+004F LATIN CAPITAL LETTER O, U+0043 LATIN CAPITAL LETTER C, U+0054 LATIN CAPITAL LETTER T, U+0059 LATIN CAPITAL LETTER Y, U+0050 LATIN CAPITAL LETTER P, U+0045 LATIN CAPITAL LETTER E), followed by a space (U+0020 SPACE), followed by the value of *current node*'s *name* IDL attribute, followed by the literal string ">" (U+003E GREATER-THAN SIGN).

5. Return *s*.

**⚠Warning!**

**It is possible that the output of this algorithm, if parsed with an [HTML parser<sup>p1059</sup>](#), will not return the original tree**

**structure. Tree structures that do not roundtrip a serialize and reparse step can also be produced by the [HTML parser](#)<sup>p1059</sup> itself, although such cases are typically non-conforming.**

#### Example

For instance, if a [textarea](#)<sup>p541</sup> element to which a Comment node has been appended is serialized and the output is then reparsed, the comment will end up being displayed in the text control. Similarly, if, as a result of DOM manipulation, an element contains a comment that contains the literal string "-->", then when the result of serializing the element is parsed, the comment will be truncated at that point and the rest of the comment will be interpreted as markup. More examples would be making a [script](#)<sup>p607</sup> element contain a [Text](#) node with the text string "</script>", or having a [p](#)<sup>p207</sup> element that contains a [ul](#)<sup>p218</sup> element (as the [ul](#)<sup>p218</sup> element's [start tag](#)<sup>p1049</sup> would imply the end tag for the [p](#)<sup>p207</sup>).

This can enable cross-site scripting attacks. An example of this would be a page that lets the user enter some font family names that are then inserted into a CSS [style](#)<sup>p170</sup> block via the DOM and which then uses the [innerHTML](#) IDL attribute to get the HTML serialization of that [style](#)<sup>p170</sup> element: if the user enters "</style><script>attack</script>" as a font family name, [innerHTML](#) will return markup that, if parsed in a different context, would contain a [script](#)<sup>p607</sup> node, even though no [script](#)<sup>p607</sup> node existed in the original DOM.

#### Example

For example, consider the following markup:

```
<form id="outer"><div></form><form id="inner"><input>
```

This will be parsed into:

```
└─ htmlp149
  └─ headp150
  └─ bodyp174
    └─ formp479 idp134="outer"
      └─ divp233
        └─ formp479 idp134="inner"
          └─ inputp486
```

The [input](#)<sup>p486</sup> element will be associated with the inner [form](#)<sup>p479</sup> element. Now, if this tree structure is serialized and reparsed, the `<form id="inner">` start tag will be ignored, and so the [input](#)<sup>p486</sup> element will be associated with the outer [form](#)<sup>p479</sup> element instead.

```
<html><head></head><body><form id="outer"><div><form
id="inner"><input></form></div></form></body></html>
```

```
└─ htmlp149
  └─ headp150
  └─ bodyp174
    └─ formp479 idp134="outer"
      └─ divp233
        └─ inputp486
```

#### Example

As another example, consider the following markup:

```
<a><table><a>
```

This will be parsed into:

```
└─ htmlp149
  └─ headp150
  └─ bodyp174
    └─ ap234
      └─ ap234
```

## [table](#)<sup>p443</sup>

That is, the [a](#)<sup>p234</sup> elements are nested, because the second [a](#)<sup>p234</sup> element is [foster parented](#)<sup>p1106</sup>. After a serialize-reparse roundtrip, the [a](#)<sup>p234</sup> elements and the [table](#)<sup>p443</sup> element would all be siblings, because the second `<a>` start tag implicitly closes the first [a](#)<sup>p234</sup> element.

```
<html><head></head><body><a><a></a><table></table></a></body></html>
```

For historical reasons, this algorithm does not round-trip an initial U+000A LINE FEED (LF) character in [pre](#)<sup>p212</sup>, [textarea](#)<sup>p541</sup>, or [listing](#)<sup>p1212</sup> elements, even though (in the first two cases) the markup being round-tripped can be conforming. The [HTML parser](#)<sup>p1059</sup> will drop such a character during parsing, but this algorithm does *not* serialize an extra U+000A LINE FEED (LF) character.

### Example

For example, consider the following markup:

```
<pre>
Hello.</pre>
```

When this document is first parsed, the [pre](#)<sup>p212</sup> element's [child text content](#) starts with a single newline character. After a serialize-reparse roundtrip, the [pre](#)<sup>p212</sup> element's [child text content](#) is simply "Hello."

Because of the special role of the [is](#)<sup>p696</sup> attribute in signaling the creation of [customized built-in elements](#)<sup>p696</sup>, in that it provides a mechanism for parsed HTML to set the element's [is value](#), we special-case its handling during serialization. This ensures that an element's [is value](#) is preserved through serialize-parse roundtrips.

### Example

When creating a [customized built-in element](#)<sup>p696</sup> via the parser, a developer uses the [is](#)<sup>p696</sup> attribute directly; in such cases serialize-parse roundtrips work fine.

```
<script>
window.SuperP = class extends HTMLParagraphElement {};
customElements.define("super-p", SuperP, { extends: "p" });
</script>

<div id="container"><p is="super-p">Superb!</p></div>

<script>
console.log(container.innerHTML); // <p is="super-p">
container.innerHTML = container.innerHTML;
console.log(container.innerHTML); // <p is="super-p">
console.assert(container.firstChild instanceof SuperP);
</script>
```

But when creating a customized built-in element via its [constructor](#)<sup>p696</sup> or via [createElement\(\)](#), the [is](#)<sup>p696</sup> attribute is not added. Instead, the [is value](#) (which is what the custom elements machinery uses) is set without intermediating through an attribute.

```
<script>
container.innerHTML = "";
const p = document.createElement("p", { is: "super-p" });
container.appendChild(p);
```

```
// The is attribute is not present in the DOM:
console.assert(!p.hasAttribute("is"));

// But the element is still a super-p:
console.assert(p instanceof SuperP);
</script>
```

To ensure that serialize-parse roundtrips still work, the serialization process explicitly writes out the element's `is` value as an `isp696` attribute:

```
<script>
console.log(container.innerHTML); // <p is="super-p">
container.innerHTML = container.innerHTML;
console.log(container.innerHTML); // <p is="super-p">
console.assert(container.firstChild instanceof SuperP);
</script>
```

**Escaping a string** (for the purposes of the algorithm above) consists of running the following steps:

1. Replace any occurrence of the "&" character by the string "&amp;";.
2. Replace any occurrences of the U+00A0 NO-BREAK SPACE character by the string "&nbsp;";.
3. If the algorithm was invoked in the *attribute mode*, replace any occurrences of the "" character by the string "&quot;";.
4. If the algorithm was *not* invoked in the *attribute mode*, replace any occurrences of the "<" character by the string "&lt;";, and any occurrences of the ">" character by the string "&gt;";.

## 12.4 Parsing HTML fragments <sup>§<sup>p11</sup></sup> <sub>57</sub>

The following steps form the **HTML fragment parsing algorithm**. The algorithm takes as input an `Element` node, referred to as the **context** element, which gives the context for the parser, as well as *input*, a string to parse, and returns a list of zero or more nodes.

### Note

*Parts marked **fragment case** in algorithms in the parser section are parts that only occur if the parser was created for the purposes of this algorithm. The algorithms have been annotated with such markings for informational purposes only; such markings have no normative weight. If it is possible for a condition described as a **fragment case**<sup>p1157</sup> to occur even when the parser wasn't created for the purposes of handling this algorithm, then that is an error in the specification.*

1. Create a new `Documentp111` node, and mark it as being an `HTML document`.
2. If the `node document` of the `contextp1157` element is in `quirks mode`, then let the `Documentp111` be in `quirks mode`. Otherwise, the `node document` of the `contextp1157` element is in `limited-quirks mode`, then let the `Documentp111` be in `limited-quirks mode`. Otherwise, leave the `Documentp111` in `no-quirks mode`.
3. Create a new `HTML parserp1059`, and associate it with the just created `Documentp111` node.
4. Set the state of the `HTML parserp1059`'s `tokenizationp1077` stage as follows, switching on the `contextp1157` element:
  - ↪ `titlep151`
  - ↪ `textareap541`
 Switch the tokenizer to the `RCDATA statep1078`.

↪ [style](#)<sup>p170</sup>

↪ [xmp](#)<sup>p1213</sup>

↪ [iframe](#)<sup>p355</sup>

↪ [noembed](#)<sup>p1212</sup>

↪ [noframes](#)<sup>p1212</sup>

Switch the tokenizer to the [RAWTEXT state](#)<sup>p1078</sup>.

↪ [script](#)<sup>p607</sup>

Switch the tokenizer to the [script data state](#)<sup>p1078</sup>.

↪ [noscript](#)<sup>p620</sup>

If the [scripting flag](#)<sup>p1076</sup> is enabled, switch the tokenizer to the [RAWTEXT state](#)<sup>p1078</sup>. Otherwise, leave the tokenizer in the [data state](#)<sup>p1078</sup>.

↪ [plaintext](#)<sup>p1212</sup>

Switch the tokenizer to the [PLAINTEXT state](#)<sup>p1079</sup>.

↪ **Any other element**

Leave the tokenizer in the [data state](#)<sup>p1078</sup>.

#### Note

*For performance reasons, an implementation that does not report errors and that uses the actual state machine described in this specification directly could use the PLAINTEXT state instead of the RAWTEXT and script data states where those are mentioned in the list above. Except for rules regarding parse errors, they are equivalent, since there is no [appropriate end tag token](#)<sup>p1077</sup> in the fragment case, yet they involve far fewer state transitions.*

- Let *root* be a new [html](#)<sup>p149</sup> element with no attributes.
- Append the element *root* to the [Document](#)<sup>p111</sup> node created above.
- Set up the parser's [stack of open elements](#)<sup>p1073</sup> so that it contains just the single element *root*.
- If the [context](#)<sup>p1157</sup> element is a [template](#)<sup>p623</sup> element, push "[in template](#)<sup>p1139</sup>" onto the [stack of template insertion modes](#)<sup>p1072</sup> so that it is the new [current template insertion mode](#)<sup>p1072</sup>.
- Create a start tag token whose name is the local name of [context](#)<sup>p1157</sup> and whose attributes are the attributes of [context](#)<sup>p1157</sup>.  
Let this start tag token be the start tag token of the [context](#)<sup>p1157</sup> node, e.g. for the purposes of determining if it is an [HTML integration point](#)<sup>p1106</sup>.
- [Reset the parser's insertion mode appropriately](#)<sup>p1072</sup>.

#### Note

*The parser will reference the [context](#)<sup>p1157</sup> element as part of that algorithm.*

- Set the parser's [form element pointer](#)<sup>p1076</sup> to the nearest node to the [context](#)<sup>p1157</sup> element that is a [form](#)<sup>p479</sup> element (going straight up the ancestor chain, and including the element itself, if it is a [form](#)<sup>p479</sup> element), if any. (If there is no such [form](#)<sup>p479</sup> element, the [form element pointer](#)<sup>p1076</sup> keeps its initial value, null.)
- Place the *input* into the [input stream](#)<sup>p1071</sup> for the [HTML parser](#)<sup>p1059</sup> just created. The encoding [confidence](#)<sup>p1066</sup> is *irrelevant*.
- Start the parser and let it run until it has consumed all the characters just inserted into the input stream.
- Return the child nodes of *root*, in [tree order](#).

## 12.5 Named character references §<sup>p11</sup> 58

This table lists the character reference names that are supported by HTML, and the code points to which they refer. It is referenced by the previous sections.

#### Note

*It is intentional, for legacy compatibility, that many code points have multiple character reference names. For example, some*

appear both with and without the trailing semicolon, or with different capitalizations.

This data is also available [as a JSON file](#).

The glyphs displayed above are non-normative. Refer to Unicode for formal definitions of the characters listed above.

### Note

The character reference names originate from XML Entity Definitions for Characters, though only the above is considered normative. [\[XMLENTITY\]p1271](#)

## 13 The XML syntax §<sup>p11</sup> 68

### Note

This section only describes the rules for XML resources. Rules for [text/html<sup>p1231</sup>](#) resources are discussed in the section above entitled "[The HTML syntax<sup>p1047</sup>](#)".

### 13.1 Writing documents in the XML syntax §<sup>p11</sup> 68

#### Note

The XML syntax for HTML was formerly referred to as "XHTML", but this specification does not use that term (among other reasons, because no such term is used for the HTML syntaxes of MathML and SVG).

The syntax for XML is defined in *XML and Namespaces in XML*. [\[XML\]<sup>p1271</sup>](#) [\[XMLNS\]<sup>p1271</sup>](#)

This specification does not define any syntax-level requirements beyond those defined for XML proper.

XML documents may contain a DOCTYPE if desired, but this is not required to conform to this specification. This specification does not define a public or system identifier, nor provide a formal DTD.

#### Note

According to XML, XML processors are not guaranteed to process the external DTD subset referenced in the DOCTYPE. This means, for example, that using [entity references](#) for characters in XML documents is unsafe if they are defined in an external file (except for `&lt;`, `&gt;`, `&amp;`, `&quot;`, and `&apos;`).

### 13.2 Parsing XML documents §<sup>p11</sup> 68

This section describes the relationship between XML and the DOM, with a particular emphasis on how this interacts with HTML.

An **XML parser**, for the purposes of this specification, is a construct that follows the rules given in *XML* to map a string of bytes or characters into a [Document<sup>p111</sup>](#) object.

#### Note

At the time of writing, no such rules actually exist.

An [XML parser<sup>p1168</sup>](#) is either associated with a [Document<sup>p111</sup>](#) object when it is created, or creates one implicitly.

This [Document<sup>p111</sup>](#) must then be populated with DOM nodes that represent the tree structure of the input passed to the parser, as defined by *XML*, *Namespaces in XML*, and *DOM*. When creating DOM nodes representing elements, the [create an element for a token<sup>p1107</sup>](#) algorithm or some equivalent that operates on appropriate XML datastructures must be used, to ensure the proper [element interfaces](#) are created and that [custom elements<sup>p696</sup>](#) are set up correctly.

DOM mutation events must not fire for the operations that the [XML parser<sup>p1168</sup>](#) performs on the [Document<sup>p111</sup>](#)'s tree, but the user agent must act as if elements and attributes were individually appended and set respectively so as to trigger rules in this specification regarding what happens when an element is inserted into a document or has its attributes set, and *DOM*'s requirements regarding [mutation observers](#) mean that mutation observers are fired (unlike mutation events). [\[XML\]<sup>p1271</sup>](#) [\[XMLNS\]<sup>p1271</sup>](#) [\[DOM\]<sup>p1266</sup>](#) [\[UIEVENTS\]<sup>p1270</sup>](#)

Between the time an element's start tag is parsed and the time either the element's end tag is parsed or the parser detects a well-formedness error, the user agent must act as if the element was in a [stack of open elements<sup>p1073</sup>](#).

## Note

This is used, e.g. by the [object<sup>p367</sup>](#) element to avoid instantiating plugins before the [param<sup>p372</sup>](#) element children have been parsed.

This specification provides the following additional information that user agents should use when retrieving an external entity: the public identifiers given in the following list all correspond to [the URL given by this link](#). (This URL is a DTD containing the [entity declarations](#) for the names listed in the [named character references<sup>p1158</sup>](#) section.) [\[XML\]<sup>p1271</sup>](#)

- `--W3C//DTD XHTML 1.0 Transitional//EN`
- `--W3C//DTD XHTML 1.1//EN`
- `--W3C//DTD XHTML 1.0 Strict//EN`
- `--W3C//DTD XHTML 1.0 Frameset//EN`
- `--W3C//DTD XHTML Basic 1.0//EN`
- `--W3C//DTD XHTML 1.1 plus MathML 2.0//EN`
- `--W3C//DTD XHTML 1.1 plus MathML 2.0 plus SVG 1.1//EN`
- `--W3C//DTD MathML 2.0//EN`
- `--WAPFORUM//DTD XHTML Mobile 1.0//EN`

Furthermore, user agents should attempt to retrieve the above external entity's content when one of the above public identifiers is used, and should not attempt to retrieve any other external entity's content.

## Note

This is not strictly a [violation<sup>p26</sup>](#) of XML, but it does contradict the spirit of XML's requirements. This is motivated by a desire for user agents to all handle entities in an interoperable fashion without requiring any network access for handling external subsets. [\[XML\]<sup>p1271</sup>](#)

XML parsers can be invoked with **XML scripting support enabled** or **XML scripting support disabled**. Except where otherwise specified, XML parsers are invoked with [XML scripting support enabled<sup>p1169</sup>](#).

When an [XML parser<sup>p1168</sup>](#) with [XML scripting support enabled<sup>p1169</sup>](#) creates a [script<sup>p607</sup>](#) element, it must have its [parser document<sup>p612</sup>](#) set and its `"non-blocking"` flag must be unset. If the parser was created as part of the [XML fragment parsing algorithm<sup>p1171</sup>](#), then the element must be marked as `"already started"` also. When the element's end tag is subsequently parsed, the user agent must [perform a microtask checkpoint<sup>p929</sup>](#), and then [prepare<sup>p613</sup>](#) the [script<sup>p607</sup>](#) element. If this causes there to be a [pending parsing-blocking script<sup>p616</sup>](#), then the user agent must run the following steps:

1. Block this instance of the [XML parser<sup>p1168</sup>](#), such that the [event loop<sup>p924</sup>](#) will not run [tasks<sup>p925</sup>](#) that invoke it.
2. [Spin the event loop<sup>p929</sup>](#) until the parser's [Document<sup>p111</sup>](#) [has no style sheet that is blocking scripts<sup>p174</sup>](#) and the [pending parsing-blocking script<sup>p616</sup>](#)'s `"ready to be parser-executed"` flag is set.
3. Unblock this instance of the [XML parser<sup>p1168</sup>](#), such that [tasks<sup>p925</sup>](#) that invoke it can again be run.
4. [Execute<sup>p616</sup>](#) the [pending parsing-blocking script<sup>p616</sup>](#).
5. There is no longer a [pending parsing-blocking script<sup>p616</sup>](#).

## Note

Since the [document.write\(\)<sup>p950</sup>](#) API is not available for XML documents, much of the complexity in the [HTML parser<sup>p1059</sup>](#) is not needed in the [XML parser<sup>p1168</sup>](#).

## Note

When the [XML parser<sup>p1168</sup>](#) has [XML scripting support disabled<sup>p1169</sup>](#), none of this happens.

When an [XML parser<sup>p1168</sup>](#) would append a node to a [template<sup>p623</sup>](#) element, it must instead append it to the [template<sup>p623</sup>](#) element's [template contents<sup>p624</sup>](#) (a `DocumentFragment` node).

## Note

This is a [willful violation<sup>p26</sup>](#) of XML; unfortunately, XML is not formally extensible in the manner that is needed for [template<sup>p623</sup>](#) processing. [\[XML\]<sup>p1271</sup>](#)

When an [XML parser<sup>p1168</sup>](#) creates a `Node` object, its `node document` must be set to the `node document` of the node into which the newly created node is to be inserted.

Certain algorithms in this specification **spoon-feed the parser** characters one string at a time. In such cases, the [XML parser<sup>p1168</sup>](#)

must act as it would have if faced with a single string consisting of the concatenation of all those characters.

When an [XML parser](#)<sup>p1168</sup> reaches the end of its input, it must [stop parsing](#)<sup>p1145</sup>, following the same rules as the [HTML parser](#)<sup>p1059</sup>. An [XML parser](#)<sup>p1168</sup> can also be [aborted](#)<sup>p1146</sup>, which must again be done in the same way as for an [HTML parser](#)<sup>p1059</sup>.

For the purposes of conformance checkers, if a resource is determined to be in [the XML syntax](#)<sup>p1168</sup>, then it is an [XML document](#).

### 13.3 Serializing XML fragments §<sup>p11</sup> 70

The **XML fragment serialization algorithm** for a [Document](#)<sup>p111</sup> or [Element](#) node either returns a fragment of XML that represents that node or throws an exception.

For [Document](#)<sup>p111</sup>s, the algorithm must return a string in the form of a [document entity](#), if none of the error cases below apply.

For [Elements](#), the algorithm must return a string in the form of an [internal general parsed entity](#), if none of the error cases below apply.

In both cases, the string returned must be XML namespace-well-formed and must be an isomorphic serialization of all of that node's [relevant child nodes](#)<sup>p1170</sup>, in [tree order](#). User agents may adjust prefixes and namespace declarations in the serialization (and indeed might be forced to do so in some cases to obtain namespace-well-formed XML). User agents may use a combination of regular text and character references to represent [Text](#) nodes in the DOM.

A node's **relevant child nodes** are those that apply given the following rules:

#### For [template](#)<sup>p623</sup> elements

The [relevant child nodes](#)<sup>p1170</sup> are the child nodes of the [template](#)<sup>p623</sup> element's [template contents](#)<sup>p624</sup>, if any.

#### For all other nodes

The [relevant child nodes](#)<sup>p1170</sup> are the child nodes of node itself, if any.

For [Elements](#), if any of the elements in the serialization are in no namespace, the default namespace in scope for those elements must be explicitly declared as the empty string. (This doesn't apply in the [Document](#)<sup>p111</sup> case.) [\[XML\]](#)<sup>p1271</sup> [\[XMLNS\]](#)<sup>p1271</sup>

For the purposes of this section, an internal general parsed entity is considered XML namespace-well-formed if a document consisting of an element with no namespace declarations whose contents are the internal general parsed entity would itself be XML namespace-well-formed.

If any of the following error cases are found in the DOM subtree being serialized, then the algorithm must throw an ["InvalidStateError" DOMException](#) instead of returning a string:

- A [Document](#)<sup>p111</sup> node with no child element nodes.
- A [DocumentType](#) node that has an external subset public identifier that contains characters that are not matched by the XML PubidChar production. [\[XML\]](#)<sup>p1271</sup>
- A [DocumentType](#) node that has an external subset system identifier that contains both a U+0022 QUOTATION MARK (") and a U+0027 APOSTROPHE (') or that contains characters that are not matched by the XML Char production. [\[XML\]](#)<sup>p1271</sup>
- A node with a local name containing a U+003A COLON (:).
- A node with a local name that does not match the XML [Name](#) production. [\[XML\]](#)<sup>p1271</sup>
- An [Attr](#) node with no namespace whose local name is the lowercase string "xml:ns". [\[XMLNS\]](#)<sup>p1271</sup>
- An [Element](#) node with two or more attributes with the same local name and namespace.
- An [Attr](#) node, [Text](#) node, [Comment](#) node, or [ProcessingInstruction](#) node whose data contains characters that are not matched by the XML Char production. [\[XML\]](#)<sup>p1271</sup>
- A [Comment](#) node whose data contains two adjacent U+002D HYPHEN-MINUS characters (-) or ends with such a character.
- A [ProcessingInstruction](#) node whose target name is an [ASCII case-insensitive](#) match for the string "xml".
- A [ProcessingInstruction](#) node whose target name contains a U+003A COLON (:).
- A [ProcessingInstruction](#) node whose data contains the string ">".

## Note

These are the only ways to make a DOM unserialisable. The DOM enforces all the other XML constraints; for example, trying to append two elements to a [Document<sup>p111</sup>](#) node will throw a ["HierarchyRequestError" DOMException](#).

### 13.4 Parsing XML fragments §<sup>p11</sup> 71

The **XML fragment parsing algorithm** either returns a [Document<sup>p111</sup>](#) or throws a ["SyntaxError" DOMException](#). Given a string *input* and a context element [context<sup>p1157</sup>](#), the algorithm is as follows:

1. Create a new [XML parser<sup>p1168</sup>](#).
2. [Feed the parser<sup>p1169</sup>](#) just created the string corresponding to the start tag of the [context<sup>p1157</sup>](#) element, declaring all the namespace prefixes that are in scope on that element in the DOM, as well as declaring the default namespace (if any) that is in scope on that element in the DOM.

A namespace prefix is in scope if the DOM `lookupNamespaceURI()` method on the element would return a non-null value for that prefix.

The default namespace is the namespace for which the DOM `isDefaultNamespace()` method on the element would return true.

## Note

*No DOCTYPE is passed to the parser, and therefore no external subset is referenced, and therefore no entities will be recognized.*

3. [Feed the parser<sup>p1169</sup>](#) just created the string *input*.
4. [Feed the parser<sup>p1169</sup>](#) just created the string corresponding to the end tag of the [context<sup>p1157</sup>](#) element.
5. If there is an XML well-formedness or XML namespace well-formedness error, then throw a ["SyntaxError" DOMException](#).
6. If the [document element](#) of the resulting [Document<sup>p111</sup>](#) has any sibling nodes, then throw a ["SyntaxError" DOMException](#).
7. Return the child nodes of the [document element](#) of the resulting [Document<sup>p111</sup>](#), in [tree order](#).

## 14 Rendering §<sup>p11</sup> 72

User agents are not required to present HTML documents in any particular way. However, this section provides a set of suggestions for rendering HTML documents that, if followed, are likely to lead to a user experience that closely resembles the experience intended by the documents' authors. So as to avoid confusion regarding the normativity of this section, "must" has not been used. Instead, the term "expected" is used to indicate behavior that will lead to this experience. For the purposes of conformance for user agents designated as [supporting the suggested default rendering](#)<sup>p46</sup>, the term "expected" in this section has the same conformance implications as "must".

### 14.1 Introduction §<sup>p11</sup> 72

In general, user agents are expected to support CSS, and many of the suggestions in this section are expressed in CSS terms. User agents that use other presentation mechanisms can derive their expected behavior by translating from the CSS rules given in this section.

In the absence of style-layer rules to the contrary (e.g. author style sheets), user agents are expected to render an element so that it conveys to the user the meaning that the element [represents](#)<sup>p120</sup>, as described by this specification.

The suggestions in this section generally assume a visual output medium with a resolution of 96dpi or greater, but HTML is intended to apply to multiple media (it is a *media-independent* language). User agent implementers are encouraged to adapt the suggestions in this section to their target media.

An element is **being rendered** if it has any associated CSS layout boxes, SVG layout boxes, or some equivalent in other styling languages.

#### Note

*Just being off-screen does not mean the element is not [being rendered](#)<sup>p1172</sup>. The presence of the [hidden](#)<sup>p758</sup> attribute normally means the element is not [being rendered](#)<sup>p1172</sup>, though this might be overridden by the style sheets.*

An element is said to **intersect the viewport** when it is [being rendered](#)<sup>p1172</sup> and its associated CSS layout box intersects the [viewport](#).

#### Note

*This specification does not define the precise timing for when the intersection is tested, but it is suggested that the timing match that of the Intersection Observer API. [\[INTERSECTIONOBSERVER\]](#)<sup>p1267</sup>*

User agents that do not honor author-level CSS style sheets are nonetheless expected to act as if they applied the CSS rules given in these sections in a manner consistent with this specification and the relevant CSS and Unicode specifications. [\[CSS\]](#)<sup>p1264</sup>  
[\[UNICODE\]](#)<sup>p1270</sup> [\[BIDI\]](#)<sup>p1264</sup>

#### Note

*This is especially important for issues relating to the `'display'`, `'unicode-bidi'`, and `'direction'` properties.*

### 14.2 The CSS user agent style sheet and presentational hints §<sup>p11</sup> 72

The CSS rules given in these subsections are, except where otherwise specified, expected to be used as part of the user-agent level style sheet defaults for all documents that contain [HTML elements](#)<sup>p43</sup>.

Some rules are intended for the author-level zero-specificity presentational hints part of the CSS cascade; these are explicitly called out as **presentational hints**.

When the text below says that an attribute *attribute* on an element *element* **maps to the pixel length property** (or properties) *properties*, it means that if *element* has an attribute *attribute* set, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p67</sup> doesn't generate an error, then the user agent is expected to use the parsed value as a pixel length for a [presentational hint](#)<sup>p1172</sup> for *properties*.

When the text below says that an attribute *attribute* on an element *element* **maps to the dimension property** (or properties) *properties*, it means that if *element* has an attribute *attribute* set, and parsing that attribute's value using the [rules for parsing dimension values](#)<sup>p69</sup> doesn't generate an error, then the user agent is expected to use the parsed dimension as the value for a [presentational hint](#)<sup>p1172</sup> for *properties*, with the value given as a pixel length if the dimension was a length, and with the value given as a percentage if the dimension was a percentage.

When the text below says that an attribute *attribute* on an element *element* **maps to the dimension property (ignoring zero)** (or properties) *properties*, it means that if *element* has an attribute *attribute* set, and parsing that attribute's value using the [rules for parsing nonzero dimension values](#)<sup>p70</sup> doesn't generate an error, then the user agent is expected to use the parsed dimension as the value for a [presentational hint](#)<sup>p1172</sup> for *properties*, with the value given as a pixel length if the dimension was a length, and with the value given as a percentage if the dimension was a percentage.

When a user agent is to **align descendants** of a node, the user agent is expected to align only those descendants that have both their '[margin-inline-start](#)' and '[margin-inline-end](#)' properties computing to a value other than 'auto', that are over-constrained and that have one of those two margins with a [used value](#) forced to a greater value, and that do not themselves have an applicable [align](#) attribute. When multiple elements are to [align](#)<sup>p1173</sup> a particular descendant, the most deeply nested such element is expected to override the others. Aligned elements are expected to be aligned by having the [used values](#) of their margins on the [line-left](#) and [line-right](#) sides be set accordingly. [\[CSSLOGICAL\]](#)<sup>p1265</sup> [\[CSSWM\]](#)<sup>p1266</sup>

## 14.3 Non-replaced elements §<sup>p11</sup> 73

### 14.3.1 Hidden elements §<sup>p11</sup> 73

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

[hidden], area, base, basefont, datalist, head, link, meta, noembed,
noframes, param, rp, script, source, style, template, track, title {
  display: none;
}

embed[hidden] { display: inline; height: 0; width: 0; }

input[type=hidden i] { display: none !important; }

@media (scripting) {
  noscript { display: none !important; }
}
```

### 14.3.2 The page §<sup>p11</sup> 73

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

html, body { display: block; }
```

For each property in the table below, given a [body](#)<sup>p174</sup> element, the first attribute that exists [maps to the pixel length property](#)<sup>p1173</sup> on the [body](#)<sup>p174</sup> element. If none of the attributes for a property are found, or if the value of the attribute that was found cannot be parsed successfully, then a default value of 8px is expected to be used for that property instead.

Property	Source
<a href="#">margin-top</a>	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">marginheight</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">topmargin</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">container frame element</a> <sup>p1174</sup> 's <a href="#">marginheight</a> <sup>p1216</sup> attribute

Property	Source
'margin-right'	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">marginwidth</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">rightmargin</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">container frame element</a> <sup>p1174</sup> 's <a href="#">marginwidth</a> <sup>p1216</sup> attribute
'margin-bottom'	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">marginheight</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">bottommargin</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">container frame element</a> <sup>p1174</sup> 's <a href="#">marginheight</a> <sup>p1216</sup> attribute
'margin-left'	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">marginwidth</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">leftmargin</a> <sup>p1216</sup> attribute
	The <a href="#">body</a> <sup>p174</sup> element's <a href="#">container frame element</a> <sup>p1174</sup> 's <a href="#">marginwidth</a> <sup>p1216</sup> attribute

If the [body](#)<sup>p174</sup> element's [node document](#)'s [browsing context](#)<sup>p804</sup> is a [child browsing context](#)<sup>p806</sup>, and the [container](#)<sup>p806</sup> of that [browsing context](#)<sup>p804</sup> is a [frame](#)<sup>p1220</sup> or [iframe](#)<sup>p355</sup> element, then the **container frame element** of the [body](#)<sup>p174</sup> element is that [frame](#)<sup>p1220</sup> or [iframe](#)<sup>p355</sup> element. Otherwise, there is no [container frame element](#)<sup>p1174</sup>.

#### ⚠Warning!

**The above requirements imply that a page can change the margins of another page (including one from another origin<sup>p829</sup>) using, for example, an [iframe](#)<sup>p355</sup>. This is potentially a security risk, as it might in some cases allow an attack to contrive a situation in which a page is rendered not as the author intended, possibly for the purposes of phishing or otherwise misleading the user.**

If a [Document](#)<sup>p111</sup>'s [browsing context](#)<sup>p804</sup> is a [child browsing context](#)<sup>p806</sup>, then it is expected to be positioned and sized to fit inside the [content box](#) of the [container](#)<sup>p806</sup> of that [browsing context](#)<sup>p804</sup>. If the [container](#)<sup>p806</sup> is not [being rendered](#)<sup>p1172</sup>, the [browsing context](#)<sup>p804</sup> is expected to have a [viewport](#) with zero width and zero height.

If a [Document](#)<sup>p111</sup>'s [browsing context](#)<sup>p804</sup> is a [child browsing context](#)<sup>p806</sup>, the [container](#)<sup>p806</sup> of that [browsing context](#)<sup>p804</sup> is a [frame](#)<sup>p1220</sup> or [iframe](#)<sup>p355</sup> element, that element has a `scrolling` attribute, and that attribute's value is an [ASCII case-insensitive](#) match for the string "off", "noscroll", or "no", then the user agent is expected to prevent any scrollbars from being shown for the [viewport](#) of the [Document](#)<sup>p111</sup>'s [browsing context](#)<sup>p804</sup>, regardless of the `'overflow'` property that applies to that [viewport](#).

When a [body](#)<sup>p174</sup> element has a [background](#)<sup>p1217</sup> attribute set to a non-empty value, the new value is expected to be [parsed](#)<sup>p87</sup> relative to the element's [node document](#), and if this is successful, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'background-image'` property to the [resulting URL string](#)<sup>p87</sup>.

When a [body](#)<sup>p174</sup> element has a [bgcolor](#)<sup>p1216</sup> attribute set, the new value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'background-color'` property to the resulting color.

When a [body](#)<sup>p174</sup> element has a [text](#)<sup>p1216</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'color'` property to the resulting color.

When a [body](#)<sup>p174</sup> element has a [link](#)<sup>p1216</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the `'color'` property of any element in the [Document](#)<sup>p111</sup> matching the [:link](#)<sup>p718</sup> [pseudo-class](#) to the resulting color.

When a [body](#)<sup>p174</sup> element has a [vlink](#)<sup>p1216</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the `'color'` property of any element in the [Document](#)<sup>p111</sup> matching the [:visited](#)<sup>p718</sup> [pseudo-class](#) to the resulting color.

When a [body](#)<sup>p174</sup> element has an [alink](#)<sup>p1216</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the `'color'` property of any element in the [Document](#)<sup>p111</sup> matching the [:active](#)<sup>p718</sup> [pseudo-class](#) and either the [:link](#)<sup>p718</sup> [pseudo-class](#) or the [:visited](#)<sup>p718</sup> [pseudo-class](#) to the resulting color.

### 14.3.3 Flow content <sup>§[p11](#)</sup> <sub>75</sub>

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

address, blockquote, center, dialog, div, figure, figcaption, footer, form,
header, hr, legend, listing, main, p, plaintext, pre, xmp {
  display: block;
}

blockquote, figure, listing, p, plaintext, pre, xmp {
  margin-block-start: 1em; margin-block-end: 1em;
}

blockquote, figure { margin-inline-start: 40px; margin-inline-end: 40px; }

address { font-style: italic; }
listing, plaintext, pre, xmp {
  font-family: monospace; white-space: pre;
}

dialog:not([open]) { display: none; }
dialog {
  position: absolute;
  offset-inline-start: 0; offset-inline-end: 0;
  width: fit-content;
  height: fit-content;
  margin: auto;
  border: solid;
  padding: 1em;
  background: white;
  color: black;
}
dialog::backdrop {
  background: rgba(0,0,0,0.1);
}

slot {
  display: contents;
}
```

The following rules are also expected to apply, as [presentational hints](#)<sup>[p1172](#)</sup>:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

pre[wrap] { white-space: pre-wrap; }
```

In [quirks mode](#), the following rules are also expected to apply:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

form { margin-block-end: 1em; }
```

The [center](#)<sup>[p1213](#)</sup> element, and the [div](#)<sup>[p233](#)</sup> element when it has an [align](#)<sup>[p1216](#)</sup> attribute whose value is an [ASCII case-insensitive](#) match for either the string "center" or the string "middle", are expected to center text within themselves, as if they had their ['text-align'](#) property set to 'center' in a [presentational hint](#)<sup>[p1172](#)</sup>, and to [align descendants](#)<sup>[p1173](#)</sup> to the center.

The [div](#)<sup>[p233](#)</sup> element, when it has an [align](#)<sup>[p1216](#)</sup> attribute whose value is an [ASCII case-insensitive](#) match for the string "left", is expected to left-align text within itself, as if it had its ['text-align'](#) property set to 'left' in a [presentational hint](#)<sup>[p1172](#)</sup>, and to [align descendants](#)<sup>[p1173](#)</sup> to the left.

The [div<sup>p233</sup>](#) element, when it has an [align<sup>p1216</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "right", is expected to right-align text within itself, as if it had its ['text-align'](#) property set to 'right' in a [presentational hint<sup>p1172</sup>](#), and to [align descendants<sup>p1173</sup>](#) to the right.

The [div<sup>p233</sup>](#) element, when it has an [align<sup>p1216</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "justify", is expected to full-justify text within itself, as if it had its ['text-align'](#) property set to 'justify' in a [presentational hint<sup>p1172</sup>](#), and to [align descendants<sup>p1173</sup>](#) to the left.

### 14.3.4 Phrasing content §<sup>p11</sup> 76

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

cite, dfn, em, i, var { font-style: italic; }
b, strong { font-weight: bolder; }
code, kbd, samp, tt { font-family: monospace; }
big { font-size: larger; }
small { font-size: smaller; }

sub { vertical-align: sub; }
sup { vertical-align: super; }
sub, sup { line-height: normal; font-size: smaller; }

ruby { display: ruby; }
rt { display: ruby-text; }

:link { color: #0000EE; }
:visited { color: #551A8B; }
:link:active, :visited:active { color: #FF0000; }
:link, :visited { text-decoration: underline; cursor: pointer; }

:focus { outline: auto; }

mark { background: yellow; color: black; } /* this color is just a suggestion and can be changed based
on implementation feedback */

abbr[title], acronym[title] { text-decoration: dotted underline; }
ins, u { text-decoration: underline; }
del, s, strike { text-decoration: line-through; }

q::before { content: open-quote; }
q::after { content: close-quote; }

br { display-outside: newline; } /* this also has bidi implications */
nobr { white-space: nowrap; }
wbr { display-outside: break-opportunity; } /* this also has bidi implications */
nobr wbr { white-space: normal; }
```

The following rules are also expected to apply, as [presentational hints<sup>p1172</sup>](#):

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

br[clear=left i] { clear: left; }
br[clear=right i] { clear: right; }
br[clear=all i], br[clear=both i] { clear: both; }
```

For the purposes of the CSS ruby model, runs of children of [ruby<sup>p247</sup>](#) elements that are not [rt<sup>p253</sup>](#) or [rp<sup>p253</sup>](#) elements are expected to be wrapped in anonymous boxes whose ['display'](#) property has the value ['ruby-base'](#). [\[CSSRUBY\]<sup>p1265</sup>](#)

When a particular part of a ruby has more than one annotation, the annotations should be distributed on both sides of the base text so as to minimize the stacking of ruby annotations on one side.

**Note**

When it becomes possible to do so, the preceding requirement will be updated to be expressed in terms of CSS ruby. (Currently, CSS ruby does not handle nested [ruby](#)<sup>p247</sup> elements or multiple sequential [rt](#)<sup>p253</sup> elements, which is how this semantic is expressed.)

User agents that do not support correct ruby rendering are expected to render parentheses around the text of [rt](#)<sup>p253</sup> elements in the absence of [rp](#)<sup>p253</sup> elements.

User agents are expected to support the `'clear'` property on inline elements (in order to render [br](#)<sup>p275</sup> elements with [clear](#)<sup>p1216</sup> attributes) in the manner described in the non-normative note to this effect in CSS.

The initial value for the `'color'` property is expected to be black. The initial value for the `'background-color'` property is expected to be 'transparent'. The canvas's background is expected to be white.

When a [font](#)<sup>p1213</sup> element has a `color` attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'color'` property to the resulting color.

The [font](#)<sup>p1213</sup> element is expected to override the color of any text decoration that spans the text of the element to the [used value](#) of the element's `'color'` property.

When a [font](#)<sup>p1213</sup> element has a `face` attribute, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'font-family'` property to the attribute's value.

When a [font](#)<sup>p1213</sup> element has a `size` attribute, the user agent is expected to use the following steps, known as the **rules for parsing a legacy font size**, to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'font-size'` property:

1. Let *input* be the attribute's value.
2. Let *position* be a pointer into *input*, initially pointing at the start of the string.
3. [Skip ASCII whitespace](#) within *input* given *position*.
4. If *position* is past the end of *input*, there is no [presentational hint](#)<sup>p1172</sup>. Return.
5. If the character at *position* is a U+002B PLUS SIGN character (+), then let *mode* be *relative-plus*, and advance *position* to the next character. Otherwise, if the character at *position* is a U+002D HYPHEN-MINUS character (-), then let *mode* be *relative-minus*, and advance *position* to the next character. Otherwise, let *mode* be *absolute*.
6. [Collect a sequence of code points](#) that are [ASCII digits](#) from *input* given *position*, and let the resulting sequence be *digits*.
7. If *digits* is the empty string, there is no [presentational hint](#)<sup>p1172</sup>. Return.
8. Interpret *digits* as a base-ten integer. Let *value* be the resulting number.
9. If *mode* is *relative-plus*, then increment *value* by 3. If *mode* is *relative-minus*, then let *value* be the result of subtracting *value* from 3.
10. If *value* is greater than 7, let it be 7.
11. If *value* is less than 1, let it be 1.
12. Set `'font-size'` to the keyword corresponding to the value of *value* according to the following table:

<i>value</i>	<code>'font-size'</code> keyword
1	'x-small'
2	'small'
3	'medium'
4	'large'
5	'x-large'
6	'xx-large'
7	'xxx-large'

### 14.3.5 Bidirectional text <sup>§p11</sup> 78

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

[dir]:dir(ltr), bdi:dir(ltr), input[type=tel i]:dir(ltr) { direction: ltr; }
[dir]:dir rtl, bdi:dir rtl { direction: rtl; }

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp, article, aside, h1, h2,
h3, h4, h5, h6, hgroup, nav, section, table, caption, colgroup, col, thead,
tbody, tfoot, tr, td, th, dir, dd, dl, dt, menu, ol, ul, li, bdi, output,
[dir=ltr i], [dir=rtl i], [dir=auto i] {
  unicode-bidi: isolate;
}

bdo, bdo[dir] { unicode-bidi: isolate-override; }

input[dir=auto i]:matches([type=search i], [type=tel i], [type=url i],
[type=email i]), textarea[dir=auto i], pre[dir=auto i] {
  unicode-bidi: plaintext;
}
/* see prose for input elements whose type attribute is in the Text state */

/* the rules setting the 'content' property on br and wbr elements also has bidi implications */
```

When an [input](#)<sup>p486</sup> element's [dir](#)<sup>p139</sup> attribute is in the [auto](#)<sup>p139</sup> state and its [type](#)<sup>p488</sup> attribute is in the [Text](#)<sup>p492</sup> state, then the user agent is expected to act as if it had a user-agent-level style sheet rule setting the ['unicode-bidi'](#) property to 'plaintext'.

Input fields (i.e. [textarea](#)<sup>p541</sup> elements, and [input](#)<sup>p486</sup> elements when their [type](#)<sup>p488</sup> attribute is in the [Text](#)<sup>p492</sup>, [Search](#)<sup>p492</sup>, [Telephone](#)<sup>p493</sup>, [URL](#)<sup>p494</sup>, or [E-mail](#)<sup>p495</sup> state) are expected to present an editing user interface with a directionality that matches the element's ['direction'](#) property.

When the document's character encoding is [ISO-8859-8](#), the following rules are additionally expected to apply, following those above: [\[ENCODING\]](#)<sup>p1266</sup>

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp, article, aside, h1, h2,
h3, h4, h5, h6, hgroup, nav, section, table, caption, colgroup, col, thead,
tbody, tfoot, tr, td, th, dir, dd, dl, dt, menu, ol, ul, li, [dir=ltr i],
[dir=rtl i], [dir=auto i], *|* {
  unicode-bidi: bidi-override;
}

input:not([type=submit i]):not([type=reset i]):not([type=button i]),
textarea {
  unicode-bidi: normal;
}
```

### 14.3.6 Quotes <sup>§p11</sup> 78

This block is automatically generated from the Unicode Common Locale Data Repository. [\[CLDR\]](#)<sup>p1264</sup>

User agents are expected to use either the block below (which will be regularly updated) or to automatically generate their own copy directly from the source material. The language codes are derived from the CLDR file names. The quotes are derived from the [delimiter](#) blocks, with fallback handled as specified in the CLDR documentation.

```
CSS @namespace url(http://www.w3.org/1999/xhtml);
```

```

:root                                     { quotes: '\201c' '\201d' '\2018' '\2019'

### 14.3.7 Sections and headings §<sup>p11</sup><sub>84</sub>

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

article, aside, h1, h2, h3, h4, h5, h6, hgroup, nav, section {
  display: block;
}

h1 { margin-block-start: 0.67em; margin-block-end: 0.67em; font-size: 2.00em; font-weight: bold; }
h2 { margin-block-start: 0.83em; margin-block-end: 0.83em; font-size: 1.50em; font-weight: bold; }
h3 { margin-block-start: 1.00em; margin-block-end: 1.00em; font-size: 1.17em; font-weight: bold; }
h4 { margin-block-start: 1.33em; margin-block-end: 1.33em; font-size: 1.00em; font-weight: bold; }
h5 { margin-block-start: 1.67em; margin-block-end: 1.67em; font-size: 0.83em; font-weight: bold; }
h6 { margin-block-start: 2.33em; margin-block-end: 2.33em; font-size: 0.67em; font-weight: bold; }

```

In the following CSS block, x is shorthand for the following selector: `:matches(article, aside, nav, section)`

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

```

```

x h1 { margin-block-start: 0.83em; margin-block-end: 0.83em; font-size: 1.50em; }
x x h1 { margin-block-start: 1.00em; margin-block-end: 1.00em; font-size: 1.17em; }
x x x h1 { margin-block-start: 1.33em; margin-block-end: 1.33em; font-size: 1.00em; }
x x x x h1 { margin-block-start: 1.67em; margin-block-end: 1.67em; font-size: 0.83em; }
x x x x x h1 { margin-block-start: 2.33em; margin-block-end: 2.33em; font-size: 0.67em; }

x hgroup > h1 ~ h2 { margin-block-start: 1.00em; margin-block-end: 1.00em; font-size: 1.17em; }
x x hgroup > h1 ~ h2 { margin-block-start: 1.33em; margin-block-end: 1.33em; font-size: 1.00em; }

x x x hgroup > h1 ~ h3 { margin-block-start: 2.33em; margin-block-end: 2.33em; font-size: 0.67em; }

x hgroup > h1 ~ h4 { margin-block-start: 1.67em; margin-block-end: 1.67em; font-size: 0.83em; }
x x hgroup > h1 ~ h4 { margin-block-start: 2.33em; margin-block-end: 2.33em; font-size: 0.67em; }

x hgroup > h1 ~ h5 { margin-block-start: 2.33em; margin-block-end: 2.33em; font-size: 0.67em; }

```

#### Note

The shorthand is used to keep this block at least mildly readable.

### 14.3.8 Lists §P11 85

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

dir, dd, dl, dt, menu, ol, ul { display: block; }
li { display: list-item; }

dir, dl, menu, ol, ul { margin-block-start: 1em; margin-block-end: 1em; }

:matches(dir, dl, menu, ol, ul) :matches(dir, dl, menu, ol, ul) {
  margin-block-start: 0; margin-block-end: 0;
}

dd { margin-inline-start: 40px; }
dir, menu, ol, ul { padding-inline-start: 40px; }

ol { list-style-type: decimal; }

dir, menu, ul {
  list-style-type: disc;
}
:matches(dir, menu, ol, ul) :matches(dir, menu, ul) {
  list-style-type: circle;
}
:matches(dir, menu, ol, ul) :matches(dir, menu, ol, ul) :matches(dir, menu, ul) {
  list-style-type: square;
}

```

The following rules are also expected to apply, as [presentational hints](#)<sup>P1172</sup>:

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

ol[type="1"], li[type="1"] { list-style-type: decimal; }
ol[type=a s], li[type=a s] { list-style-type: lower-alpha; }

```

```

ol[type=A s], li[type=A s] { list-style-type: upper-alpha; }
ol[type=i s], li[type=i s] { list-style-type: lower-roman; }
ol[type=I s], li[type=I s] { list-style-type: upper-roman; }
ul[type=none i], li[type=none i] { list-style-type: none; }
ul[type=disc i], li[type=disc i] { list-style-type: disc; }
ul[type=circle i], li[type=circle i] { list-style-type: circle; }
ul[type=square i], li[type=square i] { list-style-type: square; }

```

When rendering [li](#) <sup>p220</sup> elements, non-CSS user agents are expected to use the [ordinal value](#) <sup>p221</sup> of the [li](#) <sup>p220</sup> element to render the counter in the list item marker.

This specification does not yet define the CSS-specific rules for rendering [li](#) <sup>p220</sup> elements, because CSS doesn't yet provide sufficient hooks for this purpose.

### 14.3.9 Tables § p11 86

**CSS** @namespace url(http://www.w3.org/1999/xhtml);

```

table { display: table; }
caption { display: table-caption; }
colgroup, colgroup[hidden] { display: table-column-group; }
col, col[hidden] { display: table-column; }
thead, thead[hidden] { display: table-header-group; }
tbody, tbody[hidden] { display: table-row-group; }
tfoot, tfoot[hidden] { display: table-footer-group; }
tr, tr[hidden] { display: table-row; }
td, th { display: table-cell; }

colgroup[hidden], col[hidden], thead[hidden], tbody[hidden],
tfoot[hidden], tr[hidden] {
  visibility: collapse;
}

table {
  box-sizing: border-box;
  border-spacing: 2px;
  border-collapse: separate;
  text-indent: initial;
}
td, th { padding: 1px; }
th { font-weight: bold; }

caption { text-align: center; }
thead, tbody, tfoot, table > tr { vertical-align: middle; }
tr, td, th { vertical-align: inherit; }

thead, tbody, tfoot, tr { border-color: inherit; }
table[rules=none i], table[rules=groups i], table[rules=rows i],
table[rules=cols i], table[rules=all i], table[frame=void i],
table[frame=above i], table[frame=below i], table[frame=hsides i],
table[frame=lhs i], table[frame=rhs i], table[frame=vsides i],
table[frame=box i], table[frame=border i],
table[rules=none i] > tr > td, table[rules=none i] > tr > th,
table[rules=groups i] > tr > td, table[rules=groups i] > tr > th,
table[rules=rows i] > tr > td, table[rules=rows i] > tr > th,
table[rules=cols i] > tr > td, table[rules=cols i] > tr > th,
table[rules=all i] > tr > td, table[rules=all i] > tr > th,
table[rules=none i] > thead > tr > td, table[rules=none i] > thead > tr > th,

```

```

table[rules=groups i] > thead > tr > td, table[rules=groups i] > thead > tr > th,
table[rules=rows i] > thead > tr > td, table[rules=rows i] > thead > tr > th,
table[rules=cols i] > thead > tr > td, table[rules=cols i] > thead > tr > th,
table[rules=all i] > thead > tr > td, table[rules=all i] > thead > tr > th,
table[rules=none i] > tbody > tr > td, table[rules=none i] > tbody > tr > th,
table[rules=groups i] > tbody > tr > td, table[rules=groups i] > tbody > tr > th,
table[rules=rows i] > tbody > tr > td, table[rules=rows i] > tbody > tr > th,
table[rules=cols i] > tbody > tr > td, table[rules=cols i] > tbody > tr > th,
table[rules=all i] > tbody > tr > td, table[rules=all i] > tbody > tr > th,
table[rules=none i] > tfoot > tr > td, table[rules=none i] > tfoot > tr > th,
table[rules=groups i] > tfoot > tr > td, table[rules=groups i] > tfoot > tr > th,
table[rules=rows i] > tfoot > tr > td, table[rules=rows i] > tfoot > tr > th,
table[rules=cols i] > tfoot > tr > td, table[rules=cols i] > tfoot > tr > th,
table[rules=all i] > tfoot > tr > td, table[rules=all i] > tfoot > tr > th {
  border-color: black;
}

```

The following rules are also expected to apply, as [presentational hints<sup>p1172</sup>](#):

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

table[align=left i] { float: left; }
table[align=right i] { float: right; }
table[align=center i] { margin-inline-start: auto; margin-inline-end: auto; }
thead[align=absmiddle i], tbody[align=absmiddle i], tfoot[align=absmiddle i],
tr[align=absmiddle i], td[align=absmiddle i], th[align=absmiddle i] {
  text-align: center;
}

caption[align=bottom i] { caption-side: bottom; }
p[align=left i], h1[align=left i], h2[align=left i], h3[align=left i],
h4[align=left i], h5[align=left i], h6[align=left i] {
  text-align: left;
}
p[align=right i], h1[align=right i], h2[align=right i], h3[align=right i],
h4[align=right i], h5[align=right i], h6[align=right i] {
  text-align: right;
}
p[align=center i], h1[align=center i], h2[align=center i], h3[align=center i],
h4[align=center i], h5[align=center i], h6[align=center i] {
  text-align: center;
}
p[align=justify i], h1[align=justify i], h2[align=justify i], h3[align=justify i],
h4[align=justify i], h5[align=justify i], h6[align=justify i] {
  text-align: justify;
}
thead[valign=top i], tbody[valign=top i], tfoot[valign=top i],
tr[valign=top i], td[valign=top i], th[valign=top i] {
  vertical-align: top;
}
thead[valign=middle i], tbody[valign=middle i], tfoot[valign=middle i],
tr[valign=middle i], td[valign=middle i], th[valign=middle i] {
  vertical-align: middle;
}
thead[valign=bottom i], tbody[valign=bottom i], tfoot[valign=bottom i],
tr[valign=bottom i], td[valign=bottom i], th[valign=bottom i] {
  vertical-align: bottom;
}
thead[valign=baseline i], tbody[valign=baseline i], tfoot[valign=baseline i],
tr[valign=baseline i], td[valign=baseline i], th[valign=baseline i] {
  vertical-align: baseline;
}

```

```

td[nowrap], th[nowrap] { white-space: nowrap; }

table[rules=none i], table[rules=groups i], table[rules=rows i],
table[rules=cols i], table[rules=all i] {
  border-style: hidden;
  border-collapse: collapse;
}
table[border] { border-style: outset; } /* only if border is not equivalent to zero */
table[frame=void i] { border-style: hidden; }
table[frame=above i] { border-style: outset hidden hidden hidden; }
table[frame=below i] { border-style: hidden hidden outset hidden; }
table[frame=hsides i] { border-style: outset hidden outset hidden; }
table[frame=lhs i] { border-style: hidden hidden hidden outset; }
table[frame=rhs i] { border-style: hidden outset hidden hidden; }
table[frame=vsides i] { border-style: hidden outset; }
table[frame=box i], table[frame=border i] { border-style: outset; }

table[border] > tr > td, table[border] > tr > th,
table[border] > thead > tr > td, table[border] > thead > tr > th,
table[border] > tbody > tr > td, table[border] > tbody > tr > th,
table[border] > tfoot > tr > td, table[border] > tfoot > tr > th {
  /* only if border is not equivalent to zero */
  border-width: 1px;
  border-style: inset;
}
table[rules=none i] > tr > td, table[rules=none i] > tr > th,
table[rules=none i] > thead > tr > td, table[rules=none i] > thead > tr > th,
table[rules=none i] > tbody > tr > td, table[rules=none i] > tbody > tr > th,
table[rules=none i] > tfoot > tr > td, table[rules=none i] > tfoot > tr > th,
table[rules=groups i] > tr > td, table[rules=groups i] > tr > th,
table[rules=groups i] > thead > tr > td, table[rules=groups i] > thead > tr > th,
table[rules=groups i] > tbody > tr > td, table[rules=groups i] > tbody > tr > th,
table[rules=groups i] > tfoot > tr > td, table[rules=groups i] > tfoot > tr > th,
table[rules=rows i] > tr > td, table[rules=rows i] > tr > th,
table[rules=rows i] > thead > tr > td, table[rules=rows i] > thead > tr > th,
table[rules=rows i] > tbody > tr > td, table[rules=rows i] > tbody > tr > th,
table[rules=rows i] > tfoot > tr > td, table[rules=rows i] > tfoot > tr > th {
  border-width: 1px;
  border-style: none;
}
table[rules=cols i] > tr > td, table[rules=cols i] > tr > th,
table[rules=cols i] > thead > tr > td, table[rules=cols i] > thead > tr > th,
table[rules=cols i] > tbody > tr > td, table[rules=cols i] > tbody > tr > th,
table[rules=cols i] > tfoot > tr > td, table[rules=cols i] > tfoot > tr > th {
  border-width: 1px;
  border-block-start-style: none;
  border-inline-end-style: solid;
  border-block-end-style: none;
  border-inline-start-style: solid;
}
table[rules=all i] > tr > td, table[rules=all i] > tr > th,
table[rules=all i] > thead > tr > td, table[rules=all i] > thead > tr > th,
table[rules=all i] > tbody > tr > td, table[rules=all i] > tbody > tr > th,
table[rules=all i] > tfoot > tr > td, table[rules=all i] > tfoot > tr > th {
  border-width: 1px;
  border-style: solid;
}

table[rules=groups i] > colgroup {
  border-inline-start-width: 1px;
  border-inline-start-style: solid;
}

```

```

border-inline-end-width: 1px;
border-inline-end-style: solid;
}
table[rules=groups i] > thead,
table[rules=groups i] > tbody,
table[rules=groups i] > tfoot {
border-block-start-width: 1px;
border-block-start-style: solid;
border-block-end-width: 1px;
border-block-end-style: solid;
}

table[rules=rows i] > tr, table[rules=rows i] > thead > tr,
table[rules=rows i] > tbody > tr, table[rules=rows i] > tfoot > tr {
border-block-start-width: 1px;
border-block-start-style: solid;
border-block-end-width: 1px;
border-block-end-style: solid;
}

```

In [quirks mode](#), the following rules are also expected to apply:

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

table {
font-weight: initial;
font-style: initial;
font-variant: initial;
font-size: initial;
line-height: initial;
white-space: initial;
text-align: initial;
}

```

For the purposes of the CSS table model, the [col](#)<sup>p453</sup> element is expected to be treated as if it was present as many times as its [span](#)<sup>p454</sup> attribute [specifies](#)<sup>p67</sup>.

For the purposes of the CSS table model, the [colgroup](#)<sup>p452</sup> element, if it contains no [col](#)<sup>p453</sup> element, is expected to be treated as if it had as many such children as its [span](#)<sup>p453</sup> attribute [specifies](#)<sup>p67</sup>.

For the purposes of the CSS table model, the [colspan](#)<sup>p462</sup> and [rowspan](#)<sup>p462</sup> attributes on [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements are expected to [provide](#)<sup>p67</sup> the *special knowledge* regarding cells spanning rows and columns.

In [HTML documents](#), the following rules are also expected to apply:

```

CSS @namespace url(http://www.w3.org/1999/xhtml);

:matches(table, thead, tbody, tfoot, tr) > form { display: none !important; }

```

The [table](#)<sup>p443</sup> element's [cellspacing](#)<sup>p1217</sup> attribute [maps to the pixel length property](#)<sup>p1173</sup> ['border-spacing'](#) on the element.

The [table](#)<sup>p443</sup> element's [cellpadding](#)<sup>p1217</sup> attribute [maps to the pixel length properties](#)<sup>p1173</sup> ['padding-top'](#), ['padding-right'](#), ['padding-bottom'](#), and ['padding-left'](#) of any [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements that have corresponding [cells](#)<sup>p463</sup> in the [table](#)<sup>p463</sup> corresponding to the [table](#)<sup>p443</sup> element.

The [table](#)<sup>p443</sup> element's [height](#)<sup>p1217</sup> attribute [maps to the dimension property \(ignoring zero\)](#)<sup>p1173</sup> ['height'](#) on the [table](#)<sup>p443</sup> element.

The [table](#)<sup>p443</sup> element's [width](#)<sup>p1217</sup> attribute [maps to the dimension property \(ignoring zero\)](#)<sup>p1173</sup> ['width'](#) on the [table](#)<sup>p443</sup> element.

The [col<sup>p453</sup>](#) element's [width<sup>p1216</sup>](#) attribute [maps to the dimension property<sup>p1173</sup>](#) 'width' on the [col<sup>p453</sup>](#) element.

The [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), and [tfoot<sup>p456</sup>](#) elements' [height<sup>p1217</sup>](#) attribute [maps to the dimension property<sup>p1173</sup>](#) 'height' on the element.

The [tr<sup>p457</sup>](#) element's [height<sup>p1217</sup>](#) attribute [maps to the dimension property \(ignoring zero\)<sup>p1173</sup>](#) 'height' on the [tr<sup>p457</sup>](#) element.

The [td<sup>p459</sup>](#) and [th<sup>p460</sup>](#) elements' [height<sup>p1217</sup>](#) attributes [map to the dimension property \(ignoring zero\)<sup>p1173</sup>](#) 'height' on the element.

The [td<sup>p459</sup>](#) and [th<sup>p460</sup>](#) elements' [width<sup>p1217</sup>](#) attributes [map to the dimension property \(ignoring zero\)<sup>p1173</sup>](#) 'width' on the element.

The [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), [tfoot<sup>p456</sup>](#), [tr<sup>p457</sup>](#), [td<sup>p459</sup>](#), and [th<sup>p460</sup>](#) elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#) match for either the string "center" or the string "middle", are expected to center text within themselves, as if they had their `'text-align'` property set to 'center' in a [presentational hint<sup>p1172</sup>](#), and to [align descendants<sup>p1173</sup>](#) to the center.

The [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), [tfoot<sup>p456</sup>](#), [tr<sup>p457</sup>](#), [td<sup>p459</sup>](#), and [th<sup>p460</sup>](#) elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#) match for the string "left", are expected to left-align text within themselves, as if they had their `'text-align'` property set to 'left' in a [presentational hint<sup>p1172</sup>](#), and to [align descendants<sup>p1173</sup>](#) to the left.

The [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), [tfoot<sup>p456</sup>](#), [tr<sup>p457</sup>](#), [td<sup>p459</sup>](#), and [th<sup>p460</sup>](#) elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#) match for the string "right", are expected to right-align text within themselves, as if they had their `'text-align'` property set to 'right' in a [presentational hint<sup>p1172</sup>](#), and to [align descendants<sup>p1173</sup>](#) to the right.

The [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), [tfoot<sup>p456</sup>](#), [tr<sup>p457</sup>](#), [td<sup>p459</sup>](#), and [th<sup>p460</sup>](#) elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#) match for the string "justify", are expected to full-justify text within themselves, as if they had their `'text-align'` property set to 'justify' in a [presentational hint<sup>p1172</sup>](#), and to [align descendants<sup>p1173</sup>](#) to the left.

User agents are expected to have a rule in their user agent style sheet that matches [th<sup>p460</sup>](#) elements that have a parent node whose [computed value](#) for the `'text-align'` property is its initial value, whose declaration block consists of just a single declaration that sets the `'text-align'` property to the value 'center'.

When a [table<sup>p443</sup>](#), [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), [tfoot<sup>p456</sup>](#), [tr<sup>p457</sup>](#), [td<sup>p459</sup>](#), or [th<sup>p460</sup>](#) element has a [background<sup>p1217</sup>](#) attribute set to a non-empty value, the new value is expected to be [parsed<sup>p87</sup>](#) relative to the element's [node document](#), and if this is successful, the user agent is expected to treat the attribute as a [presentational hint<sup>p1172</sup>](#) setting the element's `'background-image'` property to the [resulting URL string<sup>p87</sup>](#).

When a [table<sup>p443</sup>](#), [thead<sup>p455</sup>](#), [tbody<sup>p454</sup>](#), [tfoot<sup>p456</sup>](#), [tr<sup>p457</sup>](#), [td<sup>p459</sup>](#), or [th<sup>p460</sup>](#) element has a `bgcolor` attribute set, the new value is expected to be parsed using the [rules for parsing a legacy color value<sup>p84</sup>](#), and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint<sup>p1172</sup>](#) setting the element's `'background-color'` property to the resulting color.

When a [table<sup>p443</sup>](#) element has a [bordercolor<sup>p1217</sup>](#) attribute, its value is expected to be parsed using the [rules for parsing a legacy color value<sup>p84</sup>](#), and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint<sup>p1172</sup>](#) setting the element's `'border-top-color'`, `'border-right-color'`, `'border-bottom-color'`, and `'border-left-color'` properties to the resulting color.

The [table<sup>p443</sup>](#) element's [border<sup>p1217</sup>](#) attribute [maps to the pixel length properties<sup>p1173</sup>](#) `'border-top-width'`, `'border-right-width'`, `'border-bottom-width'`, `'border-left-width'` on the element. If the attribute is present but parsing the attribute's value using the [rules for parsing non-negative integers<sup>p67</sup>](#) generates an error, a default value of 1px is expected to be used for that property instead.

Rules marked **"only if border is not equivalent to zero"** in the CSS block above is expected to only be applied if the [border<sup>p1217</sup>](#) attribute mentioned in the selectors for the rule is not only present but, when parsed using the [rules for parsing non-negative integers<sup>p67</sup>](#), is also found to have a value other than zero or to generate an error.

In [quirks mode](#), a [td<sup>p459</sup>](#) element or a [th<sup>p460</sup>](#) element that has a [nowrap<sup>p1217</sup>](#) attribute but also has a [width<sup>p1217</sup>](#) attribute whose value, when parsed using the [rules for parsing nonzero dimension values<sup>p70</sup>](#), is found to be a length (not an error or a number classified as a percentage), is expected to have a [presentational hint<sup>p1172</sup>](#) setting the element's `'white-space'` property to 'normal', overriding the rule in the CSS block above that sets it to 'nowrap'.

### 14.3.10 Margin collapsing quirks §<sup>p11</sup><sub>91</sub>

A node is **substantial** if it is a text node that is not [inter-element whitespace<sup>p126</sup>](#), or if it is an element node.

A node is **blank** if it is an element that contains no [substantial<sup>p1191</sup>](#) nodes.

The **elements with default margins** are the following elements: [blockquote<sup>p213</sup>](#), [dir<sup>p1212</sup>](#), [dl<sup>p222</sup>](#), [h1<sup>p186</sup>](#), [h2<sup>p186</sup>](#), [h3<sup>p186</sup>](#), [h4<sup>p186</sup>](#), [h5<sup>p186</sup>](#), [h6<sup>p186</sup>](#), [listing<sup>p1212</sup>](#), [menu<sup>p219</sup>](#), [ol<sup>p216</sup>](#), [p<sup>p207</sup>](#), [plaintext<sup>p1212</sup>](#), [pre<sup>p212</sup>](#), [ul<sup>p218</sup>](#), [xmp<sup>p1213</sup>](#)

In [quirks mode](#), any [element with default margins<sup>p1191</sup>](#) that is the [child](#) of a [body<sup>p174</sup>](#), [td<sup>p459</sup>](#), or [th<sup>p460</sup>](#) element and has no [substantial<sup>p1191</sup>](#) previous siblings is expected to have a user-agent level style sheet rule that sets its ['margin-block-start'](#) property to zero.

In [quirks mode](#), any [element with default margins<sup>p1191</sup>](#) that is the [child](#) of a [body<sup>p174</sup>](#), [td<sup>p459</sup>](#), or [th<sup>p460</sup>](#) element, has no [substantial<sup>p1191</sup>](#) previous siblings, and is [blank<sup>p1191</sup>](#), is expected to have a user-agent level style sheet rule that sets its ['margin-block-end'](#) property to zero also.

In [quirks mode](#), any [element with default margins<sup>p1191</sup>](#) that is the [child](#) of a [td<sup>p459</sup>](#) or [th<sup>p460</sup>](#) element, has no [substantial<sup>p1191</sup>](#) following siblings, and is [blank<sup>p1191</sup>](#), is expected to have a user-agent level style sheet rule that sets its ['margin-block-start'](#) property to zero.

In [quirks mode](#), any [p<sup>p207</sup>](#) element that is the [child](#) of a [td<sup>p459</sup>](#) or [th<sup>p460</sup>](#) element and has no [substantial<sup>p1191</sup>](#) following siblings, is expected to have a user-agent level style sheet rule that sets its ['margin-block-end'](#) property to zero.

### 14.3.11 Form controls §<sup>p11</sup><sub>91</sub>

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

input, select, button, textarea {
  letter-spacing: initial;
  word-spacing: initial;
  line-height: initial;
  text-transform: initial;
  text-indent: initial;
  text-shadow: initial;
}

input, select, textarea {
  text-align: initial;
}

input:matches([type=reset i], [type=button i], [type=submit i]), button {
  text-align: center;
}

input:matches([type=reset i], [type=button i], [type=submit i], [type=color i]), button {
  display: inline-block;
}

input:matches([type=radio i], [type=checkbox i], [type=reset i], [type=button i],
[type=submit i], [type=color i], [type=search i]), select, button {
  box-sizing: border-box;
}

textarea { white-space: pre-wrap; }
```

In [quirks mode](#), the following rules are also expected to apply:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

input:not([type=image i]), textarea { box-sizing: border-box; }
```

Each kind of form control is also described in the [Widgets<sup>p1199</sup>](#) section, which describes the look and feel of the control.

### 14.3.12 The [hr<sup>p210</sup>](#) element §<sup>p11</sup> 92

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

hr {
  color: gray;
  border-style: inset;
  border-width: 1px;
  margin-block-start: 0.5em;
  margin-inline-end: auto;
  margin-block-end: 0.5em;
  margin-inline-start: auto;
  overflow: hidden;
}
```

The following rules are also expected to apply, as [presentational hints<sup>p1172</sup>](#):

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

hr[align=left i] { margin-left: 0; margin-right: auto; }
hr[align=right i] { margin-left: auto; margin-right: 0; }
hr[align=center i] { margin-left: auto; margin-right: auto; }
hr[color], hr[noshade] { border-style: solid; }
```

If an [hr<sup>p210</sup>](#) element has either a [color<sup>p1216</sup>](#) attribute or a [noshade<sup>p1216</sup>](#) attribute, and furthermore also has a [size<sup>p1216</sup>](#) attribute, and parsing that attribute's value using the [rules for parsing non-negative integers<sup>p67</sup>](#) doesn't generate an error, then the user agent is expected to use the parsed value divided by two as a pixel length for [presentational hints<sup>p1172</sup>](#) for the properties '[border-top-width](#)', '[border-right-width](#)', '[border-bottom-width](#)', and '[border-left-width](#)' on the element.

Otherwise, if an [hr<sup>p210</sup>](#) element has neither a [color<sup>p1216</sup>](#) attribute nor a [noshade<sup>p1216</sup>](#) attribute, but does have a [size<sup>p1216</sup>](#) attribute, and parsing that attribute's value using the [rules for parsing non-negative integers<sup>p67</sup>](#) doesn't generate an error, then: if the parsed value is one, then the user agent is expected to use the attribute as a [presentational hint<sup>p1172</sup>](#) setting the element's '[border-bottom-width](#)' to 0; otherwise, if the parsed value is greater than one, then the user agent is expected to use the parsed value minus two as a pixel length for [presentational hints<sup>p1172</sup>](#) for the '[height](#)' property on the element.

The [width<sup>p1216</sup>](#) attribute on an [hr<sup>p210</sup>](#) element [maps to the dimension property<sup>p1173</sup>](#) '[width](#)' on the element.

When an [hr<sup>p210</sup>](#) element has a [color<sup>p1216</sup>](#) attribute, its value is expected to be parsed using the [rules for parsing a legacy color value<sup>p84</sup>](#), and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint<sup>p1172</sup>](#) setting the element's '[color](#)' property to the resulting color.

### 14.3.13 The [fieldset<sup>p555</sup>](#) and [legend<sup>p558</sup>](#) elements §<sup>p11</sup> 92

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

fieldset {
  display: block;
  margin-inline-start: 2px;
  margin-inline-end: 2px;
  border: groove 2px ThreeDFace;
  padding-block-start: 0.35em;
  padding-inline-end: 0.75em;
  padding-block-end: 0.625em;
  padding-inline-start: 0.75em;
  min-inline-size: min-content;
}
```

```

}

legend {
  padding-inline-start: 2px; padding-inline-end: 2px;
}

legend[align=left i] {
  justify-self: left;
}

legend[align=center i] {
  justify-self: center;
}

legend[align=right i] {
  justify-self: right;
}

```

The [fieldset<sup>p555</sup>](#) element, when it generates a [CSS box](#), is expected to act as follows:

- The element is expected to establish a new [block formatting context](#).
- The `'display'` property is expected to act as follows:
  - If the computed value of `'display'` is a value such that the [outer display type](#) is 'inline', then behave as 'inline-block'.
  - Otherwise, behave as 'flow-root'.

#### Note

*This does not change the computed value.*

- If the element's box has a child box that matches the conditions in the list below, then the first such child box is the 'fieldset' element's **rendered legend**:
  - The child is a [legend<sup>p558</sup>](#) element.
  - The child's used value of `'float'` is 'none'.
  - The child's used value of `'position'` is not 'absolute' or 'fixed'.
- If the element has a [rendered legend<sup>p1193</sup>](#), then the border is expected to not be painted behind the rectangle defined as follows, using the writing mode of the fieldset:
  1. The block-start edge of the rectangle is the smaller of the block-start edge of the [rendered legend<sup>p1193</sup>](#)'s margin rectangle at its static position (ignoring transforms), and the block-start outer edge of the [fieldset<sup>p555</sup>](#)'s border.
  2. The block-end edge of the rectangle is the larger of the block-end edge of the [rendered legend<sup>p1193</sup>](#)'s margin rectangle at its static position (ignoring transforms), and the block-end outer edge of the [fieldset<sup>p555</sup>](#)'s border.
  3. The inline-start edge of the rectangle is the smaller of the inline-start edge of the [rendered legend<sup>p1193</sup>](#)'s border rectangle at its static position (ignoring transforms), and the inline-start outer edge of the [fieldset<sup>p555</sup>](#)'s border.
  4. The inline-end edge of the rectangle is the larger of the inline-end edge of the [rendered legend<sup>p1193</sup>](#)'s border rectangle at its static position (ignoring transforms), and the inline-end outer edge of the [fieldset<sup>p555</sup>](#)'s border.
- The space allocated for the element's border on the block-start side is expected to be the element's `'border-block-start-width'` or the [rendered legend<sup>p1193</sup>](#)'s margin box size in the [fieldset<sup>p555</sup>](#)'s block-flow direction, whichever is greater.
- For the purpose of calculating the used `'block-size'`, if the computed `'block-size'` is not 'auto', the space allocated for the [rendered legend<sup>p1193</sup>](#)'s margin box that spills out past the border, if any, is expected to be subtracted from the `'block-size'`. If the content box's block-size would be negative, then let the content box's block-size be zero instead.
- If the element has a [rendered legend<sup>p1193</sup>](#), then that element is expected to be the first child box.
- The [anonymous fieldset content box<sup>p1194</sup>](#) is expected to appear after the [rendered legend<sup>p1193</sup>](#) and is expected to contain the content (including the `'::before'` and `'::after'` pseudo-elements) of the [fieldset<sup>p555</sup>](#) element except for the [rendered legend<sup>p1193</sup>](#), if there is one.

- The used value of the ['padding-top'](#), ['padding-right'](#), ['padding-bottom'](#), and ['padding-left'](#) properties are expected to be zero.
- For the purpose of calculating the min-content inline size, use the greater of the min-content inline size of the [rendered legend<sup>p1193</sup>](#) and the min-content inline size of the [anonymous fieldset content box<sup>p1194</sup>](#).
- For the purpose of calculating the max-content inline size, use the greater of the max-content inline size of the [rendered legend<sup>p1193</sup>](#) and the max-content inline size of the [anonymous fieldset content box<sup>p1194</sup>](#).

A [fieldset<sup>p555</sup>](#) element's [rendered legend<sup>p1193</sup>](#), if any, is expected to act as follows:

- The element is expected to establish a new [formatting context](#) for its contents. The type of this [formatting context](#) is determined by its ['display'](#) value, as usual.
- The ['display'](#) property is expected to behave as if its computed value was blockified.

#### Note

*This does not change the computed value.*

- If the [computed value](#) of ['inline-size'](#) is 'auto', then the [used value](#) is the [fit-content inline size](#).
- The element is expected to be positioned in the inline direction as is normal for blocks (e.g., taking into account margins and the ['justify-self'](#) property).
- The element's box is expected to be constrained in the inline direction by the inline content size of the [fieldset<sup>p555</sup>](#) as if it had used its computed inline padding.

#### Example

For example, if the [fieldset<sup>p555</sup>](#) has a specified padding of 50px, then the [rendered legend<sup>p1193</sup>](#) will be positioned 50px in from the [fieldset<sup>p555</sup>](#)'s border. The padding will further apply to the [anonymous fieldset content box<sup>p1194</sup>](#) instead of the [fieldset<sup>p555</sup>](#) element itself.

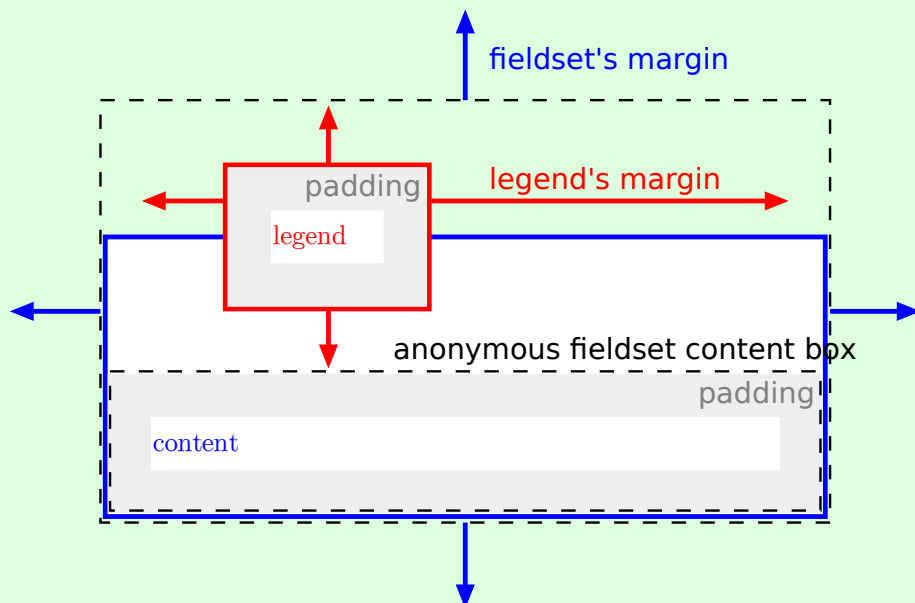

- The element is expected to be positioned in the block-flow direction such that its border box is centered over the border on the block-start side of the [fieldset<sup>p555</sup>](#) element.

A [fieldset<sup>p555</sup>](#) element's **anonymous fieldset content box** is expected to act as follows:

- The ['display'](#) property is expected to act as follows:
  - If the computed value of ['display'](#) on the [fieldset<sup>p555</sup>](#) element is 'grid' or 'inline-grid', then set the used value to 'grid'.
  - If the computed value of ['display'](#) on the [fieldset<sup>p555</sup>](#) element is 'flex' or 'inline-flex', then set the used value to 'flex'.
  - Otherwise, set the used value to 'flow-root'.
- The following properties are expected to inherit from the [fieldset<sup>p555</sup>](#) element:
  - ['align-content'](#)
  - ['align-items'](#)
  - ['border-radius'](#)
  - ['column-count'](#)
  - ['column-fill'](#)
  - ['column-gap'](#)
  - ['column-rule'](#)
  - ['column-width'](#)
  - ['flex-direction'](#)
  - ['flex-wrap'](#)
  - ['grid-auto-columns'](#)
  - ['grid-auto-flow'](#)
  - ['grid-auto-rows'](#)
  - ['grid-column-gap'](#)
  - ['grid-row-gap'](#)
  - ['grid-template-areas'](#)
  - ['grid-template-columns'](#)
  - ['grid-template-rows'](#)
  - ['justify-content'](#)
  - ['justify-items'](#)
  - ['overflow'](#)
  - ['padding-bottom'](#)
  - ['padding-left'](#)
  - ['padding-right'](#)

- ['padding-top'](#)
  - ['text-overflow'](#)
  - ['unicode-bidi'](#)
- The ['block-size'](#) property is expected to be set to '100%'.
  - For the purpose of calculating percentage padding, act as if the padding was calculated for the [fieldset<sup>p555</sup>](#) element.

#### Note

The legend is rendered over the top border, and the top border area reserves vertical space for the legend. The fieldset's top margin starts at the top margin edge of the legend. The legend's horizontal margins, or the ['justify-self'](#) property, gives its horizontal position. The [anonymous fieldset content box<sup>p1194</sup>](#) appears below the legend.

## 14.4 Replaced elements §<sup>p11</sup> 95

#### Note

The following elements can be [replaced elements](#): [audio<sup>p377</sup>](#), [canvas<sup>p627</sup>](#), [embed<sup>p363</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [input<sup>p486</sup>](#), [object<sup>p367</sup>](#), and [video<sup>p373</sup>](#).

### 14.4.1 Embedded content §<sup>p11</sup> 95

The [embed<sup>p363</sup>](#), [iframe<sup>p355</sup>](#), and [video<sup>p373</sup>](#) elements are expected to be treated as [replaced elements](#).

A [canvas<sup>p627</sup>](#) element that [represents<sup>p120</sup> embedded content<sup>p129</sup>](#) is expected to be treated as a [replaced element](#); the contents of such elements are the element's bitmap, if any, or else a [transparent black](#) bitmap with the same [intrinsic dimensions](#) as the element. Other [canvas<sup>p627</sup>](#) elements are expected to be treated as ordinary elements in the rendering model.

An [object<sup>p367</sup>](#) element that [represents<sup>p120</sup> an image, plugin, or its nested browsing context<sup>p806</sup>](#) is expected to be treated as a [replaced element](#). Other [object<sup>p367</sup>](#) elements are expected to be treated as ordinary elements in the rendering model.

The [audio<sup>p377</sup>](#) element, when it is [exposing a user interface<sup>p429</sup>](#), is expected to be treated as a [replaced element](#) about one line high, as wide as is necessary to expose the user agent's user interface features. When an [audio<sup>p377</sup>](#) element is not [exposing a user interface<sup>p429</sup>](#), the user agent is expected to force its ['display'](#) property to compute to 'none', irrespective of CSS rules.

Whether a [video<sup>p373</sup>](#) element is [exposing a user interface<sup>p429</sup>](#) is not expected to affect the size of the rendering; controls are expected to be overlaid above the page content without causing any layout changes, and are expected to disappear when the user does not need them.

When a [video](#)<sup>p373</sup> element represents a poster frame or frame of video, the poster frame or frame of video is expected to be rendered at the largest size that maintains the aspect ratio of that poster frame or frame of video without being taller or wider than the [video](#)<sup>p373</sup> element itself, and is expected to be centered in the [video](#)<sup>p373</sup> element.

Any subtitles or captions are expected to be overlaid directly on top of their [video](#)<sup>p373</sup> element, as defined by the relevant rendering rules; for WebVTT, those are the [rules for updating the display of WebVTT text tracks](#). [\[WEBVTT\]](#)<sup>p1271</sup>

When the user agent starts [exposing a user interface](#)<sup>p429</sup> for a [video](#)<sup>p373</sup> element, the user agent should run the [rules for updating the text track rendering](#)<sup>p416</sup> of each of the [text tracks](#)<sup>p415</sup> in the [video](#)<sup>p373</sup> element's [list of text tracks](#)<sup>p415</sup> that are [showing](#)<sup>p416</sup> and whose [text track kind](#)<sup>p415</sup> is one of [subtitles](#)<sup>p415</sup> or [captions](#)<sup>p415</sup> (e.g., for [text tracks](#)<sup>p415</sup> based on WebVTT, the [rules for updating the display of WebVTT text tracks](#)). [\[WEBVTT\]](#)<sup>p1271</sup>

#### Note

Resizing [video](#)<sup>p373</sup> and [canvas](#)<sup>p627</sup> elements does not interrupt video playback or clear the canvas.

The following CSS rules are expected to apply:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);  
  
iframe { border: 2px inset; }  
video { object-fit: contain; }
```

## 14.4.2 Images <sup>p11</sup><sub>96</sub>

User agents are expected to render [img](#)<sup>p314</sup> elements and [input](#)<sup>p486</sup> elements whose [type](#)<sup>p488</sup> attributes are in the [Image Button](#)<sup>p511</sup> state, according to the first applicable rules from the following list:

### ↪ If the element [represents](#)<sup>p120</sup> an image

The user agent is expected to treat the element as a [replaced element](#) and render the image according to the rules for doing so defined in CSS.

### ↪ If the element does not [represent](#)<sup>p120</sup> an image and either:

- the user agent has reason to believe that the image will become [available](#)<sup>p330</sup> and be rendered in due course, or
- the element has no `alt` attribute, or
- the [Document](#)<sup>p111</sup> is in [quirks mode](#), and the element already has [intrinsic dimensions](#) (e.g., from the [dimension attributes](#)<sup>p443</sup> or CSS rules)

The user agent is expected to treat the element as a [replaced element](#) whose content is the text that the element represents, if any, optionally alongside an icon indicating that the image is being obtained (if applicable). For [input](#)<sup>p486</sup> elements, the element is expected to appear button-like to indicate that the element is a [button](#)<sup>p479</sup>.

### ↪ If the element is an [img](#)<sup>p314</sup> element that [represents](#)<sup>p120</sup> some text and the user agent does not expect this to change

The user agent is expected to treat the element as a non-replaced phrasing element whose content is the text, optionally with an icon indicating that an image is missing, so that the user can request the image be displayed or investigate why it is not rendering. In non-graphical contexts, such an icon should be omitted.

### ↪ If the element is an [img](#)<sup>p314</sup> element that [represents](#)<sup>p120</sup> nothing and the user agent does not expect this to change

The user agent is expected to treat the element as a [replaced element](#) whose [intrinsic dimensions](#) are 0. (In the absence of further styles, this will cause the element to essentially not be rendered.)

### ↪ If the element is an [input](#)<sup>p486</sup> element that does not [represent](#)<sup>p120</sup> an image and the user agent does not expect this to change

The user agent is expected to treat the element as a [replaced element](#) consisting of a button whose content is the element's alternative text. The [intrinsic dimensions](#) of the button are expected to be about one line in height and whatever width is necessary to render the text on one line.

The icons mentioned above are expected to be relatively small so as not to disrupt most text but be easily clickable. In a visual environment, for instance, icons could be 16 pixels by 16 pixels square, or 1em by 1em if the images are scalable. In an audio environment, the icon could be a short bleep. The icons are intended to indicate to the user that they can be used to get to whatever options the UA provides for images, and, where appropriate, are expected to provide access to the context menu that would have

come up if the user interacted with the actual image.

All animated images with the same [absolute URL](#) and the same image data are expected to be rendered synchronized to the same timeline as a group, with the timeline starting at the time of the least recent addition to the group.

#### Note

*In other words, when a second image with the same [absolute URL](#) and animated image data is inserted into a document, it jumps to the point in the animation cycle that is currently being displayed by the first image.*

When a user agent is to **restart the animation** for an [img<sup>p314</sup>](#) element showing an animated image, all animated images with the same [absolute URL](#) and the same image data in that [img<sup>p314</sup>](#) element's [node document](#) are expected to restart their animation from the beginning.

The following CSS rules are expected to apply when the [Document<sup>p111</sup>](#) is in [quirks mode](#):

```
CSS @namespace url(http://www.w3.org/1999/xhtml);  
  
img[align=left i] { margin-right: 3px; }  
img[align=right i] { margin-left: 3px; }
```

### 14.4.3 Attributes for embedded content and images §<sup>p11</sup><sub>97</sub>

The following CSS rules are expected to apply as [presentational hints<sup>p1172</sup>](#):

```
CSS @namespace url(http://www.w3.org/1999/xhtml);  
  
iframe[frameborder=0], iframe[frameborder=no i] { border: none; }  
  
embed[align=left i], iframe[align=left i], img[align=left i],  
input[type=image i][align=left i], object[align=left i] {  
  float: left;  
}  
  
embed[align=right i], iframe[align=right i], img[align=right i],  
input[type=image i][align=right i], object[align=right i] {  
  float: right;  
}  
  
embed[align=top i], iframe[align=top i], img[align=top i],  
input[type=image i][align=top i], object[align=top i] {  
  vertical-align: top;  
}  
  
embed[align=baseline i], iframe[align=baseline i], img[align=baseline i],  
input[type=image i][align=baseline i], object[align=baseline i] {  
  vertical-align: baseline;  
}  
  
embed[align=texttop i], iframe[align=texttop i], img[align=texttop i],  
input[type=image i][align=texttop i], object[align=texttop i] {  
  vertical-align: text-top;  
}  
  
embed[align=absmiddle i], iframe[align=absmiddle i], img[align=absmiddle i],  
input[type=image i][align=absmiddle i], object[align=absmiddle i],  
embed[align=abscenter i], iframe[align=abscenter i], img[align=abscenter i],
```

```

input[type=image i][align=abscenter i], object[align=abscenter i] {
  vertical-align: middle;
}

embed[align=bottom i], iframe[align=bottom i], img[align=bottom i],
input[type=image i][align=bottom i], object[align=bottom i] {
  vertical-align: bottom;
}

```

When an [embed<sup>p363</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), or [object<sup>p367</sup>](#) element, or an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Image Button<sup>p511</sup>](#) state, has an [align](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "center" or the string "middle", the user agent is expected to act as if the element's [vertical-align](#) property was set to a value that aligns the vertical middle of the element with the parent element's baseline.

The [hspace](#) attribute of [embed<sup>p363</sup>](#), [img<sup>p314</sup>](#), or [object<sup>p367</sup>](#) elements, and [input<sup>p486</sup>](#) elements with a [type<sup>p488</sup>](#) attribute in the [Image Button<sup>p511</sup>](#) state, [maps to the dimension properties<sup>p1173</sup>](#) [margin-left](#) and [margin-right](#) on the element.

The [vspace](#) attribute of [embed<sup>p363</sup>](#), [img<sup>p314</sup>](#), or [object<sup>p367</sup>](#) elements, and [input<sup>p486</sup>](#) elements with a [type<sup>p488</sup>](#) attribute in the [Image Button<sup>p511</sup>](#) state, [maps to the dimension properties<sup>p1173</sup>](#) [margin-top](#) and [margin-bottom](#) on the element.

When an [img<sup>p314</sup>](#) element, [object<sup>p367</sup>](#) element, or [input<sup>p486</sup>](#) element with a [type<sup>p488</sup>](#) attribute in the [Image Button<sup>p511</sup>](#) state has a [border](#) attribute whose value, when parsed using the [rules for parsing non-negative integers<sup>p67</sup>](#), is found to be a number greater than zero, the user agent is expected to use the parsed value for eight [presentational hints<sup>p1172</sup>](#): four setting the parsed value as a pixel length for the element's [border-top-width](#), [border-right-width](#), [border-bottom-width](#), and [border-left-width](#) properties, and four setting the element's [border-top-style](#), [border-right-style](#), [border-bottom-style](#), and [border-left-style](#) properties to the value 'solid'.

The [width<sup>p443</sup>](#) and [height<sup>p443</sup>](#) attributes on [embed<sup>p363</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [object<sup>p367</sup>](#) or [video<sup>p373</sup>](#) elements, and [input<sup>p486</sup>](#) elements with a [type<sup>p488</sup>](#) attribute in the [Image Button<sup>p511</sup>](#) state and that either represents an image or that the user expects will eventually represent an image, [map to the dimension properties<sup>p1173</sup>](#) [width](#) and [height](#) on the element respectively.

The [intrinsic aspect ratio](#) for an [img<sup>p314</sup>](#) element *img* is computed as follows:

1. If *img*'s [current request<sup>p330</sup>](#) is [available<sup>p330</sup>](#) and has an [intrinsic aspect ratio](#), then use that intrinsic aspect ratio.
2. If *img*'s [width<sup>p443</sup>](#) and [height<sup>p443</sup>](#) attribute values, when parsed using the [rules for parsing dimension values<sup>p69</sup>](#), are both not an error, not a percentage, and non-zero, then use the ratio resulting from dividing the [width<sup>p443</sup>](#) attribute value by the [height<sup>p443</sup>](#) attribute value.
3. Otherwise, *img* has no [intrinsic aspect ratio](#).

#### 14.4.4 Image maps § p11 98

Shapes on an [image map<sup>p439</sup>](#) are expected to act, for the purpose of the CSS cascade, as elements independent of the original [area<sup>p437</sup>](#) element that happen to match the same style rules but inherit from the [img<sup>p314</sup>](#) or [object<sup>p367</sup>](#) element.

For the purposes of the rendering, only the [cursor](#) property is expected to have any effect on the shape.

##### Example

Thus, for example, if an [area<sup>p437</sup>](#) element has a [style<sup>p141</sup>](#) attribute that sets the [cursor](#) property to 'help', then when the user designates that shape, the cursor would change to a Help cursor.

##### Example

Similarly, if an [area<sup>p437</sup>](#) element had a CSS rule that set its [cursor](#) property to 'inherit' (or if no rule setting the [cursor](#) property matched the element at all), the shape's cursor would be inherited from the [img<sup>p314</sup>](#) or [object<sup>p367</sup>](#) element of the [image map<sup>p439</sup>](#), not from the parent of the [area<sup>p437</sup>](#) element.

## 14.5 Widgets §<sup>p11</sup><sub>99</sub>

### 14.5.1 Introduction §<sup>p11</sup><sub>99</sub>

The elements defined in this section can be rendered in a variety of manners, within the guidelines provided below. User agents are encouraged to set the `'appearance'` CSS property appropriately to achieve platform-native appearances for widgets, and are expected to implement any relevant animations, etc, that are appropriate for the platform.

### 14.5.2 Button layout §<sup>p11</sup><sub>99</sub>

**Button layout** is as follows:

- The `'display'` property is expected to act as follows:
  - If the computed value of `'display'` is `'inline-grid'`, `'grid'`, `'inline-flex'`, or `'flex'`, then behave as the computed value.
  - Otherwise, if the computed value of `'display'` is a value such that the `outer display type` is `'inline'`, then behave as `'inline-block'`.
  - Otherwise, behave as `'flow-root'`.
- The element is expected to establish a new `formatting context` for its contents. The type of this formatting context is determined by its `'display'` value, as usual.
- If the element is `absolutely positioned`, then for the purpose of the `CSS visual formatting model`, act as if the element is a `replaced element`. [CSS]<sup>p1264</sup>
- If the `computed value` of `'inline-size'` is `'auto'`, then the `used value` is the `fit-content inline size`.
- For the purpose of the `'normal'` keyword of the `'align-self'` property, act as if the element is a replaced element.
- If the element is an `input`<sup>p486</sup> element, or if it is a `button`<sup>p528</sup> element and its computed value for `'display'` is not `'inline-grid'`, `'grid'`, `'inline-flex'`, or `'flex'`, then the element's box has a child **anonymous button content box** with the following behaviors:
  - The box is a `block-level block container` that establishes a new `block formatting context` (i.e., `'display'` is `'flow-root'`).
  - If the box does not overflow in the horizontal axis, then it is centered horizontally.
  - If the box does not overflow in the vertical axis, then it is centered vertically.

Otherwise, there is no `anonymous button content box`<sup>p1199</sup>.

### 14.5.3 The `button`<sup>p528</sup> element §<sup>p11</sup><sub>99</sub>

The `button`<sup>p528</sup> element, when it generates a `CSS box`, is expected to depict a button and to use `button layout`<sup>p1199</sup> whose `anonymous button content box`<sup>p1199</sup>'s contents (if there is an `anonymous button content box`<sup>p1199</sup>) are the child boxes the element's box would otherwise have.

### 14.5.4 The `details`<sup>p597</sup> and `summary`<sup>p600</sup> elements §<sup>p11</sup><sub>99</sub>

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

summary {
  display: list-item;
  counter-increment: list-item 0;
  list-style: disclosure-closed inside;
}
details[open] > summary {
  list-style-type: disclosure-open;
```

```
}
```

The [details<sup>p597</sup>](#) element is expected to render as a [block box](#). The element is also expected to have an internal [shadow tree](#) with two [slots](#), both rendered as a [block box](#). The first [slot](#) is expected to take the [details<sup>p597</sup>](#) element's first [summary<sup>p600</sup>](#) element child, if any. The second [slot](#) is expected to take the [details<sup>p597</sup>](#) element's remaining descendants, if any.

The first [slot](#) is expected to allow the user to request the details be shown or hidden.

The second [slot](#) is expected to be removed from the rendering when the [details<sup>p597</sup>](#) element does not have an [open<sup>p597</sup>](#) attribute.

#### 14.5.5 The [input<sup>p486</sup>](#) element as a text entry widget §<sup>p12</sup><sub>00</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Text<sup>p492</sup>](#), [Search<sup>p492</sup>](#), [Telephone<sup>p493</sup>](#), [URL<sup>p494</sup>](#), or [E-mail<sup>p495</sup>](#) state, is expected to render as an ['inline-block'](#) box depicting a text control. Additionally, the ['line-height'](#) property, if it has a [computed value](#) equivalent to a value that is less than 1.0, must have a [used value](#) of 1.0.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Password<sup>p497</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a text control that obscures data entry.

If these text controls provide a text selection, then, when the user changes the current selection, the user agent is expected to [queue an element task<sup>p926</sup>](#) on the [user interaction task source<sup>p932</sup>](#) given the [input<sup>p486</sup>](#) element to [fire an event](#) named [select<sup>p1261</sup>](#) at the element, with the [bubbles](#) attribute initialized to true.

If an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in one of the above states has a [size<sup>p515</sup>](#) attribute, and parsing that attribute's value using the [rules for parsing non-negative integers<sup>p67</sup>](#) doesn't generate an error, then the user agent is expected to use the attribute as a [presentational hint<sup>p1172</sup>](#) for the ['width'](#) property on the element, with the value obtained from applying the [converting a character width to pixels<sup>p1200</sup>](#) algorithm to the value of the attribute.

If an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in one of the above states does *not* have a [size<sup>p515</sup>](#) attribute, then the user agent is expected to act as if it had a user-agent-level style sheet rule setting the ['width'](#) property on the element to the value obtained from applying the [converting a character width to pixels<sup>p1200</sup>](#) algorithm to the number 20.

The [converting a character width to pixels](#) algorithm returns  $(size-1) \times avg + max$ , where *size* is the character width to convert, *avg* is the average character width of the primary font for the element for which the algorithm is being run, in pixels, and *max* is the maximum character width of that same font, also in pixels. (The element's ['letter-spacing'](#) property does not affect the result.)

#### 14.5.6 The [input<sup>p486</sup>](#) element as domain-specific widgets §<sup>p12</sup><sub>00</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Date<sup>p497</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a date control.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Month<sup>p498</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a month control.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Week<sup>p499</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a week control.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Time<sup>p500</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a time control.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Local Date and Time<sup>p501</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a local date and time control.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Number<sup>p502</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a number control.

These controls are all expected to be about one line high, and about as wide as necessary to show the widest possible value.

### 14.5.7 The [input<sup>p486</sup>](#) element as a range control §<sup>p12</sup><sub>01</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Range<sup>p503</sup>](#) state is expected to render as an ['inline-block'](#) box depicting a slider control.

When the control is wider than it is tall (or square), the control is expected to be a horizontal slider, with the lowest value on the right if the ['direction'](#) property on this element has a [computed value](#) of ['rtl'](#), and on the left otherwise. When the control is taller than it is wide, it is expected to be a vertical slider, with the lowest value on the bottom.

Predefined suggested values (provided by the [list<sup>p521</sup>](#) attribute) are expected to be shown as tick marks on the slider, which the slider can snap to.

User agents are expected to use the [used value](#) of the ['direction'](#) property on the element to determine the direction in which the slider operates. Typically, a left-to-right (['ltr'](#)) horizontal control would have the lowest value on the left and the highest value on the right, and vice versa.

### 14.5.8 The [input<sup>p486</sup>](#) element as a color well §<sup>p12</sup><sub>01</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Color<sup>p506</sup>](#) state is expected to depict a color well, which, when activated, provides the user with a color picker (e.g. a color wheel or color palette) from which the color can be changed. The element, when it generates a [CSS box](#), is expected to use [button layout<sup>p1199</sup>](#), that has no child boxes of the [anonymous button content box<sup>p1199</sup>](#). The [anonymous button content box<sup>p1199</sup>](#) is expected to have a [presentational hint<sup>p1172</sup>](#) setting the ['background-color'](#) property to the element's [value<sup>p559</sup>](#).

Predefined suggested values (provided by the [list<sup>p521</sup>](#) attribute) are expected to be shown in the color picker interface, not on the color well itself.

### 14.5.9 The [input<sup>p486</sup>](#) element as a checkbox and radio button widgets §<sup>p12</sup><sub>01</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Checkbox<sup>p506</sup>](#) state is expected to render as an ['inline-block'](#) box containing a single checkbox control, with no label.

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Radio Button<sup>p507</sup>](#) state is expected to render as an ['inline-block'](#) box containing a single radio button control, with no label.

### 14.5.10 The [input<sup>p486</sup>](#) element as a file upload control §<sup>p12</sup><sub>01</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [File Upload<sup>p508</sup>](#) state, when it generates a [CSS box](#), is expected to render as an ['inline-block'](#) box containing a span of text giving the file name(s) of the [selected files<sup>p508</sup>](#), if any, followed by a button that, when activated, provides the user with a file picker from which the selection can be changed. The button is expected to use [button layout<sup>p1199</sup>](#) and the contents of the [anonymous button content box<sup>p1199</sup>](#) are expected to be [implementation-defined](#) (and possibly locale-specific) text, for example "Choose file".

### 14.5.11 The [input<sup>p486</sup>](#) element as a button §<sup>p12</sup><sub>01</sub>

An [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Submit Button<sup>p511</sup>](#), [Reset Button<sup>p513</sup>](#), or [Button<sup>p514</sup>](#) state, when it generates a [CSS box](#), is expected to depict a button and use [button layout<sup>p1199</sup>](#) and the contents of the [anonymous button content box<sup>p1199</sup>](#) are expected to be the text of the element's [value<sup>p490</sup>](#) attribute, if any, or text derived from the element's [type<sup>p488</sup>](#) attribute in an [implementation-defined](#) (and probably locale-specific) fashion, if not.

## 14.5.12 The [marquee<sup>p1217</sup>](#) element §<sup>p12</sup><sub>02</sub>

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

marquee {
  display: inline-block;
  text-align: initial;
}
```

The [marquee<sup>p1217</sup>](#) element, while [turned on<sup>p1218</sup>](#), is expected to render in an animated fashion according to its attributes as follows:

### If the element's [behavior<sup>p1218</sup>](#) attribute is in the [scroll<sup>p1218</sup>](#) state

Slide the contents of the element in the direction described by the [direction<sup>p1218</sup>](#) attribute as defined below, such that it begins off the start side of the [marquee<sup>p1217</sup>](#), and ends flush with the inner end side.

#### Example

For example, if the [direction<sup>p1218</sup>](#) attribute is [left<sup>p1218</sup>](#) (the default), then the contents would start such that their left edge are off the side of the right edge of the [marquee<sup>p1217</sup>](#)'s [content area](#), and the contents would then slide up to the point where the left edge of the contents are flush with the left inner edge of the [marquee<sup>p1217</sup>](#)'s [content area](#).

Once the animation has ended, the user agent is expected to [increment the marquee current loop index<sup>p1219</sup>](#). If the element is still [turned on<sup>p1218</sup>](#) after this, then the user agent is expected to restart the animation.

### If the element's [behavior<sup>p1218</sup>](#) attribute is in the [slide<sup>p1218</sup>](#) state

Slide the contents of the element in the direction described by the [direction<sup>p1218</sup>](#) attribute as defined below, such that it begins off the start side of the [marquee<sup>p1217</sup>](#), and ends off the end side of the [marquee<sup>p1217</sup>](#).

#### Example

For example, if the [direction<sup>p1218</sup>](#) attribute is [left<sup>p1218</sup>](#) (the default), then the contents would start such that their left edge are off the side of the right edge of the [marquee<sup>p1217</sup>](#)'s [content area](#), and the contents would then slide up to the point where the *right* edge of the contents are flush with the left inner edge of the [marquee<sup>p1217</sup>](#)'s [content area](#).

Once the animation has ended, the user agent is expected to [increment the marquee current loop index<sup>p1219</sup>](#). If the element is still [turned on<sup>p1218</sup>](#) after this, then the user agent is expected to restart the animation.

### If the element's [behavior<sup>p1218</sup>](#) attribute is in the [alternate<sup>p1218</sup>](#) state

When the [marquee current loop index<sup>p1219</sup>](#) is even (or zero), slide the contents of the element in the direction described by the [direction<sup>p1218</sup>](#) attribute as defined below, such that it begins flush with the start side of the [marquee<sup>p1217</sup>](#), and ends flush with the end side of the [marquee<sup>p1217</sup>](#).

When the [marquee current loop index<sup>p1219</sup>](#) is odd, slide the contents of the element in the opposite direction than that described by the [direction<sup>p1218</sup>](#) attribute as defined below, such that it begins flush with the end side of the [marquee<sup>p1217</sup>](#), and ends flush with the start side of the [marquee<sup>p1217</sup>](#).

#### Example

For example, if the [direction<sup>p1218</sup>](#) attribute is [left<sup>p1218</sup>](#) (the default), then the contents would with their right edge flush with the right inner edge of the [marquee<sup>p1217</sup>](#)'s [content area](#), and the contents would then slide up to the point where the *left* edge of the contents are flush with the left inner edge of the [marquee<sup>p1217</sup>](#)'s [content area](#).

Once the animation has ended, the user agent is expected to [increment the marquee current loop index<sup>p1219</sup>](#). If the element is still [turned on<sup>p1218</sup>](#) after this, then the user agent is expected to continue the animation.

The [direction<sup>p1218</sup>](#) attribute has the meanings described in the following table:

<a href="#">direction<sup>p1218</sup></a> attribute state	Direction of animation	Start edge	End edge	Opposite direction
<a href="#">left<sup>p1218</sup></a>	← Right to left	Right	Left	→ Left to Right
<a href="#">right<sup>p1218</sup></a>	→ Left to Right	Left	Right	← Right to left
<a href="#">up<sup>p1218</sup></a>	↑ Up (Bottom to Top)	Bottom	Top	↓ Down (Top to Bottom)
<a href="#">down<sup>p1218</sup></a>	↓ Down (Top to Bottom)	Top	Bottom	↑ Up (Bottom to Top)

In any case, the animation should proceed such that there is a delay given by the [marquee scroll interval](#)<sup>p1218</sup> between each frame, and such that the content moves at most the distance given by the [marquee scroll distance](#)<sup>p1219</sup> with each frame.

When a [marquee](#)<sup>p1217</sup> element has a `bgColor` attribute set, the value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p84</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1172</sup> setting the element's `'background-color'` property to the resulting color.

The `width` and `height` attributes on a [marquee](#)<sup>p1217</sup> element [map to the dimension properties](#)<sup>p1173</sup> `'width'` and `'height'` on the element respectively.

The [intrinsic height](#) of a [marquee](#)<sup>p1217</sup> element with its [direction](#)<sup>p1218</sup> attribute in the [up](#)<sup>p1218</sup> or [down](#)<sup>p1218</sup> states is 200 CSS pixels.

The `vspace` attribute of a [marquee](#)<sup>p1217</sup> element [maps to the dimension properties](#)<sup>p1173</sup> `'margin-top'` and `'margin-bottom'` on the element. The `hspace` attribute of a [marquee](#)<sup>p1217</sup> element [maps to the dimension properties](#)<sup>p1173</sup> `'margin-left'` and `'margin-right'` on the element.

The `'overflow'` property on the [marquee](#)<sup>p1217</sup> element is expected to be ignored; overflow is expected to always be hidden.

### 14.5.13 The [meter](#)<sup>p550</sup> element §<sup>p12</sup><sub>03</sub>

The [meter](#)<sup>p550</sup> element is expected to render as an `'inline-block'` box with a `'height'` of `'1em'` and a `'width'` of `'5em'`, a `'vertical-align'` of `'-0.2em'`, and with its contents depicting a gauge.

When the element is wider than it is tall (or square), the depiction is expected to be of a horizontal gauge, with the minimum value on the right if the `'direction'` property on this element has a [computed value](#) of `'rtl'`, and on the left otherwise. When the element is taller than it is wide, it is expected to depict a vertical gauge, with the minimum value on the bottom.

User agents are expected to use a presentation consistent with platform conventions for gauges, if any.

#### Note

*Requirements for what must be depicted in the gauge are included in the definition of the [meter](#)<sup>p550</sup> element.*

### 14.5.14 The [progress](#)<sup>p548</sup> element §<sup>p12</sup><sub>03</sub>

The [progress](#)<sup>p548</sup> element is expected to render as an `'inline-block'` box with a `'height'` of `'1em'` and a `'width'` of `'10em'`, and a `'vertical-align'` of `'-0.2em'`.

When the element is wider than it is tall, the element is expected to be depicted as a horizontal progress bar, with the start on the right and the end on the left if the `'direction'` property on this element has a [computed value](#) of `'rtl'`, and with the start on the left and the end on the right otherwise. When the element is taller than it is wide, it is expected to be depicted as a vertical progress bar, with the lowest value on the bottom. When the element is square, it is expected to be depicted as a direction-independent progress widget (e.g. a circular progress ring).

User agents are expected to use a presentation consistent with platform conventions for progress bars. In particular, user agents are expected to use different presentations for determinate and indeterminate progress bars. User agents are also expected to vary the presentation based on the dimensions of the element.

#### Example

For example, on some platforms for showing indeterminate progress there is a "spinner" progress indicator with square dimensions, which could be used when the element is square, and an indeterminate progress bar, which could be used when the element is wide.

## Note

Requirements for how to determine if the progress bar is determinate or indeterminate, and what progress a determinate progress bar is to show, are included in the definition of the [progress](#)<sup>p548</sup> element.

### 14.5.15 The [select](#)<sup>p530</sup> element § p12 04

A [select](#)<sup>p530</sup> element is either a **list box** or a **drop-down box**, depending on its attributes.

A [select](#)<sup>p530</sup> element whose [multiple](#)<sup>p532</sup> attribute is present is expected to render as a multi-select [list box](#)<sup>p1204</sup>.

A [select](#)<sup>p530</sup> element whose [multiple](#)<sup>p532</sup> attribute is absent, and whose [display size](#)<sup>p532</sup> is greater than 1, is expected to render as a single-select [list box](#)<sup>p1204</sup>.

When the element renders as a [list box](#)<sup>p1204</sup>, it is expected to render as an `'inline-block'` box whose `'height'` is the height necessary to contain as many rows for items as given by the element's [display size](#)<sup>p532</sup>, or four rows if the attribute is absent, and whose `'width'` is the [width of the select's labels](#)<sup>p1204</sup> plus the width of a scrollbar.

A [select](#)<sup>p530</sup> element whose [multiple](#)<sup>p532</sup> attribute is absent, and whose [display size](#)<sup>p532</sup> is 1, is expected to render as a one-line **drop-down box**<sup>p1204</sup> whose width is the [width of the select's labels](#)<sup>p1204</sup>.

In either case ([list box](#)<sup>p1204</sup> or [drop-down box](#)<sup>p1204</sup>), the element's items are expected to be the element's [list of options](#)<sup>p532</sup>, with the element's [optgroup](#)<sup>p537</sup> element [children](#) providing headers for groups of options where applicable.

An [optgroup](#)<sup>p537</sup> element is expected to be rendered by displaying the element's [label](#)<sup>p538</sup> attribute.

An [option](#)<sup>p539</sup> element is expected to be rendered by displaying the element's [label](#)<sup>p539</sup>, indented under its [optgroup](#)<sup>p537</sup> element if it has one.

The **width of the select's labels** is the wider of the width necessary to render the widest [optgroup](#)<sup>p537</sup>, and the width necessary to render the widest [option](#)<sup>p539</sup> element in the element's [list of options](#)<sup>p532</sup> (including its indent, if any).

If a [select](#)<sup>p530</sup> element contains a [placeholder label option](#)<sup>p532</sup>, the user agent is expected to render that [option](#)<sup>p539</sup> in a manner that conveys that it is a label, rather than a valid option of the control. This can include preventing the [placeholder label option](#)<sup>p532</sup> from being explicitly selected by the user. When the [placeholder label option](#)<sup>p532</sup>'s [selectedness](#)<sup>p540</sup> is true, the control is expected to be displayed in a fashion that indicates that no valid option is currently selected.

User agents are expected to render the labels in a [select](#)<sup>p530</sup> in such a manner that any alignment remains consistent whether the label is being displayed as part of the page or in a menu control.

### 14.5.16 The [textarea](#)<sup>p541</sup> element § p12 04

The [textarea](#)<sup>p541</sup> element is expected to render as an `'inline-block'` box depicting a multiline text control. If this multiline text control provides a selection, then, when the user changes the current selection, the user agent is expected to [queue an element task](#)<sup>p926</sup> on the [user interaction task source](#)<sup>p932</sup> given the [textarea](#)<sup>p541</sup> element to [fire an event](#) named [select](#)<sup>p1261</sup> at the element, with the [bubbles](#) attribute initialized to true.

If the element has a [cols](#)<sup>p543</sup> attribute, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p67</sup> doesn't generate an error, then the user agent is expected to use the attribute as a [presentational hint](#)<sup>p1172</sup> for the `'width'` property on the element, with the value being the [textarea effective width](#)<sup>p1204</sup> (as defined below). Otherwise, the user agent is expected to act as if it had a user-agent-level style sheet rule setting the `'width'` property on the element to the [textarea effective width](#)<sup>p1204</sup>.

The **textarea effective width** of a [textarea](#)<sup>p541</sup> element is  $size \times avg + sbw$ , where *size* is the element's [character width](#)<sup>p543</sup>, *avg* is the average character width of the primary font of the element, in [CSS pixels](#), and *sbw* is the width of a scrollbar, in [CSS pixels](#). (The element's `'letter-spacing'` property does not affect the result.)

If the element has a [rows](#)<sup>p543</sup> attribute, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p67</sup> doesn't generate an error, then the user agent is expected to use the attribute as a [presentational hint](#)<sup>p1172</sup> for the `'height'` property on the element, with the value being the [textarea effective height](#)<sup>p1205</sup> (as defined below). Otherwise, the user agent is expected to act as if it had a user-agent-level style sheet rule setting the `'height'` property on the element to the [textarea effective height](#)<sup>p1205</sup>.

The **textarea effective height** of a [textarea<sup>p541</sup>](#) element is the height in [CSS pixels](#) of the number of lines specified the element's [character height<sup>p543</sup>](#), plus the height of a scrollbar in [CSS pixels](#).

User agents are expected to apply the ['white-space'](#) CSS property to [textarea<sup>p541</sup>](#) elements. For historical reasons, if the element has a [wrap<sup>p544</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "off", then the user agent is expected to treat the attribute as a [presentational hint<sup>p1172</sup>](#) setting the element's ['white-space'](#) property to 'pre'.

## 14.6 Frames and framesets §<sup>p12</sup> 05

User agent are expected to render [frameset<sup>p1219</sup>](#) elements as a box with the height and width of the [viewport](#), with a surface rendered according to the following layout algorithm:

1. The *cols* and *rows* variables are lists of zero or more pairs consisting of a number and a unit, the unit being one of *percentage*, *relative*, and *absolute*.

Use the [rules for parsing a list of dimensions<sup>p71</sup>](#) to parse the value of the element's *cols* attribute, if there is one. Let *cols* be the result, or an empty list if there is no such attribute.

Use the [rules for parsing a list of dimensions<sup>p71</sup>](#) to parse the value of the element's *rows* attribute, if there is one. Let *rows* be the result, or an empty list if there is no such attribute.

2. For any of the entries in *cols* or *rows* that have the number zero and the unit *relative*, change the entry's number to one.
3. If *cols* has no entries, then add a single entry consisting of the value 1 and the unit *relative* to *cols*.

If *rows* has no entries, then add a single entry consisting of the value 1 and the unit *relative* to *rows*.

4. Invoke the algorithm defined below to [convert a list of dimensions to a list of pixel values<sup>p1206</sup>](#) using *cols* as the input list, and the width of the surface that the [frameset<sup>p1219</sup>](#) is being rendered into, in [CSS pixels](#), as the input dimension. Let *sized cols* be the resulting list.

Invoke the algorithm defined below to [convert a list of dimensions to a list of pixel values<sup>p1206</sup>](#) using *rows* as the input list, and the height of the surface that the [frameset<sup>p1219</sup>](#) is being rendered into, in [CSS pixels](#), as the input dimension. Let *sized rows* be the resulting list.

5. Split the surface into a grid of  $w \times h$  rectangles, where  $w$  is the number of entries in *sized cols* and  $h$  is the number of entries in *sized rows*.

Size the columns so that each column in the grid is as many [CSS pixels](#) wide as the corresponding entry in the *sized cols* list.

Size the rows so that each row in the grid is as many [CSS pixels](#) high as the corresponding entry in the *sized rows* list.

6. Let *children* be the list of [frame<sup>p1220</sup>](#) and [frameset<sup>p1219</sup>](#) elements that are [children](#) of the [frameset<sup>p1219</sup>](#) element for which the algorithm was invoked.

7. For each row of the grid of rectangles created in the previous step, from top to bottom, run these substeps:

1. For each rectangle in the row, from left to right, run these substeps:

1. If there are any elements left in *children*, take the first element in the list, and assign it to the rectangle.

If this is a [frameset<sup>p1219</sup>](#) element, then recurse the entire [frameset<sup>p1219</sup>](#) layout algorithm for that [frameset<sup>p1219</sup>](#) element, with the rectangle as the surface.

Otherwise, it is a [frame<sup>p1220</sup>](#) element; render its [nested browsing context<sup>p806</sup>](#), positioned and sized to fit the rectangle.

2. If there are any elements left in *children*, remove the first element from *children*.

8. If the [frameset<sup>p1219</sup>](#) element [has a border<sup>p1206</sup>](#), draw an outer set of borders around the rectangles, using the element's [frame border color<sup>p1206</sup>](#).

For each rectangle, if there is an element assigned to that rectangle, and that element [has a border<sup>p1206</sup>](#), draw an inner set of borders around that rectangle, using the element's [frame border color<sup>p1206</sup>](#).

For each (visible) border that does not abut a rectangle that is assigned a [frame<sup>p1220</sup>](#) element with a [noresize](#) attribute

(including rectangles in further nested [frameset<sup>p1219</sup>](#) elements), the user agent is expected to allow the user to move the border, resizing the rectangles within, keeping the proportions of any nested [frameset<sup>p1219</sup>](#) grids.

A [frameset<sup>p1219</sup>](#) or [frame<sup>p1220</sup>](#) element **has a border** if the following algorithm returns true:

1. If the element has a `frameborder` attribute whose value is not the empty string and whose first character is either a U+0031 DIGIT ONE (1) character, a U+0079 LATIN SMALL LETTER Y character (y), or a U+0059 LATIN CAPITAL LETTER Y character (Y), then return true.
2. Otherwise, if the element has a `frameborder` attribute, return false.
3. Otherwise, if the element has a parent element that is a [frameset<sup>p1219</sup>](#) element, then return true if *that* element [has a border<sup>p1206</sup>](#), and false if it does not.
4. Otherwise, return true.

The **frame border color** of a [frameset<sup>p1219</sup>](#) or [frame<sup>p1220</sup>](#) element is the color obtained from the following algorithm:

1. If the element has a `bordercolor` attribute, and applying the [rules for parsing a legacy color value<sup>p84</sup>](#) to that attribute's value does not result in an error, then return the color so obtained.
2. Otherwise, if the element has a parent element that is a [frameset<sup>p1219</sup>](#) element, then return the [frame border color<sup>p1206</sup>](#) of that element.
3. Otherwise, return gray.

The algorithm to **convert a list of dimensions to a list of pixel values** consists of the following steps:

1. Let *input list* be the list of numbers and units passed to the algorithm.  
Let *output list* be a list of numbers the same length as *input list*, all zero.  
Entries in *output list* correspond to the entries in *input list* that have the same position.
2. Let *input dimension* be the size passed to the algorithm.
3. Let *count percentage* be the number of entries in *input list* whose unit is *percentage*.  
Let *total percentage* be the sum of all the numbers in *input list* whose unit is *percentage*.  
Let *count relative* be the number of entries in *input list* whose unit is *relative*.  
Let *total relative* be the sum of all the numbers in *input list* whose unit is *relative*.  
Let *count absolute* be the number of entries in *input list* whose unit is *absolute*.  
Let *total absolute* be the sum of all the numbers in *input list* whose unit is *absolute*.  
Let *remaining space* be the value of *input dimension*.
4. If *total absolute* is greater than *remaining space*, then for each entry in *input list* whose unit is *absolute*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total absolute*. Then, set *remaining space* to zero.  
Otherwise, for each entry in *input list* whose unit is *absolute*, set the corresponding value in *output list* to the number of the entry in *input list*. Then, decrement *remaining space* by *total absolute*.
5. If *total percentage* multiplied by the *input dimension* and divided by 100 is greater than *remaining space*, then for each entry in *input list* whose unit is *percentage*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total percentage*. Then, set *remaining space* to zero.  
Otherwise, for each entry in *input list* whose unit is *percentage*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by the *input dimension* and divided by 100. Then, decrement *remaining space* by *total percentage* multiplied by the *input dimension* and divided by 100.
6. For each entry in *input list* whose unit is *relative*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total relative*.
7. Return *output list*.

User agents working with integer values for frame widths (as opposed to user agents that can lay frames out with subpixel accuracy)

are expected to distribute the remainder first to the last entry whose unit is *relative*, then equally (not proportionally) to each entry whose unit is *percentage*, then equally (not proportionally) to each entry whose unit is *absolute*, and finally, failing all else, to the last entry.

The contents of a [frame](#)<sup>p1220</sup> element that does not have a [frameset](#)<sup>p1219</sup> parent are expected to be rendered as [transparent black](#); the user agent is expected to not render its [nested browsing context](#)<sup>p806</sup> in this case, and its [nested browsing context](#)<sup>p806</sup> is expected to have a [viewport](#) with zero width and zero height.

## 14.7 Interactive media §<sup>p12</sup><sub>07</sub>

### 14.7.1 Links, forms, and navigation §<sup>p12</sup><sub>07</sub>

User agents are expected to allow the user to control aspects of [hyperlink](#)<sup>p279</sup> activation and [form submission](#)<sup>p588</sup>, such as which [browsing context](#)<sup>p804</sup> is to be used for the subsequent [navigation](#)<sup>p852</sup>.

User agents are expected to allow users to discover the destination of [hyperlinks](#)<sup>p279</sup> and of [forms](#)<sup>p479</sup> before triggering their [navigation](#)<sup>p852</sup>.

User agents are expected to inform the user of whether a [hyperlink](#)<sup>p279</sup> includes [hyperlink auditing](#)<sup>p288</sup>, and to let them know at a minimum which domains will be contacted as part of such auditing.

User agents may allow users to [navigate](#)<sup>p852</sup> [browsing contexts](#)<sup>p804</sup> to the URLs [indicated](#)<sup>p87</sup> by the `cite` attributes on [q](#)<sup>p243</sup>, [blockquote](#)<sup>p213</sup>, [ins](#)<sup>p306</sup>, and [del](#)<sup>p307</sup> elements.

User agents may surface [hyperlinks](#)<sup>p279</sup> created by [link](#)<sup>p154</sup> elements in their user interface.

#### Note

While [link](#)<sup>p154</sup> elements that create [hyperlinks](#)<sup>p279</sup> will match the `:link`<sup>p718</sup> or `:visited`<sup>p718</sup> pseudo-classes, will react to clicks if visible, and so forth, this does not extend to any browser interface constructs that expose those same links. Activating a link through the browser's interface, rather than in the page itself, does not trigger `click` events and the like.

### 14.7.2 The [title](#)<sup>p136</sup> attribute §<sup>p12</sup><sub>07</sub>

User agents are expected to expose the [advisory information](#)<sup>p136</sup> of elements upon user request, and to make the user aware of the presence of such information.

On interactive graphical systems where the user can use a pointing device, this could take the form of a tooltip. When the user is unable to use a pointing device, then the user agent is expected to make the content available in some other fashion, e.g. by making the element a [focusable area](#)<sup>p763</sup> and always displaying the [advisory information](#)<sup>p136</sup> of the currently [focused](#)<sup>p764</sup> element, or by showing the [advisory information](#)<sup>p136</sup> of the elements under the user's finger on a touch device as the user pans around the screen.

U+000A LINE FEED (LF) characters are expected to cause line breaks in the tooltip; U+0009 CHARACTER TABULATION (tab) characters are expected to render as a nonzero horizontal shift that lines up the next glyph with the next tab stop, with tab stops occurring at points that are multiples of 8 times the width of a U+0020 SPACE character.

#### Example

For example, a visual user agent could make elements with a [title](#)<sup>p136</sup> attribute [focusable](#)<sup>p765</sup>, and could make any [focused](#)<sup>p764</sup> element with a [title](#)<sup>p136</sup> attribute show its tooltip under the element while the element has focus. This would allow a user to tab around the document to find all the advisory text.

#### Example

As another example, a screen reader could provide an audio cue when reading an element with a tooltip, with an associated key to read the last tooltip for which a cue was played.

### 14.7.3 Editing hosts §<sup>p12</sup><sub>08</sub>

The current text editing caret (i.e. the [active range](#), if it is empty and in an [editing host](#)<sup>p782</sup>), if any, is expected to act like an inline [replaced element](#) with the vertical dimensions of the caret and with zero width for the purposes of the CSS rendering model.

#### Note

*This means that even an empty block can have the caret inside it, and that when the caret is in such an element, it prevents margins from collapsing through the element.*

### 14.7.4 Text rendered in native user interfaces §<sup>p12</sup><sub>08</sub>

User agents are expected to honor the Unicode semantics of text that is exposed in user interfaces, for example supporting the bidirectional algorithm in text shown in dialogs, title bars, popup menus, and tooltips. Text from the contents of elements is expected to be rendered in a manner that honors [the directionality](#)<sup>p139</sup> of the element from which the text was obtained. Text from attributes is expected to be rendered in a manner that honours the [directionality of the attribute](#)<sup>p140</sup>.

#### Example

Consider the following markup, which has Hebrew text asking for a programming language, the languages being text for which a left-to-right direction is important given the punctuation in some of their names:

```
<p dir="rtl" lang="he">
  <label>
    :בחר שפת תכנות:
  > select>
    <option dir="ltr">C++</option>
    <option dir="ltr">C#</option>
    <option dir="ltr">FreePascal</option>
    <option dir="ltr">F#</option>
  </select>
</label>
</p>
```

If the [select](#)<sup>p539</sup> element was rendered as a drop down box, a correct rendering would ensure that the punctuation was the same both in the drop down, and in the box showing the current selection.

#### Example

The directionality of attributes depends on the attribute and on the element's [dir](#)<sup>p139</sup> attribute, as the following example demonstrates. Consider this markup:

```
<table>
  <tr>
    <th abbr="(A" dir=ltr>A
    <th abbr="(A" dir=rtl>A
    <th abbr="(A" dir=auto>A
  </table>
```

If the [abbr](#)<sup>p461</sup> attributes are rendered, e.g. in a tooltip or other user interface, the first will have a left parenthesis (because the direction is 'ltr'), the second will have a right parenthesis (because the direction is 'rtl'), and the third will have a right parenthesis (because the direction is determined *from the attribute value* to be 'rtl').

However, if instead the attribute was not a [directionality-capable attribute](#)<sup>p140</sup>, the results would be different:

```
<table>
<tr>
  <th data-abbr="(X" dir=ltr>A
  <th data-abbr="(X" dir=rtl>A
  <th data-abbr="(X" dir=auto>A
</table>
```

In this case, if the user agent were to expose the `data-abbrev` attribute in the user interface (e.g. in a debugging environment), the last case would be rendered with a *left* parenthesis, because the direction would be determined from the element's contents.

A string provided by a script (e.g. the argument to [`window.alert\(\)`](#)<sup>p957</sup>) is expected to be treated as an independent set of one or more bidirectional algorithm paragraphs when displayed, as defined by the bidirectional algorithm, including, for instance, supporting the paragraph-breaking behavior of U+000A LINE FEED (LF) characters. For the purposes of determining the paragraph level of such text in the bidirectional algorithm, this specification does *not* provide a higher-level override of rules P2 and P3. [\[BIDI\]](#)<sup>p1264</sup>

When necessary, authors can enforce a particular direction for a given paragraph by starting it with the Unicode U+200E LEFT-TO-RIGHT MARK or U+200F RIGHT-TO-LEFT MARK characters.

#### Example

Thus, the following script:

```
alert('\u05DC\u05DE\u05D3 HTML \u05D4\u05D9\u05D5\u05DD!')
```

...would always result in a message reading "למוד HTML היום!" (not "היום HTML למד!"), regardless of the language of the user agent interface or the direction of the page or any of its elements.

#### Example

For a more complex example, consider the following script:

```
/* Warning: this script does not handle right-to-left scripts correctly */
var s;
if (s = prompt('What is your name?')) {
  alert(s + '! Ok, Fred, ' + s + ', and Wilma will get the car.');
```

When the user enters "Kitty", the user agent would alert "Kitty! Ok, Fred, Kitty, and Wilma will get the car.". However, if the user enters "لا أفهم", then the bidirectional algorithm will determine that the direction of the paragraph is right-to-left, and so the output will be the following unintended mess: ".and Wilma will get the car , لا أفهم ,Ok, Fred ! أفهم!"

To force an alert that starts with user-provided text (or other text of unknown directionality) to render left-to-right, the string can be prefixed with a U+200E LEFT-TO-RIGHT MARK character:

```
var s;
if (s = prompt('What is your name?')) {
  alert('\u200E' + s + '! Ok, Fred, ' + s + ', and Wilma will get the car.');
```

## 14.8 Print media <sup>p12</sup><sub>09</sub>

User agents are expected to allow the user to request the opportunity to **obtain a physical form** (or a representation of a physical form) of a [Document](#)<sup>p111</sup>. For example, selecting the option to print a page or convert it to PDF format. [\[PDF\]](#)<sup>p1268</sup>

When the user actually [obtains a physical form](#)<sup>p1209</sup> (or a representation of a physical form) of a [Document](#)<sup>p111</sup>, the user agent is

expected to create a new rendering of the [Document<sup>p111</sup>](#) for the print media.

## 14.9 Unstyled XML documents § p12 10

HTML user agents may, in certain circumstances, find themselves rendering non-HTML documents that use vocabularies for which they lack any built-in knowledge. This section provides for a way for user agents to handle such documents in a somewhat useful manner.

While a [Document<sup>p111</sup>](#) is an [unstyled document<sup>p1210</sup>](#), the user agent is expected to render [an unstyled document view<sup>p1210</sup>](#).

A [Document<sup>p111</sup>](#) is an **unstyled document** while it matches the following conditions:

- The [Document<sup>p111</sup>](#) has no author style sheets (whether referenced by HTTP headers, processing instructions, elements like [link<sup>p154</sup>](#), inline elements like [style<sup>p170</sup>](#), or any other mechanism).
- None of the elements in the [Document<sup>p111</sup>](#) have any [presentational hints<sup>p1172</sup>](#).
- None of the elements in the [Document<sup>p111</sup>](#) have any [style attributes](#).
- None of the elements in the [Document<sup>p111</sup>](#) are in any of the following namespaces: [HTML namespace](#), [SVG namespace](#), [MathML namespace](#)
- The [Document<sup>p111</sup>](#) has no [focusable area<sup>p763</sup>](#) (e.g. from XLink) other than the [viewport](#).
- The [Document<sup>p111</sup>](#) has no [hyperlinks<sup>p279</sup>](#) (e.g. from XLink).
- There exists no [script<sup>p895</sup>](#) whose [settings object<sup>p895</sup>](#) specifies this [Document<sup>p111</sup>](#) as the [responsible document<sup>p897</sup>](#).
- None of the elements in the [Document<sup>p111</sup>](#) have any registered event listeners.

**An unstyled document view** is one where the DOM is not rendered according to CSS (which would, since there are no applicable styles in this context, just result in a wall of text), but is instead rendered in a manner that is useful for a developer. This could consist of just showing the [Document<sup>p111</sup>](#) object's source, maybe with syntax highlighting, or it could consist of displaying just the DOM tree, or simply a message saying that the page is not a styled document.

### Note

*If a [Document<sup>p111</sup>](#) stops being an [unstyled document<sup>p1210</sup>](#), then the conditions above stop applying, and thus a user agent following these requirements will switch to using the regular CSS rendering.*

## 15 Obsolete features §<sup>p12</sup> 11

### 15.1 Obsolete but conforming features §<sup>p12</sup> 11

Features listed in this section will trigger warnings in conformance checkers.

Authors should not specify a [border<sup>p1216</sup>](#) attribute on an [img<sup>p314</sup>](#) element. If the attribute is present, its value must be the string "0". CSS should be used instead.

Authors should not specify a [charset<sup>p1213</sup>](#) attribute on a [script<sup>p607</sup>](#) element. If the attribute is present, its value must be an [ASCII case-insensitive](#) match for "utf-8". (This has no effect in a document that conforms to the requirements elsewhere in this standard of being encoded as [UTF-8](#).)

Authors should not specify a [language<sup>p1215</sup>](#) attribute on a [script<sup>p607</sup>](#) element. If the attribute is present, its value must be an [ASCII case-insensitive](#) match for the string "JavaScript" and either the [type<sup>p608</sup>](#) attribute must be omitted or its value must be an [ASCII case-insensitive](#) match for the string "text/javascript". The attribute should be entirely omitted instead (with the value "JavaScript", it has no effect), or replaced with use of the [type<sup>p608</sup>](#) attribute.

Authors should not specify a value for the [type<sup>p608</sup>](#) attribute on [script<sup>p607</sup>](#) elements that is the empty string or a [JavaScript MIME type essence match](#). Instead, they should omit the attribute, which has the same effect.

Authors should not specify a [type<sup>p1215</sup>](#) attribute on a [style<sup>p170</sup>](#) element. If the attribute is present, its value must be an [ASCII case-insensitive](#) match for "[text/css<sup>p1262</sup>](#)".

Authors should not specify the [name<sup>p1213</sup>](#) attribute on [a<sup>p234</sup>](#) elements. If the attribute is present, its value must not be the empty string and must neither be equal to the value of any of the [IDs](#) in the element's [tree](#) other than the element's own [ID](#), if any, nor be equal to the value of any of the other [name<sup>p1213</sup>](#) attributes on [a<sup>p234</sup>](#) elements in the element's [tree](#). If this attribute is present and the element has an [ID](#), then the attribute's value must be equal to the element's [ID](#). In earlier versions of the language, this attribute was intended as a way to specify possible targets for [fragments](#) in [URLs](#). The [id<sup>p134</sup>](#) attribute should be used instead.

Authors should not, but may despite requirements to the contrary elsewhere in this specification, specify the [maxlength<sup>p515</sup>](#) and [size<sup>p515</sup>](#) attributes on [input<sup>p486</sup>](#) elements whose [type<sup>p488</sup>](#) attributes are in the [Number<sup>p502</sup>](#) state. One valid reason for using these attributes regardless is to help legacy user agents that do not support [input<sup>p486</sup>](#) elements with `type="number"` to still render the text control with a useful width.

#### 15.1.1 Warnings for obsolete but conforming features §<sup>p12</sup> 11

To ease the transition from HTML4 Transitional documents to the language defined in *this* specification, and to discourage certain features that are only allowed in very few circumstances, conformance checkers must warn the user when the following features are used in a document. These are generally old obsolete features that have no effect, and are allowed only to distinguish between likely mistakes (regular conformance errors) and mere vestigial markup or unusual and discouraged practices (these warnings).

The following features must be categorized as described above:

- The presence of a [border<sup>p1216</sup>](#) attribute on an [img<sup>p314</sup>](#) element if its value is the string "0".
- The presence of a [charset<sup>p1213</sup>](#) attribute on a [script<sup>p607</sup>](#) element if its value is an [ASCII case-insensitive](#) match for "utf-8".
- The presence of a [language<sup>p1215</sup>](#) attribute on a [script<sup>p607</sup>](#) element if its value is an [ASCII case-insensitive](#) match for the string "JavaScript" and if there is no [type<sup>p608</sup>](#) attribute or there is and its value is an [ASCII case-insensitive](#) match for the string "text/javascript".
- The presence of a [type<sup>p1215</sup>](#) attribute on a [script<sup>p607</sup>](#) element if its value is a [JavaScript MIME type essence match](#).
- The presence of a [type<sup>p1215</sup>](#) attribute on a [style<sup>p170</sup>](#) element if its value is an [ASCII case-insensitive](#) match for "[text/css<sup>p1262</sup>](#)".
- The presence of a [name<sup>p1213</sup>](#) attribute on an [a<sup>p234</sup>](#) element, if its value is not the empty string.
- The presence of a [maxlength<sup>p515</sup>](#) attribute on an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Number<sup>p502</sup>](#) state.

- The presence of a [size<sup>p515</sup>](#) attribute on an [input<sup>p486</sup>](#) element whose [type<sup>p488</sup>](#) attribute is in the [Number<sup>p502</sup>](#) state.

Conformance checkers must distinguish between pages that have no conformance errors and have none of these obsolete features, and pages that have no conformance errors but do have some of these obsolete features.

### Example

For example, a validator could report some pages as "Valid HTML" and others as "Valid HTML with warnings".

## 15.2 Non-conforming features §<sup>p12</sup> 12

Elements in the following list are entirely obsolete, and must not be used by authors:

### **applet**

Use [embed<sup>p363</sup>](#) or [object<sup>p367</sup>](#) instead.

### **acronym**

Use [abbr<sup>p245</sup>](#) instead.

### **bgsound**

Use [audio<sup>p377</sup>](#) instead.

### **dir**

Use [ul<sup>p218</sup>](#) instead.

### **frame<sup>p1220</sup>**

### **frameset<sup>p1219</sup>**

### **noframes**

Either use [iframe<sup>p355</sup>](#) and CSS instead, or use server-side includes to generate complete pages with the various invariant parts merged in.

### **isindex**

Use an explicit [form<sup>p479</sup>](#) and [text control<sup>p492</sup>](#) combination instead.

### **keygen**

For enterprise device management use cases, use native on-device management capabilities.

For certificate enrollment use cases, use the Web Cryptography API to generate a keypair for the certificate, and then export the certificate and key to allow the user to install them manually. [\[WEBCRYPTO\]<sup>p1271</sup>](#)

### **listing**

Use [pre<sup>p212</sup>](#) and [code<sup>p262</sup>](#) instead.

### **menuitem**

To implement a custom context menu, use script to handle the [contextmenu<sup>p1260</sup>](#) event.

### **nextid**

Use GUIDs instead.

### **noembed**

Use [object<sup>p367</sup>](#) instead of [embed<sup>p363</sup>](#) when fallback is necessary.

### **plaintext**

Use the "[text/plain](#)" [MIME type](#) instead.

### **rb**

### **rtc**

Providing the ruby base directly inside the [ruby<sup>p247</sup>](#) element or using nested [ruby<sup>p247</sup>](#) elements is sufficient.

## **strike**

Use [del<sup>p307</sup>](#) instead if the element is marking an edit, otherwise use [s<sup>p241</sup>](#) instead.

## **xmp**

Use [pre<sup>p212</sup>](#) and [code<sup>p262</sup>](#) instead, and escape "<" and "&" characters as "&lt;" and "&amp;" respectively.

## **basefont**

## **big**

## **blink**

## **center**

## **font**

## **marquee<sup>p1217</sup>**

## **multicol**

## **nobr**

## **spacer**

## **tt**

Use appropriate elements or CSS instead.

Where the [tt<sup>p1213</sup>](#) element would have been used for marking up keyboard input, consider the [kbd<sup>p266</sup>](#) element; for variables, consider the [var<sup>p263</sup>](#) element; for computer code, consider the [code<sup>p262</sup>](#) element; and for computer output, consider the [samp<sup>p265</sup>](#) element.

Similarly, if the [big<sup>p1213</sup>](#) element is being used to denote a heading, consider using the [h1<sup>p186</sup>](#) element; if it is being used for marking up important passages, consider the [strong<sup>p238</sup>](#) element; and if it is being used for highlighting text for reference purposes, consider the [mark<sup>p271</sup>](#) element.

See also the [text-level semantics usage summary<sup>p277</sup>](#) for more suggestions with examples.

The following attributes are obsolete (though the elements are still part of the language), and must not be used by authors:

### **charset on [a<sup>p234</sup>](#) elements**

### **charset on [link<sup>p154</sup>](#) elements**

Use an HTTP `Content-Typep88` header on the linked resource instead.

### **charset on [script<sup>p607</sup>](#) elements (except as noted in the previous section)**

Omit the attribute. Both documents and scripts are required to use [UTF-8](#), so it is redundant to specify it on the [script<sup>p607</sup>](#) element since it inherits from the document.

### **coords on [a<sup>p234</sup>](#) elements**

### **shape on [a<sup>p234</sup>](#) elements**

Use [area<sup>p437</sup>](#) instead of [a<sup>p234</sup>](#) for image maps.

### **methods on [a<sup>p234</sup>](#) elements**

### **methods on [link<sup>p154</sup>](#) elements**

Use the HTTP OPTIONS feature instead.

### **name on [a<sup>p234</sup>](#) elements (except as noted in the previous section)**

### **name on [embed<sup>p363</sup>](#) elements**

### **name on [img<sup>p314</sup>](#) elements**

### **name on [option<sup>p539</sup>](#) elements**

Use the [id<sup>p134</sup>](#) attribute instead.

### **rev on [a<sup>p234</sup>](#) elements**

### **rev on [link<sup>p154</sup>](#) elements**

Use the [rel<sup>p279</sup>](#) attribute instead, with an opposite term. (For example, instead of `rev="made"`, use `rel="author"`.)

### **urn on [a](#)<sup>p234</sup> elements**

### **urn on [link](#)<sup>p154</sup> elements**

Specify the preferred persistent identifier using the [href](#)<sup>p279</sup> attribute instead.

### **accept on [form](#)<sup>p479</sup> elements**

Use the [accept](#)<sup>p509</sup> attribute directly on the [input](#)<sup>p486</sup> elements instead.

### **hreflang on [area](#)<sup>p437</sup> elements**

### **type on [area](#)<sup>p437</sup> elements**

These attributes do not do anything useful, and for historical reasons there are no corresponding IDL attributes on [area](#)<sup>p437</sup> elements. Omit them altogether.

### **nohref on [area](#)<sup>p437</sup> elements**

Omitting the [href](#)<sup>p279</sup> attribute is sufficient; the [nohref](#)<sup>p1214</sup> attribute is unnecessary. Omit it altogether.

### **profile on [head](#)<sup>p150</sup> elements**

Unnecessary. Omit it altogether.

### **version on [html](#)<sup>p149</sup> elements**

Unnecessary. Omit it altogether.

### **ismap on [input](#)<sup>p486</sup> elements**

Unnecessary. Omit it altogether. All [input](#)<sup>p486</sup> elements with a [type](#)<sup>p488</sup> attribute in the [Image Button](#)<sup>p511</sup> state are processed as server-side image maps.

### **usemap on [input](#)<sup>p486</sup> elements**

Use [img](#)<sup>p314</sup> instead of [input](#)<sup>p486</sup> for image maps.

### **longdesc on [iframe](#)<sup>p355</sup> elements**

### **longdesc on [img](#)<sup>p314</sup> elements**

Use a regular [a](#)<sup>p234</sup> element to link to the description, or (in the case of images) use an [image map](#)<sup>p439</sup> to provide a link from the image to the image's description.

### **lowsrc on [img](#)<sup>p314</sup> elements**

Use a progressive JPEG image (given in the [src](#)<sup>p315</sup> attribute), instead of using two separate images.

### **target on [link](#)<sup>p154</sup> elements**

Unnecessary. Omit it altogether.

### **type on [menu](#)<sup>p219</sup> elements**

To implement a custom context menu, use script to handle the [contextmenu](#)<sup>p1260</sup> event. For toolbar menus, omit the attribute.

### **label on [menu](#)<sup>p219</sup> elements**

### **contextmenu on all elements**

### **onshow on all elements**

To implement a custom context menu, use script to handle the [contextmenu](#)<sup>p1260</sup> event.

### **scheme on [meta](#)<sup>p160</sup> elements**

Use only one scheme per field, or make the scheme declaration part of the value.

### **archive on [object](#)<sup>p367</sup> elements**

### **classid on [object](#)<sup>p367</sup> elements**

### **code on [object](#)<sup>p367</sup> elements**

### **codebase on [object](#)<sup>p367</sup> elements**

### **codetype on [object](#)<sup>p367</sup> elements**

Use the [data](#)<sup>p368</sup> and [type](#)<sup>p368</sup> attributes to invoke [plugins](#)<sup>p44</sup>. To set parameters with these names in particular, the [param](#)<sup>p372</sup> element can be used.

### **declare on [object](#)<sup>p367</sup> elements**

Repeat the [object](#)<sup>p367</sup> element completely each time the resource is to be reused.

### **standby on [object<sup>p367</sup>](#) elements**

Optimize the linked resource so that it loads quickly or, at least, incrementally.

### **typemustmatch on [object<sup>p367</sup>](#) elements**

Avoid using [object<sup>p367</sup>](#) elements with untrusted resources.

### **type on [param<sup>p372</sup>](#) elements**

### **valuetype on [param<sup>p372</sup>](#) elements**

Use the [name<sup>p373</sup>](#) and [value<sup>p373</sup>](#) attributes without declaring value types.

### **language on [script<sup>p607</sup>](#) elements (except as noted in the previous section)**

Omit the attribute for JavaScript; for [data blocks<sup>p608</sup>](#), use the [type<sup>p608</sup>](#) attribute instead.

### **event on [script<sup>p607</sup>](#) elements**

### **for on [script<sup>p607</sup>](#) elements**

Use DOM events mechanisms to register event listeners. [\[DOM\]<sup>p1266</sup>](#)

### **type on [style<sup>p170</sup>](#) elements (except as noted in the previous section)**

Omit the attribute for CSS; for [data blocks<sup>p608</sup>](#), use [script<sup>p607</sup>](#) as the container instead of [style<sup>p170</sup>](#).

### **datapagesize on [table<sup>p443</sup>](#) elements**

Unnecessary. Omit it altogether.

### **summary on [table<sup>p443</sup>](#) elements**

Use one of the [techniques for describing tables<sup>p448</sup>](#) given in the [table<sup>p443</sup>](#) section instead.

### **abbr on [td<sup>p459</sup>](#) elements**

Use text that begins in an unambiguous and terse manner, and include any more elaborate text after that. The [title<sup>p136</sup>](#) attribute can also be useful in including more detailed text, so that the cell's contents can be made terse. If it's a heading, use [th<sup>p460</sup>](#) (which has an [abbr<sup>p461</sup>](#) attribute).

### **axis on [td<sup>p459</sup>](#) and [th<sup>p460</sup>](#) elements**

Use the [scope<sup>p460</sup>](#) attribute on the relevant [th<sup>p460</sup>](#).

### **scope on [td<sup>p459</sup>](#) elements**

Use [th<sup>p460</sup>](#) elements for heading cells.

### **datasrc on [a<sup>p234</sup>](#), [button<sup>p528</sup>](#), [div<sup>p233</sup>](#), [frame<sup>p1220</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [input<sup>p486</sup>](#), [label<sup>p483</sup>](#), [legend<sup>p558</sup>](#), [marquee<sup>p1217</sup>](#), [object<sup>p367</sup>](#), [option<sup>p539</sup>](#), [select<sup>p530</sup>](#), [span<sup>p275</sup>](#), [table<sup>p443</sup>](#), and [textarea<sup>p541</sup>](#) elements**

### **datafld on [a<sup>p234</sup>](#), [button<sup>p528</sup>](#), [div<sup>p233</sup>](#), [fieldset<sup>p555</sup>](#), [frame<sup>p1220</sup>](#), [iframe<sup>p355</sup>](#), [img<sup>p314</sup>](#), [input<sup>p486</sup>](#), [label<sup>p483</sup>](#), [legend<sup>p558</sup>](#), [marquee<sup>p1217</sup>](#), [object<sup>p367</sup>](#), [param<sup>p372</sup>](#), [select<sup>p530</sup>](#), [span<sup>p275</sup>](#), and [textarea<sup>p541</sup>](#) elements**

### **dataformatas on [button<sup>p528</sup>](#), [div<sup>p233</sup>](#), [input<sup>p486</sup>](#), [label<sup>p483</sup>](#), [legend<sup>p558</sup>](#), [marquee<sup>p1217</sup>](#), [object<sup>p367</sup>](#), [option<sup>p539</sup>](#), [select<sup>p530</sup>](#), [span<sup>p275</sup>](#), and [table<sup>p443</sup>](#) elements**

Use script and a mechanism such as [XMLHttpRequest](#) to populate the page dynamically. [\[XHR\]<sup>p1271</sup>](#)

### **dropzone on all elements**

Use script to handle the [dragenter<sup>p801</sup>](#) and [dragover<sup>p801</sup>](#) events instead.

[alink on body<sup>p174</sup>](#) elements  
[bgcolor on body<sup>p174</sup>](#) elements  
[bottommargin on body<sup>p174</sup>](#) elements  
[leftmargin on body<sup>p174</sup>](#) elements  
[link on body<sup>p174</sup>](#) elements  
[marginheight on body<sup>p174</sup>](#) elements  
[marginwidth on body<sup>p174</sup>](#) elements  
[rightmargin on body<sup>p174</sup>](#) elements  
[text on body<sup>p174</sup>](#) elements  
[topmargin on body<sup>p174</sup>](#) elements

Use CSS instead.

## 15.3 Requirements for implementations § p12

17

### 15.3.1 The `marquee` element § p12

17

The `marquee`<sup>p1217</sup> element is a presentational element that animates content. CSS transitions and animations are a more appropriate mechanism. [\[CSSANIMATIONS\]](#)<sup>p1265</sup> [\[CSSTRANSITIONS\]](#)<sup>p1266</sup>

The `marquee`<sup>p1217</sup> element must implement the `HTMLMarqueeElement`<sup>p1217</sup> interface.

```

IDL [Exposed=Window]
interface HTMLMarqueeElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute DOMString behavior;
  [CEReactions] attribute DOMString bgColor;
  [CEReactions] attribute DOMString direction;

```

```

[CEReactions] attribute DOMString height;
[CEReactions] attribute unsigned long hspace;
[CEReactions] attribute long loop;
[CEReactions] attribute unsigned long scrollAmount;
[CEReactions] attribute unsigned long scrollDelay;
[CEReactions] attribute boolean trueSpeed;
[CEReactions] attribute unsigned long vspace;
[CEReactions] attribute DOMString width;

attribute EventHandler onbounce;
attribute EventHandler onfinish;
attribute EventHandler onstart;

void start();
void stop();
};

```

A [marquee<sup>p1217</sup>](#) element can be **turned on** or **turned off**. When it is created, it is [turned on<sup>p1218</sup>](#).

When the **start()** method is called, the [marquee<sup>p1217</sup>](#) element must be [turned on<sup>p1218</sup>](#).

When the **stop()** method is called, the [marquee<sup>p1217</sup>](#) element must be [turned off<sup>p1218</sup>](#).

When a [marquee<sup>p1217</sup>](#) element is created, the user agent must [queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given the [marquee<sup>p1217</sup>](#) element to [fire an event](#) named `start` at the element.

The **behavior** content attribute on [marquee<sup>p1217</sup>](#) elements is an [enumerated attribute<sup>p66</sup>](#) with the following keywords (all non-conforming):

Keyword	State
scroll	<b>scroll</b>
slide	<b>slide</b>
alternate	<b>alternate</b>

The [missing value default<sup>p66</sup>](#) and [invalid value default<sup>p66</sup>](#) are the [scroll<sup>p1218</sup>](#) state.

The **direction** content attribute on [marquee<sup>p1217</sup>](#) elements is an [enumerated attribute<sup>p66</sup>](#) with the following keywords (all non-conforming):

Keyword	State
left	<b>left</b>
right	<b>right</b>
up	<b>up</b>
down	<b>down</b>

The [missing value default<sup>p66</sup>](#) and [invalid value default<sup>p66</sup>](#) are the [left<sup>p1218</sup>](#) state.

The **trueSpeed** content attribute on [marquee<sup>p1217</sup>](#) elements is a [boolean attribute<sup>p65</sup>](#).

A [marquee<sup>p1217</sup>](#) element has a **marquee scroll interval**, which is obtained as follows:

1. If the element has a `scrollDelay` attribute, and parsing its value using the [rules for parsing non-negative integers<sup>p67</sup>](#) does not return an error, then let *delay* be the parsed value. Otherwise, let *delay* be 85.
2. If the element does not have a [trueSpeed<sup>p1218</sup>](#) attribute, and the *delay* value is less than 60, then let *delay* be 60 instead.
3. The [marquee scroll interval<sup>p1218</sup>](#) is *delay*, interpreted in milliseconds.

A [marquee<sup>p1217</sup>](#) element has a **marquee scroll distance**, which, if the element has a `scrollamount` attribute, and parsing its value using the [rules for parsing non-negative integers<sup>p67</sup>](#) does not return an error, is the parsed value interpreted in [CSS pixels](#), and otherwise is 6 [CSS pixels](#).

A [marquee<sup>p1217</sup>](#) element has a **marquee loop count**, which, if the element has a `loop` attribute, and parsing its value using the [rules for parsing integers<sup>p66</sup>](#) does not return an error or a number less than 1, is the parsed value, and otherwise is `-1`.

The `loop` IDL attribute, on getting, must return the element's [marquee loop count<sup>p1219</sup>](#); and on setting, if the new value is different than the element's [marquee loop count<sup>p1219</sup>](#) and either greater than zero or equal to `-1`, must set the element's [loop<sup>p1219</sup>](#) content attribute (adding it if necessary) to the [valid integer<sup>p66</sup>](#) that represents the new value. (Other values are ignored.)

A [marquee<sup>p1217</sup>](#) element also has a **marquee current loop index**, which is zero when the element is created.

The rendering layer will occasionally **increment the marquee current loop index**, which must cause the following steps to be run:

1. If the [marquee loop count<sup>p1219</sup>](#) is `-1`, then return.
2. Increment the [marquee current loop index<sup>p1219</sup>](#) by one.
3. If the [marquee current loop index<sup>p1219</sup>](#) is now equal to or greater than the element's [marquee loop count<sup>p1219</sup>](#), [turn off<sup>p1218</sup>](#) the [marquee<sup>p1217</sup>](#) element and [queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given the [marquee<sup>p1217</sup>](#) element to [fire an event](#) named `finish` at the [marquee<sup>p1217</sup>](#) element.

Otherwise, if the [behavior<sup>p1218</sup>](#) attribute is in the [alternate<sup>p1218</sup>](#) state, then [queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given the [marquee<sup>p1217</sup>](#) element to [fire an event](#) named `bounce` at the [marquee<sup>p1217</sup>](#) element.

Otherwise, [queue an element task<sup>p926</sup>](#) on the [DOM manipulation task source<sup>p932</sup>](#) given the [marquee<sup>p1217</sup>](#) element to [fire an event](#) named `start` at the [marquee<sup>p1217</sup>](#) element.

The following are the [event handlers<sup>p934</sup>](#) (and their corresponding [event handler event types<sup>p937</sup>](#)) that must be supported, as [event handler content attributes<sup>p935</sup>](#) and [event handler IDL attributes<sup>p935</sup>](#), by [marquee<sup>p1217</sup>](#) elements:

Event handler <sup>p934</sup>	Event handler event type <sup>p937</sup>
<code>onbounce</code>	<code>bounce</code>
<code>onfinish</code>	<code>finish</code>
<code>onstart</code>	<code>start</code>

The `behavior`, `direction`, `height`, `hspace`, `vspace`, and `width` IDL attributes must [reflect<sup>p91</sup>](#) the respective content attributes of the same name.

The `bgColor` IDL attribute must [reflect<sup>p91</sup>](#) the `bgcolor` content attribute.

The `scrollAmount` IDL attribute must [reflect<sup>p91</sup>](#) the `scrollamount` content attribute. The default value is 6.

The `scrollDelay` IDL attribute must [reflect<sup>p91</sup>](#) the `scrolldelay` content attribute. The default value is 85.

The `trueSpeed` IDL attribute must [reflect<sup>p91</sup>](#) the [truespeed<sup>p1218</sup>](#) content attribute.

### 15.3.2 Frames §<sup>p12</sup> 19

The `frameset` element acts as [the body element<sup>p115</sup>](#) in documents that use frames.

The [frameset<sup>p1219</sup>](#) element must implement the [HTMLFrameSetElement<sup>p1219</sup>](#) interface.

```
IDL [Exposed=Window]
interface HTMLFrameSetElement : HTMLElement {
  [HTMLConstructor] constructor();
```

```
[CEReactions] attribute DOMString cols;
[CEReactions] attribute DOMString rows;
};
HTMLFrameSetElement includes WindowEventHandlers;
```

The `cols` and `rows` IDL attributes of the `frameset` element must [reflect](#) the respective content attributes of the same name.

The `frameset` element exposes as [event handler content attributes](#) a number of the [event handlers](#) of the `Window` object. It also mirrors their [event handler IDL attributes](#).

The [event handlers](#) of the `Window` object named by the [Window-reflecting body element event handler set](#), exposed on the `frameset` element, replace the generic [event handlers](#) with the same names normally supported by [HTML elements](#).

The `frame` element has a [nested browsing context](#) similar to the `iframe` element, but rendered within a `frameset` element.

A `frame` element is said to be an **active frame element** when it is [in a document](#).

When a `frame` element *element* is created as an [active frame element](#), or becomes an [active frame element](#) after not having been one, the user agent must run these steps:

1. [Create a new nested browsing context](#) for *element*.
2. [Process the frame attributes](#) for the first time.

When a `frame` element stops being an [active frame element](#), the user agent must [discard](#) the element's [nested browsing context](#), and then set the element's [nested browsing context](#) to null.

Whenever a `frame` element with a non-null [nested browsing context](#) has its `src` attribute set, changed, or removed, the user agent must [process the frame attributes](#).

When the user agent is to **process the frame attributes**, it must run the first appropriate steps from the following list:

↪ **If the element has no `src` attribute specified, and the user agent is processing the `frame`'s attributes for the first time**

[Queue an element task](#) on the [DOM manipulation task source](#) given the `frame` element to [fire an event](#) named [load](#) at the `frame` element.

↪ **Otherwise**

Run the [otherwise steps for iframe or frame elements](#).

Any [navigation](#) required of the user agent in the [process the frame attributes](#) algorithm must use the `frame` element's [node document's browsing context](#) as the [source browsing context](#).

Furthermore, if the [active document](#) of the element's [nested browsing context](#) before such a [navigation](#) was not [completely loaded](#) at the time of the new [navigation](#), then the [navigation](#) must be completed with [replacement enabled](#).

Similarly, if the element's [nested browsing context's session history](#) contained only one [Document](#) when the [process the frame attributes](#) algorithm was invoked, and that was the [about:blank Document](#) created when its [nested browsing context](#) was created, then any [navigation](#) required of the user agent in that algorithm must be completed with [replacement enabled](#).

When a [Document](#) in a `frame` is marked as [completely loaded](#), the user agent must [fire an event](#) named [load](#) at the `frame` element.

The `frame` element [potentially delays the load event](#).

The `frame` element must implement the [HTMLFrameElement](#) interface.

```
IDL [Exposed=Window]
interface HTMLFrameElement : HTMLElement {
  [HTMLConstructor] constructor();
};
```

```

[CEReactions] attribute DOMString name;
[CEReactions] attribute DOMString scrolling;
[CEReactions] attribute USVString src;
[CEReactions] attribute DOMString frameBorder;
[CEReactions] attribute USVString longDesc;
[CEReactions] attribute boolean noResize;
readonly attribute Document? contentDocument;
readonly attribute WindowProxy? contentWindow;

[CEReactions] attribute [LegacyNullToEmptyString] DOMString marginHeight;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString marginWidth;
};

```

The **name**, **scrolling**, and **src** IDL attributes of the [frame](#)<sup>p1220</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name. For the purposes of reflection, the [frame](#)<sup>p1220</sup> element's **src** content attribute is defined as containing a [URL](#).

The **frameBorder** IDL attribute of the [frame](#)<sup>p1220</sup> element must [reflect](#)<sup>p91</sup> the element's **frameborder** content attribute.

The **longDesc** IDL attribute of the [frame](#)<sup>p1220</sup> element must [reflect](#)<sup>p91</sup> the element's **longdesc** content attribute, which for the purposes of reflection is defined as containing a [URL](#).

The **noResize** IDL attribute of the [frame](#)<sup>p1220</sup> element must [reflect](#)<sup>p91</sup> the element's **noresize** content attribute.

The **contentDocument** IDL attribute, on getting, must return the [frame](#)<sup>p1220</sup> element's [content document](#)<sup>p808</sup>.

The **contentWindow** IDL attribute must return the [WindowProxy](#)<sup>p826</sup> object of the [frame](#)<sup>p1220</sup> element's [nested browsing context](#)<sup>p806</sup>, if the element's [nested browsing context](#)<sup>p806</sup> is non-null, or return null otherwise.

The **marginHeight** IDL attribute of the [frame](#)<sup>p1220</sup> element must [reflect](#)<sup>p91</sup> the element's **marginheight** content attribute.

The **marginWidth** IDL attribute of the [frame](#)<sup>p1220</sup> element must [reflect](#)<sup>p91</sup> the element's **marginwidth** content attribute.

### 15.3.3 Other elements, attributes and APIs §p12 21

User agents must treat [acronym](#)<sup>p1212</sup> elements in a manner equivalent to [abbr](#)<sup>p245</sup> elements in terms of semantics and for purposes of rendering.

```

IDL partial interface HTMLAnchorElement {
  [CEReactions] attribute DOMString coords;
  [CEReactions] attribute DOMString charset;
  [CEReactions] attribute DOMString name;
  [CEReactions] attribute DOMString rev;
  [CEReactions] attribute DOMString shape;
};

```

The **coords**, **charset**, **name**, **rev**, and **shape** IDL attributes of the [a](#)<sup>p234</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

```

IDL partial interface HTMLAreaElement {
  [CEReactions] attribute boolean noHref;
};

```

The **noHref** IDL attribute of the [area](#)<sup>p437</sup> element must [reflect](#)<sup>p91</sup> the element's [nohref](#)<sup>p1214</sup> content attribute.

```

IDL partial interface HTMLBodyElement {

```

```
[CEReactions] attribute [LegacyNullToEmptyString] DOMString text;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString link;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString vLink;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString aLink;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
[CEReactions] attribute DOMString background;
};
```

The **text** IDL attribute of the [body<sup>p174</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [text<sup>p1216</sup>](#) content attribute.

The **link** IDL attribute of the [body<sup>p174</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [link<sup>p1216</sup>](#) content attribute.

The **aLink** IDL attribute of the [body<sup>p174</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [aLink<sup>p1216</sup>](#) content attribute.

The **vLink** IDL attribute of the [body<sup>p174</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [vLink<sup>p1216</sup>](#) content attribute.

The **bgColor** IDL attribute of the [body<sup>p174</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [bgColor<sup>p1216</sup>](#) content attribute.

The **background** IDL attribute of the [body<sup>p174</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [background<sup>p1217</sup>](#) content attribute. (The [background<sup>p1217</sup>](#) content is *not* defined to contain a [URL](#), despite rules regarding its handling in the rendering section above.)

```
IDL partial interface HTMLBRElement {
  [CEReactions] attribute DOMString clear;
};
```

The **clear** IDL attribute of the [br<sup>p275</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLTableCaptionElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the [caption<sup>p451</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLTableColElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
  [CEReactions] attribute DOMString vAlign;
  [CEReactions] attribute DOMString width;
};
```

The **align** and **width** IDL attributes of the [col<sup>p453</sup>](#) element must [reflect<sup>p91</sup>](#) the respective content attributes of the same name.

The **ch** IDL attribute of the [col<sup>p453</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [char<sup>p1216</sup>](#) content attribute.

The **chOff** IDL attribute of the [col<sup>p453</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [charOff<sup>p1216</sup>](#) content attribute.

The **vAlign** IDL attribute of the [col<sup>p453</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [vAlign<sup>p1216</sup>](#) content attribute.

User agents must treat [dir<sup>p1212</sup>](#) elements in a manner equivalent to [ul<sup>p218</sup>](#) elements in terms of semantics and for purposes of rendering.

The [dir<sup>p1212</sup>](#) element must implement the [HTMLDirectoryElement<sup>p1222</sup>](#) interface.

```
IDL [Exposed=Window]
interface HTMLDirectoryElement : HTMLElement {
```

```
[HTMLConstructor] constructor();

[CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the [dir](#)<sup>p1212</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```
IDL partial interface HTMLDivElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the [div](#)<sup>p233</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```
IDL partial interface HTMLDListElement {
  [CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the [dl](#)<sup>p222</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```
IDL partial interface HTMLEmbedElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString name;
};
```

The **name** and **align** IDL attributes of the [embed](#)<sup>p363</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

The [font](#)<sup>p1213</sup> element must implement the [HTMLFontElement](#)<sup>p1223</sup> interface.

```
IDL [Exposed=Window]
interface HTMLFontElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString color;
  [CEReactions] attribute DOMString face;
  [CEReactions] attribute DOMString size;
};
```

The **color**, **face**, and **size** IDL attributes of the [font](#)<sup>p1213</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

```
IDL partial interface HTMLHeadingElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the [h1](#)<sup>p186</sup>–[h6](#)<sup>p186</sup> elements must [reflect](#)<sup>p91</sup> the content attribute of the same name.

#### Note

The **profile** IDL attribute on [head](#)<sup>p150</sup> elements (with the [HTMLHeadElement](#)<sup>p150</sup> interface) is intentionally omitted. Unless so required by [another applicable specification](#)<sup>p63</sup>, implementations would therefore not support this attribute. (It is mentioned here as it was defined in a previous version of DOM.)

```

IDL partial interface HTMLHRElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString color;
  [CEReactions] attribute boolean noShade;
  [CEReactions] attribute DOMString size;
  [CEReactions] attribute DOMString width;
};

```

The **align**, **color**, **size**, and **width** IDL attributes of the [hr](#)<sup>p210</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

The **noShade** IDL attribute of the [hr](#)<sup>p210</sup> element must [reflect](#)<sup>p91</sup> the element's [noshade](#)<sup>p1216</sup> content attribute.

```

IDL partial interface HTMLHtmlElement {
  [CEReactions] attribute DOMString version;
};

```

The **version** IDL attribute of the [html](#)<sup>p149</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```

IDL partial interface HTMLIFrameElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString scrolling;
  [CEReactions] attribute DOMString frameBorder;
  [CEReactions] attribute USVString longDesc;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString marginHeight;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString marginWidth;
};

```

The **align** and **scrolling** IDL attributes of the [iframe](#)<sup>p355</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

The **frameBorder** IDL attribute of the [iframe](#)<sup>p355</sup> element must [reflect](#)<sup>p91</sup> the element's [frameborder](#)<sup>p1216</sup> content attribute.

The **longDesc** IDL attribute of the [iframe](#)<sup>p355</sup> element must [reflect](#)<sup>p91</sup> the element's [longdesc](#)<sup>p1214</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#).

The **marginHeight** IDL attribute of the [iframe](#)<sup>p355</sup> element must [reflect](#)<sup>p91</sup> the element's [marginheight](#)<sup>p1216</sup> content attribute.

The **marginWidth** IDL attribute of the [iframe](#)<sup>p355</sup> element must [reflect](#)<sup>p91</sup> the element's [marginwidth](#)<sup>p1216</sup> content attribute.

```

IDL partial interface HTMLImageElement {
  [CEReactions] attribute DOMString name;
  [CEReactions] attribute USVString lowsrc;
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute unsigned long hspace;
  [CEReactions] attribute unsigned long vspace;
  [CEReactions] attribute USVString longDesc;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString border;
};

```

The **name**, **align**, **border**, **hspace**, and **vspace** IDL attributes of the [img](#)<sup>p314</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

The **longDesc** IDL attribute of the [img](#)<sup>p314</sup> element must [reflect](#)<sup>p91</sup> the element's [longdesc](#)<sup>p1214</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#).

The **lowsrc** IDL attribute of the [img](#)<sup>p314</sup> element must [reflect](#)<sup>p91</sup> the element's [lowsrc](#)<sup>p1214</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#).

```
IDL partial interface HTMLInputElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString useMap;
};
```

The **align** IDL attribute of the [input](#)<sup>p486</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

The **useMap** IDL attribute of the [input](#)<sup>p486</sup> element must [reflect](#)<sup>p91</sup> the element's [usemap](#)<sup>p1214</sup> content attribute.

```
IDL partial interface HTMLLegendElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the [legend](#)<sup>p558</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```
IDL partial interface HTMLLIElement {
  [CEReactions] attribute DOMString type;
};
```

The **type** IDL attribute of the [li](#)<sup>p220</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```
IDL partial interface HTMLLinkElement {
  [CEReactions] attribute DOMString charset;
  [CEReactions] attribute DOMString rev;
  [CEReactions] attribute DOMString target;
};
```

The **charset**, **rev**, and **target** IDL attributes of the [link](#)<sup>p154</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

User agents must treat [listing](#)<sup>p1212</sup> elements in a manner equivalent to [pre](#)<sup>p212</sup> elements in terms of semantics and for purposes of rendering.

```
IDL partial interface HTMLMenuElement {
  [CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the [menu](#)<sup>p219</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

```
IDL partial interface HTMLMetaElement {
  [CEReactions] attribute DOMString scheme;
};
```

User agents may treat the [scheme](#)<sup>p1214</sup> content attribute on the [meta](#)<sup>p160</sup> element as an extension of the element's [name](#)<sup>p162</sup> content attribute when processing a [meta](#)<sup>p160</sup> element with a [name](#)<sup>p162</sup> attribute whose value is one that the user agent recognizes as supporting the [scheme](#)<sup>p1214</sup> attribute.

User agents are encouraged to ignore the [scheme](#)<sup>p1214</sup> attribute and instead process the value given to the metadata name as if it had

been specified for each expected value of the [scheme<sup>p1214</sup>](#) attribute.

#### Example

For example, if the user agent acts on [meta<sup>p160</sup>](#) elements with [name<sup>p162</sup>](#) attributes having the value "eGMS.subject.keyword", and knows that the [scheme<sup>p1214</sup>](#) attribute is used with this metadata name, then it could take the [scheme<sup>p1214</sup>](#) attribute into account, acting as if it was an extension of the [name<sup>p162</sup>](#) attribute. Thus the following two [meta<sup>p160</sup>](#) elements could be treated as two elements giving values for two different metadata names, one consisting of a combination of "eGMS.subject.keyword" and "LGCL", and the other consisting of a combination of "eGMS.subject.keyword" and "ORLY":

```
<!-- this markup is invalid -->
<meta name="eGMS.subject.keyword" scheme="LGCL" content="Abandoned vehicles">
<meta name="eGMS.subject.keyword" scheme="ORLY" content="Mah car: kthxbye">
```

The suggested processing of this markup, however, would be equivalent to the following:

```
<meta name="eGMS.subject.keyword" content="Abandoned vehicles">
<meta name="eGMS.subject.keyword" content="Mah car: kthxbye">
```

The [scheme](#) IDL attribute of the [meta<sup>p160</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLObjectElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString archive;
  [CEReactions] attribute DOMString code;
  [CEReactions] attribute boolean declare;
  [CEReactions] attribute unsigned long hspace;
  [CEReactions] attribute DOMString standby;
  [CEReactions] attribute unsigned long vspace;
  [CEReactions] attribute DOMString codeBase;
  [CEReactions] attribute DOMString codeType;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString border;
};
```

The [align](#), [archive](#), [border](#), [code](#), [declare](#), [hspace](#), [standby](#), and [vspace](#) IDL attributes of the [object<sup>p367</sup>](#) element must [reflect<sup>p91</sup>](#) the respective content attributes of the same name.

The [codeBase](#) IDL attribute of the [object<sup>p367</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [codebase<sup>p1214</sup>](#) content attribute, which for the purposes of reflection is defined as containing a [URL](#).

The [codeType](#) IDL attribute of the [object<sup>p367</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [codetype<sup>p1214</sup>](#) content attribute.

```
IDL partial interface HTMLListElement {
  [CEReactions] attribute boolean compact;
};
```

The [compact](#) IDL attribute of the [ol<sup>p216</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLParagraphElement {
  [CEReactions] attribute DOMString align;
};
```

The [align](#) IDL attribute of the [p<sup>p207</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLParamElement {
  [CEReactions] attribute DOMString type;
  [CEReactions] attribute DOMString valueType;
};
```

The **type** IDL attribute of the [param<sup>p372</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

The **valueType** IDL attribute of the [param<sup>p372</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [valuetype<sup>p1215</sup>](#) content attribute.

User agents must treat [plaintext<sup>p1212</sup>](#) elements in a manner equivalent to [pre<sup>p212</sup>](#) elements in terms of semantics and for purposes of rendering. (The parser has special behavior for this element, though.)

```
IDL partial interface HTMLPreElement {
  [CEReactions] attribute long width;
};
```

The **width** IDL attribute of the [pre<sup>p212</sup>](#) element must [reflect<sup>p91</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLStyleElement {
  [CEReactions] attribute DOMString type;
};
```

The **type** IDL attribute of the [style<sup>p170</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [type<sup>p1215</sup>](#) content attribute.

```
IDL partial interface HTMLScriptElement {
  [CEReactions] attribute DOMString charset;
  [CEReactions] attribute DOMString event;
  [CEReactions] attribute DOMString htmlFor;
};
```

The **charset** and **event** IDL attributes of the [script<sup>p607</sup>](#) element must [reflect<sup>p91</sup>](#) the respective content attributes of the same name.

The **htmlFor** IDL attribute of the [script<sup>p607</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [for<sup>p1215</sup>](#) content attribute.

```
IDL partial interface HTMLTableElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString border;
  [CEReactions] attribute DOMString frame;
  [CEReactions] attribute DOMString rules;
  [CEReactions] attribute DOMString summary;
  [CEReactions] attribute DOMString width;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString cellPadding;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString cellSpacing;
};
```

The **align**, **border**, **frame**, **summary**, **rules**, and **width**, IDL attributes of the [table<sup>p443</sup>](#) element must [reflect<sup>p91</sup>](#) the respective content attributes of the same name.

The **bgColor** IDL attribute of the [table<sup>p443</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [bgcolor<sup>p1217</sup>](#) content attribute.

The **cellPadding** IDL attribute of the [table<sup>p443</sup>](#) element must [reflect<sup>p91</sup>](#) the element's [cellpadding<sup>p1217</sup>](#) content attribute.

The **cellSpacing** IDL attribute of the [table](#)<sup>p443</sup> element must [reflect](#)<sup>p91</sup> the element's [cellspacing](#)<sup>p1217</sup> content attribute.

```
IDL partial interface HTMLTableSectionElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
  [CEReactions] attribute DOMString vAlign;
};
```

The **align** IDL attribute of the [tbody](#)<sup>p454</sup>, [thead](#)<sup>p455</sup>, and [tfoot](#)<sup>p456</sup> elements must [reflect](#)<sup>p91</sup> the content attribute of the same name.

The **ch** IDL attribute of the [tbody](#)<sup>p454</sup>, [thead](#)<sup>p455</sup>, and [tfoot](#)<sup>p456</sup> elements must [reflect](#)<sup>p91</sup> the elements' [char](#)<sup>p1217</sup> content attributes.

The **chOff** IDL attribute of the [tbody](#)<sup>p454</sup>, [thead](#)<sup>p455</sup>, and [tfoot](#)<sup>p456</sup> elements must [reflect](#)<sup>p91</sup> the elements' [charoff](#)<sup>p1217</sup> content attributes.

The **vAlign** IDL attribute of the [tbody](#)<sup>p454</sup>, [thead](#)<sup>p455</sup>, and [tfoot](#)<sup>p456</sup> element must [reflect](#)<sup>p91</sup> the elements' [valign](#)<sup>p1217</sup> content attributes.

```
IDL partial interface HTMLTableCellElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString axis;
  [CEReactions] attribute DOMString height;
  [CEReactions] attribute DOMString width;

  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
  [CEReactions] attribute boolean noWrap;
  [CEReactions] attribute DOMString vAlign;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
};
```

The **align**, **axis**, **height**, and **width** IDL attributes of the [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

The **ch** IDL attribute of the [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements must [reflect](#)<sup>p91</sup> the elements' [char](#)<sup>p1217</sup> content attributes.

The **chOff** IDL attribute of the [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements must [reflect](#)<sup>p91</sup> the elements' [charoff](#)<sup>p1217</sup> content attributes.

The **noWrap** IDL attribute of the [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements must [reflect](#)<sup>p91</sup> the elements' [nowrap](#)<sup>p1217</sup> content attributes.

The **vAlign** IDL attribute of the [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements must [reflect](#)<sup>p91</sup> the elements' [valign](#)<sup>p1217</sup> content attributes.

The **bgColor** IDL attribute of the [td](#)<sup>p459</sup> and [th](#)<sup>p460</sup> elements must [reflect](#)<sup>p91</sup> the elements' [bgcolor](#)<sup>p1217</sup> content attributes.

```
IDL partial interface HTMLTableRowElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
  [CEReactions] attribute DOMString vAlign;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
};
```

The **align** IDL attribute of the [tr](#)<sup>p457</sup> element must [reflect](#)<sup>p91</sup> the content attribute of the same name.

The **ch** IDL attribute of the [tr](#)<sup>p457</sup> element must [reflect](#)<sup>p91</sup> the element's [char](#)<sup>p1217</sup> content attribute.

The **chOff** IDL attribute of the [tr](#)<sup>p457</sup> element must [reflect](#)<sup>p91</sup> the element's [charoff](#)<sup>p1217</sup> content attribute.

The **vAlign** IDL attribute of the [tr](#)<sup>p457</sup> element must [reflect](#)<sup>p91</sup> the element's [valign](#)<sup>p1217</sup> content attribute.

The **bgColor** IDL attribute of the [tr](#)<sup>p457</sup> element must [reflect](#)<sup>p91</sup> the element's [bgcolor](#)<sup>p1217</sup> content attribute.

```
IDL partial interface HTMLULListElement {
  [CEReactions] attribute boolean compact;
  [CEReactions] attribute DOMString type;
};
```

The **compact** and **type** IDL attributes of the [ul](#)<sup>p218</sup> element must [reflect](#)<sup>p91</sup> the respective content attributes of the same name.

User agents must treat [xmp](#)<sup>p1213</sup> elements in a manner equivalent to [pre](#)<sup>p212</sup> elements in terms of semantics and for purposes of rendering. (The parser has special behavior for this element though.)

```
IDL partial interface Document {
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString fgColor;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString linkColor;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString vlinkColor;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString alinkColor;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;

  [SameObject] readonly attribute HTMLCollection anchors;
  [SameObject] readonly attribute HTMLCollection applets;

  void clear();
  void captureEvents();
  void releaseEvents();

  [SameObject] readonly attribute HTMLAllCollection all;
};
```

The attributes of the [Document](#)<sup>p111</sup> object listed in the first column of the following table must [reflect](#)<sup>p91</sup> the content attribute on [the body element](#)<sup>p115</sup> with the name given in the corresponding cell in the second column on the same row, if [the body element](#)<sup>p115</sup> is a [body](#)<sup>p174</sup> element (as opposed to a [frameset](#)<sup>p1219</sup> element). When there is no [body element](#)<sup>p115</sup> or if it is a [frameset](#)<sup>p1219</sup> element, the attributes must instead return the empty string on getting and do nothing on setting.

IDL attribute	Content attribute
<b>fgColor</b>	<a href="#">text</a> <sup>p1216</sup>
<b>linkColor</b>	<a href="#">link</a> <sup>p1216</sup>
<b>vlinkColor</b>	<a href="#">vlink</a> <sup>p1216</sup>
<b>alinkColor</b>	<a href="#">alink</a> <sup>p1216</sup>
<b>bgColor</b>	<a href="#">bgcolor</a> <sup>p1216</sup>

The **anchors** attribute must return an [HTMLCollection](#) rooted at the [Document](#)<sup>p111</sup> node, whose filter matches only [a](#)<sup>p234</sup> elements with [name](#)<sup>p1213</sup> attributes.

The **applets** attribute must return an [HTMLCollection](#) rooted at the [Document](#)<sup>p111</sup> node, whose filter matches nothing. (It exists for historical reasons.)

The **clear()**, **captureEvents()**, and **releaseEvents()** methods must do nothing.

The **all** attribute must return an [HTMLAllCollection](#)<sup>p94</sup> rooted at the [Document](#)<sup>p111</sup> node, whose filter matches all elements.

```
IDL partial interface Window {
    void captureEvents();
    void releaseEvents();

    [Replaceable, SameObject] readonly attribute External external;
};
```

The **captureEvents()** and **releaseEvents()** methods must do nothing.

The **external** attribute of the [Window<sup>p816</sup>](#) interface must return an instance of the [External<sup>p1230</sup>](#) interface:

```
IDL [Exposed=Window]
interface External {
    void AddSearchProvider();
    void IsSearchProviderInstalled();
};
```

The **AddSearchProvider()** and **IsSearchProviderInstalled()** methods must do nothing.

## 16 IANA considerations <sup>§<sup>p12</sup></sup>

31

### 16.1 text/html <sup>§<sup>p12</sup></sup>

31

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

#### Type name:

text

#### Subtype name:

html

#### Required parameters:

No required parameters

#### Optional parameters:

charset

The `charset` parameter may be provided to specify the [document's character encoding](#), overriding any [character encoding declarations](#)<sup>p169</sup> in the document other than a Byte Order Mark (BOM). The parameter's value must be an [ASCII case-insensitive](#) match for the string "utf-8". [\[ENCODING\]](#)<sup>p1266</sup>

#### Encoding considerations:

8bit (see the section on [character encoding declarations](#)<sup>p169</sup>)

#### Security considerations:

Entire novels have been written about the security considerations that apply to HTML documents. Many are listed in this document, to which the reader is referred for more details. Some general concerns bear mentioning here, however:

HTML is scripted language, and has a large number of APIs (some of which are described in this document). Script can expose the user to potential risks of information leakage, credential leakage, cross-site scripting attacks, cross-site request forgeries, and a host of other problems. While the designs in this specification are intended to be safe if implemented correctly, a full implementation is a massive undertaking and, as with any software, user agents are likely to have security bugs.

Even without scripting, there are specific features in HTML which, for historical reasons, are required for broad compatibility with legacy content but that expose the user to unfortunate security problems. In particular, the `img`<sup>p314</sup> element can be used in conjunction with some other features as a way to effect a port scan from the user's location on the Internet. This can expose local network topologies that the attacker would otherwise not be able to determine.

HTML relies on a compartmentalization scheme sometimes known as the *same-origin policy*. An [origin](#)<sup>p829</sup> in most cases consists of all the pages served from the same host, on the same port, using the same protocol.

It is critical, therefore, to ensure that any untrusted content that forms part of a site be hosted on a different [origin](#)<sup>p829</sup> than any sensitive content on that site. Untrusted content can easily spoof any other page on the same origin, read data from that origin, cause scripts in that origin to execute, submit forms to and from that origin even if they are protected from cross-site request forgery attacks by unique tokens, and make use of any third-party resources exposed to or rights granted to that origin.

#### Interoperability considerations:

Rules for processing both conforming and non-conforming content are defined in this specification.

#### Published specification:

This document is the relevant specification. Labeling a resource with the `text/html`<sup>p1231</sup> type asserts that the resource is an [HTML document](#) using [the HTML syntax](#)<sup>p1047</sup>.

#### Applications that use this media type:

Web browsers, tools for processing Web content, HTML authoring tools, search engines, validators.

#### Additional information:

##### Magic number(s):

No sequence of bytes can uniquely identify an HTML document. More information on detecting HTML documents is available in *MIME Sniffing*. [\[MIMESNIFF\]](#)<sup>p1268</sup>

##### File extension(s):

"html" and ".html" are commonly, but certainly not exclusively, used as the extension for HTML documents.

**Macintosh file type code(s):**

[Fragments](#) used with [text/html<sup>p1231</sup>](#) resources either refer to [the indicated part of the document<sup>p864</sup>](#) or provide state information for in-page scripts.

## 16.2 [multipart/x-mixed-replace](#) <sup>p12</sup><sub>32</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

multipart

**Subtype name:**

x-mixed-replace

**Required parameters:**

- boundary (defined in RFC2046) [\[RFC2046\]<sup>p1269</sup>](#)

**Optional parameters:**

No optional parameters.

**Encoding considerations:**

binary

**Security considerations:**

Subresources of a [multipart/x-mixed-replace<sup>p1232</sup>](#) resource can be of any type, including types with non-trivial security implications such as [text/html<sup>p1231</sup>](#).

**Interoperability considerations:**

None.

**Published specification:**

This specification describes processing rules for Web browsers. Conformance requirements for generating resources with this type are the same as for [multipart/mixed<sup>p1262</sup>](#). [\[RFC2046\]<sup>p1269</sup>](#)

**Applications that use this media type:**

This type is intended to be used in resources generated by Web servers, for consumption by Web browsers.

**Additional information:****Magic number(s):**

No sequence of bytes can uniquely identify a [multipart/x-mixed-replace<sup>p1232</sup>](#) resource.

**File extension(s):**

No specific file extensions are recommended for this type.

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) used with [multipart/x-mixed-replace](#)<sup>p1232</sup> resources apply to each body part as defined by the type used by that body part.

## 16.3 [application/xhtml+xml](#) §<sup>p12</sup><sub>33</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

xhtml+xml

**Required parameters:**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**Optional parameters:**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**Encoding considerations:**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**Security considerations:**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**Interoperability considerations:**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**Published specification:**

Labeling a resource with the [application/xhtml+xml](#)<sup>p1233</sup> type asserts that the resource is an XML document that likely has a [document element](#) from the [HTML namespace](#). Thus, the relevant specifications are *XML*, *Namespaces in XML*, and this specification. [[XML](#)]<sup>p1271</sup> [[XMLNS](#)]<sup>p1271</sup>

**Applications that use this media type:**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**Additional information:****Magic number(s):**

Same as for [application/xml](#)<sup>p1262</sup> [[RFC7303](#)]<sup>p1270</sup>

**File extension(s):**

"xhtml" and "xht" are sometimes used as extensions for XML resources that have a [document element](#) from the [HTML namespace](#).

**Macintosh file type code(s):**

## 16.4 text/cache-manifest <sup>p12</sup><sub>34</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

text

**Subtype name:**

cache-manifest

**Required parameters:**

No parameters

**Optional parameters:**

**charset**

The `charset` parameter may be provided. The parameter's value must be "utf-8". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

**Encoding considerations:**

8bit (always UTF-8)

**Security considerations:**

Cache manifests themselves pose no immediate risk unless sensitive information is included within the manifest. Implementations, however, are required to follow specific rules when populating a cache based on a cache manifest, to ensure that certain origin-based restrictions are honored. Failure to correctly implement these rules can result in information leakage, cross-site scripting attacks, and the like.

**Interoperability considerations:**

Rules for processing both conforming and non-conforming content are defined in this specification.

**Published specification:**

This document is the relevant specification.

**Applications that use this media type:**

Web browsers.

**Additional information:****Magic number(s):**

Cache manifests begin with the string "CACHE MANIFEST", followed by either a U+0020 SPACE character, a U+0009 CHARACTER TABULATION (tab) character, a U+000A LINE FEED (LF) character, or a U+000D CARRIAGE RETURN (CR) character.

**File extension(s):**

"appcache"

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) have no meaning with [text/cache-manifest<sup>p1234</sup>](#) resources.

## 16.5 [text/ping](#) §<sup>p12</sup><sub>35</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

text

**Subtype name:**

ping

**Required parameters:**

No parameters

**Optional parameters:**

**charset**

The **charset** parameter may be provided. The parameter's value must be "utf-8". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

**Encoding considerations:**

Not applicable.

**Security considerations:**

If used exclusively in the fashion described in the context of [hyperlink auditing<sup>p288</sup>](#), this type introduces no new security concerns.

**Interoperability considerations:**

Rules applicable to this type are defined in this specification.

**Published specification:**

This document is the relevant specification.

**Applications that use this media type:**

Web browsers.

**Additional information:****Magic number(s):**

[text/ping<sup>p1235</sup>](#) resources always consist of the four bytes 0x50 0x49 0x4E 0x47 (`PING`).

**File extension(s):**

No specific file extension is recommended for this type.

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

Only intended for use with HTTP POST requests generated as part of a Web browser's processing of the [ping<sup>p279</sup>](#) attribute.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) have no meaning with [text/ping](#)<sup>p1235</sup> resources.

**16.6 application/microdata+json** §<sup>p12</sup><sub>36</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

microdata+json

**Required parameters:**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**Optional parameters:**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**Encoding considerations:**

8bit (always UTF-8)

**Security considerations:**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**Interoperability considerations:**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**Published specification:**

Labeling a resource with the [application/microdata+json](#)<sup>p1236</sup> type asserts that the resource is a JSON text that consists of an object with a single entry called "items" consisting of an array of entries, each of which consists of an object with an entry called "id" whose value is a string, an entry called "type" whose value is another string, and an entry called "properties" whose value is an object whose entries each have a value consisting of an array of either objects or strings, the objects being of the same form as the objects in the aforementioned "items" entry. Thus, the relevant specifications are *JSON* and this specification. [\[JSON\]](#)<sup>p1267</sup>

**Applications that use this media type:**

Applications that transfer data intended for use with HTML's microdata feature, especially in the context of drag-and-drop, are the primary application class for this type.

**Additional information:****Magic number(s):**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**File extension(s):**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**Macintosh file type code(s):**

Same as for [application/json](#)<sup>p1262</sup> [\[JSON\]](#)<sup>p1267</sup>

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) used with [application/microdata+json](#)<sup>p1236</sup> resources have the same semantics as when used with [application/json](#)<sup>p1262</sup> (namely, at the time of writing, no semantics at all). [\[JSON\]](#)<sup>p1267</sup>

## 16.7 text/event-stream <sup>p12</sup><sub>37</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

### Type name:

text

### Subtype name:

event-stream

### Required parameters:

No parameters

### Optional parameters:

charset

The `charset` parameter may be provided. The parameter's value must be "utf-8". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

### Encoding considerations:

8bit (always UTF-8)

### Security considerations:

An event stream from an origin distinct from the origin of the content consuming the event stream can result in information leakage. To avoid this, user agents are required to apply CORS semantics. [\[FETCH\]](#)<sup>p1266</sup>

Event streams can overwhelm a user agent; a user agent is expected to apply suitable restrictions to avoid depleting local resources because of an overabundance of information from an event stream.

Servers can be overwhelmed if a situation develops in which the server is causing clients to reconnect rapidly. Servers should use a 5xx status code to indicate capacity problems, as this will prevent conforming clients from reconnecting automatically.

### Interoperability considerations:

Rules for processing both conforming and non-conforming content are defined in this specification.

### Published specification:

This document is the relevant specification.

### Applications that use this media type:

Web browsers and tools using Web services.

### Additional information:

#### Magic number(s):

No sequence of bytes can uniquely identify an event stream.

#### File extension(s):

No specific file extensions are recommended for this type.

#### Macintosh file type code(s):

No specific Macintosh file type codes are recommended for this type.

### Person & email address to contact for further information:

Ian Hickson <ian@hixie.ch>

### Intended usage:

Common

### Restrictions on usage:

This format is only expected to be used by dynamic open-ended streams served using HTTP or a similar protocol. Finite resources are not expected to be labeled with this type.

### Author:

Ian Hickson <ian@hixie.ch>

**Specification document(s):**

This document is the relevant specification.

**Related information:**

None.

## 16.12 web+ scheme prefix §<sup>p12</sup><sub>39</sub>

This section describes a convention for use with the IANA URI scheme registry. It does not itself register a specific scheme. [\[RFC7595\]<sup>p1269</sup>](#)

**Scheme name:**

Schemes starting with the four characters "web+" followed by one or more letters in the range a-z.

**Status:**

Permanent

**Scheme syntax:**

Scheme-specific.

**Scheme semantics:**

Scheme-specific.

**Encoding considerations:**

All "web+" schemes should use UTF-8 encodings where relevant.

**Applications/protocols that use this scheme name:**

Scheme-specific.

**Interoperability considerations:**

The scheme is expected to be used in the context of Web applications.

**Security considerations:**

Any Web page is able to register a handler for all "web+" schemes. As such, these schemes must not be used for features intended

to be core platform features (e.g. network transfer protocols like HTTP or FTP). Similarly, such schemes must not store confidential information in their URLs, such as usernames, passwords, personal information, or confidential project names.

**Contact:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

Ian Hickson <ian@hixie.ch>

<a href="#">wbr</a> <sup>p277</sup>	Line breaking opportunity	<a href="#">flow</a> <sup>p128</sup> ; <a href="#">phrasing</a> <sup>p129</sup>	<a href="#">phrasing</a> <sup>p129</sup>	empty	<a href="#">globals</a> <sup>p133</sup>	<a href="#">HTMLElement</a> <sup>p121</sup>
<a href="#">autonomous custom elements</a> <sup>p696</sup>	Author-defined elements	<a href="#">flow</a> <sup>p128</sup> ; <a href="#">phrasing</a> <sup>p129</sup> ; <a href="#">palpable</a> <sup>p130</sup>	<a href="#">flow</a> <sup>p128</sup> ; <a href="#">phrasing</a> <sup>p129</sup>	<a href="#">transparent</a> <sup>p130</sup>	<a href="#">globals</a> <sup>p133</sup> ; any, as decided by the element's author	Supplied by the element's author (inherits from <a href="#">HTMLElement</a> <sup>p121</sup> )

An asterisk (\*) in a cell indicates that the actual rules are more complicated than indicated in the table above.

† Categories in the "Parents" column refer to parents that list the given categories in their content model, not to elements that themselves are in those categories. For example, the [a](#)<sup>p234</sup> element's "Parents" column says "phrasing", so any element whose content model contains the "phrasing" category could be a parent of an [a](#)<sup>p234</sup> element. Since the "flow" category includes all the "phrasing" elements, that means the [th](#)<sup>p460</sup> element could be a parent to an [a](#)<sup>p234</sup> element.

## Element content categories § p12 47

This section is non-normative.

## Attributes § p12

48

This section is non-normative.

List of attributes (excluding event handler content attributes)

Attribute	Element(s)	Description	Value
abbr	<a href="#">th</a> <sup>p461</sup>	Alternative label to use for the header cell when referencing the cell in other contexts	<a href="#">Text</a> <sup>p126*</sup>
accept	<a href="#">input</a> <sup>p509</sup>	Hint for expected file type in <a href="#">file upload controls</a> <sup>p508</sup>	<a href="#">Set of comma-separated tokens</a> <sup>p86*</sup> consisting of <a href="#">valid MIME type strings with no parameters</a> or audio/*, video/*, or image/*
accept-charset	<a href="#">form</a> <sup>p480</sup>	Character encodings to use for <a href="#">form submission</a> <sup>p588</sup>	<a href="#">ASCII case-insensitive</a> match for "UTF-8"
accesskey	<a href="#">HTML elements</a> <sup>p778</sup>	Keyboard shortcut to activate or focus element	<a href="#">Ordered set of unique space-separated tokens</a> <sup>p85</sup> , <a href="#">case-sensitive</a> <sup>p65</sup> , consisting of one code point in length
action	<a href="#">form</a> <sup>p564</sup>	URL to use for <a href="#">form submission</a> <sup>p588</sup>	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p86</sup>
allow	<a href="#">iframe</a> <sup>p361</sup>	<a href="#">Feature policy</a> to be applied to the <a href="#">iframe</a> <sup>p355</sup> 's contents	<a href="#">Serialized feature policy</a>
allowfullscreen	<a href="#">iframe</a> <sup>p361</sup>	Whether to allow the <a href="#">iframe</a> <sup>p355</sup> 's contents to use <a href="#">requestFullscreen()</a>	<a href="#">Boolean attribute</a> <sup>p65</sup>
allowpaymentrequest	<a href="#">iframe</a> <sup>p361</sup>	Whether the <a href="#">iframe</a> <sup>p355</sup> 's contents are allowed to use the <a href="#">PaymentRequest</a> interface to make payment requests	<a href="#">Boolean attribute</a> <sup>p65</sup>
alt	<a href="#">area</a> <sup>p437</sup> , <a href="#">img</a> <sup>p315</sup> , <a href="#">input</a> <sup>p512</sup>	Replacement text for use when images are not available	<a href="#">Text</a> <sup>p126*</sup>
as	<a href="#">link</a> <sup>p157</sup>	<a href="#">Potential destination</a> for a preload request (for <a href="#">rel</a> <sup>p155</sup> ="preload <sup>p299</sup> " and <a href="#">rel</a> <sup>p155</sup> ="modulepreload <sup>p296</sup> ")	<a href="#">Potential destination</a> , for <a href="#">rel</a> <sup>p155</sup> ="preload <sup>p299</sup> "; <a href="#">script-like destination</a> , for <a href="#">rel</a> <sup>p155</sup> ="modulepreload <sup>p296</sup> "
async	<a href="#">script</a> <sup>p688</sup>	Execute script when available, without blocking while fetching	<a href="#">Boolean attribute</a> <sup>p65</sup>
autocapitalize	<a href="#">HTML elements</a> <sup>p784</sup>	Recommended autocapitalization behavior (for supported input methods)	"on <sup>p785</sup> "; "off <sup>p785</sup> "; "none <sup>p785</sup> "; "sentences <sup>p785</sup> "; "words <sup>p785</sup> "; "characters <sup>p785</sup> "
autocomplete	<a href="#">form</a> <sup>p481</sup>	Default setting for autofill feature for controls in the form	"on"; "off"
autocomplete	<a href="#">input</a> <sup>p566</sup> ; <a href="#">select</a> <sup>p566</sup> ; <a href="#">textarea</a> <sup>p566</sup>	Hint for form autofill feature	<a href="#">Autofill field</a> <sup>p568</sup> name and related tokens*
autofocus	<a href="#">HTML elements</a> <sup>p775</sup>	Automatically focus the element when the page is loaded	<a href="#">Boolean attribute</a> <sup>p65</sup>
autoplay	<a href="#">audio</a> <sup>p401</sup> ; <a href="#">video</a> <sup>p401</sup>	Hint that the <a href="#">media resource</a> <sup>p382</sup> can be started automatically when the page is loaded	<a href="#">Boolean attribute</a> <sup>p65</sup>
charset	<a href="#">meta</a> <sup>p161</sup>	<a href="#">Character encoding declaration</a> <sup>p169</sup>	"utf-8"
checked	<a href="#">input</a> <sup>p490</sup>	Whether the control is checked	<a href="#">Boolean attribute</a> <sup>p65</sup>
cite	<a href="#">blockquote</a> <sup>p214</sup> ; <a href="#">del</a> <sup>p308</sup> ; <a href="#">ins</a> <sup>p308</sup> ; <a href="#">q</a> <sup>p243</sup>	Link to the source of the quotation or more information about the edit	<a href="#">Valid URL potentially surrounded by spaces</a> <sup>p86</sup>
class	<a href="#">HTML elements</a> <sup>p134</sup>	Classes to which the element belongs	<a href="#">Set of space-separated tokens</a> <sup>p85</sup>
color	<a href="#">link</a> <sup>p157</sup>	Color to use when customizing a site's icon (for <a href="#">rel</a> <sup>p155</sup> ="mask-icon")	CSS <a href="#">&lt;color&gt;</a>
cols	<a href="#">textarea</a> <sup>p543</sup>	Maximum number of characters per line	<a href="#">Valid non-negative integer</a> <sup>p67</sup> greater than zero
colspan	<a href="#">td</a> <sup>p462</sup> ; <a href="#">th</a> <sup>p462</sup>	Number of columns that the cell is to span	<a href="#">Valid non-negative integer</a> <sup>p67</sup> greater than zero
content	<a href="#">meta</a> <sup>p161</sup>	Value of the element	<a href="#">Text</a> <sup>p126*</sup>
contenteditable	<a href="#">HTML elements</a> <sup>p780</sup>	Whether the element is editable	"true"; "false"

span	<a href="#">col</a> <sup>p454</sup> ; <a href="#">colgroup</a> <sup>p453</sup>	Number of columns spanned by the element	<a href="#">Valid non-negative integer</a> <sup>p67</sup> greater than zero
spellcheck	<a href="#">HTML elements</a> <sup>p782</sup>	Whether the element is to have its spelling and grammar checked	"true"; "false"
src	<a href="#">audio</a> <sup>p384</sup> ; <a href="#">embed</a> <sup>p363</sup> ; <a href="#">iframe</a> <sup>p356</sup> ; <a href="#">img</a> <sup>p315</sup> ; <a href="#">input</a> <sup>p511</sup> ; <a href="#">script</a> <sup>p608</sup> ; <a href="#">source</a> <sup>p312</sup> ; <a href="#">track</a> <sup>p380</sup> ; <a href="#">video</a> <sup>p384</sup>	Address of the resource	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p86</sup>
srcdoc	<a href="#">iframe</a> <sup>p356</sup>	A document to render in the <a href="#">iframe</a> <sup>p355</sup>	The source of an <a href="#">iframe srcdoc document</a> <sup>p356</sup> *
srclang	<a href="#">track</a> <sup>p380</sup>	Language of the text track	Valid BCP 47 language tag
srcset	<a href="#">img</a> <sup>p315</sup> ; <a href="#">source</a> <sup>p312</sup>	Images to use in different situations (e.g., high-resolution displays, small monitors, etc.)	Comma-separated list of <a href="#">image candidate strings</a> <sup>p329</sup>
start	<a href="#">ol</a> <sup>p217</sup>	<a href="#">Starting value</a> <sup>p217</sup> of the list	<a href="#">Valid integer</a> <sup>p66</sup>
step	<a href="#">input</a> <sup>p520</sup>	Granularity to be matched by the form control's value	<a href="#">Valid floating-point number</a> <sup>p67</sup> greater than zero, or "any"
style	<a href="#">HTML elements</a> <sup>p141</sup>	Presentational and formatting instructions	CSS declarations*
tabindex	<a href="#">HTML elements</a> <sup>p766</sup>	Whether the element is <a href="#">focusable</a> <sup>p765</sup> and <a href="#">sequentially focusable</a> <sup>p765</sup> , and the relative order of the element for the purposes of <a href="#">sequential focus navigation</a> <sup>p772</sup>	<a href="#">Valid integer</a> <sup>p66</sup>
target	<a href="#">a</a> <sup>p279</sup> ; <a href="#">area</a> <sup>p279</sup>	<a href="#">Browsing context</a> <sup>p804</sup> for <a href="#">hyperlink</a> <sup>p279</sup> <a href="#">navigation</a> <sup>p852</sup>	<a href="#">Valid browsing context name or keyword</a> <sup>p811</sup>
target	<a href="#">base</a> <sup>p153</sup>	Default <a href="#">browsing context</a> <sup>p804</sup> for <a href="#">hyperlink</a> <sup>p279</sup> <a href="#">navigation</a> <sup>p852</sup> and <a href="#">form submission</a> <sup>p588</sup>	<a href="#">Valid browsing context name or keyword</a> <sup>p811</sup>
target	<a href="#">form</a> <sup>p565</sup>	<a href="#">Browsing context</a> <sup>p804</sup> for <a href="#">form submission</a> <sup>p588</sup>	<a href="#">Valid browsing context name or keyword</a> <sup>p811</sup>
title	<a href="#">HTML elements</a> <sup>p136</sup>	Advisory information for the element	<a href="#">Text</a> <sup>p126</sup>
title	<a href="#">abbr</a> <sup>p246</sup> ; <a href="#">dfn</a> <sup>p245</sup>	Full term or expansion of abbreviation	<a href="#">Text</a> <sup>p126</sup>
title	<a href="#">input</a> <sup>p519</sup>	Description of pattern (when used with <a href="#">pattern</a> <sup>p518</sup> attribute)	<a href="#">Text</a> <sup>p126</sup>
title	<a href="#">link</a> <sup>p156</sup>	Title of the link	<a href="#">Text</a> <sup>p126</sup>
title	<a href="#">link</a> <sup>p156</sup> ; <a href="#">style</a> <sup>p171</sup>	<a href="#">CSS style sheet set name</a>	<a href="#">Text</a> <sup>p126</sup>
translate	<a href="#">HTML elements</a> <sup>p138</sup>	Whether the element is to be translated when the page is localized	"yes"; "no"
type	<a href="#">a</a> <sup>p280</sup> ; <a href="#">link</a> <sup>p156</sup>	Hint for the type of the referenced resource	<a href="#">Valid MIME type string</a>
type	<a href="#">button</a> <sup>p529</sup>	Type of button	" <a href="#">submit</a> <sup>p529</sup> ", " <a href="#">reset</a> <sup>p529</sup> ", " <a href="#">button</a> <sup>p529</sup> "
type	<a href="#">embed</a> <sup>p363</sup> ; <a href="#">object</a> <sup>p368</sup> ; <a href="#">source</a> <sup>p312</sup>	Type of embedded resource	<a href="#">Valid MIME type string</a>
type	<a href="#">input</a> <sup>p488</sup>	Type of form control	<a href="#">input type keyword</a> <sup>p488</sup>

Attribute	Element(s)	Description	Value
type	<a href="#">ol</a> <sup>p217</sup>	Kind of list marker	"1" <sup>p217</sup> , "a" <sup>p217</sup> , "A" <sup>p217</sup> , "i" <sup>p217</sup> , "I" <sup>p217</sup>
type	<a href="#">script</a> <sup>p600</sup>	Type of script	"module"; a <a href="#">valid MIME type string</a> that is not a <a href="#">JavaScript MIME type essence match</a>
usemap	<a href="#">img</a> <sup>p439</sup> ; <a href="#">object</a> <sup>p439</sup>	Name of <a href="#">image map</a> <sup>p439</sup> to use	<a href="#">Valid hash-name reference</a> <sup>p86</sup> *
value	<a href="#">button</a> <sup>p530</sup> ; <a href="#">option</a> <sup>p540</sup>	Value to be used for <a href="#">form submission</a> <sup>p588</sup>	<a href="#">Text</a> <sup>p126</sup>
value	<a href="#">data</a> <sup>p255</sup>	Machine-readable value	<a href="#">Text</a> <sup>p126</sup> *
value	<a href="#">input</a> <sup>p490</sup>	Value of the form control	Varies*
value	<a href="#">li</a> <sup>p220</sup>	<a href="#">Ordinal value</a> <sup>p221</sup> of the list item	<a href="#">Valid integer</a> <sup>p66</sup>
value	<a href="#">meter</a> <sup>p551</sup> ; <a href="#">progress</a> <sup>p549</sup>	Current value of the element	<a href="#">Valid floating-point number</a> <sup>p67</sup>
value	<a href="#">param</a> <sup>p373</sup>	Value of parameter	<a href="#">Text</a> <sup>p126</sup>
width	<a href="#">canvas</a> <sup>p628</sup> ; <a href="#">embed</a> <sup>p443</sup> ; <a href="#">iframe</a> <sup>p443</sup> ; <a href="#">img</a> <sup>p443</sup> ; <a href="#">input</a> <sup>p443</sup> ; <a href="#">object</a> <sup>p443</sup> ; <a href="#">video</a> <sup>p443</sup>	Horizontal dimension	<a href="#">Valid non-negative integer</a> <sup>p67</sup>
wrap	<a href="#">textarea</a> <sup>p544</sup>	How the value of the form control is to be wrapped for <a href="#">form submission</a> <sup>p588</sup>	"soft" <sup>p544</sup> , "hard" <sup>p544</sup>

An asterisk (\*) in a cell indicates that the actual rules are more complicated than indicated in the table above.

List of event handler content attributes

Attribute	Element(s)	Description	Value
onabort	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">abort</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onauxclick	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">auxclick</a> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onafterprint	<a href="#">body</a> <sup>p943</sup>	<a href="#">afterprint</a> <sup>p1260</sup> event handler for <a href="#">Window</a> <sup>p816</sup> object	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onbeforeprint	<a href="#">body</a> <sup>p943</sup>	<a href="#">beforeprint</a> <sup>p1260</sup> event handler for <a href="#">Window</a> <sup>p816</sup> object	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onbeforeunload	<a href="#">body</a> <sup>p943</sup>	<a href="#">beforeunload</a> <sup>p1260</sup> event handler for <a href="#">Window</a> <sup>p816</sup> object	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onblur	<a href="#">HTML elements</a> <sup>p942</sup>	<a href="#">blur</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncancel	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">cancel</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncanplay	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">canplay</a> <sup>p433</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncanplaythrough	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">canplaythrough</a> <sup>p433</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onchange	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">change</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onclick	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">click</a> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onclose	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">close</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncontextmenu	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">contextmenu</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncopy	<a href="#">HTML elements</a> <sup>p943</sup>	<a href="#">copy</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncuechange	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">cuechange</a> <sup>p434</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oncut	<a href="#">HTML elements</a> <sup>p943</sup>	<a href="#">cut</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondblclick	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dblclick</a> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondrag	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">drag</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondragend	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dragend</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondragenter	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dragenter</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondragexit	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dragexit</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondragleave	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dragleave</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondragover	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dragover</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondragstart	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">dragstart</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondrop	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">drop</a> <sup>p801</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
ondurationchange	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">durationchange</a> <sup>p433</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onemptied	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">emptied</a> <sup>p432</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onended	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">ended</a> <sup>p433</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onerror	<a href="#">HTML elements</a> <sup>p942</sup>	<a href="#">error</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onfocus	<a href="#">HTML elements</a> <sup>p942</sup>	<a href="#">focus</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onformdata	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">formdata</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onhashchange	<a href="#">body</a> <sup>p943</sup>	<a href="#">hashchange</a> <sup>p1260</sup> event handler for <a href="#">Window</a> <sup>p816</sup> object	<a href="#">Event handler content attribute</a> <sup>p935</sup>
oninput	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">input</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>

Attribute	Element(s)	Description	Value
oninvalid	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">invalid</a> <sup>p1260</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onkeydown	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">keydown</a> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onkeypress	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">keypress</a> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onkeyup	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">keyup</a> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onlanguagechange	<a href="#">body</a> <sup>p943</sup>	<a href="#">languagechange</a> <sup>p1260</sup> event handler for <a href="#">Window</a> <sup>p816</sup> object	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onload	<a href="#">HTML elements</a> <sup>p942</sup>	<a href="#">load</a> <sup>p1261</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onloadeddata	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">loadeddata</a> <sup>p433</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onloadedmetadata	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">loadedmetadata</a> <sup>p432</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>
onloadstart	<a href="#">HTML elements</a> <sup>p941</sup>	<a href="#">loadstart</a> <sup>p432</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p935</sup>

## Events §<sup>p12</sup> 60

This section is non-normative.

Event	Interface	List of events Interesting targets	Description
<a href="#">abort</a>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> when the download was aborted by the user
<a href="#">DOMContentLoaded</a>	<a href="#">Event</a>	<a href="#">Document</a> <sup>p111</sup>	Fired at the <a href="#">Document</a> <sup>p111</sup> once the parser has finished
<a href="#">afterprint</a>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> after printing
<a href="#">beforeprint</a>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> before printing
<a href="#">beforeunload</a>	<a href="#">BeforeUnloadEvent</a> <sup>p876</sup>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> when the page is about to be unloaded, in case the page would like to show a warning prompt
<a href="#">blur</a>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup> , elements	Fired at nodes when they stop being <a href="#">focused</a> <sup>p764</sup>
<a href="#">cancel</a>	<a href="#">Event</a>	<a href="#">dialog</a> <sup>p603</sup> elements	Fired at <a href="#">dialog</a> <sup>p603</sup> elements when they are canceled by the user (e.g. by pressing the Escape key)
<a href="#">change</a>	<a href="#">Event</a>	Form controls	Fired at controls when the user commits a value change (see also the <a href="#">input</a> <sup>p1260</sup> event)
<a href="#">click</a>	<a href="#">MouseEvent</a>	Elements	Normally a mouse event; also synthetically fired at an element before its <a href="#">activation behavior</a> is run, when an element is activated from a non-pointer input device (e.g. a keyboard)
<a href="#">close</a>	<a href="#">Event</a> or <a href="#">CloseEvent</a> <sup>p994</sup>	<a href="#">dialog</a> <sup>p603</sup> elements, <a href="#">WebSocket</a> <sup>p988</sup>	Fired at <a href="#">dialog</a> <sup>p603</sup> elements when they are closed, and at <a href="#">WebSocket</a> <sup>p988</sup> elements when the connection is terminated
<a href="#">connect</a>	<a href="#">MessageEvent</a> <sup>p978</sup>	<a href="#">SharedWorkerGlobalScope</a> <sup>p1027</sup>	Fired at a shared worker's global scope when a new client connects
<a href="#">contextmenu</a>	<a href="#">MouseEvent</a>	Elements	Fired at elements when the user requests their context menu
<a href="#">copy</a>	<a href="#">Event</a>	Elements	Fired at elements when the user copies data to the clipboard
<a href="#">cut</a>	<a href="#">Event</a>	Elements	Fired at elements when the user copies the selected data on the clipboard and removes the selection from the document
<a href="#">error</a>	<a href="#">Event</a> or <a href="#">ErrorEvent</a> <sup>p922</sup>	Global scope objects, <a href="#">Worker</a> <sup>p1032</sup> objects, elements, networking-related objects	Fired when unexpected errors occur (e.g. networking errors, script errors, decoding errors)
<a href="#">focus</a>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup> , elements	Fired at nodes <a href="#">gaining focus</a> <sup>p764</sup>
<a href="#">formdata</a>	<a href="#">FormDataEvent</a> <sup>p596</sup>	<a href="#">form</a> <sup>p479</sup> elements	Fired at a <a href="#">form</a> <sup>p479</sup> element when it is <a href="#">constructing the entry list</a> <sup>p592</sup>
<a href="#">hashchange</a>	<a href="#">HashChangeEvent</a> <sup>p868</sup>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> when the <a href="#">fragment</a> part of the document's <a href="#">URL</a> changes
<a href="#">input</a>	<a href="#">Event</a>	Form controls	Fired at controls when the user changes the value (see also the <a href="#">change</a> <sup>p1260</sup> event)
<a href="#">invalid</a>	<a href="#">Event</a>	Form controls	Fired at controls during form validation if they do not satisfy their constraints
<a href="#">languagechange</a>	<a href="#">Event</a>	Global scope objects	Fired at the global scope object when the user's preferred languages change

Event	Interface	Interesting targets	Description
<b>load</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup> , elements	Fired at the <a href="#">Window</a> <sup>p816</sup> when the document has finished loading; fired at an element containing a resource (e.g. <a href="#">img</a> <sup>p314</sup> , <a href="#">embed</a> <sup>p363</sup> ) when its resource has finished loading
<b>message</b>	<a href="#">MessageEvent</a> <sup>p978</sup>	<a href="#">Window</a> <sup>p816</sup> , <a href="#">EventSource</a> <sup>p980</sup> , <a href="#">WebSocket</a> <sup>p988</sup> , <a href="#">MessagePort</a> <sup>p1002</sup> , <a href="#">BroadcastChannel</a> <sup>p1005</sup> , <a href="#">DedicatedWorkerGlobalScope</a> <sup>p1026</sup> , <a href="#">Worker</a> <sup>p1032</sup> , <a href="#">ServiceWorkerContainer</a>	Fired at an object when it receives a message
<b>messageerror</b>	<a href="#">MessageEvent</a> <sup>p978</sup>	<a href="#">Window</a> <sup>p816</sup> , <a href="#">MessagePort</a> <sup>p1002</sup> , <a href="#">BroadcastChannel</a> <sup>p1005</sup> , <a href="#">DedicatedWorkerGlobalScope</a> <sup>p1026</sup> , <a href="#">Worker</a> <sup>p1032</sup> , <a href="#">ServiceWorkerContainer</a>	Fired at an object when it receives a message that cannot be deserialized
<b>offline</b>	<a href="#">Event</a>	Global scope objects	Fired at the global scope object when the network connections fails
<b>online</b>	<a href="#">Event</a>	Global scope objects	Fired at the global scope object when the network connections returns
<b>open</b>	<a href="#">Event</a>	<a href="#">EventSource</a> <sup>p980</sup> , <a href="#">WebSocket</a> <sup>p988</sup>	Fired at networking-related objects when a connection is established
<b>pagehide</b>	<a href="#">PageTransitionEvent</a> <sup>p868</sup>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> when the page's entry in the <a href="#">session history</a> <sup>p836</sup> stops being the <a href="#">current entry</a> <sup>p836</sup>
<b>pageshow</b>	<a href="#">PageTransitionEvent</a> <sup>p868</sup>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> when the page's entry in the <a href="#">session history</a> <sup>p836</sup> becomes the <a href="#">current entry</a> <sup>p836</sup>
<b>paste</b>	<a href="#">Event</a>	Elements	Fired at elements when the user will insert the clipboard data in the most suitable format (if any) supported for the given context
<b>popstate</b>	<a href="#">PopStateEvent</a> <sup>p867</sup>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> when the user navigates the <a href="#">session history</a> <sup>p836</sup>
<b>readystatechange</b>	<a href="#">Event</a>	<a href="#">Document</a> <sup>p111</sup>	Fired at the <a href="#">Document</a> <sup>p111</sup> when it finishes parsing and again when all its subresources have finished loading
<b>rejectionhandled</b>	<a href="#">PromiseRejectionEvent</a> <sup>p923</sup>	Global scope objects	Fired at global scope objects when a previously-unhandled promise rejection becomes handled
<b>reset</b>	<a href="#">Event</a>	<a href="#">form</a> <sup>p479</sup> elements	Fired at a <a href="#">form</a> <sup>p479</sup> element when it is <a href="#">reset</a> <sup>p597</sup>
<b>securitypolicyviolation</b>	<a href="#">Event</a>	Elements	Fired at elements when a Content Security Policy violation is generated [ <a href="#">CSP</a> ] <sup>p1264</sup>
<b>select</b>	<a href="#">Event</a>	Form controls	Fired at form controls when their text selection is adjusted (whether by an API or by the user)
<b>slotchange</b>	<a href="#">Event</a>	<a href="#">slot</a> <sup>p626</sup> elements	Fired at <a href="#">slot</a> <sup>p626</sup> elements when their <a href="#">assigned nodes</a> change
<b>storage</b>	<a href="#">StorageEvent</a> <sup>p1043</sup>	<a href="#">Window</a> <sup>p816</sup>	Fired at <a href="#">Window</a> <sup>p816</sup> event when the corresponding <a href="#">localStorage</a> <sup>p1042</sup> or <a href="#">sessionStorage</a> <sup>p1041</sup> storage areas change
<b>submit</b>	<a href="#">Event</a>	<a href="#">form</a> <sup>p479</sup> elements	Fired at a <a href="#">form</a> <sup>p479</sup> element when it is <a href="#">submitted</a> <sup>p589</sup>
<b>toggle</b>	<a href="#">Event</a>	<a href="#">details</a> <sup>p597</sup> element	Fired at <a href="#">details</a> <sup>p597</sup> elements when they open or close
<b>unhandledrejection</b>	<a href="#">PromiseRejectionEvent</a> <sup>p923</sup>	Global scope objects	Fired at global scope objects when a promise rejection goes unhandled
<b>unload</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p816</sup>	Fired at the <a href="#">Window</a> <sup>p816</sup> object when the page is going away

## MIME Types §<sup>p12</sup> 61

This section is non-normative.

The following MIME types are mentioned in this specification:

**[application/atom+xml](#)**

Atom [[ATOM](#)]<sup>p1264</sup>

***application/ecmascript***

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

***application/javascript***

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

***application/json***

JSON [\[JSON\]](#)<sup>p1267</sup>

***application/x-ecmascript***

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

***application/x-javascript***

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

***application/octet-stream***

Generic binary data [\[RFC2046\]](#)<sup>p1269</sup>

***application/microdata+json***<sup>p1236</sup>

Microdata as JSON

***application/rss+xml***

RSS

***application/x-www-form-urlencoded***

Form submission

***application/xhtml+xml***<sup>p1233</sup>

HTML

***application/xml***

XML [\[XML\]](#)<sup>p1271</sup> [\[RFC7303\]](#)<sup>p1270</sup>

***image/gif***

GIF images [\[GIF\]](#)<sup>p1266</sup>

***image/jpeg***

JPEG images [\[JPEG\]](#)<sup>p1267</sup>

***image/png***

PNG images [\[PNG\]](#)<sup>p1268</sup>

***image/svg+xml***

SVG images [\[SVG\]](#)<sup>p1270</sup>

***multipart/form-data***

Form submission [\[RFC7578\]](#)<sup>p1270</sup>

***multipart/mixed***

Generic mixed content [\[RFC2046\]](#)<sup>p1269</sup>

***multipart/x-mixed-replace***<sup>p1232</sup>

Streaming server push

***text/cache-manifest***<sup>p1234</sup>

Offline application cache manifests

***text/css***

CSS [\[CSS\]](#)<sup>p1264</sup>

***text/ecmascript***

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

***text/event-stream***<sup>p1237</sup>

Server-sent event streams

***text/javascript***

JavaScript [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/javascript1.0**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/javascript1.1**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/javascript1.2**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/javascript1.3**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/javascript1.4**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/javascript1.5**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/jscript**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/json**

JSON (legacy type)

**text/livescript**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/plain**

Generic plain text [\[RFC2046\]](#)<sup>p1269</sup> [\[RFC3676\]](#)<sup>p1269</sup>

**text/html**<sup>p1231</sup>

HTML

**text/ping**<sup>p1235</sup>

Hyperlink auditing

**text/uri-list**

List of URLs [\[RFC2483\]](#)<sup>p1269</sup>

**text/vcard**

vCard [\[RFC6350\]](#)<sup>p1269</sup>

**text/vtt**

WebVTT [\[WEBVTT\]](#)<sup>p1271</sup>

**text/x-ecmascript**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/x-javascript**

JavaScript (legacy type) [\[JAVASCRIPT\]](#)<sup>p1267</sup>

**text/xml**

XML [\[XML\]](#)<sup>p1271</sup> [\[RFC7303\]](#)<sup>p1270</sup>

**video/mp4**

MPEG-4 video [\[RFC4337\]](#)<sup>p1269</sup>

**video/mpeg**

MPEG video [\[RFC2046\]](#)<sup>p1269</sup>

Weiss, Yonathan Randolph, Yury Delendik, 平野裕 (Yutaka Hirano), Yuzo Fujishima, Zhenbin Xu, 张智强 (Zhiqiang Zhang), Zoltan Herczeg, and Øistein E. Andersen, for their useful comments, both large and small, that have led to changes to this specification over the years.

Thanks also to everyone who has ever posted about HTML to their blogs, public mailing lists, or forums, including all the contributors to the [various W3C HTML WG lists](#) and the [various WHATWG lists](#).

Special thanks to Richard Williamson for creating the first implementation of [canvas](#)<sup>p627</sup> in Safari, from which the canvas feature was designed.

Special thanks also to the Microsoft employees who first implemented the event-based drag-and-drop mechanism, [contenteditable](#)<sup>p780</sup>, and other features first widely deployed by the Windows Internet Explorer browser.

Special thanks and \$10,000 to David Hyatt who came up with a broken implementation of the [adoption agency algorithm](#)<sup>p1127</sup> that the editor had to reverse engineer and fix before using it in the parsing section.

Thanks to the participants of the microdata usability study for allowing us to use their mistakes as a guide for designing the microdata feature.

Thanks to the many sources that provided inspiration for the examples used in the specification.

Thanks also to the Microsoft blogging community for some ideas, to the attendees of the W3C Workshop on Web Applications and Compound Documents for inspiration, to the #mrt crew, the #mrt.no crew, and the #whatwg crew, and to Pillar and Hedral for their ideas and support.

Thanks to Igor Zhanov for generating PDF versions of the specification.

Special thanks to the [RICG](#) for developing the [picture](#)<sup>p311</sup> element and related features; in particular thanks to Adrian Bateman, Bruce Lawson, David Newton, Ilya Grigorik, John Schoenick, Leon de Rijke, Mat Marquis, Marcos Cáceres, Tab Atkins, Theresa O'Connor, and Yoav Weiss for their contributions.

Special thanks to the [WPWG](#) for incubating the [custom elements](#)<sup>p689</sup> feature. In particular, thanks to David Hyatt and Ian Hickson for their influence through the XBL specifications, Dimitri Glazkov for the first draft of the custom elements specification, and to Alex Komoroske, Alex Russell, Andres Rios, Boris Zbarsky, Brian Kardell, Daniel Buchner, Dominic Cooney, Erik Arvidsson, Elliott Sprehn, Hajime Morrita, Hayato Ito, Jan Miksovsky, Jonas Sicking, Olli Pettay, Rafael Weinstein, Roland Steiner, Ryosuke Niwa, Scott Miles, Steve Faulkner, Steve Orvell, Tab Atkins, Theresa O'Connor, Tim Perry, and William Chen for their contributions.

Part of the revision history of the [picture](#)<sup>p311</sup> element and related features can be found in the [ResponsiveImagesCG/picture-element repository](#).

Part of the revision history of the [theme-color](#)<sup>p164</sup> metadata name can be found in the [whatwg/meta-theme-color repository](#).

Part of the revision history of the [custom elements](#)<sup>p689</sup> feature can be found in the [w3c/webcomponents repository](#), which is available under the [W3C Permissive Document License](#).

Part of the revision history of the [innerText](#)<sup>p145</sup> IDL attribute can be found in the [rocallahan/innerText-spec repository](#).

For about ten years starting in 2003, this standard was almost entirely written by Ian Hickson ([Google](#), [ian@hixie.ch](mailto:ian@hixie.ch)). More recently, Simon Pieters ([Bocoup](#), [zcorpan@gmail.com](mailto:zcorpan@gmail.com)), [Anne van Kesteren](#) ([Mozilla](#), [annevk@annevk.nl](mailto:annevk@annevk.nl)), [Philip Jägenstedt](#) ([Google](#), [philip@foolip.org](mailto:philip@foolip.org)), and [Domenic Denicola](#) ([Google](#), [d@domenic.me](mailto:d@domenic.me)), all previously long-time contributors, have joined Ian in editing the text directly.
